ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
agric., agricultural.
ambas., ambassador(s).
Amer., American.
ant., ancient.
ann., annual.
arron., arrondissement.
A.-S., Anglo-Saxon.
A.V., Authorised Version.
b., born.
Biog. Dic., Biographical Dictionary.
bor., borough.
bp., birthplace.
Brit., British.
C., Comrade.
c., about.
cap., capital.
cf., compare.
co., county.
com., commune.
cub. ft., cubic feet.
d., died.
Dan., Danish.
dept., department.
dist., district.
div., division.
E., east; eastern.
eccles., ecclesiastical.
ed., edition; edited.
e.g., for example.
Ency. Brit., Encyclopædia Britannica.
Eng., English.
estab., established; establishment.
F., Fahrenheit.
fl., flourished.
fort. tn., fortified town.
Fr., French.
ft., feet.
Ger., German.
Gk., Greek.
gov., government.
Heb., Hebrew.
hist., history.
horticult., horticultural.
h.p., horse-power.
hr., hour.
i.e., that is.
in., inch(es).
inhab., inhabitant(s).

is., island(s).
It., Italian.
Jap., Japanese.
jour., journal.
Lat., Latin.
lat., latitude.
lb., pound(s).
l. b., left bank.
long., longitude.
m., mile(s).
manuf., manufacture.
min., minute(s).
mrkt. tn., market town.
MS., manuscript.
mt., mount; mountain.
N., north; northern.
N.T., New Testament.
O.E., Old English.
O.F., Old French.
O.T., Old Testament.
oz., ounce(s).
par., parish.
parl., parliamentary.
pop., population.
prin., principal.
prof., professor.
prov., province; provincial.
pub., published; publication.
q.v., which see.
R., riv., river.
r. b., right bank.

Coal-Fish, see GREENCOD.

Coal Gas, see GAS MANUFACTURE.

Coal, Hydrogenation of, conversion of coal into a mixture of oils by treatment with hydrogen. The best method of hydrogenation is that of Bergius, which consists, essentially, of converting coke into a mixture of hydrogen and carbon monoxide by heating in steam and purifying the mixed gases from sulphur. The next stage is to oxidise the carbon monoxide to carbon dioxide, which is effected with further steam heating and a catalyst. The carbon dioxide is then removed by water under a pressure of 750 lb. to the square inch and the hydrogen is freed from any remaining traces of carbon monoxide by treatment with a solution of copper compound and ammonia. The coal, having been cleansed by flotation, is then mixed with creosote oil and a catalyst and ground to a fluid paste, which latter is heated, with the hydrogen, at a pressure of 250 times that of the atmosphere. It is thus converted into a mixture of oils which, on fractional distillation, can be separated into petrol and heavy and middle oil. Some four tons of coal are required to yield one of petrol, and ensuing petrol is of good quality and volatile.

Coaling Stations. Since Great Britain has world-wide commercial interests, it is a necessity that ports should be specially fitted out for supplying steamships with coal. At the same time these stations are an essential to the R.N., and as a consequence have to be in some measure fortified for defence. The armament of these stations is in the main light, although a great amount of money has necessarily been spent on them. Some defence, however, is necessary against attack from the air. The majority of the C. S. of the world are now oil-fuelling stations as well, but oil supplies are more vulnerable than coal, especially from the air. Among the prin. stations may be named Aden, Bombay, Brisbane, Calcutta, Cape Town, Christchurch (New Zealand), Colombo, Durban, Falkland Is., Fiji Is., Gibraltar, Halifax, Hong Kong, Jamaica, Karachi, Labuan, Malta, Mauritius, Rangoon, Sierra Leone, Singapore, Sydney, and Zanzibar. The great coal-shipping firms of Great Britain have depots for the storing and supply of coal all over the world.

Coalition, combination of states or political parties having different or opposed interests, effected for the purpose of attaining a specific end or carrying out or resisting a particular policy. Some international Cs. were the first C. against France in 1793, formed by England, Spain, Holland, Austria, and Prussia; the second C. against France in 1798 after the battle of the Nile, and the third C., of which the chief members were England, Austria,

and Russia, formed in 1805, largely through the exertions of Pitt. Perhaps the most celebrated C. of political parties in past Eng. hist. was the C. ministry of 1783, with the duke of Portland as nominal Prime Minister, the two antagonists Fox and North being the secretaries of state, following on the C. of Fox and Burke in 1782 to turn Shelburne out of office, both Cs. arising out of the bitterness and personal recriminations engendered by the loss of the Amer. colonies. In 1804 Pitt, Fox, and Grenville united to oppose the Addington ministry, but on Pitt becoming Prime Minister the C. broke up because the king refused to receive Fox. The object of this last C., which sank the differences of its members over the question of Catholic emancipation, was to secure a stronger ministry in view of the general menace to Europe from France under Bonaparte. Most Cs. between parties either break up at once or become permanent through the absorption of one party by the other. The latter happened in the case of the Liberal and Conservative C. against Gladstone's Home Rule Bill of 1893. Where a particular reform or projected measure is, or is thought to be, of very far-reaching importance, it may often happen that what were previously matters of controversy sink into insignificance in one all-absorbing fear or dislike of the one great change. Perhaps in England a more significant C. was never experienced before the First World War than that of the Liberal, Nationalist, and Labour parties after the general election of 1910, the dominant motive of which was the determination to give Home Rule to Ireland. The necessity, on the outbreak of the First World War, of sinking party politics in the larger issues led in Great Britain to the formation of a C. Gov., representative of all shades of political opinion—a political *modus vivendi* which was not adopted on the outbreak of the Second World War, mainly because a National Gov. was in office. The War Cabinet which was formed very soon afterwards, at once exercised a greater and more arbitrary authority than had long been customary under the Brit. constitution. Under the Defence of the Realm Act (q.v.) powers, almost amounting to a dictatorship, were vested in the Prime Minister and the chief officials of state. In order to produce harmonious relations essentially Liberal projects were dropped, and even Bills which had become Acts of Parliament under the Liberal Gov. had their date of operation postponed. The C. subsisted throughout the war, and once again assumed office after the general election of 1918, but finally yielded to the party system in 1922, the immediate cause of

Coal

the downfall being the gov.'s policy on the Chanak affair. (See under GRÆCO-TURKISH WAR (1921-22); HARINGTON, SIR CHARLES; TURKEY.) The 'National' Gov. of 1931 was also essentially a C. Gov. of the Conservative party, together with such of the representatives of the Liberal and Labour parties as were opposed to the previous Socialist regime. Its formation, however, soon estranged the bulk of the Labour and orthodox Liberal parties.

Coal, Low Temperature Carbonisation of, see CARBONISATION.

Coal Measures, see COAL-FIELDS; CARBONIFEROUS SYSTEM; PALEONTOLOGY; PETROLOGY; GEOLOGY.

Coal Mines, Nationalisation of. By the Coal Act, 1938, a Coal Commission was constituted, in which was vested, as from July 1, 1942, the ownership of all coal (and certain associated minerals and rights), with the duty of exercising their functions as owners 'in such manner as they might think best for promoting the interests, efficiency, and better organisation of the coal-mining industry.' The aggregate amount of compensation to be paid by the commission for coal and coal rights was fixed by the Act at £66,450,000, with additional sums for other associated property and rights, and the commission might borrow up to £76,450,000 for the payment of compensation and other expenses payable by them. The valuation of separate coal holdings, as registered under the Coal (Registration of Ownership) Act, 1937, was carried out by valuation boards appointed by the Ministry of Fuel and Power, and payment of the compensation completed. The commission was also charged with duties of promoting amalgamation of colliery undertakings in any area in which they considered the number of separate undertakings to be so great as to be detrimental to the efficient working, treating, or disposing of coal. After the Second World War, the Coal Commission was replaced by the National Coal Board, constituted under the Coal Industry Nationalisation Act, 1946, and a tribunal was set up to determine the global sum of compensation to be paid for certain assets of the coal industry to be transferred to the Coal Board. The tribunal fixed the amount of compensation at £164,660,000. The assets transferred may be described broadly as the assets of the coal industry, excluding assets such as coke ovens and by-product plant. The award is dated Aug. 1, 1946. In pursuance of an order made under the Coal Mines Nationalisation Act the transfer of the C. M. to national ownership was effected on Jan. 1, 1947.

Coal-mining. Exploration or Prospecting.—In prospecting for coal a knowledge of geology is essential in order to determine whether the rocks are coal-bearing or belong to the Carboniferous system. In countries where C. operations are in progress, valuable information may be obtained from neighbouring collieries, pub. papers, and records such as the Brit. Geological Survey memoirs and maps. In most cases, the coal outcrops have been

Coal-mining

worked away, but their former existence may be marked by blackened earth or old rubbish heaps at the surface. The bed of a stream may contain coal fragments derived from some outcrop of a seam. By searching upstream this outcrop may be located. Where the nature of the rocks indicate, with a reasonable degree of certainty, that coal exists in the area, the expense of boring to prove it may be justified. Before doing so, however, a geological survey is often necessary. Boring is resorted to for the purpose of demonstrating that the great expenditure necessary for shaft sinking is warranted. Two, three, or more boreholes are often put down at points selected from the geological survey. These boreholes will provide information regarding (a) the number, thickness, and quality of the seams, (b) the nature of the rocks through which the shafts will have to be sunk, (c) the depth from the surface of the individual seams, (d) the amount and direction of dip, (e) the presence of water, and (f) the existence and position of faults, which information will help to determine the best location for the shafts. With the aid of the above information, it is possible to estimate the expense of sinking the shafts; the total quantity of coal available; the cost of working and the probable profit. There are a number of boring methods, but all of them may be classified under either one or the other of two main systems: (1) *Percussive* system, carried out with the aid of free-falling tools, or (2) *Rotary* system, which involves the cutting out of a solid core of the strata passed through. Generally, the second method is preferred, as the rock cores enable a complete record of the strata passed through to be obtained.

Sinking and filling Shafts.—If the information provided by the boreholes is favourable, shafts are sunk to work the coal seams. The first step is to select the best position for sinking. This depends upon (a) the proximity of a main railway so as to limit the expenditure on branch railways; (b) the existence of a good road for transport; (c) the limitation of underground roadways; (d) the presence of faults which may damage the shaft; and (e) the presence of a supply of clean water for steam boilers, etc. In mountainous areas, valleys are naturally preferred for shafts as they ensure the minimum depth to reach the coal. With dipping seams, the shafts are often sunk to the deeper part so that the bulk of the coal and water will gravitate to the shaft bottom and thus save power. Normally, the shafts are sunk near the centre of the taking so as to limit the length of haulage and ventilation roads in all directions. The law requires that at least two shafts, fifteen yards or more apart, be sunk to work each independent coal taking. One will act as the *downcast* or ingress and the other as the *upcast* or egress. Both shafts must be provided with winding gear for the conveyance of workmen. The shaft must be adequate of size, and the factors which determine this are (a) the required daily output of coal; (b) the total quantity

of coal in the taking; (c) the period of the lease (in England it varies from thirty to ninety-nine years and in Scotland from twenty to thirty years); and (d) an additional space must be allowed for water and compressed-air pipes and ventilation. The above information will determine the size of the tubs or trams for carrying the coal, the size of the cages in the shaft, and finally the size of the shaft itself. Engineers are nowadays generous in shaft sizes to allow ample space for ventilation. In Great Britain, shafts up to 24 and 25 ft. in diameter are not uncommon. A depth of 4000 to 5000 ft. is considered to be about the maximum at which coal can be profitably mined in Great Britain, although in the gold mines of S. Africa shafts up to nearly 7000 ft. have been sunk. There is a great variety of shaft forms, such as the rectangular, octagonal, elliptical, and circular. The rectangular is easy to secure with timber and divide into compartments. The circular shape is the strongest to resist rock pressure and can be lined easily with brick, concrete, or cast-iron tubing. The circular is the form usually adopted in England and Wales, the size varying up to 25 ft. in diameter. When sinking through the incoherent surface deposits, special precautions are necessary. Sometimes beds of water-logged gravel or quicksand will render the sinking difficult and necessitate special methods. Having reached the hard rock, the sinking operations include blasting and excavating, removal of debris in special buckets, raising the water, and finally lining or supporting the shaft sides. The sinking costs will fluctuate greatly according to time and place. In the case of a fairly large shaft £100 or more per yard of depth is not uncommon. (For fuller information on this subject see *SINKING*.) When the coal is reached, the mining engineer provides for the protection of the shaft and surface buildings from damage, due to ground subsidence, by leaving a large pillar of coal around the shaft bottom. This is left intact except for the necessary haulage and ventilation roads. The size of this coal pillar varies with the depth of the shafts, the thickness of the seam worked, the dip of the strata, and other factors.

Methods of Working.—When the shafts have reached the coal and the shaft pillar formed, the method of working the seam must be decided. The various methods may be classified broadly into two systems, namely *longwall* and *pillar and stall*. In the longwall method, the coal face is opened out at the edge of the shaft pillar and the whole of the seam removed in one operation. The space from which the coal has been removed is completely or partly filled with dirt obtained from the seam or the rock beds above or below the seam. This area filled with dirt is known as the *goaf* or *gob*, and through this all roads to gain access to the coal face are maintained. In the pillar and stall method, the seam is divided into rectangular pillars by driving stalls or boards at right angles to each other.

After a certain area of coal has been split up into pillars, the work of extracting them is commenced. The seam is therefore removed in two operations, as distinguished from the longwall method, in which the coal is worked in one operation. There are numerous modifications of these two main systems to meet the varying conditions, such as thickness and inclination of seam, and so on. As a general rule, seams of 4 ft. or under in thickness are worked longwall, and seams over this thickness by some form of pillar and stall. The system of working to be adopted will depend upon (a) the thickness and inclination of the seam; (b) the depth below the surface; (c) the nature of roof and floor; (d) the presence of gas or water; (e) the presence of old workings; (f) the existence of valuable surface buildings requiring protection. In *longwall advancing*, the coal is worked from the shaft pillar towards the boundary, while in *longwall retreating* the main roads are driven to the boundary and the seam is worked backwards towards the shaft.

FIG. 1 TIMBERING IN COAL FACE

The bearing of the main roads driven from the shaft bottom varies with the haulage requirements, the inclination of the seam, and the position of the shaft relative to the coal taking. The advantages of the longwall system of working are (a) it is very suitable for machine cutting and conveying; (b) concentration of men; (c) the ventilation is better; (d) better roof control and therefore greater safety. Fig. 1 shows a section across a longwall coal face, with the goaf packed with dirt, props for supporting the roof, and a sprag to hold the face slip until the miner is ready to work it. The pillar and stall method is usually adopted in thick seams or when working under valuable property or water, in which case the pillars are left to support the strata. This system of working is expensive owing to the large number of narrow drivages, and the removal of the pillars is delayed until the whole block is split up.

Timbering.—The roof and sides of mine roadways and coal faces must be supported and made secure to prevent accidents and to maintain traffic and ventilation. At the coal face a bad roof must be supported immediately the coal is removed, and even a good roof must be made secure to keep it good. Ordinary timbering will only resist the minor pressure caused by the weight of the rock immediately above the coal. The major rock pressure is irresistible and can only be controlled by systematic packing of the goaf. Timber supports often give

warning, by a crackling sound, of roof weights. Since about 50 per cent of the fatal accidents in mines are due to falls, timber supports are a necessity. In Northumberland and Durham, a special body of trained men are employed in each pit to do this work, while in Wales, Lancashire, and Scotland, the colliers do most of the timbering required in their places. At the coal face single props are

FIG. 2. PLAN OF SYSTEMATIC TIMBERING

set with a lid on top. This lid distributes the pressure over a greater area. With hard floors, the feet of the props are often tapered to prevent their crushing when the roof weight comes on. With soft floors, a sole piece is often placed under the prop as well as above it. Another method used in the coal face and on the sides of roadways is that of chocks consisting of pieces of wood placed horizontally in the form of squares, which are built up to the roof and wedged tightly. A method which is gradually being adopted in most coal-fields is that known as systematic timbering. Fig. 2 shows the method being applied in a

FIG. 3. TIMBERING IN INCLINED SEAM

longwall face. Of course, with good roofs, the distance apart of the props can be greater than when the roof is bad. Roadways are usually supported by means of a cross-bar and props, although when only the roof requires securing, a cross-bar alone may be sufficient. Fig. 3 shows double timbering in an inclined and moderately thick seam where part of the hard floor is removed for headroom. The joint between the cross-bar and the uprights is known as the Welsh notch. In the case of wide roadways, the cross-bars are sometimes supported by a centre

prop. Nowadays, main roadways that require supporting are lined with brick or reinforced concrete arches, or by brick side walls with steel girders as cross-bars. Semicircular steel arches are now a frequent method of supporting roadways. These are placed 2 to 4 ft. apart with tie-rods to secure them one to the other. This method of support has many advantages, such as great strength; it is less cumbersome than wood and it is fireproof and not so liable to decay. Even at the coal face, steel is gradually replacing wood as supports. Steel props may be in the form of cylinders or girders, and many are made adjustable to fit the height of the seam or to yield or gradually with increasing roof pressures. The chief methods of preserving mine timber are thorough drying before use, stripping the bark, and the use of preservatives such as zinc chloride, copper sulphate, iron sulphate, lime, and creosote (from tar). The timber in return airways is usually sprayed with

Fox Photos

MINERS BREAKING COAL FOR REMOVAL IN TUBS

a solution of copper sulphate at regular intervals. In America, shaft timber is often sprayed with cement, which renders it fireproof and fungus-proof.

Winning the Coal.—The most laborious work of the miner is that of cutting down the coal and then filling it into tubs. Most seams have joints or cleavage planes, and there is always one direction along which the coal will yield most readily. The cleats in the coal are known as back or face slips, depending on the direction from which they are worked. For example, the seam shown in Fig. 1 is being worked on the face. If it was worked from the opposite direction, the working would be on the back. When the slips are as shown in Fig. 1 the miner works away the lower part or butt, when the coal can be readily parted slip by slip. The miner's tools consist of picks, shovels, hammers, wedges, and hatchets. Among the other tools occasionally used are drilling machines, worked either by hand, electricity, or compressed air. These machines are used for boring in the seam, roof, or floor to blast it loose. When the seam has been undercut, sprags may be necessary to hold the coal until the loading commences. A sprag is an

inclined prop against the coal as shown in Fig. 1. If the coal is hard, it may be necessary to use mechanical wedges or even shot-firing to bring it down. When shot-firing is resorted to in gassy or fiery mines, only permitted explosives may be employed. These explosives minimise the danger of flame communication in the presence of inflammable gas such as fire-damp. Shot-firing in gassy mines can only be performed by a competent man, called a shot-firer, duly appointed by the management.

Coal Face Machinery.—During the last ten to fifteen years, economic necessity has compelled colliery managers to introduce machinery to perform the more arduous work at the coal face. Coal face machinery has become necessary because of (a) the rising cost of production; (b) the shorter working hours; (c) the exhaustion of thick seams and the necessity for working thin seams; (d) the shortage of skilled miners, and (e) the necessity for

FIG. 4. FACE CONVEYORS

increasing the output per man and reduction of working costs. The longwall method of working lends itself well to the use of face machinery such as coal-cutters and face conveyors. A coal-cutting machine consists essentially of an engine or motor which by means of a gear case works either a disk, chain, or a bar type of cutter. A longwall coal-cutter is fixed at one end of the coal face and by means of a rope or chain is hauled along the face whilst cutting a groove or channel to a depth of 3 to 6 ft. as it travels along. The disk machine acts in principle like a circular saw, except that it is laid horizontally instead of vertically. In the chain machine the cutters are fixed to an endless chain resembling that of a band saw. The bar machine carries teeth along its length and in action resembles a saw-file. These machines are worked either electrically or by compressed air. With coal-cutting machines in use, the quantity of coal to be loaded is far greater than when the coal is cut by hand. In view of this, coal-face conveyors have become a necessity to remove and deliver the coal to the tubs. Different types of conveyors are in use, the most popular being the belt, jigger (or shaker), and the scraper chain. The conveyor extends the whole length of the coal face and delivers the coal either into the tubs at the roadway or on to a gate or main conveyor. There are machines now in operation which

simultaneously cut and load the coal on longwall faces, which may be 100 yds. in length, and give an output of 250–300 tons of coal per shift. Fig. 4 is a section along a coal face showing two face belt conveyors (A) delivering coal on to a tub (B). In some cases these face conveyors deliver the coal on to a gate conveyor, which in turn discharges into tubs some distance back on the gate road. At the Comrie pit of Fife—the first to lead the way—every ton of coal is mechanically cut and conveyed, and lifted to the surface by the modern skip winding method. The National Coal Board is planning to extend this method to as many mines as possible and in 1947 placed orders for £9,000,000 worth of new machines—cutters, loaders, and conveyors. Production apart, the Board has also prepared schemes for mechanical cleaning of coal in centralised washing plants, and for the reorganisation of underground haulage.

Haulage of Coal Underground.—There is a great variety of haulage systems in use underground. The system to be adopted depends upon (a) the amount and direction of gradient; (b) the regularity or otherwise of gradient; (c) the daily and total tonnage of coal to be hauled; and (d) the power available. In small mines, men or boys may be employed to push the trams to and from a siding or double-parting. When a set of full trams has been collected it is hauled outwards by a haulier with a horse or by a rope and mechanical haulage. Where horses or ponies are used, the gradient should not exceed about one in a hundred and the roadway must be large enough to prevent injuries to the animals. Mine trams (or tubs) are usually built of steel or steel alloyed with copper to prevent corrosion. Locomotives, which are popular in America, may be driven by petrol, electricity, compressed air, or storage battery. Safety from fire or explosion is obtained by using compressed air or storage battery locomotives. In Brit. mines, electricity and compressed-air power are favoured for haulage purposes. Electricity is largely confined to the main haulage planes where the ventilation is good, and compressed air is preferred for the inbye haulages where ventilation difficulties might render electricity dangerous. Where the full tubs have to be brought downhill on an inclined plane a self-acting incline can be used. In this case, the gravity pull of the full tubs is utilised to haul up the empty tubs. This is varied sometimes and the full tubs haul a bogie (a low carriage containing iron weights) up the incline, and the weight this bogie, when descending, hauls up the empty tubs. The arrangement calls for a drum (with brakes) on top of the incline around which a rope or chain is coiled to haul the coal tubs. All self-acting inclines are provided with safety appliances to prevent accidents from runaway tubs. With a direct-acting haulage or dip-haulage, only one rope is used. This system is adopted on inclined planes where the full trams have to be hauled uphill and the gradient

is sufficient to allow the empties to run down the plane on their return journey. A haulage engine and drum are fixed on top; the drum can be thrown out of gear when the empties run back under their own weight. When the gradient is undulating or is insufficient to allow the empty tubs to return by gravity, the main- and tail haulage system is employed. In this case two ropes are used. One of these known as the tail rope, hauls the empty tubs inbye, and the other, called the main rope, hauls the full tubs outbye or towards the shaft bottom. The endless-rope system of haulage is greatly favoured on long, fairly flat roadways. As the name implies, one endless rope is used in which travels continuously in one direction. The ends of two ropes are spliced or joined so as to form one endless rope. This travels from the haulage engine drums to a return wheel or pulley placed at the other end of the haulage plane. Usually two roads are laid, side by side, and the full tubs pass outwards on one road and the empties pass inwards on the other. This arrangement requires a wide haulage road and consequently, in weak strata, two separate and parallel roadways are sometimes preferred, one for the full tubs and the other for the empties. The trams are attached to the rope in various ways, and can be attached or detached by hand or by other means. In modern mines, men or boys are never employed to push coal tubs, in fact even horses and ponies are being replaced gradually by power haulages or locomotives. There are a number of mines with no horses underground, and the number is increasing.

Coal Winding.—The coal tubs, on reaching the shaft bottom, are run into cages. Two cages are provided in each shaft, one ascending while the other descends. The cages are guided in the shaft by wood, rail, or wire-rope guides to avoid collision and to give steadiness at high speeds. Rope guides are often used and these are suspended from cross girders in the head-gear and held taut by weights in the shaft bottom. Each cage may have from one to four decks, each deck holding one or more tubs. Totally enclosed double-decked cages of wrought iron or steel and holding two tubs on each deck are common. The cages are attached to the winding rope by chains. Winding ropes are now almost exclusively made of plough steel owing to its great tensile strength, elasticity, and wearing qualities. A plough steel rope has a breaking stress of 95–125 tons per sq. in. Winding engines are driven either by steam or electricity, the latter being preferred for smooth working. The load on the winding engine varies considerably during a complete wind, being a maximum at the start. Various methods are used to counterbalance the weight of the winding rope. The tail-rope method is frequently employed. This consists in fixing a rope to the bottom of each cage and running it around a pulley at the bottom of the shaft. If this tail rope equals the weight of the winding rope, the dead load on the winding engine is

only that of the coal, as the cages will balance each other. Conical or spiral drums (instead of cylindrical drums) are sometimes used for the same purpose. Nowadays, coal winding is sometimes performed by the skip or bucket method which, in conjunction with face and gate-road conveyors, is a further step towards the elimination of tubs underground.

Mine Gases.—The chief noxious gases with which miners are concerned are firedamp, carbon dioxide, and carbon monoxide. Firedamp, methane or carburetted hydrogen, is the most common mine gas. It is colourless, odourless, tasteless, and a non-poisonous gas, although it will cause suffocation when breathed, owing to the absence of air. Since it is only about half as heavy as air, it is generally found near the roof or in cavities. When mixed with air in certain proportions it is very explosive. Its presence in mine air is detected by its effect on the flame of a miner's safety lamp, on which a bluish cap is formed when sufficient gas is present. Firedamp is given off from the coal and the surrounding rocks, sometimes suddenly as 'blowers.' Carbon dioxide also exists in varying small quantities in coal and is produced by the combustion of carbonaceous material, the burning of lamps, and the breathing of men and horses. It is a colourless and odourless gas and, being about one and a half times as heavy as air, it accumulates near the floor and in dip workings. This gas will not burn, neither will it support combustion. It is detected by the dimness of the flame of a safety lamp, and the flame is extinguished when large quantities are present. When breathed it causes fatigue, panting, and headache according to the amount present. Carbon monoxide is principally produced as a result of gob fires and by the explosion of firedamp and coal dust. It is a colourless and odourless gas, slightly lighter than air. This gas is a very deadly poison and the breathing of even minute traces will cause poisonous effects. The symptoms of carbon monoxide poisoning are breathlessness and palpitation, severe headaches, drowsiness, or collapse according to the amount present.

Ventilation.—The prin. function of ventilation is to convey fresh air to all parts of the mine and to carry away gases and waste products, and thus provide a safe and wholesome atmosphere in all parts where men work or travel. In certain small mines, the ventilation is natural, owing to a difference in temp. of the air in the downcast and the upcast. Natural ventilation is, however, unreliable, and is always liable to cease or even change its direction according to the season of the year. The Coal Mines Act, 1911, of Great Britain states that a place is not fit to work in if the air contains either less than 19 per cent of oxygen or more than 1½ per cent of carbon dioxide. Formerly, many mines were ventilated by steam jets, waterfalls, or furnaces. A jet of steam was allowed to issue near the bottom of the upcast shaft which heated the air and caused it to flow

upwards to the surface. A waterfall was used in the downcast to induce a downward air current. Furnaces were used at the bottom of the upcast to heat the air and cause it to ascend the shaft. Furnaces are now prohibited in large mines newly opened on account of the explosion risks, and the other methods enumerated above are rapidly going out

FIG. 5. VENTILATING FAN

of use except in emergencies. Fans are almost exclusively used nowadays. In this case the air current is produced by blades or vanes attached to a revolving shaft. The air in the fan is whirled round and round and flies off at the tips, like a stone from a sling. More air enters from the mine shaft to occupy the space in

FIG. 6. AIR CROSSING

the fan, and this process goes on continually. These centrifuge ventilators or fans are of two types, exhausting or forcing fans. The former exhausts the air from the top of the upcast shaft, while the latter forces the air down the downcast shaft. Most fans nowadays are of the exhausting type as shown in Fig. 5. The air current which is created by a fan

FIG. 7. USE OF BRATTICE

or other means, must be guided or circulated throughout the mine. This is accomplished by ventilation doors, air-crossings, brattices, etc. When the air current has to be deflected or turned at branch roads a door is used, which can close automatically. When an intake airway crosses a return airway, an air-crossing, as shown in Fig. 6, is constructed to prevent the two currents mixing. Brattice sheets are sometimes necessary

in narrow places to direct the air to the working face as shown in plan in Fig. 7. Coursing the air-current by means of doors, stoppings, and brattices is a very important branch of mine ventilation.

Pumping.—The following systems of dealing with pit water are employed according to circumstances: (a) raising water in chests or tanks from dip workings; (b) winding water in barrels in shafts; (c) removing water by means of siphons; and (d) removing water by means of pumps driven by steam, compressed air, or electricity. When the quantity of water to be dealt with is small, tanks or barrels are used to remove it to the surface. With greater quantities it is usual to employ pumps of various types. Formerly, it was a common practice to fix the pumping engine at the surface with rods leading down the shaft and pumping the water from a sump, i.e. the place where the water was allowed to accumulate. Another method has the engine and pump at the pit-bottom, the steam being carried down the shaft to drive it. Of late years great strides have been made in the use of three-throw, centrifugal, and turbine pumps driven by electricity. Several of these pumping units may be installed between the workings and the surface, one pump delivering its water to the next pump and so on until the surface is reached.

Lighting of Mines.—The various methods of mine lighting are (a) candles; (b) torches; (c) open lamps; (d) oil safety lamps; and (e) electric lamps. The danger of using candles and open lamps in mines is that the pressure of fire-damp in the right percentage would cause an explosion. An oil safety lamp is one which has its flame protected in such a way that it should not ignite fire-damp if present in the air. Several types of oil safety lamps are in use, being modifications of the original Davy, Stephenson, and Clanny lamps (see DAVY LAMP). Electric safety lamps are now made of satisfactory design, either to be carried by hand or worn in the hat. They possess many advantages over the oil lamps, such as better illumination, and are now very popular in Great Britain, U.S.A., and Canada.

Sorting and Cleaning.—When the coal reaches the surface, the tubs are run on to a weighing machine and the weight is registered. They are then run on to a revolving 'tippler,' where the coal is discharged on to either a fixed bar or a jiggling screen which separates the small from the large coal. The large coal passes on travelling belts to picking belts or tables where pieces of shale are removed by boys or older men. From there it is either subjected to further screening and sizing by machines or loaded direct into railway wagons underneath. The removal of dirt on the picking belts is only a preliminary cleaning, as small coal and some varieties of large coal are so full of impurities that they can only be efficiently cleaned by washing in water or other liquid. There is a large variety of coal washers but the

principle in all cases is more or less the same. If raw coal be placed in an upward current of water of a certain velocity, the coal particles will be carried upwards by the stream, but the impurities such as shale, being heavier, will descend through the upcoming water. This principle of so arranging a current of water that the coal particles are separated from the shale is used in all coal-washing plants.

Coal Supplies. On the initiative of the XII. International Geological Congress, which met in Toronto in 1913, an inquiry was made into the C. S. of the world. Actual world resources were estimated in metric tons at 716,154,000,000, while the possible and probable reserves totalled 6,681,399,000,000. Table 1 gives the distribution of these resources according to continents.

A list of the chief coal-producing countries and their production is given in Table 2. Tables 3A and 3B give world deposits, output, and consumption of both coal and lignite for 1936. World output in 1938 decreased by 100,000,000 tons in comparison with 1937, and was approximately 1,190,000,000 tons, more than nine-tenths of the decrease being in the U.S.A.

United Kingdom.—It will be seen from Table 4 (which shows the output of coal in Great Britain in 1934-38 and the amounts exported) that a vast amount of Brit. coal is exported all over the world; it can further be noticed from our knowledge of the coal-fields (q.v.) that whereas the U.S.A. coal-fields are eighty-three times larger than the Brit. fields, yet there is but little more than twice as much coal produced yearly in America as in the United Kingdom. In view of the enormous output of the United Kingdom fields and their comparatively small size, fears have been aroused for, and much thought has been given to, the possible exhaustion of our C. S. Two royal commissions have thoroughly studied the subject, one being under the chairmanship of the duke of Argyll, and the other under Lord Allerton. The first of these commissions pub. its report in 1871, and the conclusion reached was that the attainable amount of coal in the known coal-fields was 90,207,000,000 tons, and the probable amount available in other places was 56,273,000,000 tons, thus making a total coal supply of 146,480,000,000 tons. The second commission on C. S. reported in 1905 that the net estimate of unworked coal was 100,915,000,000 long tons. This allowed for all possible losses, but at the same time it was recognised that inferior coal and small coal, hitherto discounted, had become of use to sev. important industries, such as the patent fuel trade and the gas and by-product industry. In 1913 Dr. Strahan

TABLE 3 A. STATISTICS OF DEPOSITS, OUTPUT, AND CONSUMPTION OF BOTH COAL AND LIGNITE FOR THE YEAR 1936

* The consumption figures relate only to the countries for which statistics are available. Coal-briquettes, coke, lignite, and lignite-briquettes are converted into coal units as follows: 1 ton coal-briquettes = 1 ton coal; 1 ton coke = 1½ tons coal; 1 ton lignite = ¾ ton coal; 1 ton lignite-briquettes = ¾ ton coal.

compiled the report in Great Britain for the XII. International Congress, basing his statistics on the findings of the 1905 commission, modified, however, by further exploration. Estimates were reckoned to a depth of 6000 ft., as against the 4000 ft. hitherto held to be the limit, and the total reserve of coal for the United Kingdom, including Ireland, was put at 189,434,749,920 metric tons. Less than 10 per cent of this reserve is anthracite. The Samuel Coal Commission, 1925, basing its assumption on the figures of previous estimates, reported that at the present rate of output the actual reserve of coal, mined at a depth of 4000 ft., would last five centuries. Taking into

account all probable reserves, including the possibility of mining at a depth lower than 4000 ft., the reserve would last seven centuries or more.

Statistics of C. production in and export from the United Kingdom for the two decades following the First World War, as compared with pre-1914 figures, show a sharp decline. Exports decreased by 40 per cent; the number of mines in operation declined from over 3000 to not much more than 2000, with a corresponding reduction of miners of nearly 250,000. The more economic use of coal and alternative kinds of fuel are largely responsible for the declines. The increasing use of oil has displaced coal to the

1939	231	766,000	301.9	16s. 5d.
1944	184	710,000	259.0	33s. 3d.

TABLE 6. FALL IN COAL PRODUCTION, 1939-44

extent of 3,000,000 tons or more a year, and the coal bunker trade (by 1938) had dropped twice that tonnage. Other factors in the retrocession were quotas, restrictions, and price cutting. The output of saleable coal and the number of wage-earners in the years 1938-43 is shown in Table 5. A statistical digest issued by the Ministry of Fuel and Power shows a fall in coal production, coupled with enhanced costs, in 1944 as compared with 1939 (Table 6).

United States of America.—The Amer. coal trade was fully estab. in 1820, although the output was not then very large, when the Schuylkill Navigation Company sent coal down the Lehigh and Delaware Rrs. to Philadelphia. Up to the year 1870 the coal output of the U.S.A. was less than that of either Great Britain or Germany. Then, in 1871, the U.S.A. began to pass Germany, and from 1877 onwards completely left Germany behind. Great Britain's output was passed in 1899, and the U.S.A. are now producing nearly one-third of the world's C. S. In 1920 over 587,000,000 long tons were produced, while in 1923 and 1926 the total was 587,000,000 tons in each year, the average for the decade 1920-29 being over 500,000,000 tons. In 1932 the figure dropped to 317,000,000 tons, and in 1933 to 336,000,000 tons. In the same decade exports averaged nearly 28,000,000 tons. Recent export figures have been lower. In 1929 the U.S.A. had 11.7 per cent of world coal exports; in 1936 the proportion was 9.2, as against the United Kingdom's 40.1 and 34.9 respectively, and Germany's 19.8 and 26.4. The total area estimated to contain coal-beds is close on 500,000 sq. m., of which about 250,530 contain anthracite and bituminous coal, about 100,000 varying grades of bituminous, cannel, and lignitic coal, and the rest ordinary lignite. In the 1913 estimate for the Geological Congress the original tonnage of all kinds of coal on levels above 3000 ft. was reckoned at 3,225,394,300,000 metric tons. The total production of coal to the end of 1910 was 7,480,355,040 metric tons, and an amount equal to half this figure was allowed for waste; it followed that 11,220,532,560 tons out of the original tonnage had been exhausted, leaving a reserve of over 3,200,000,000. See R. C. Smart, *The Economics of the Coal Industry*, 1930; J. O. Nef, *The Rise of the British Coal Industry*, 1932; I. Thomas, *Coal in the New Era: Our National Wealth*, 1934; Political and Economic Planning, *The British Coal Industry*, 1936; Imperial Institute, *The*

Mineral Industry of the British Empire and Foreign Countries: Summary (annual) 1938; H. L. Pirie, *British Coal*, 1944. See also bibliographies for COAL, COAL-FIELDS, COAL-MINING.

Coal Tar, one of the products obtained from the destructive distillation of coal, the others being coal gas and ammoniacal liquor. It consists chiefly of aromatic hydrocarbons, and is usually the heavier of the two condensed products, being a dark-coloured viscid oil. The composition of the tar, however, varies greatly according to the temp. at which it is distilled, or even with the shape of the retort. These hydrocarbons can be separated from one another partly by fractional distillation, they having different boiling points, and C. T. to-day is chiefly valuable because it is the starting point of these by-products. The tar obtained from brown coal and bituminous shale is the foundation of the manuf. of paraffin and mineral oils. Generally, however, C. T. is a by-product in the manuf. of coal gas, and is not as a rule considered to be the prin. product. Only during the last seventy-five years has it become of any importance even commercially. It is interesting to note, however, that Becher and Serle, who took out the first patent for the destructive distillation of coal, in 1861, did so to get C. T. and pitch, not coal gas (Lunge). It is since it was discovered that dyes, drugs, and other important substances can be obtained from it that C. T. became of value commercially. Previously, it used to be burned under the gas retorts, and used for making roofing-felt. For this latter purpose it had to be deprived of its more volatile constituents, benzene being formed in this manner. Again, heavy oils were distilled from it and used for preserving wood, light oils giving naphtha. In 1856, however, the aniline colours were discovered and prepared from benzol, which is obtained exclusively from C. T. A description of the constituents of C. T. cannot be given within the scope of this article, but the following gives some idea of the various products obtained from C. T. Distilled up to 140° C. benzol is obtained, while redistillation of this and a further distilling up to 170° C. yields solvent- and burning-naphtha; heated from 170° to 230° C. the light oil, naphthalene, and carbolic acid are given. Further heating from 230° to 270° C. results in the formation of creosote oil and lubricating oil, these being known as the heavy oils. Beyond this, anthracene oil, anthracene, lamp-black, pitch, and coke are obtained.

The processes are not so simple as they seem, however, and in practice the sp. grs. are noted, as well as the temps., the products sometimes forming at temps. lower than those given above. Further, in the later stages of distillation, some of the earlier products are formed, and have to be separated out. C. T. is of enormous importance on account of the vast number of indispensable substances prepared from its various constituents. Benzene, C₆H₆, the prin. constituent of the lowest boiling-point fraction, is used not merely as a motor car fuel, but also as the starting point for the preparation of aniline, phenol (carbolic acid), picric acid, and innumerable other bodies in general employment as explosives, dyes, disinfectants, drugs, and photographic reagents. Naphthalene and anthracene are the parent substances of large and important series of dyes, while creosote oil is used to preserve wood and for general disinfectant purposes. Pitch finds application in the manuf. of coal briquettes and in the paint and varnish industry. 'Prepared tar,' which is C. T. from which only the more volatile constituents have been distilled off, is widely employed as a binder in road-making. During the First World War, most of the high explosives, as well as tear-gas, etc., were made from substances occurring in C. T., and the research then expended on the subject has borne fruit in later years, particularly in the manuf. of synthetic perfumes and in the preparation of pure organic chemicals for bacteriological, medical, and pathological work. Some million tons of C. T. are produced annually in Great Britain, the U.S.A., Germany, and France, one ton of coal yielding on an average about one cwt. of C. T., or about 11 lb. of benzene and other valuable products, excluding the pitch. See articles on the various substances named above, and read J. J. Redwood, *Mineral Oils and By-products*, 1897; G. Lunge, *Coal Tar and Ammonia*, 1916; A. R. Warnes, *Coal-tar Distillation*, 1923.

Coal-tit, Coal-timousse, or Coalmouse, popular name for the *Parus ater*, or *Parus britannicus*, a small species of Paridae with a black head and dull-coloured body.

Coal Trade. Various laws have been passed regulating the C. T. From very early times the Corporation of London used to weigh or measure all coal brought into the port, while the mayor and aldermen of London and the justices of the cos. could also, by virtue of Acts of Parliament dating back to Edward VI.'s reign, fix the retail price of coal. Further, general taxes have been levied on coal at different times. At one time the Corporation of London could exact these dues. In 1667 they were exacted to aid in repairing the damage done by the Great Fire, and they were continued till 1889, and the proceeds used for civic improvements. In William III.'s reign a tax was levied on sea-borne coal. This tax was abolished for a short time in 1830, re-exacted in 1842, and dropped in 1845. From 1901 to 1906 there was a tax of one shilling levied on every ton of coal ex-

ported from this country. Up to 1913 the C. T. prospered under individualistic control, and immediately after the First World War the coal industry was in better working condition in England than in the rest of Europe. In 1921 came a depression with a mining stoppage of three months. The C. T. improved in 1922, until in 1924 foreign competition began to have its effect, and in 1925, 500 of the Brit. mines were closed. A stoppage of seven months followed in 1926, during which year the U.S.A. nearly doubled their exports and a great stimulus was given to the European C. T., especially

Fox Photos

LEICESTERSHIRE MINERS ON THEIR WAY TO PIT-HEAD BATHS

in Poland. In 1928 the Yorkshire and Midland coal-fields were combined under the Central Collieries Commercial Association, based on the Ithenish-Westphalian Syndicate, which after 1893 had rationalised the Ger. C. T. with marked success. The C.C.C.A. and similar marketing schemes in Scotland and S. Wales regulated the output and stabilised the prices of over 60 per cent of the national production. These schemes were an attempt to overcome the inter-collery competition, due to the individualistic traditions of the coal-owners, and to eliminate the profits of the middleman, thus paving the way towards a national selling organisation for the export trade. (See COAL MINES, NATIONALISATION OF.) Increase of production of Amer. coal, and consequently of Amer. C. T., is due to technical administration and a high standard of output due to machine-cutting. Output per man rose from 3.73 tons in 1913 to 4.78 tons in 1927. An important factor in production, too, has been the increasing regard to the welfare of the miner, evidenced in the provision widely of pit-head baths, canteens, private bus services, and housing

schemes. Under a scheme announced in June 1948, univ. scholarships are awarded by the National Coal Board to selected pit workers to enable them to qualify in mining engineering and allied subjects. Statistics of Brit. and Amer. export trade are given under COAL SUPPLIES. See also R. C. Smart, *The Economics of the Coal Industry*, 1930.

Coalville, tn. and dist., Leicestershire. The tn. is 5 m. distant from Ashby-de-la-Zouche and 16 m. from Leicester. Coal mines are in the dist. Pop. 20,500.

Coanza, or Quanza, one of the main rivs. of the Portuguese W. African country of Angola; it flows in a N.W. course and finally reaches the Atlantic, where it has attained to a breadth of 1 m., owing to the many falls as well as tribs. which have contributed to its bulk on its journey to the sea. The riv. is unnavigable in parts owing to the Cambambe Falls, but it can be navigated for a distance of 120 m. from its mouth as far as these falls.

Coast (Lat. *costa*, a rib), border of the land as it meets the sea, forming a shore line of more or less irregularity of contour, according to the various causes which have been at work. Though the sea-C. is generally *invariant* when the word C. is used, it is also applied to the shores of large rivs. or lakos. Many elements combine in producing the various types and varieties of Cs., of which the broad outlines may be described, though, of course, no two Cs. are exactly alike in detail. The chief agents in the sculpture and formation of the C. are the currents of the sea and the erosion caused by the waves; these agents have to work on widely different kinds of material, as some Cs. are of hard rock, others of sand, and others again of heterogeneous rocks. It is estimated that nine-tenths of the world's coastline is fringed with sand. The presence or absence of sand-dunes depends mainly on the nature of the rocks along the coast. The waves lorned by the winds run ashore and beat upon the land, the C. of which is gradually worn away by this unrelenting and unrelenting attack; the land which is washed away is carried into deeper water, and so the area of the land is reduced. The character of the C. has a great effect on both the coastwise trade and the international trade of a country; for neither form of commerce can attain great proportions unless there is a sufficiency of safe harbourage for the vessels engaged in it. Shore-lines in their original form, that is to say, before they were changed by the action of the sea, may be divided into two main categories. The first class is that produced by the land having been raised, the second where it has been lowered. Where the sea lies on an uplifted bottom, the shore-line would be of an unbroken and simple character, and would be bordered by shallow water. The shore-line would be of a broken and more complicated nature, and bordered by deeper water, where the sea lies on a depressed land surface. Shore-lines belonging to the first category are generally deficient in harbours, and

traffic between land and sea is by no means easy. As an example the C.-line of Buenos Aires may be cited; the waters are shallow for a long distance from the shore-line, and artificial harbours have to be dredged before vessels of any size can approach close to the land. The shore-lines of the second class are, as a rule, well supplied with harbours situated in sheltered bays. An irregular C. is favourable to the development of the maritime arts and to the breeding of expert sailors and fishermen; among examples of shores of this class may be mentioned those of Patagonia and Norway. If the C.-line runs parallel to a int. range, it is, as a rule, of a more regular character than when it crosses the folds of the range. A recently elevated C. is more irregular in outline than one which has been exposed to the action of the waves for a long time. The irregularities which were impressed upon the surface of a recently depressed C. before submergence took place will be traceable in the C.-line. If a C. is composed of homogeneous rock, and the action of the waves is similar along its extent, the outline formed will be regular; if, however, the rocks composing the C. are of varying degrees of hardness, bays and inlets will be eaten out of the softer rocks, and headlands, etc., will be formed of the harder rocks. The same results will be obtained if the rocks of the C. are homogeneous, but the action of the waves varies, as where the waves are more violent bays will be formed. In shores of the first class, the waves of the sea, especially in stormy weather, beat up the sands of the bottom, and in course of time build sand-reefs off the shore. These reefs enclose long, narrow lagoons; the finer particles which compose them are swept away, but the reef is not destroyed thereby, for the loss occasioned is repaired by the sand which is brought in from the sea bottom. The ebb and flow of the tides and the action of the rivs. preserve inlets through the reefs; the number and size of these inlets are, of course, regulated by the strength of the tides. On the C. of Texas there are few inlets, and traffic between land and sea is cut off for long distances; one reef extends for nearly 100 m. with no inlets. On the C. of S. Carolina, where the tidal action is very strong, the inlets are very numerous, and traffic is not so much impeded. The depth and even the outline of the channels on Cs. of this nature may be changed so rapidly by the action of tidal currents that charts are unreliable, and local pilots must be employed by the captains of vessels. Tidal deltas are also formed by the action of the tides, and their outer edge often forms a bar which is only navigable at high tide. When the sand is brought to a reef in greater quantities than it is carried away, the reef advances into the sea, and may be a mile or more wide; at Atlantic City, in New Jersey, U.S.A., the reef is gaining on the sea in this manner. If, on the other hand, more sand is carried away than is gained, the reef gradually becomes smaller, and at

length disappears, when the mainland is once more exposed directly to the action of the sea; the low C. of the middle Netherlands has thus retreated. It is of rare occurrence for coastal plains to end in cliffs which are at a great height above the sea. Such a phenomenon would be of comparatively frequent occurrence if the action of the sea on a coastal plain were uninterrupted for a long time; it is therefore inferred that such a development is generally interrupted by either a subsidence or an upheaval of the land. The best example of the results of such an uninterrupted development may be seen in the coastal cliffs of Normandy in France. The progress of formation of C.-lines of the regular first class is often interrupted by depression of the land. The C. is then changed into one of the second class, though the bays and headlands will not be of extraordinary magnitude. In the same way, the land may be elevated and interrupt the C. formation, but in such cases the effects are not so easily visible. The former C.-line will be marked by low sand dunes and ridges, if no very advanced stage of development had been reached before the upheaval, or by higher terraces and bluffs, the height of which will vary according to the progress made. The coastal plain of Mexico, for example, is marked by several terrace-like benches or steps; it is inferred from this that the elevation of the country took place gradually, thus giving time for the effects of the action of the sea between each upheaval to be perceptible. When an uneven land surface is partly submerged, the valleys become bays and the hills islands. The forms of the land present more variety than those of the sea bottom, and hence shores of the second class are more varied in outline. The sea's action will be greatest on the projecting headlands and outlying islands. The rock fragments, weathered from the C., after being rounded by the action of the waves, grind the rocks at their base and cut a notch in the edge of the land. The base of the cliff thus formed is worn away by the dashing of the waves, great masses of rock fall, and the shore is gradually worn away. Isolated rocks, 'needles,' and columns, are often left off the shore in such cases; the 'Old Man of Hoy,' in the N. of Scotland, is an example. If a shore-line of the second class suffers a further depression, the sea will begin its action on the cliffs in much the same way as before; the lines of the C. will naturally be altered, and the former is, in many cases, be submerged. When an upheaval takes place, the former C.-line may be traced at some distance from the new one; the cliffs and beaches which composed it are distinct at first, but in course of time are affected by the weather, and become merged in the general character of the land. Along the W. C. of Scotland there are evidences that the land has been uplifted for 20 or 25 ft.; the cliffs of it stretch inland, and the former C.-line was more advanced in character than most of the present C. The bays of the former shore-line, when elevated, form coastal

plains lying between rugged headlands; such formations form most beautiful scenery, and abound along the shores of Italy. The W. C. of Norway now stands some hundreds of feet higher than in former times, as is evidenced by the platform or bench, of low land which borders the mts. which formed the ancient sea cliff. From the fjord and its configuration of the C., it is probable that after the platform mentioned above had been cut, the land was raised even higher than it now is, and was eroded by glaciers. A depression then took place which drowned the valleys and created the present multiplicity of is. Where one part of the cliff is weaker or composed of softer rocks than the rest, the waves in time excavate a cave; among the numerous examples of such, Fingal's Cave on the is. of Staffa, Scotland, and many caves on the C. of Maine, U.S.A., may be mentioned. S.-lines are affected by climate and temp. as much as the land. In Arctic climates the land is bordered by a fringe of ice, known as the 'ice foot.' In the equatorial and warm seas certain kinds of trees grow on the shores and impede landing; of these the most important is the mangrove-tree. Coral reefs also are found in these waters (for their formation and action, see ATOLL, CORAL, GREAT BARRIER REEF, etc.). The waves and currents of lakes are not so violent as those of the open sea, but the Cs. of lakes exhibit many features analogous to those of sea-Cs. The S. shore of Lake Erie, for instance, has been washed away so as to develop low cliffs of a fairly even front for many miles. When lakes are formed at the back of barriers of glacial drift, their waters may rise upon a land surface of much irregularity, and the Cs. of the lake thus be of very varied character. Lake Lucerne, Lake of the Woods, and Lake Superior are examples of irregular lakes. The indication and measurement of C.-lines vary on maps according to the scale thereof, as it is, of course, impossible to show as much detail on a small-scale map as on a large one. When the scale is very large, two C.-lines will be shown, the one showing the position at high-water, the other at low-water mark. The measurement of the C.-line is also a matter of some difficulty, as when all irregularities possible are included, the length is of necessity greater. There are two methods of measuring; the first way is simply from point to point of the headlands of the C. The other way is to include every bay and inlet, and to measure up every riv. to the point where the action of the tide ceases. The ratio between these measurements is an indication of the coastal development of the country measured. See E. M. Ward, *English Coastal Evolution*, 1922.

Coastal Command, development of 'Coastal Area, R.A.F.,' which was formed towards the end of the First World War; to develop, in relationship with the Admiralty, all aspects of air co-operation in a war at sea; to administer and train the Fleet Air Arm on land, and to

develop flying boats for the defence of trade and Imperial communications. In 1937 the administration of the Fleet Air Arm was transferred from the C. C. to the Admiralty and the main function of the Command then became the provision of trained shore-based squadrons for the defence of trade and for closer co-operation with the navy in home waters. The C. C. was divided into groups whose geographical boundaries conformed to those of the naval commands on shore with which they were associated. These groups covered all Great Britain and N. Ireland, while there was a separate group in Iceland (q.v.) and a station at Gibraltar. Each air force group and naval command had an Area Combined Headquarters, where the operations room common to both services was situated. The army staff responsible for the anti-aircraft and other defences were normally part of headquarters. In the operations room were boards and charts setting out all the information shown separately in the rooms of the various combined headquarters, while for plotting operations there were large wall maps of the oceans showing the position of convoys, escort vessels, and enemy raiders at a glance. The efficiency of the various headquarters depended largely on a rapid and secret system of communications. Attached to headquarters of both groups and stations was a meteorological section, of vital importance for weather forecasts. In the intelligence room information from the air-sea front line was received and interpreted. The interpretation and processing of photographs was the work of a specially trained staff. Intelligence officers had to be able to discover without delay all about enemy ships, their dimensions, armament, and cargoes; enemy convoys and their destination; enemy aerodromes and aircraft based on them; guns, balloons, and other defences surrounding targets. That the work of the C. C. airmen in the Second World War was of the highest importance might be inferred from the fact that their patrols for the protection of ocean convoys covered more than half the seas from the Arctic to the Equator, and from the Bay of Biscay to the Amer. shores, throughout the duration of the battle of the Atlantic. It was due to spotting by their craft of the *Bismarck* (q.v.) weighing anchor for her first and final sortie that that warship was so soon sunk. Aircraft in use with the command for general reconnaissance and convoy protection included both shore-based machines and flying boats. Among the former were the Anson (later replaced by faster craft), the Amer.-built Hudson, the Liberator—well armed with gun turrets and a formidable foe of the Ger. Focke-Wulf and U-boats for which latter it carried depth-charges—and converted Wellingtons and Whitleys. The chief flying boats in use at the beginning of the war were the Stranraer (withdrawn in 1941), the London, the Sunderland, the Amer.-built Catalina which had no superior for long-distance

patrol work (one was in the air for over twenty-six hours during the operations which ended in the sinking of the *Bismarck*), the Lerwick, and the Northrop (a float-plane). Beauforts were used for torpedo attack; Hudsons, Whitleys, and Wellingtons for bombing; and Beaufighters and Blenheims for long-range fighting. At the beginning of the war the Command had no more than 171 aircraft and beyond their range protection for convoys had to be provided by aircraft carriers. Wellingtons were fitted with a device for exploding the magnetic mines laid by the Gers. in Brit. waters, but such mine-sweeping from the air was a hazardous task. From the outset the Command joined with the navy in attacking the U-boat wherever and whenever it was located. The prison-ship *Altmark* (see NAVAL OPERATIONS IN SECOND WORLD WAR) was discovered in Josing Fjord by C. C. reconnaissance. Valuable protection was afforded by Hudsons and other aircraft of C. C. for the armada of small ships which evacuated the Brit. Army from Dunkirk at a time when the numerous Ger. Heinkel machines dominated the skies. The U-boat nest at St. Nazaire was frequently raided by C. C. in 1940 and after, and the dockgate there was destroyed in a combined-operations raid. Innumerable attacks were concentrated on Brest and on the Ger. battleships *Scharnhorst* and *Gneisenau* anchored there. Among the perils encountered by the airmen of C. C. on their long and unremitting tasks, the chief was weather, a greater peril than even the enemy 'flak' or his fighter craft. C. C. largely reduced the menace of the Focke-Wulf. Frequently U-boat crews surfaced and surrendered to C. C. aircraft. With mine, bomb, and torpedo, C. C. maintained throughout the war an unrelenting offensive against the enemy's shipping along the coasts of Europe, and thus imposed an ever-increasing strain upon his land communications. See H.M.S.O., *Coastal Command*, 1942.

Coast Defence, required by a maritime nation to protect her commerce in time of war. The systematic defence of the coast by means of fortresses is a necessary protection to the navy, and such defences serve as a basis of operation and a safe harbour to the fleet. These fortifications also afford protection to the magazines and collected stores and materials, with which the fleet may be speedily equipped should war break out suddenly. Large inlets, bays, and riv. mouths are usually chosen as the safest sites. It must also be remembered that such depots, etc., are liable to attack by land as well as by sea, and must be protected against attacks in the rear and flanks. The fortress, then, must be able to obstruct any entrance on the part of the enemy by cutting off any side channels, while leaving, at the same time, a free entrance to the home fleet. The fortresses are equipped with torpedo-boats, bomb-proofs, searchlights, etc., and a strong artillery is essential for the proper defence thereof. In Great Britain the C. D.

is procured by means of a group of one or more fortresses, set at a certain distance along the sea coast. In each fortress is a fixed armament of heavy and light batteries and quick-firing guns, which are used particularly to withstand a frontal attack by sea. There is also a movable armament of machine guns for use in a rear or flank attack by land. A large fortress is divided into sections, so that, by scattering the forts, the enemy may be prevented from concentrating their fire. Each group of batteries is under the control of fire commanders, the highest executive rank of artillery command. In modern warfare it is essential to have a strong army to back up the navy in time of difficulty, as was seen in the Russo-Jap. war. Accordingly, a strong coastguard corps should be supplied to prevent landing at any weak points along the coast.

During the First World War, the greatest attack on C. D. was that at the entrance of the Dardanelles (q.v.) in 1915, when the allied fleets of Great Britain and France attacked the Turkish fortresses. The land batteries were armed with 9- and 10-inch guns on each side of the entrance and 9-, 10-, 11-, and 14-inch guns and mortars on each bank at the Narrows. The attack was carried on intermittently for about a month, but the fleets lost so heavily that it was decided to await the land attack. The combined attacks by land and sea failed to reduce the Turkish defences and the allied forces withdrew from the Gallipoli peninsula (q.v.). It was expected in this war that the extensive use of aircraft and submarines would change the character of C. Ds., but it was found that the counter-measures neutralised any forms of attack from these new machines of war. Aircraft proved to be particularly vulnerable to the C. D. artillery, which could, from concealed positions, also attack ships at a greater distance than formerly, and with better control of fire. On the other hand, shore batteries had to be better concealed and protected in case of an aerial bomb attack. In the Second World War coastal anti-aircraft guns were far more powerful than in the First World War and were far more numerous. Moreover, fighter planes had to be regarded as an essential factor in C. D. (See also COASTAL COMMAND for measures taken to protect coastal and other convoys.) Shore defences were more elaborate than in the First World War. In anticipation of a possible Ger. invasion cement blocks or anti-tank obstructions were sown thickly along the coast wherever a landing might seem to be practicable, and formidable iron and wire barriers were erected in the sea a short distance off-shore. Further, mine-laying was much extended so as to render approach by enemy surface or other sea craft both difficult and hazardous. See ARMUNITION: ARMY; ARTILLERY; NAVY; ORD-NANCE; SUBMARINE MINES; TORPEDO.

Coast Erosion, see COAST PROTECTION; EROSION.

Coastguard. The C. service was organised after the Napoleonic wars to prevent smuggling. It was under the control of the Customs until 1831, when it was transferred for administrative purposes to the Admiralty and, in 1856, placed entirely under the direction of the Admiralty, its purpose being the protection of the shores of the United Kingdom. The coast is divided into six dists.: Scottish, E., S., W., S. of Ireland, and the N. of Ireland. The service is under the direct control of the admiral-superintendent of naval reserves. Each dist. is divided into forty-four divs., which in turn are divided into stations, over each of which is an officer in charge. The total number of men in the service, including officers in charge of stations, petty officers, and seamen, is about 5000. The Cs. are generally men who have seen active service. Each dist. has a ship in command of a captain. The duty of the Cs. is to patrol the coast day and night between the stations, to signal to vessels out at sea in distress, to be ready for life-saving in time of shipwreck, etc., and they also have duties in connection with the customs. In 1923 the Brit. C. service was reorganised and the Board of Customs and Excise and the Board of Trade now control the service. Since 1925 it has been largely a life-saving service with very much reduced numbers. In the U.S.A. a C. service was created by an Act of Congress in 1915, absorbing the previous duties of the revenue cutter and the life-saving services. This service is responsible for maintaining the N. Atlantic International Ice Patrol. See also under SIGNALS.

Coasting Trade, shipping trade carried between ports of the same country. In Great Britain C. T. includes, by law, all trade by sea 'from any one part of the United Kingdom to any other part thereof.' Formerly such trade was limited within the United Kingdom to Brit. vessels, but in 1854 an Act was passed extending the privileges of coastwise trade to foreign ships. There are special rates of harbour, pier, and dock tolls, and pilotage, tonnage, duties, etc., allowed to coasting steamers. Ships while they are engaged in C. T. may not deal with foreign ports; but certain provisions are made for steamers, from a foreign port, engaged in trade with more than one port in the United Kingdom, and for steamers, bound for a foreign port, that must call for cargo or passengers at more than one port in the United Kingdom. Great Britain is the only country that has opened her coastwise trade to all the world, but, nevertheless, the share of foreign nations in the trade is only reckoned at about 10 per cent. The coastwise trade of Great Britain in general amounts in total tonnage to a little more than half the shipping entering the ports of the United Kingdom.

Before the First World War the tonnage of ships departing from Brit. ports on the C. T. amounted to 85,000,000. The post-war trade by 1930 had approached to within 15,000,000 of that figure, and by

1937 was over 65,000,000. In the U.S.A. a considerable domestic trade is carried on by water. About 230,000,000 tons of cargo are shipped annually from one port to another on the Atlantic and Pacific coasts and in the gulf of Mexico. A C. T. also flourishes on the Great Lakes and commerce is conducted by water to the extent of 120,000,000 tons of cargo annually. On the Atlantic coast the centre of trade is the port of New York, and about 2,000,000 tons of cargo are shipped annually from there along the coast to the ports on the New England coast. The trade from New York is mostly in wool, cotton, hides, and metals, and the return trade from New England to New York is of equal volume. In Canada the Brit. ships employed on the C. T. both between seaports and on the Great Lakes have a total tonnage of 40,000,000 for steam and motor vessels, and 3,000,000 for sailing vessels.

Coast Protection, result aimed at by the various devices which are adopted for the protection of the land from erosion, damage by waves, etc. The main object in the reclamation of land is the increase of cultivable ground; it is principally in connection with such reclaimed land that protective works are necessary, though in many cases they are adopted rather to prevent the encroachment of the sea than to retain land already won. There are two prin. kinds of protective works, sea-walls or banks, and groynes. There are three main kinds of walls, those with very sloping batter, vertical, or stepped batter. The best form appears to be a wall with an almost vertical face, or alternatively slightly stepped. The vertical face resists the action of the waves most, and is thus opposed to more force, but it also breaks the recoil; a wall with a face sloping inward has not so much resistance to meet at the first onslaught of the waves, but by its form it accentuates the recoil; a stepped wall breaks the force of both the waves and the recoil. In the case of the two former kinds of wall, they are particularly liable to be undermined by the action of the waves, and should be protected at the foot by an 'apron.' If the foreshore consists of hard rock this is not so necessary, as the shore itself fulfils the function. Generally speaking, however, sea-walls are not satisfactory, regarded as the sole means of protection for the coast, and must generally be supplemented with groynes. They are very costly, and although they may seem at first to resist the erosive action of the sea, they, in reality, increase it.

The other form of C. P., that afforded by the construction of groynes, is on a different principle. Groynes promote the natural accretion of detritus or eroded material on a beach by the construction of artificial shelter. The littoral drift of sand down a beach may be intercepted by means of groynes projecting from the beach line, and so accretion of sand may take the place of erosion. This is, of course, the ideal result of groynes, but there are sev. difficulties and disadvantages to be overcome. The building of

groynes has, in fact, been a matter of trial and error. Erosion produces a littoral drift, and much of the drifted material is of necessity carried out and deposited in deep water. If high groynes are used, the two sides of the groyne will not receive the detritus equally, and one side will be denuded; this difficulty is found at Dungeness, Cromer, and Hastings, for example. The general effect of groynes is to render the adjacent portion, not so protected, more liable to the eroding influence of the waves. The distance to which groynes can be carried out to sea

John H. Stone

LOWER CLIFF WALK, BRIGHTON

determines their efficacy in collecting drift: they should always reach low-water mark. The beach of any shore, which is composed of movable material, should gradually slope up to high-water mark in the form of an ellipse; the sea will then not do much damage, but roll in and out without erosion. This result is attained by raising the groynes slightly above the beach and promoting the accumulation of drift to leeward, as the scour of the waves is lessened and the passage of the detritus over the obstacle facilitated. As the drift accumulates, the groynes should be gradually raised, if necessary, and extended. The direction of the wind controls the travel of the drift, as the latter veers with the wind. In England there are examples of groynes of every design, laid out at every sort of angle. They used to be laid out at right angles, but no rule can be applied to a varying coastline,

for the groyne should be designed to meet squarely the waves driven by the prevailing winds. The proof of good design in groyneage is that the accumulation either side of the groyne should be equal. Where a coast is fringed with sand dunes, the beach should be protected from erosion by a regular series of groynes; the dunes or the promenade then receive sufficient protection by a simple sloping wall, with a maximum inclination of two to one. Bridlington beach is protected by groynes, with very good results, as are the sandbanks at Poole harbour. Among other places at which groynes have been instrumental in improving the condition of the beach may be mentioned Sheringham, Weymouth, Cromer, Eastbourne, Dymchurch, Deal, etc. A more detailed account of the groynes at Bridlington will serve to show the results in this particular case, and the general principles acted upon. The Bridlington beach, which rests upon boulder clay, was rapidly being lessened as the result of increased erosion due to the erection of sea-walls. Groynes consisting of piles with dimensions of 14 ft. by 9 in. by 9 in., made of pitch-pine, and 11-in.-by-4-in. planks, were erected along the seashore. To obviate the denudation of the sand to leeward, the planking was at no time raised more than two strakes above sea level, but fresh planks were added as necessary. The prevailing gales in the winter are S.E., and hence the groynes were slanted 10° S. of E., from the perpendicular. The cost of this operation was between 12s. 3d. and 18s. per lineal foot, and very good results were obtained. In Poole harbour the groynes were built at varying angles, and there is no doubt that if it had not been for these preventive measures the harbour would have been silted up. The timber groynes which were built on the beach between Latching and Shoreham had the effect, in the course of a few years, of causing the high-water mark to recede 85 ft. Low wooden groyneage has been used for the preservation of Romney Marsh. It was inexpensive and has proved successful. At Blankenburgh, groynes were constructed which had an excellent effect in checking the eroding action of the R. Scheldt. They were 820 ft. long, and at intervals of 680 ft., they extended to below low-water mark, and were at right angles to the beach. In order to facilitate the even distribution of drift over the whole area to be protected, and to lessen the erosion from wave action, the groynes were raised only slightly above the beach. They were built with wide tops and had a foundation of fascines and concrete, faced with brick-work or stone pitching. The result was to form practically an ideal sloping beach (*cf. supra*), on which wave action was reduced to a minimum. This type of groyne is, however, too expensive for general use. The extension of groynes below low-water mark is advocated by some engineers, and as submerged wood, even when treated to a creosoting process, is always liable to be attacked by such enemies as the teredo, concrete and other

similar materials have been suggested for groynes. Experience alone will prove which is the best material. For C. P. in Holland sea-walls or dikes are used in addition to groynes, and for the protection of submerged banks fascine mattresses. The latter are made of willow brushwood and are ballasted with stone. The Zuider Zee has now been enclosed and partly reclaimed. The prin. method of construction for the enclosing dike is an exterior dam of boulder clay, and behind this sand covered with a layer of clay, having a facing of stone both sides.

Another important feature of C. P. is dune fixation. The importance of this is recognised in the U.S.A., and grass is generally planted. In England marram grass has been used successfully, notably on the Norfolk coast, and on shingle beaches for protection against on-shore gales tamarisk is recommended.

Under the Coast Protection Bill (introduced in 1948) amending the law on C. P. against erosion, the council of each maritime co., bor., or co. dist. will be the protection authority. Orders may be made for setting up C. P. Boards, which will be empowered to raise money for protection work and to hold land. Development of land will not be allowed unless the protection authority certifies that it is consistent with C. P. See W. H. Wheeler, *History of the Fens*, 1897, and *The Sea Coast*, 1902; F. M. du Plat Taylor, *The Reclamation of Land from the Sea*, 1931; E. R. Matthews, *Coast Erosion and Protection*, 1931.

Coast Ranges, system of mts. in N. America extending along Brit. Columbia, Washington, Oregon, and California, and almost parallel to the Pacific coast. These mts. are very irregular, sometimes attaining to a great height and then remaining at a comparatively low one for a considerable distance. The character of the scenery is also very varied, the mts. in some places being almost bare, and in other places being densely covered with thick forests of trees. In Brit. Columbia the Coast Range, called also Cascade Range, average a height of 6000-7000 ft., although some peaks attain to a height of 9000 ft. Many of the trees on the slopes of the C. R. grow to an enormous height, of which the Douglas spruce is an excellent example, being 250-300 ft. high. In Washington the mts. are called the Olympic group and are very rugged, the highest peak, Olympic, being 8150 ft. high. The mt. range diminishes in size in Oregon, averaging between 4000 and 5000 ft. in most parts. In California the C. R. present an insignificant appearance for about 400 m. Further on, nearer San Francisco, they attain to a great height in some peaks, whilst not far from Los Angeles the San Bernardino peak rises 11,100 ft. high.

Coatbridge, tn. of Lanarkshire, Scotland, 9 m. E. of Glasgow, and one of the eleven vills. in the par. of Old Monkland. It became a municipal bor., with the privileges of a royal burgh, in 1885. There are sev. large collieries and an important iron and steel industry. C. lies

in the centre of a mineral dist., and possesses in addition to sev. churches a technical school, various municipal buildings, and two fine parks. Pop. 43,000.

Coatapec, tn. in the Atlantic state Vera Cruz, Mexico, 58 m. distant from the cap. Pop. 10,000.

Coates, Albert, Eng. musical conductor, b. April 23, 1882, in St. Petersburg (Leningrad), of wholly Eng. parentage. Educated at Buckhurst Hill School, and studied science at Liverpool under Sir Oliver Lodge. Returned to Russia. Entered Leipzig Conservatorium; joined Nikisch's conducting class. Conducted Imperial Opera at St. Petersburg five years. Came to England in 1919, conductor to Sir Thomas Beecham at Covent Garden. Conductor of London Symphony Orchestra and Royal Philharmonic Society. Director, Philharmonic Orchestra, Rochester, New York, 1923 to 1925 when he returned to England. Director of Brit. music-drama opera season at Covent Garden, 1936. Operas: *Samuel Pepys* (1929); *Pickwick* (1936).

Coates, Eric (b. 1886), Eng. composer, b. at Hucknall, Nottinghamshire. He won a scholarship at the Royal Academy of Music in 1906. For some years after 1912 he was prin. viola at Queen's Hall. His compositions include chamber music and many songs and marches.

Coates, John (1865-1941), Eng. tenor singer, b. near Bradford; began his music as a choirboy. When his voice broke he had been trained as a baritone, and he pursued his career as a baritone in light opera in England and America for some time. In 1899 he was striving to achieve a reputation as a tenor, producing in that year Sullivan's setting of Kipling's *Absent-minded Beggar*. His chance came at Worcester three years later, and henceforward the prov. festivals sought him for leading parts, especially in modern oratorio. He sang in Elgar's later works at Birmingham, in Bantock's *Omar Khayyám* there, and in Walford Davies's *Everyman* at Leeds. He made his first appearance in London in 1894 at the Savoy Theatre, and eventually, in 1901, took part in the Covent Garden opera. His name is inseparably linked with Elgar's *The Dream of Gerontius*, the occasion of his first singing the name part, in Worcester in 1902, being the real launching of Elgar's masterpiece on its career of wide popularity in England. Sang in different parts of Germany, and the U.S.A.

Coates, Joseph Gordon (1878-1943), New Zealand statesman, was b. at Matakohe, son of Edward C., farmer. Educated privately. Became M.P. for Kaipara, 1911. Served with Infantry in France, Jan. 1917 till Feb. 1919. Attained rank of major and received Military Cross. On return home took office under premier Massey; filled offices of postmaster-general and minister of public works. Became Prime Minister on death of Massey, 1925. His Reform party was defeated at the general election of 1928, and he was succeeded by Sir Joseph Ward, leader of the new United

party. Held various offices in the Coalition Gov., 1931-35.

Coatesville, bor. in Chester co., Pennsylvania, U.S.A., 37 m. W. of Philadelphia. It is situated on Brandywine Creek. Its chief manufs. are paper, steel rails, and boilers. Pop. 15,000.

Coat of Arms, see ARMS, COATS OF, and HERALDRY.

Coati, or **Coati-mundi**, genus of Procyonidae, related to the racoon. They are indigenous to N. and S. America, are gregarious and arboreal; the nose forms a mobile proboscis useful in digging up its food.

Coats, James (1774-1857), founder of a cotton-thread business in Paisley, which is now known as J. and P. Coats Ltd.

Coats, Sir Peter (1808-90), and **Thomas** (1809-83), sons of James C., b. at Paisley, both Scottish thread manufs. Both gave generously to many philanthropic schemes, and Paisley owes much to them.

Coats Land, region of Antarctica, in the Amer. quadrant, skirting Weddell Sea. It was discovered by Bruce, and named after the brothers Coats.

Coatzacoalcas: 1. Riv. in Mexico which has its rise in the Sierra Madre, Tehuantepec Isthmus, and ultimately falls into Campeachy Bay. In length it is 150 m., and is navigable for about 30 m. from its mouth. 2. Puerto Mexico, port in Vera Cruz, Mexico, on the gulf of Mexico. The E. terminus of the Tehuantepec railway across the isthmus, standing at the mouth of the wide and deep C. R. The climate is hot. Two converging jetties about 4333 ft. long extend from the mouth of the riv. to the sea to prevent the formation of a bar. Its wharves are equipped with electric cranes. The beach is the main street. Pop. 20,000.

Cob, see HORSE.

Cobalt, tn. in Ontario, Canada. 330 m. N. of Toronto, named from the abundant supply of cobalt ore. Nearly 300,000 ounces of silver were produced in 1903-18, but much less later. The first valuable discovery of ore was made in 1903. Pop. 4000.

Cobalt and Cobalt Ores. Cobalt (symbol Co, atomic weight 5.90) is a metal of the iron group of elements. It is a hard white metal resembling nickel, produced by the reduction of its oxide or chloride by hydrogen or carbon. Like iron and nickel, it is magnetic, although to a lesser degree. The element is remarkable for the brilliant colours of some of its compounds. Thus a blue colour is imparted to potash glass by the addition of a little C. salt, when C. silicate is formed. C. is a relatively rare metal, but plenty of it is found mined with the silver ores in Ontario round about C. The chief ores are C. glance (CoAsS), the arsenide, and sulphide; smaltine (CoAs₂), the arsenide; and C. bloom, which is an arsenate of the metal. These are converted into oxide by roasting and reduced with carbon. The metal itself is becoming increasingly important as a constituent of various alloys, while its compounds are used in the manuf. of paints (both as pigments and as driers). C.

chloride gives a pink solution in water, which forms a favourite invisible ink; writing done with this liquid is invisible—more or less—when dry, but goes brilliantly blue on warming.

Cobán, cap. of Alta Verapaz, Guatemala, Central America. It is situated in the finest coffee dist. of the republic. Chalk is found there and made into crayons. Pop. 4640.

Cobar, municipality and post tn. in co. Robinson, 350 m. N.W. of Sydney, New S. Wales. The dist. is the centre of copper gold, and silver mining: wool-growing is also an industry. Pop. 4000.

Cobb, Irvin S., b. Paducah, Kentucky, U.S.A., Jan. 22, 1876, and graduated from univ. of Georgia. Held various positions as reporter and on editorial desks in Paducah, Louisville, and New York city, and then became a regular staff contributor to various Amer. magazines, specialising in the short story, of which he is considered one of the best modern exponents, particularly of the story in a humorous vein. Many of his stories deal with his native Kentucky, of which he has made himself a sort of prose laureate. Among his best known books are *Old Judge Priest* (1915) and *Red Likker* (1929).

Cobbe, Frances Power (1822–1904), Eng. writer, and social investigator. She was a staunch supporter of women's suffrage and the founder of the National Anti-Visitation Society. Pub. *An Essay on Intuitive Morals* (1855); *The Duties of Women* (1881); and *The Scientific Spirit of the Age* (1888).

Cobbett, William (1763–1835), author and politician, was of lowly origin. As a lad he tilled the soil, but at the age of twenty became a solicitor's clerk. Finding the life ungenial, he enlisted and went with the 54th Regiment to New Brunswick. He was soon promoted to the rank of sergeant-major, and, entrusted with the keeping of the regimental accounts, he discovered peculations on the part of some officers. He secured his discharge and gave information to the War Office. A court-martial was summoned, but C., learning that he was to be confronted with perjured witnesses, fled the country. After a brief sojourn in France, he went to the U.S.A., where he found full play for his talents as a pamphleteer. He became a noted character, and his fame spread to England, where many of his writings were reprinted. His hatred of shams and dishonesty eventually made him the defendant in a libel action, which, being decided against him, ruined him. He returned to England in 1800, and was taken up by the Tory leaders, Wyndham and Dr. Lawrence providing him with funds to start the *Political Register* in 1802, which was pub. weekly until his death. His industry, as he was never tired of pointing out, was prodigious, and his output enormous. Besides writing the greater part of the *Register*, he was the author of many books, mostly of a utilitarian nature, such as *Cobbett's Cottage Economy* (1822) and *The English Gardener* (1829). He also originated and ed. the

Parliamentary History, the *Parliamentary Debates* (later to be known as *Hansard*), and the *State Trials*. His most characteristic book is *Advice to Young Men* (1830); his best, *Rural Rides* (1830). His great merit as an author was his clear, vigorous style. An active politician, he was always on the side of the oppressed, for whose cause he was always willing to suffer. He was prosecuted by the gov. in 1810, and imprisoned in Newgate for two years; and in 1817, on the suspension of the Habeas Corpus Act, he went to America to escape a second period of incarceration. It was his perpetual endeavour to stir up the poor to demand better conditions and to secure a greater control of public affairs. He was, indeed, one of the most strenuous advocates of parl. reform, one of the most valuable of his pubs. the *Register*, reaching a vast public. Appropriately enough, he was returned as a member of the first Reform Parliament, but he was then too old to achieve any marked success in a new sphere of activity. He had great, even overweening, self-confidence, and even where he failed, he showed the path to others, and many of the reforms that have been effected since his day were due to his teachings. See L. Melville, *The Life and Letters of William Cobbett in England and America*, 1913; G. D. H. Cole, *The Life of William Cobbett*, 1924, 1947; M. Bowen, *Peter Porcupine*, 1935.

Cobbler, The, or Ben Arthur, mt. of Argyllshire, Scotland, 3 m. W.N.W. of Arrochar. It is 2891 ft. high and has some interesting rock-climbs.

Cobden, Richard (1804–65), statesman, was the fourth of eleven children of a small Sussex farmer, who fell on evil days and had to part with his farm soon after Waterloo. Richard was taken charge of by relatives, who sent him to a rough and ready school in Yorkshire. Later he became a clerk, and then a commercial traveller, until in 1828 he set up in business on his own account as a calico merchant in Manchester. The business prospered, and eventually the merchant became a manufacturer, and found time to remedy some of the defects of his education. Economics was his favourite study, and he became an active advocate of free trade. He gave expression to his views in pamphlets issued respectively in 1835 and 1836, *England, Ireland, and America*, and *Russia*. Being a prosperous man by this time he offered himself as a parl. candidate for Stockton at the first general election after Queen Victoria's accession; but it was not until three years later that this constituency sent him to Westminster. He was already a prominent member of the Anti-Corn Law League, which had been founded at Manchester in the autumn of 1838, and was supported by Charles Villiers and John Bright. To obtain the repeal of the laws imposing a duty on the importation of corn was the matter nearest his heart, and it was on this subject that, on Aug. 25, 1841, he made his maiden speech in the House of Commons. How strenuously he devoted himself to his self-imposed task is a matter

of common knowledge, and the arguments he adduced will be found set forth in his *Speeches on Free Trade* (collected in 1903). For years he waged warfare against the protectionists, but at last circumstances aided him. Peel began to be convinced of the necessity of bringing the question of the repeal of the corn laws within the range of practical politics, and during the Irish famine in Oct. 1846 he declared that the only remedy was 'the total and absolute repeal for ever of all duties on all articles of subsistence.' The Cabinet did not agree with this decision, and on Dec. 9 Peel resigned. Lord John Russell, who was for total repeal of the duties, was sent for, and invited C. to take office in his administration, but C. declined, believing that as a private member he could more effectually aid the cause he had at heart. Dissensions between Grey and Palmerston prevented Lord John from forming a ministry, and Peel returned on Dec. 20. In the following month he introduced a repeal Bill, which after much bitter debate in the Commons, received the royal assent on June 26. C.'s object was achieved, and he was hailed as the saviour of the poor. His exertions had, however, left him no time for the conduct of his own affairs, and his business was on the verge of bankruptcy; but ruin was averted, for a grateful nation subscribed £80,000 as a testimonial to him. In 1860 another subscription was started and realised £40,000. Nothing that C. did after the repeal of the corn laws was commensurate in value to his share in securing that measure, but after his prin. object was effected he strove in other directions to further free trade. His next most important achievement was the negotiation of a commercial treaty between France and England, to bring about which he went to Paris in Oct. 1859. He went as a private person, but when he had silenced the objections of the Fr. protectionists he was given official powers, and on Jan. 23, 1860, he and Lord Cowley were the Eng. signatories to the treaty. 'Rare is the privilege of any man,' Gladstone said in the House of Commons, 'who, having fourteen years ago rendered to his country one signal and splendid service, now again within the same brief span of life, decorated neither by rank nor title, bearing no mark to distinguish him from the people whom he serves, has been permitted to perform a great and memorable service to his country.' This public tribute was well deserved, for there is not a more sincere or a less self-seeking man to be found in the annals of Eng. hist. C. d. on April 2, 1865. See Lord Morley, *Life of Richard Cobden*, 1881; J. A. Hobson, *Richard Cobden*, 1918.

Cobet, Carel Gabriel (1813-89), Dutch classical scholar, b. at Paris. In 1846 was made prof. at Leyden, where he remained until his death. His chief works are *Novæ Lectiones* (1858); *Variæ Lectiones* (1873); *Miscellanea Critica* (1876); *Observationes Criticæ* (1877); *Collectanea Critica* (1878); *Briefven aan Geel* (1892).

Cobb (formerly **Queenstown**), port and mkt. tn. in the co. of Cork, Ire. It presents a picturesque appearance, with its houses rising in successive terraces on a steep slope. It was, until 1913, a centre for the Amer. mails, and for the departure of emigrants. Originally called Cove of Cork, it was changed to its later name, Queenstown, in honour of Queen Victoria's visit in 1849. The name was again changed with the advent of de Valera's Fianna Fail Gov. to its present name. The climate is salubrious. Pop. 7000.

Cobham, or **Church Cobham**, vil. in Surrey, England, situated on R. Mole, 6 m. W. of Epsom. Pop. 5000.

Cobham, Lord, see **OLDCASTLE, SIR JOHN**.

Cobham, Sir Alan John, Brit. aviator, b. 1891; son of Frederick C. Educated at Wilson Grammar School. A farm-pupil in 1912; began a commercial career in City of London, 1913. Served in First World War, Aug. 1914 till Jan. 1919—three years in France; commissioned 1917 in the Royal Flying Corps, afterwards R.A.F. In 1920, undertook aerial photographing for the Aircraft Manufacturing Company. Joined the De Havilland Aircraft Company, 1921. Same year began series of long flights; flew 5000 m. round Europe. Another tour, 8000 m., round Europe and N. Africa, in 1922; in June flew from Belgrade to London in a day. Flew 12,000 m. over Europe, N. Africa, and Palestine, in 1923; also London to Brussels with 6 h.p. engine. In 1924 flew from London to Rangoon and back. In 1925-26 flew London to Cape Town and back; in 1926 England to Australia and back; won Britannia Trophy 1923, 1925, and 1926; and in last-named year was made K.B.E. He was commander-pilot of a flying-boat expedition which flew completely round Africa, Nov. 1927 to May 1928.

Cobitis genus of carp-like fishes popularly known as loaches, which are natives of Europe and the E. Indies. The spined loach is a European species found in Britain which makes a peculiar breathing sound.

Coble, low, flat-bottomed boat with a square stern, of one ton burden, 20 ft. in length, and 5 ft. in breadth, rowed with three pairs of oars, and fitted with a lug-sail. It is used chiefly in the cod and turbot fishery. The name is also applied to a smaller boat in use by the salmon fishers.

Coblenz, see **KOBLENZ**.

Cob-nut, **Filbert**, and **Hazel-nut**, are all names of the fruits of various species of the cultivated hazel (*Corylus*), the parent form of which is *C. avellana*. The three fruits differ chiefly in the length of the husks or involucre, which in filberts (*q.v.*) are longer than the nuts, about equal in cobs, and less in hazels. The fruits are edible and are largely cultivated as dessert fruits. *C. tuberosa* is the Kentish cob or great cob, also known as Lambert's filbert. It has a large thick-shelled nut, the kernel of which is covered by a reddish coat. Barcelona nut is sometimes

mentioned as a kind of cob or as a variety of Kentish cob.

Coborn, Charles (1852-1945), Brit. music-hall comedian and singer, b. at Mile End, son of a ship agent. His true name was Colin Whitton McCallum and he took his stage name at random from C. Road, Bow. Began his professional career at the Alhambra, Sandgate. In 1877 he played the title role in *The Man in the Moon* at the Theatre Royal. He made a name at Oxford as a coster comedian. His outstanding successes were his songs *The Man who broke the Bank at Monte Carlo*, written and composed by Fred Gilbert, which he sang hundreds of times, and *Two Lovely Black Eyes*. He did much for the comfort of the music-hall profession by forming, in 1885, the Music Hall Artists' Association. Reappeared in 1927 in the 'Veterans of Variety' and, later, in broadcast programmes. In 1928 he pub. a vol. of reminiscences with the title of his Monte Carlo song.

Cobourg, cap. tn. of Northumberland co., Ontario, Canada, 77 m. N.E. of Toronto, and situated on the N. shore of Lake Ontario. It possesses a good harbour, and has woollen mills, foundries, car and carpet manufs. Pop. 6000.

COBRA

Cobra, Portuguese name for sev. poisonous snakes in the colubrine genus (family *Elapidae*) *Naja* common to S. Asia and Africa. The most familiar of these is *N. tripudians*, or *C. da capello*, the hooded snake of India. The colours vary from pale brown to dark grey in some specimens, while others are dark brown and bear spectacle-like black and white markings on the neck, a portion of the body which becomes a hood-like expansion when the creature is roused. In habit the C. is usually nocturnal, and unless attacked is not, as a rule, dangerous; its diet consists of small vertebrates, e.g. rats and frogs; its length may be from 4½ to 6 ft. Although it is terrestrial and conceals itself among stones during the day, it can both swim and climb gracefully and well.

N. haje is the spy-slang or Cape spitting snake and the Egyptian asp (*q.v.*).

Cobra, King, or Giant, see HAMADRYAD.

Coburg, tn. of Upper Franconia, Bavaria, Germany, formerly cap. of the duchy of C., and residence of the duke of Saxe-Coburg alternately with Gotha; situated on the Itz (trib. of R. Main), about 26 m. from Bamberg, 48 m. from Gotha. The Marktplatz contains Theed's statue of Albert the prince consort, the old Rathaus, gov. buildings, and the large arsenal with its fine ducal library. In the Schlossplatz are the ducal palace of Ehrenburg, containing fine paintings and a state banquet hall, the theatre, various churches, and Schwanthaler's statue of Duke Ernst I. On the citadel above the tn. is the old castle and fortress of the dukes of C., recently restored. It was one of the most celebrated structures of the Middle Ages, said to date from the early tenth century. It is now a museum of art and antiquities. Luther took refuge there, 1530; it defied Wallenstein's attacks, 1632. C. manufs. basket-work, thermos flasks, and porcelain, has breweries and a vegetable market. Pop. 30,000.

Coca, see under COCAINE.

Cocaine ($C_{17}H_{19}O_2N$), chief alkaloid found in the leaves of the coca-tree. *Erythroxylon Coca* is a shrub of the order Erythroxylaceae; it attains a height of 6-8 ft., and is met with in many tropical countries, particularly in S. America, where the natives have long been in the habit of chewing the leaves for the stimulating effects produced. When the practice has been long indulged in, the appetite for ordinary food fails, the subject tends to rely on the drug, and eventually collapse occurs. As an occasional tonic, however, coca leaves have considerable value, and are said to enable the Indians to perform remarkable feats of endurance. The properties of the plant were demonstrated in Europe by Christison, and many preparations of value as stimulants have been made with coca leaves extract as an important constituent. Many alkaloids have been found in the leaves, the most important being C. One extract is first made by steeping the coca leaves in hot water. The solution is then treated with lead acetate in order to precipitate tannin, etc., and the lead in the filtrate is precipitated by the addition of sodium sulphate. The solution is then rendered alkaline with soda and the C. extracted with ether and purified by recrystallisation from alcohol. C. forms colourless prisms melting at 98° C. It is soluble with difficulty in water, but forms salts readily. The preparation usually employed in medicine is the hydrochloride ($C_{17}H_{19}O_2N.HCl$), which is readily formed by neutralising the alkaline extract with hydrochloric acid and evaporating the solution to crystallisation. The most important property of C. is its capacity for removing all sensation of pain on local application, and it is used for this purpose in dentistry and other minor surgical operations. Taken by the mouth, it acts first as a stimulant and then as a

narcotic. It resembles caffeine in its effect on the nerve-centres, and atropine in its effect on the respiratory and circulatory organs. The dose for internal use is from $\frac{1}{4}$ to 2 grains. For injection to produce local anaesthesia a 2 - 8 per cent solution of the hydrochloride is employed. C. has been found of great use in eye operations. When applied to the conjunctiva, it dilates the pupil and abolishes pain. For some time after the application there is paralysis of the function of accommodation, so that the patient does not see clearly. For producing local anaesthesia various methods are employed, according to the nature and seat of the operation and the depth of anaesthesia desired. Simple external application to the skin has little effect, but the effect on mucous membrane is to produce a tingling followed by numbness with partial or total loss of sensibility to pain, according to the idiosyncrasy of the subject. There is usually a blanching of the surface, owing probably to constriction of the blood-vessels. Short operations in the nasal passages may be rendered painless by the application of C., also such operations as the removal of tonsils. A deep local anaesthesia can be produced in a superficial part by hypodermic injection. This is not only used for dental and other small operations, but also on occasions when general anaesthesia is dangerous or undesirable. Its use is avoided when possible, as in certain persons it is liable to cause depression of the heart, with possibly fatal results. Another disadvantage of its use is the impossibility of sterilising C. by heat as it decomposes. There is therefore some danger of septic germs being introduced, although a fairly strong solution is not a favourable medium for the growth of micro-organisms. It is true that the distressing symptoms consequent upon the use of ether or chloroform are avoided, but C. is not free from painful after-effects, and sometimes the sensibility of the part is increased when the influence of the drug has passed away. C. is sometimes used to produce spinal analgesia, though it has been largely superseded by stovaine, eucaine, and novocaine. The method employed is the injection of the solution into the sac containing the spinal cord in the lumbar region. The effect produced is insensibility to pain in the lower part of the body. A danger always present in the administration of C. is the possibility of setting up the drug habit. Its employment, for instance, to modify recurrent pains tends to produce a craving for C. which is much more insidiously developed and more difficult to eradicate than the craving for alcohol. The patient simulates pain to procure the drug, even to the point of self-deception. The firm estab. of the habit leads to moral degeneration, sleeplessness, emaciation, and death. The suppression of the improper use of narcotics came within the activities of the League of Nations, before which body much evidence of such usage was

given in Geneva in Jan. 1929. The Brit. delegate, Sir Malcolm Delevingne, presented a report on the activities of a factory in Holland whose illicit operations amounted to 3,350 oz. of C., much of which was consigned to China. Attention was also drawn to the amount of information contained in the It. report on the methods employed in the underworld for the distribution of C. and on the close relations existing between the C. traffic and the white slave traffic. The report also dealt with the ingenuity in concealing their trade of those trafficking in this drug and to the part sometimes played by pharmaceutical chemists in selling it at greatly enhanced prices.

Cocamas, see COCOMAS.

Cocanada, seaport in the Godavari dist., Madras, India, 86 m. S.W. of Vizagapatam; it has exports of cotton, rice, sugar, and cigars. Pop. 53,000.

Coca Wine (*Vinum coxae*), wine used for stimulating effects, and consisting of one part of C. and eight parts of sherry. It is strongly medicated, and must contain half a grain of alkaloid in the ounce, otherwise it is necessary to have a licence before it can be sold. A weaker preparation, containing one in twenty or thirty of a sweet red wine, is sometimes sold by wine merchants.

Coccajo, Merlino, see FOLENGO TROFILO.

Cocceius, Johannes (originally Koeh or Kohen) (1603-69), Dutch Hebraist and theologian. He was one of the leading exponents of the federal or covenant system of theology, an 'important attempt . . . to do justice to the historical development of revelation.' His disciples were known by the name of Coccejans. His chief works were *Summa Doctrinae de Federe et Testamento Dei* (1648); *Lexicon et Commentarius Sermonis Hebraici et Chaldaici Veteris Testamenti* (1669).

Cocceji, Heinrich von (1644-1719), Ger. jurist whose *Juris Publici Prudentia* for a long time remained the text-book of Ger. civil law.

Cocceji, Samuel (1679-1755), son of Heinrich von C. From prof. in Frankfurt-on-Oder, he passed through the various offices, until in 1747 he became the chancellor of Frederick the Great. He wrote *Norum Systema Jurisprudentiae* (1744-52).

Cocoo, Coco, Scratch-coco, Taro, and Eddoes, are all names given to *Colocasia esculenta*, an E. Indian species of Araceae. The C. is often used as a foliage plant; the rhizomes contain a poisonous property, but lose this when they are boiled, and form a nutritious food for the natives.

Coccoliths, or Coccolites, are small, saucer-like disks found in the ooze of the Atlantic, sometimes singly and sometimes aggregated together. It is considered probable that they are the remains of unicellular marine algae.

Coccoloba, genus of Polygonaceae, consists of tropical plants of very handsome appearance, some of which produce edible fruits. There are more than 120 species, restricted to tropical and sub-tropical America. *C. uvifera*, the seaside

grape, is a small tree, the leaves, wood, and bark of which are powerfully astringent owing to the presence of tannin, and a decoction called Jamaica kino is evaporated from them. The wood is valued for cabinet-making and contains a colouring matter used as a dye; the fruit is edible and is sold in W. Indian markets, but is little valued.

Coccosteus, curious genus of fossil fishes characterised by having a spineless tail, while the head and body were covered with large bony tuberculated plates. Some of the species were very large, and good specimens of *C. decipiens* have been found in Scotland.

Cocculus, the dried berry of *Anamirta* (formerly *Menispermum*) *coccula*. *C. indicus* is the commercial name. The berries contain a poisonous active principle known as picrotoxin, about which great care is exercised when it is used medicinally.

Coccus, genus of hemipterous-homopterous insects typical of the family Coccidae, of which the species are called familiarly scale-insects or mealy bugs. The females are wingless, and of a very degenerate type; when adult they fix themselves to a plant by means of their proboscis, and remain there until they produce their young and die. The males, however, are devoid of mouth-parts, and consequently do not live long after fulfilling their one duty, that of fertilising the females. They are unlike their mates in being beautiful and well-developed creatures with anal cerci and a single pair of wings. Some of the coccids are destructive to vegetable life, while others are of value to man. Such are *C. cacti*, (*Dactylopus coccus*) which yields cochineal, and *C.* (or *Gossyparia*) *mannifera* (*C. manniparus*) which exudes the honey-dew supposed to be the manna of the O.T. This latter occurs on the leaves of *Tamarix gallica* var. *mannifer* a. 'Lac' is produced by an Indian coccid (see SHELLAC).

Coccyx, terminal portion at the lower end of the spinal column, consisting of four or five vertebrae.

Cocentaina, in the prov. of Alicante, Spain, 5 m. from Alcoy. It has manufs. of silk, linen, and paper.

Cochabamba, second city of importance in Bolivia, has a pop. of 50,000 at an altitude of 8435 ft. The prov. (pop. about 500,000) of which it is the cap. is sometimes called the granary of the republic. There are large herds of cattle and rich forests. The city is the distributing centre for E. Bolivia, and there is a rich mining region. C has a cathedral, univ., high schools, banks, air lines to Sucre, etc., and a railway to Oruro.

Cochet, Henri, Fr. lawn tennis player; b. 1901, at Lyons. Learned game there on covered courts. Regional champion, and military champion, of France 1921; many other continental victories. In 1927 won men's singles at Wimbledon; in 1928 U.S.A. singles, and doubles at Wimbledon. In 1932 won the all-England plate at Wimbledon, but was defeated by Vines (U.S.A.) in the Davis

Cup final, and again at Wimbledon in singles, 1930-33. Became a professional player in 1933.

Cochin (Tamil *Kaci*, harbour): 1. Dependent state of India within the presidency of Madras, of area over 1300 sq. m. Mostly a low tract of land between the W. Ghats and the sea. Its chief products are cotton, rice, cardamoms, ginger, indigo, coco-nuts, and pepper. Teak abounds, and salt is manufactured on the coast. The cap. is Ernakolam, but the rajah lives at Tripunthura. The chief commercial centre is Mattancheri. Numerous backwaters and coast lakes facilitate internal communication, and a metre-gauge line was constructed (1902) connecting Ernakolam and Shoranur. The pop. consists largely of Hindus and Christians. Many Jews reside in the suburbs, some of them of the black type. Till the ninth century A.D. C. was part of the anct. Chera or Kerala kingdom. The apostle Thomas is said to have gone there, but hist. is obscure till the arrival of the Portuguese. Vasco da Gama reached the Malabar coast in 1498. In 1663 the Dutch drove out the Portuguese; 1776, Hyder Ali of Mysore became suzerain; 1791, Tippoo ceded C. to Britain. Pop. over 1,205,000. 2. Tn. on the Malabar coast, near the entrance to the great lagoon of Travancore, about 95 m. from Calicut. Here Vasco da Gama d. It has an arsenal, a harbour, and shipbuilding yards, and carries on much maritime trade. The first possession of the Portuguese in India, taken from them by the Dutch, 1663, and by the Brit., 1795. It was formally ceded to England, 1814. It is the see of a Catholic bishop and of two Syrian bishops. The people are chiefly Christians, Hindus, and Muslims. Christian and Jewish colonists have existed since the first century A.D., the Christians forming the sect of Nussurani Mappilas. The colony of black Jews claim to have been settled in India in the fourth century. Pop. 25,000.

Cochin China (Fr. or Lower), Fr. possession in S.E. of Asia in the extreme S. of Fr. Indo-China. Also called Gladinh, or Nam-ki (country of the S.). Bounded by Cambodia and Annam, on N., S.E. by S. China Sea, and W. by gulf of Siam. A peninsula in the S., ending in Point Ca-Mau, it separates the China Sea and gulf of Siam. Off the coast are Condor Is. (Pulo Kondor) and Pulo Obi in the China Sea, and the Fu Kwok group in the gulf of Siam. Its area is 26,476 sq. m. C. C. is mostly a broad, low-lying, alluvial plain, including the deltas of the Mekong and Donngai Rs., together with the Salgon R. and the Great and Little Vajeros. The coast region is swampy, and cane-covered marshes stretch far inland. Two canals connect the Bassak arm of the Mekong with the gulf of Siam. The climate is subject to monsoons and is unhealthy for Europeans. Towards the N. there is higher land, mt. summits rising to about 2000 ft. In the W. are the last outliers of the Elephant Mts. of Cambodia. Forests in the N.E. contain valuable

woods for shipbuilding and cabinet-making. The gamboge-tree abounds. There are two railway lines, Saigon to Mytho and Saigon to the frontier of Annam, also a line links Loc Ninh with Ben Dongxo, the terminus of the C. C. tramway; and a complete network of roads, but the rlys. and canals are still more important. C. C. is an agric. country. Rice is the prin. crop, being over 3,000,000 tons a year. Next come areca nuts, betel nuts, coco-nuts, sugarcane, maize, mulberry, cotton, pepper, palm oil, rubber, sweet potatoes, earth-nuts, coffee, oranges, and bananas. Water-buffaloes are much used for labour, also zebus. Among other animals found there are the elephant, rhinoceros, deer, wild boar, tiger, and many smaller animals. Peacocks, snipe, partridges, pheasants, and woodcocks also abound. Minerals are not very abundant, but phosphate of lime is found at Ha-tien, lignite and granite quarries are worked and salt is produced on the coast from lagoons and pits at Saktrang, Bac-leu, and Baria. The large cultivators, especially those owning estates in the W., ruthlessly exploit the tenant-farmers, by reserving for themselves not only most of the benefits, but making further by exactions through loans. The most recent figures show that C. C. is still the leading rice-growing colony of Indo-China, the number of tons produced in 1937 being 3,155,000 as compared with Tonkin, 1,735,000; Annam, 1,032,000; and Cambodia, 960,000. The greater part is used for domestic consumption. There are twenty-seven rice-mills in Cholon, mostly in Chinese hands. Rubber-growing began in C. C. some thirty-eight years ago, and soon spread to Cambodia; present area under *hevea* in C. C. being about 100,000 hectares (Cambodia about 30,000 hectares). Pepper cultivation is carried on on the borders of C. C., but suffers as an export crop from Fr. W. African competition. In 1937 the distilleries of C. C. produced 156,000 hectolitres of alcohol. Three sugar refineries have been set up in Saigon, the combined output being 18,000 tons of sugar, besides rum and alcohol. With Cambodia C. C. is a centre of sericulture in Indo-China. The majority of the pop. are Annamese. There are also Cambodians and Chinese, with a few Moïs, Malays, and Europeans. In religion over a million are Buddhists, and about 75,000 are Rom. Catholics. The Fr. have estab. very many schools, mostly conducted by native teachers. Trade is chiefly in the hands of the Chinese, the main centre being Saigon. Native industries produce jewellery, mats (at Saigon and Rach-Gia (or Rach Gia) especially), pottery, cigarettes (Saigon and Cholon), and soap (Cholon). Storms prevail in May and Aug., while in July, the brief dry season, fever and dysentery are common. The seasons are very regular and harvests good. Irrigation and drainage are carried on energetically in the central and S.W. provs. C. C.'s role as an exporting colony increases: the value of her exports is four-

fold that of Tongking, while both Annam and Cambodia have only an insignificant export trade. The exports include rice, dried fish, pepper, hides, gamboge, areca nuts, copra, cotton, cardamoms, spices, live animals, dyes, isinglass, and silk. For administrative purposes there are four provs. The governor of C. C. is under the orders of the gov. of Indo-China and (before 1941) was assisted by a Privy Council. There was also an elected colonial council consisting of twenty-four Fr. and native members. C. C. was represented in the Fr. Parliament by one deputy. Local affairs are entrusted to native officials. The cap. is Saigon with a pop. of 112,000 (1936) (with Cholon, 300,000 in 1945). Other important places are Cholon, Bienhoa, Long-xuyen, Chau-doc, Bentre, and Tay-ninh. The Khmer kingdom (at its zenith from ninth to twelfth centuries A.D.) included much of modern C. C., the rest being under the empire of Champa (ended in fifteenth century). The Annamese took the E. region in the seventeenth century, and in the eighteenth they occupied the W. also. Hence C. C. was formerly a name for the old kingdom of Annam, extending to the S. of Tongking. About 1861 C. C. came under Fr. rule, becoming a Fr. colony, 1867. In 1887 it united with Cambodia, Annam, and Tongking to form the Indo-Chinese Union. From the capitulation of Japan in 1945 Brit. troops landed in C. C. to disarm the Jap. and keep order. The Fr. authorities acknowledged their debt of gratitude to the Brit. for the loyalty with which they carried out their mission until the arrival of Fr. troops under Gen. Leclerc. The Brit. occupying authorities well understood the necessity of close co-operation between the colonial powers in face of the cleverly conducted propaganda against colonial empires. The control of Leclerc's troops was methodically extended, and all centres of resistance gradually overcome. On March 6, 1946, a preliminary agreement was concluded between Fr. representatives and those of the revolutionary party Viet-Namh, by which the latter was to become a free republic of the Fr. union. The eventual reunion of C. C., Annam, and Tongking was foreshadowed, and proposals made to sound popular opinion through the machinery of a referendum. In 1947 a republican form of gov. was instituted in C. C. Pop. (1936) 4,616,000. For bibliography see INDO-CHINA, FRENCH.

Cochineal, natural dyo-stuff employed in dyeing scarlet, crimson, and orange, and in the preparation of the pigments lake and carmine. It consists of the bodies of the female insects of the *Coccus cacti* (family Coccidae, order Hemiptera), so called because the chief food of the species is a variety of cactus, particularly the nopal, found in Mexico and Peru. It is now also cultivated in Algiers, Spain, etc. The insects are collected from the plants into bags, and killed either in an oven or by exposure to the sun or steam. Different kinds of treatment produce the various varieties of C., the

best being known as silver, the next as black, and an inferior quality as granilla. The use of C. reached Europe from Mexico in the sixteenth century.

Cochläus, Johannes (properly Dobneck) (1479-1552), Rom. Catholic controversialist and writer, b. at Wendelstein. He sat on the Rom. Catholic side in the first commission at Augsburg, and at the Regensburg Colloquy in 1546. His best known work is *Commentaria de Actis et Scriptis Lutheri* (1549; Ger. ed. 1580 and 1582). His *Kleine Schriften* were ed. by J. Schweizer in 1920. Other works are *De Matrimonio Regis Angliæ* (1535); *Scopa in Araneas Ricardi Morysini Angli* (1538) (both written strongly against the marriage of Henry VIII. of England with Anne Boleyn); and *Historia Hussitarum* (1549). His life has been written by Spahn, 1898.

Cochlea, see E.A.R.

Cochlearia, genus of cruciferous plants, growing wild in Europe and Asia Minor. *Armoracia lapathifolia*, the horse-radish, grows in Britain, but is not in reality a native, the wild specimens being evidently escapes from gardens; the root is a well-known condiment. *C. officinalis*, the scurvy-grass, is a native of Britain found in muddy places near the sea-coast; the fresh plant is a stimulant and possesses antiscorbutic properties.

Cochran, Sir Charles Blake (b. 1875), Eng. theatrical manager, b. at Lindfield, Sussex. Educated at Brighton, where he was influenced towards the theatre by Aubrey Beardsley. In America he acted from 1890 to 1893. In 1897 he produced *John Gabriel Borkman*. His first London production was *Sporting Simpson*, at the Royalty Theatre in 1902. He has produced more than 100 shows of all kinds. Made a big success with *The Miracle at Olympia*. Has won fame also as a promoter of large-scale entertainments of all kinds—including boxing and wrestling matches. It was C. who introduced Hackenschmidt. Pub. *The Secrets of a Showman* (1925); *Cock-a-doodle-do* (1941); and *1 Showman Looks On* (1945).

Cochrane, Sir Alexander Forrester Inglis (1758-1832), Eng. admiral who took part in the actions off Martinique in the *Montague*, 1780. In 1795 he seized two large Fr. store ships out of a squadron of five. In Lord Keith's expedition to Egypt in 1801 he commanded the *Ajar*, and in 1806 he took a prominent part in the battle off San Domingo, being second in command under Duckworth. He was uncle of the celebrated Adm. Thomas (Lord) C., earl of Dundonald, and father of Adm. Sir Thomas John C.

Cochrane, Douglas Mackinnon Baillie Hamilton, twelfth Earl of Dundonald (1852-1935). Brit. soldier. He entered the 2nd Life Guards in 1870; served in the Nile expedition from 1884 to 1885, and in Stewart's march to the relief of Khartoum, and fought at the battles of Abuklea and Goubat. In the Boer war he was present at the battle of Colenso, and at the head of the 2nd Cavalry Brigade was the first to enter Ladysmith at the raising of the siege by Sir Redvers Buller

(Feb. 28, 1900). Commander of the Brit. forces in Canada, 1902-4, but recalled by the secretary of state for war in consequence of his public criticism of one of the ministers.

Cochrane, Robert, Earl of Mar (d. 1482), Scottish architect, and a favourite of King James III. He is supposed by some to have been associated in the building of Parliament House at Stirling. After his accession to the earldom, probably about 1479, he was seized by the order of Lord Angus and other nobles, and hanged over Lauder bridge.

Cochrane, Thomas, tenth Earl of Dundonald (1775-1860), began his career in the navy when about eighteen years old, and in 1801, when he held the post of commander of the *Speedy*, distinguished himself in the service. Some years later he was elected member for Westminster, and endeavoured in that capacity to reform the Admiralty. He saw a good deal of service against France, but at Aix roads in 1809, he was not successful in his attempt to bring about the destruction of the Fr. fleet, and although the fault was the caution of C.'s admiral, C. had to bear the blame. In 1914 he suffered expulsion from the navy on a false charge of fraud, was expelled from Parliament, and was imprisoned. He escaped, and was re-elected for Westminster. He was, however, recaptured, and had to serve one year's imprisonment. He entered the service of Chile and commanded that country's navy during the war of Liberation, winning sev. fights. After this he did brilliant service in defence of the independence of Brazil (1823-25), and in 1827-28 was in the service of Greece. By the year 1832 he had managed to regain his position in the Eng. Navy, being made an admiral. He also served as commander-in-chief in the N. Amer. and W. Indies station, 1848. It was under C. (then a captain) that Marryat in 1806, started on his first voyage in H.M.S. *Impérieuse* for the Mediterranean (see autobiographical incidents in Marryat's *Frank Milnamay*) 'Capt. Savage' in *Peter Simple* is generally conceded to be meant for Capt. C., of the *Impérieuse*. C.'s *Autobiography* contains a hist. of the *Impérieuse*. He wrote *The Autobiography of a Seaman*, 1860-61. See life by his son; and J. B. Atlay, *The Trial of Lord Cochrane before Lord Ellenborough*, 1897; C. Lloyd, *Lord Cochrane*, 1947.

Cochrane, Sir Thomas John (1789-1872), Eng. admiral, son of Adm. Sir A. F. I. C. While commanding the *Surprise*, 1813, he captured the *Decatur*, an Amer. privateer, afterwards assisting in the attacks on Washington and Baltimore.

Cock, Edward (1805-92), Brit. surgeon, who was apprenticed at the age of sixteen to his uncle, Sir Astley Cooper, at St. Thomas's Hospital. On the estab. of Guy's Hospital he was appointed the demonstrator of anatomy. He was consulting surgeon there in 1871. He was probably the first who performed the operation of oesophagotomy. His chief work was *Practical Anatomy of the Head, Neck, and Chest* (1835).

Cockade, modern substitute for the badge worn in olden days on the dress or appointments of the servants of the house. Custom is the only authority for its use, and excepting casual references in the description of military accoutrements, no official recognition of the C. occurs. Probably the earliest Cs. known were those which were worn in Scotland for William of Orange at the time of the revolution. The white C. was that worn by the Jacobites, while a black one was used by the house of Hanover and by the household of the estab. gov. From the hats of the military it passed on to those of the civil servants of the Crown, and as headgear changed in fashion, the use of the C. became confined to servants only. Hence the custom of generations was estab. by which the use of the C. is confined to the servants of those who bear commissions from the Crown or its delegates, i.e. justices of the peace, who receive commissions from the lord-lieutenant of the co.

Cockaigne, Land of (O.F. *coquaigne*, modern Fr. *cocagne*, coming through It. *cocagna* and Lat. *coquere* to cook, and perhaps lit. rally, meaning land of cakes), imaginary land familiar in medieval romances, in which it was possible to live a luxurious life of perfect idleness. All the features of the landscape were good to eat or drink; the rivs. were of wine, the houses of cakes and sweetmeats, and the streets of pastry, while roasted geese and fowls and buttered larks went about asking to be eaten. There is a thirteenth-century Eng. poem, *The Land of Cockayne*, which ridicules monastic life. The term has been applied to London in its aspect to the rustic of the city with streets paved with gold, and this has probably led to its frequent confusion with cockney.

COCKATOO

Cockatoo, bird belonging to the family Psittacidae, of the sub-order Psittaci, of the order of the Cuculiformes. They are closely related to the true parrots, with which they are commonly considered. True Cs. are light in colour, generally white with tinges of red and orange.

They are found in Australasia and the E. Indian Is. The term is often extended to include allied genera of dark plumage, such as the black C. In heraldry a C. is a beast with head, shoulders, and legs of a cock, and the body, wings, and tail of a wyvern.

Cockatrice, fabulous monster believed in in auct. and medieval times (see Pliny, *Natural History*, and Aldrovandus, seventeenth century), said to come from a cock's egg hatched by a serpent and to possess deadly powers, being able to wither plants (except rue) and to kill men and animals (except the weasel) by its glance. The cock's crow killed it—hence travellers took the bird with them as a protection. In the Bible C. merely means a very venomous reptile. It is sometimes identified with the basilisk.

Cockburn, Sir Alexander James Edmund (1802-80), lord chief justice of England. Came of auct. Scottish stock; son of Alexander C. of the diplomatic service. He was educated at Trinity Hall, Cambridge; became a barrister in the Middle Temple, 1829; recorder of Southampton, 1840-46; Q.C., 1841; M.P. for Southampton, 1847-56; solicitor-general, 1850. His opening speech in the prosecution of Palmer in the celebrated Rugeley murder case in 1856 is famous as a forensic model of its kind. C. defended (1843) the crazy Scotsman, McNaughten, who shot Sir Robert Peel's secretary, Drummond, and estab. the defence of insanity, initiating the general rule (see McNAUGHTEN'S CASE). Briefed against Attorney-General, Thesiger, in the case of R. v. Newman (later Cardinal Newman), a libel prosecution launched against Newman who had denounced a profligate Rom. Catholic friar named Achilli, who was lecturing on Rom. Catholicism in England. The verdict against Newman was set aside. C. was knighted in 1850; in 1851 he was made attorney-general; recorder of Bristol, 1851-56; and became lord chief justice of court of common pleas in 1856, of court of queen's bench in 1859, and of England in 1874. C. was presiding judge in the Tichborne trial and an arbitrator in the Alabama dispute. A man of brilliant abilities and of high reputation as a judge. See *The Greville Memoirs*; J. McCarthy, *History of Our Own Times*; and S. Ballantine, *Experiences*.

Cockburn, Mrs. Alicia, or Alison (c. 1712-94), writer of Scottish songs, b. at Fairlie, Selkirkshire, her maiden name being Rutherford. In 1731 she married Patrick C., an advocate, the son of Adam C., lord justice-clerk, and the brother of C. of Ormiston, the father of Scottish agriculture. She became a famous Edinburgh hostess, being noted for her wit, sprightliness, and conversational powers, and numbered among her intimate friends Scott (to whom she was distantly related), David Hume, John Home, and Lord Monboddo. She had considerable poetical abilities, and is best known for her version of *The Flowers of the Forest*, which first appeared in *The Lark* in 1765. Other songs by her appear in Johnson's *Musical*

Museum, 1853. See her *Letters and Memoirs*, ed. by T. Craig Brown, 1900.

Cockburn, Catharine (née Trotter) (1679-1749). Eng. miscellaneous writer, whose works include *Verse on Congreve's 'Mourning Bride'* (1697); three tragedies: *Agnes de Castro* (1696), *Fatal Friendship* (1698), and *The Unhappy Penitent* (1701); *Love at a Loss* (1701), a comedy. His writings in defence of Locke and other philosophical works.

Cockburn, Sir George (1772-1853), Brit. admiral who served under Nelson with the frigate *Minerve* during 1796-1802. From 1803 to 1805 he commanded the *Phaeton* in the E. Indies; and in 1813 took an important part in the capture of Washington; in 1815 became commander-in-chief at St. Helena, having conveyed Napoleon there from Plymouth.

Cockburn, Henry Thomas, Lord (1779-1854), Scottish jurist and judge, b. near Edinburgh, the son of Archibald C., a baron of the Scottish court of exchequer. In 1831 he became lord rector of the univ. of Glasgow, and in 1834 was promoted to the bench as one of the lords of the court of session, under the title of Lord C. He was appointed a lord commissioner of judiciary in 1837. He pub. *A Life of Lord Jeffrey* (1852), while *Memorials of his Time*, a book full of humour and interest, was pub. posthumously in 1856.

Cockburn, Sir John Alexander (1850-1929), Anglo-Australian statesman, b. at Corsbie, near Duns, Scotland; in 1875 he settled in S. Australia, and in 1884 was elected to the House of Assembly as representative for Burra, and in 1887 for Mt. Barker. He was minister of education, 1885-87; Premier and chief secretary, 1889-90; chief secretary, 1892; minister of education and agriculture, 1893-98. Made K.C.M.G. in 1900. He represented S. Australia at the Federal conferences and at numerous international congresses, and wrote *Australian Federation* (1901).

Cockchafer, or *Melolontha vulgaris*, lamellicorn coleopterous insect in the family Scarabaeidae and section Melolonthidae. The larvae are found in dung or in decaying vegetable matter or buried in the ground. The beetle is of a brownish colour, is over an inch in length, and is destructive to crops. When in flight it emits a loud whirring sound. Its life is short, but the larval stage is of very long duration, lasting from three to five years, most of which time is spent at some depth below the soil. The C. is common to continental Europe, but is not so frequently found in England.

Cockcroft, Sir John Douglas (b. 1897), Brit. physicist, formerly Jacksonian prof. of natural philosophy at Cambridge, and since 1946 director of the Atomic Energy Research Estab. of the Ministry of Supply. Working under Rutherford at Cambridge he constructed (with Walton) apparatus for accelerating atomic nuclei to very high speeds, and with this was able to produce the first examples of completely artificial transmutation (i.e. the conversion of nuclei of one element to those of a different kind).

Rutherford had previously shown that such transformations sometimes occurred when alpha particles from radioactive material collided with atoms, but prior to C.'s experiments no nuclei had been artificially accelerated to speeds sufficient to produce similar changes.

Cockenzie and Port Seton, fishing port on N.W. coast of E. Lothian, Scotland, on the firth of Forth, 1 m. E. of Prestonpans, which is its station, and 4 m. N.E. of Musselburgh. The two vills. now form one small port. Pop. 2800.

Cocker, Edward (1631-76), Eng. engraver and teacher. His famous *Cocker's Arithmetic*, pub. posthumously by John Hawkins, 1678 (confined to commercial questions only), was popular for nearly a century. More than 100 eds. were sold. 'According to Cocker' became a proverbial phrase. 'Daniel's Copy-book engraven by Edward Cocker, Philomath, 1684,' is preserved in the Brit. Museum. Other works were *A Guide to Penmanship*, *Tutor to Arithmetic*, and *Complete Arithmetician*. See *Pepys's Diary*, Aug. 10, 11, 1664, and A. De Morgan's *Arithmetical Books from the Invention of Printing to the Present Time*, 1847.

Cockerell, Charles Robert (1788-1836), Eng. architect. He assisted in the excavation of the Æginetan and Phigalian marbles. In 1819 he became surveyor to St. Paul's; and from 1840 to 1857 was prof. of architecture at the Royal Academy. Among his best-known works are the Taylor buildings at Oxford, 1841-42.

Cockerell, Sir Sydney Carlyle (b. 1867), Brit. paleographer, educated at St. Paul's school. From 1889-92 was a coal merchant. Secretary to Wm. Morris and the Kelmscott Press, 1892-98 (see on this MORRIS, WILLIAM). Director of the Fitzwilliam Museum (q.v.) 1908-37. Fellow of Jesus College, Cambridge 1910-16, of Downing College, 1932-37. A literary executor of Wm. Morris, Wilfrid Scawon Blunt, and Thomas Hardy. Has written various bibliographical monographs, especially on illuminated MSS.

Cockermouth, Eng. tn. In Cumberland, at confluence of Derwent and Cocker Rs., 25 m. from Carlisle. Wordsworth's bp., 1770. Bordering on the Lake Dist. There are coal mines near; flax and woollen mills; it manufs. hats, hosiery, and paper, also thread for art needlework. There are interesting ruins of an old castle built about the eleventh century, destroyed by the Parliamentarians, 1648. There are also Rom. remains near by. Pop. 5000.

Cocker Spaniel, small breed of dog, believed to be of Sp. origin; reared for work with the gun, especially for woodcock shooting. It has a soft, wavy coat, black, red, or cream; short legs, square muzzle, and long, low-set ears. See also under SPANIEL.

Cock-fighting, anct. and widely practised sport, consisting of the pitting against each other for fighting of specially bred and trained game-cocks. It appears to have been known in India, China, and Persia, and was introduced into Greece

from the E. during the time of Themistocles. From here it spread to Asia Minor, Sicily, and Rome, and from Rome northward and westwards over the greater part of Europe. In most European countries it is now illegal, but it is still practised in Spain, and is popular in Sp. S. America, China, Siam, and the Malay Peninsula. It was probably introduced to England at a very early date by the Romans, but our first definite knowledge of it comes from a description by Wm. FitzStephen, in the reign of Henry II., of the cock-fights at schools on Shrove Tuesday. It reached its highest popularity in the time of Edward III., and though it was prohibited, on account of the gambling it entailed, about 1366, it continued to be a favorite sport for many centuries. Henry VIII. built the famous royal cockpit at Whitehall, and the pastime was known as the royal diversion during the time of the Stuarts. James I. and Charles II. were enthusiastic devotees, the former being said to have attended at least two fights a week. C. was rigorously opposed by the Puritans, and Cromwell managed to suppress it entirely for a short time. It was finally abolished by law in 1849, but is still carried on more or less clandestinely. The sport was introduced into Scotland about 1881, and here partridges were frequently used instead of cocks, while in Wales a special form of combat, known as the Welsh main, was evolved. The cock-pits were usually circular, about 20 ft. in diameter, consisting of a stage covered with matting and surrounded by a barrier round which the audience stood. Almost every tn. in the kingdom had one, the larger prov. cities three or four each, and London a considerable number, of which the best known were in Westminster, Drury Lane, Jewin Street, Bridge Walk, Pall Mall, the Haymarket, and Covent Garden. The usual form of combat was that in which an agreed number of pairs of birds fought together, the final result being decided by the majority of victories on one side or the other. In the Welsh main, on the other hand, eight pairs fought, and the eight victors were paired and fought again, and so on till only one bird was left alive. There was also the battle royal, in which a certain number of birds were set upon each other and left to fight till all but one were killed. The game fowl is probably the nearest modern variety to the original Indian jungle-fowl. A cock is fought when one or two years old, and is trained by diet and exercise for about a month previously. The wings, tail, hackle, rump, and comb are all carefully trimmed, and spurs, from 1 to 2½ in. long, attached to the heels.

Cockie-lecky, or **Cooky-lecky**, soup, common in Scotland and the N. of England, made from a fowl boiled with leeks.

Cock Lane Ghost, imposture which greatly agitated London about 1762. A house in Cock Lane, Smithfield, tenanted by a man named Parsons, was said to be visited by mysterious noises

and by the apparition of a Mrs. Kent, who had d. there two years before. Inquiry revealed that the visitation was the work of Parsons's little daughter, aged eleven, and was a scheme on the part of Parsons to blackmail Kent by making it appear that he had murdered his wife. Parsons was condemned to stand in the pillory three times and to two years' imprisonment. The house was visited by large crowds, among them being Dr. Johnson.

Cockle, popular name of members of the Cardidae, a family of eulamellibranchiate molluscs. The species are widely distributed in many seas, especially those of the tropics. The shells are strong, heart-shaped, and ribbed, and the foot is long and bent. By means of this foot the C. burrow in mud and sand and also leap over the sand for a short distance. *Cardium edule* is the edible C. familiarly known in Britain as an article of diet.

Cockney, contemptuous term applied to a Londoner, strictly speaking to one born within the sound of the bells of Bow church. Various more or less fanciful etymologies of the word have been suggested, but there is little doubt that that given by Dr. Murray of 'cocken-ey' = 'cock's egg,' which came to mean a child overlong nursed, and so a milksoop, is the correct one. The term seems to have been first used of Londoners in particular in the seventeenth century.

Cook of the Rock, or *Rupicola*, genus of S. Amer. passeriform birds, the males of which are very handsome, with a purple-crested head and general orange colour, and have the curious characteristic of performing a strange dance before an assembly of their species. The hen bird is dull-coloured, and does not partake of her mate's antics.

Cook of the Wood, see CAPERCAILLIE.

Cookpen, par. 2½ m. S. of Dalkeith. Dalhousie Castle, formerly the residence of the marquess of Dalhousie, governor-general of India 1847-56, is now a school for boys. The grounds include those of the Laird o' C. of Scottish song. Pop. 5700.

Cook-penny, payment formerly made by the scholars of certain schools, especially in the N. of England, to their master at Shrovetide. It was originally intended to defray the expenses of cock-fighting, a regular institution at the schools.

Cockpit, originally the enclosed space devoted to the sport of cock-fighting. The site of an old C. opposite Whitehall was used for the erection of a block of buildings used by the Treasury and Privy Council, and the name survived until the nineteenth century. The name was also given to a theatre built in the early seventeenth century on the site where the present Drury Lane Theatre now stands. The C. was also the place in the old sailing men-of-war where the wounded were attended to during action, and was situated near the after-hatchway under the lower gun-deck.

Cockroach, term employed in speaking of either the whole family of orthopterous

insects known as Blattidae, or of certain members only of the family. The species are very widely distributed, and the Brit. black-beetle is a true 'C.', bearing little resemblance to a beetle. Some of the species are wingless, but usually the male has two well-developed pairs of wings—a stiff front pair called the *tegmina*, and a membranous hind pair—and the female bears rudimentary structures to represent each pair. In habit the insects are omnivorous and nocturnal. The female has a broader abdomen than the male, and her eggs are laid in hard capsules. *Phyllodromia germanica*, the croton bug of America, is common also in Europe, and is a representative species of 'C.'; *Blatta* (or *Periplaneta*) *orientalis* is the pest of Brit. kitchens. (*Periplaneta* is also the generic name given by some entomologists to a flying species, *P. americana*, and to the Australian *C.*, *P. australasie*. See L. C. Miall and A. Denny *The Structure and Life-history of the Cockroach*, 1886.

Cockscomb, see CELOSIA.

Cock's-foot Grass, pasture grass of Europe, Asia, and N. Africa, valued chiefly as a food for sheep very early in the spring before its young leaves have had time to become tough.

Cockton, Henry (1807-53), Eng. novelist, b. in London. Only remembered for two of a number of novels: *The Life and Adventures of Valentine Vox, the Ventriloquist* (1840); and *Sylvester Sound the Somnambulist* (1844).

Cocles, Horatius, see HORATIUS COCLES.

Coco (plant), see COCCO.

Coco, riv. of Nicaragua. Central America, known also as Wanks, Segovia, Yoro, Herbias, and Telpanesa. It rises in the N.W. in the dept. of Segovia, and forms part of the boundary between Nicaragua and Honduras, flowing into the Caribbean Sea at Cape Gracias-à-Dios. It is navigable for about 150 m., but large vessels cannot pass the sand-bar at the mouth.

Coco (or Cuoco), Vincent (1770-1823), It. politician and man of letters, was made member of the Royal Council by Joseph Bonaparte after the battle of Marengo. His best known works are *Platone in Italia*, which may be described as a philosophical novel, and *Revoluzioni di Napoli*.

Cocoa and Chocolate are derived from the cocoa bean, fruit of the tree *Theobroma Cacao*, member of the family Sterculiaceae, related to mallows and linden. Two other species have some commercial importance: *T. pentagona* and *T. sphaerocarpa*. Originally wild in Central America; now cultivated in tropical belt 20° N. and S. of equator, requiring mean shade temp. 80° F. with only occasional variations of 15° above or below, and rainfall of at least 50 in. per annum, without marked seasonal fluctuations. The prin. producing countries are Africa (Gold Coast, Nigeria, Fr. and Portuguese W. Africa); America (Brazil, Venezuela, Ecuador, etc.); San Domingo, Trinidad, and other W. Indian is.; also Ceylon, Java, and New Guinea. The possibility of commercial

production in Malaya, Brit. Guiana, etc., is being explored.

The tree is 15-25 ft. high, with broad-leaved luxuriant foliage. Flowers are small, pale pink, pale yellow, wax-like texture; the fruit produced in pods; buds, flowers, and fruit at all stages of development are present simultaneously; pods grow on main trunk and branches. A tree produces 6000 flowers, but only ten to sixty mature. Pods differ in size (6 to 10 in.), shape (gherkin or lemon to melon) and colour (yellow, maroon, crimson-purple). There are two main varieties: *Criollo* (lemon-shaped, broad at stalk end,

Cadbury Brothers Ltd.

A WEST AFRICAN COCOA FARMER HARVESTING HIS CROP

skin soft and furrowed) and *Forastero* (smoother and harder with great variety of shapes). The pod contains twenty to forty seeds ('beans') in white pulp, sweet and faintly acid to first taste but bitter and astringent on biting. *Criollo* seeds are large, plump, and white; *Forastero* smaller, flatter, and heliotrope; some trees yield both colours. The yield varies, but the typical 1-lb. pod produces 4-oz. seeds = 1½ oz. commercial cured bean. Yield higher in Brit. W. Africa, but average yield of dried cocoa in all growing countries probably 2 lb. per tree (= 1 lb. commercial cocoa powder) or less. *Criollo* gives good quality and moderate yield, *Forastero* medium quality and high yield.

Cultivation, Harvesting, and Marketing.—In S. America and the W. Indies cultivation is on plantations, in W. Africa on small native-owned farms. Trees are protected from wind by other plantings and usually from sun, but practice varies; they can be intermingled with 'catch

crops,' e.g. yams. The tree bears at four to five years, reaches maturity at ten to fifteen years, and continues for thirty to forty years. Ripe pods are present throughout the year, but there are usually two harvests. The pods are separated from tree by cutlass (machete) or hooked knife on a long pole (goulet). The pods are then cut open, and the beans and pulp scooped out: these are placed in heaps on ground and covered with leaves, or in 'sweating boxes'; the pulp ferments and drains away. This process matures the beans and changes the interior to chocolate brown. This is necessary in order to produce beans of suitable quality. The beans are then dried, preferably in the sun. Brit. W. African cocoa is (1949) marketed by Gold Coast and Nigerian Cocoa Marketing Boards, the share allocated to Britain by the International Emergency Food Committee being purchased by Ministry of Food and reallocated to manufacturers. Consumers' representatives still act as buying agents.

World Production, Consumption, and Price.—The most remarkable feature of world production is the enormous growth of the industry in the Gold Coast, to which cocoa was introduced about 1879. The export in 1890 was a mere 80 lb., while to-day, with Nigeria, Gold Coast produces more than half the world yield, and nearly double the whole world production of 1909. In 1939 world production reached a peak of over 700,000 metric tons, of which Brit. W. Africa accounted for nearly 400,000 tons. In the same year world consumption nearly equalled production, U.S.A. taking nearly 300,000 tons and the United Kingdom over 100,000 tons. Production of course decreased in countries affected by war, e.g. the Gold Coast, where labour was diverted to military service, and other countries reduced production through dislocation of markets. In the crop year ended Sept. 1948 the International Emergency Food Committee allocated world production of 599,000 tons (including 284,000 tons from Brit. W. Africa) to consuming countries. U.S.A. received 278,000 tons and United Kingdom 103,000 tons. Gold Coast production has also been affected by 'swollen shoot' and other diseases. Favourable weather, however, gave an excellent yield in 1948-49. The price paid by Brit. manufacturers for cocoa beans reached its lowest level, 32s. 6d. per cwt., in 1933. In 1938 it was 41s. 8d. After that prices were controlled. They rose to 62s. 8d. in 1946 and to 237s. 2d. in 1948. In U.S.A. prices reached a peak of 46 cents a lb. (255s. per cwt.) in Nov. 1947. The great increase in price after the war was largely due to removal of 'ceilings' by U.S.A., in conjunction with high world demand. By 1949 there was considerable recession in prices.

Manufacture.—The initial processes in manuf. of drinking cocoa (powder) and chocolate for eating and drinking are the same. Mechanical sieves and magnetic separators remove foreign bodies from beans, which are roasted in revolving

drums heated by coke fires, gas jets, or super-heated steam. This brings out the aroma and facilitates breaking of bean into small pieces ('nib') and winnowing away of shell. Blending takes place at this stage. The nib is then ground. Owing to the high fat ('cocoa butter') content (56 per cent), grinding produces a viscous brown liquid, as fat is melted by heat generated. When cool the liquid solidifies. Hydraulic presses, exerting pressure up to 6000 lb. per sq. in., extract a fixed proportion of cocoa butter, which is refined for chocolate manuf. and other purposes. Cocoa remains as dry hard cakes, which are broken up, ground and reground to powder, and sifted through silk for drinking cocoa. In a modern factory all stages of production, including tin-making, are embodied in a series of 'linked processes' involving automatic and semi-automatic machinery, gravity being largely used for conveyance of material.

Eating Chocolate.—While cocoa powder consists of bean *minus* some of its cocoa butter, chocolate contains full butter content of bean *plus* extra cocoa butter added to compensate for increased bulk due to inclusion of sugar. Eating chocolate is of two main kinds: moulded and couverture (or confectionery). Couverture for covering fruits, nuts, biscuits, preserves, and other 'centres' needs a higher proportion of butter than chocolate for moulding into blocks. Balance in production of cocoa and chocolate is therefore important to the manufacturer. He does not want to buy cocoa butter nor, generally speaking, to produce a surplus, though there is a market for this in manuf. of other confectionery and of cosmetics and other pharmaceutical preparations. In chocolate manuf. finely powdered sugar, extra cocoa butter, and cocoa 'mass' are mixed and ground in a *mélangeur*, in which heavy granite rollers rotate on a revolving granite bed. The material is kept warm enough to be plastic and is delivered to a series of refining machines. The first consists of rolls revolving at different speeds and delivers the chocolate in dry, flaky condition. Another process is *conching* (so called from shape of machine: *Fr. conche*, a shell) in which semi-liquid mixture is mechanically kneaded for long periods. For confectionery chocolate a fluid product is required. 'Centres' pass on a moving wire mesh under a curtain of chocolate. Decoration is added with a fork or other implement. Hand-covering is also practised, centres being dipped into bowls of liquid chocolate with a decorating fork. Moulded chocolate is less liquid. It is run into moulds, shaken mechanically, and knocked out (in form of blocks, bars, sticks, etc.) when cool and set hard. Fruit (e.g. raisins) and nuts (whole or chopped) can be mixed in before moulding.

Milk Chocolate is made with dried powdered milk or with fresh liquid milk. In the latter case, partially evaporated milk is mixed with chocolate mass and sugar. Factories for this purpose have been estab. in dairy dists., and the

partially finished product ('crumb') is sent to the parent factory for the final stages of manuf.

By-products.—Apart from cocoa butter, by-products of the industry are cocoa shell, a constituent of some cattle foods, and the drug, theobromine, a useful stimulant.

Constituents and Food Value.—Cocoa nib consists typically of 55–56 per cent fats, 25 per cent carbohydrates, 12 per cent proteins, and the balance of salts, iron, etc., yielding 2975 calories per lb. A good brand of plain eating chocolate is composed of 32 per cent fat, 60 per cent carbohydrates, and 5 per cent proteins (= 2500 Calories per lb.); milk chocolate made with fresh milk of 37 per cent fat, 54 per cent carbohydrates, and 9 per cent proteins (= 2600 Calories per lb.), while cocoa powder has about 28 per cent fat, 34 per cent carbohydrates, 13 per cent proteins, and 20 per cent other constituents (= 2100 Calories per lb.).

Consumption.—Pre-war consumption (estimated) in the United Kingdom of chocolate and sugar confectionery was 7.1 oz. (representing 5.3 pence) per head per week, of which 3.2 oz. (2.9 pence) was chocolate. When the United Kingdom was consuming over 70z. per week, consumption in U.S.A. was 4½ oz. When, under rationing, consumption in the United Kingdom was reduced to 3 oz., U.S.A. reached peak consumption of 6.3 oz. (1944). The total consumer value in the United Kingdom in 1939 was about £54,000,000, of which about one-third represented ingredients, one-third manufacturing costs and one-third, cost of distribution. In 1943 ingredient costs represented about half of value.

Employment.—Between 1900 and 1939 the industry was largely mechanised, output being more than doubled while employment increased by one-fifth. In 1939 82,300 (26,400 men and 55,900 women) were employed, but rationing and other disturbances of economic conditions reduced total number to 35,600 in 1943.

History.—Cocoa beans were first brought to Europe in 1494 by Columbus, but he did not realise their value. Cortez, who conquered Mexico in 1519, noted the use which the Aztecs of Mexico made of cocoa beans and he introduced chocolate as a beverage into Spain. Cortez found that the Aztecs, believing that it was a gift to man from the gods, consumed large quantities of a preparation made from the roasted and ground bean called *chocolatl*. Montezuma, the Aztec emperor, and his court were said to use fifty jars a day. It was beaten to a paste, flavoured with spices and taken cold. For a century Spain kept secret the recipe for chocolate, but France learned it and knowledge of chocolate spread thence to other countries. In 1657 a Frenchman opened a 'chocolate house' in Bishopsgate, London. During the latter half of the seventeenth century chocolate houses sprang up all over London and became resort of politicians, wits, gamblers, and literati. At one, White's in St. James's Street, a centre for reckless gambling, was founded the first club

(see CLUBS). High import duties were imposed on cocoa beans. It was not till 1853 that, by imposition of a uniform penny a pound on imported colonial and foreign beans, price was brought within reach of less well-to-do. Factory production in England was started by Fry's in 1728. When chocolate as a sweetmeat was introduced is not certainly known, but as late as 1842 a leading Eng. manufacturer listed only one 'line' of eating chocolate. Modern drinking cocoa was invented about 1823 by van Houten, the Dutch maker, who expressed part of cocoa butter, but it was not until the 1860's that it was introduced into England by Cadbury's. Hitherto cocoa had been mixed with farinaceous substances in order to counter-balance high fat content. The new process of making cocoa by creating a supply of cocoa butter enabled more palatable eating chocolate to be made. Sir Hans Sloane prepared a milk chocolate for drinking in the late eighteenth century. Peter, the Swiss maker, introduced milk chocolate for eating in 1876.

Fincke, *Handbuch der Kakaoerzeugnisse* (Berlin), 1936; H. C. J. Wynoogst, *Hints for Cocoa and Chocolate Manufacture* (Copenhagen), 1938.

Coco de Mer, so called from the fact that it was first seen floating on the Indian Ocean, is the fruit of a species of palm. The double coco-nut, as it is sometimes termed, is the largest fruit known, and takes ten years to attain maturity.

Cocomas, Cocamas, or Cucamas, aboriginal tribe of S. Amer. Indians, mainly inhabiting a dist. on the Marañon and lower Huallaga Rs. in Peru. They were first visited by Jesuit missionaries in 1681, and were then cannibals, but are now partly Christianised, and considerably more industrious and courageous than most of the natives. It is suggested by a study of their language that they are a remnant of the Tupi-Guarani stock.

Coco-nut, fruit of a species of palm (*Cocos nucifera*) found in most tropical regions, and reaching perfection in a sandy soil near the sea. It is found on even the smallest is. of the Pacific, the nuts being admirably adapted for distribution by ocean currents, and germinating readily when cast up on shore. The tree grows to a height of 60–100 ft., and consists of a cylindrical stem 1½–2 ft. thick, marked with rings where leaves have formerly grown, and terminating in a crown of from sixteen to twenty graceful pinnate

leaves each about 15 ft. long. These consist of a strong central rib, on both sides of which are numerous long thin leaflets. The flowers grow in branching spikes, 5-6 ft. long, enclosed in a spathe, and each of these produces from five to fifteen nuts. The C. as seen in England is the inner kernel, which is naturally enclosed in a thick fibrous outer husk. The inner shell contains the kernel, which in turn encloses a milky liquid. The tree begins to bear at seven or eight years of age, and continues to produce four or five crops a year for seventy or eighty years. Its uses to the natives of the regions where it grows are numberless. The nut, in various stages, is a standard article of food, and the milk forms an agreeable

case of many insects, especially of moths and silk-worms. This outer web or ball is spun from the mouth by caterpillars before passing into the chrysalis state. Originally the word was only applied to the C. spun by the silk-worm (*Bombyx*). It is now extended to all similar structures (e.g. silken case spun by spiders to receive their eggs). The pupal stage may last a long or only a short time, the covering splitting when the insect is ready to emerge.

Cocos, genus of tropical palms containing thirty species of graceful plants. The commonest of these is *C. nucifera*, the coco-nut palm, which serves a great variety of purposes in its native countries, and is well known to us on account of its edible fruit.

Cocos Islands, see KEELING.

Cocteau, Jean (b. 1891), Fr. poet, dramatist, and novelist, b. in Maisons-Laffitte, France. Has thrown himself into every new movement in the artistic world of France, drawing upon the new artists and musicians like Picasso, Erik Satie, Darius Milhaud to collaborate with him in the production of ballets like his famous *Le Boeuf sur le Toit* (1920) and *Les Mariés de la Tour Eiffel* (1921). Two of his novels, *Le Grand Écart* and *Thomas l'imposteur* (both 1923), had a considerable sale. His books of criticism, *Carte blanche*, *Le Coq et l'Arlequin*, *Le Secret professionnel*, have become the guide-books for the younger writers. His *Opium: Journal d'une désinvolture*, pub. in 1930, is presumably autobiographic. In 1940, with the pub. of *La Fin du Potomak*, he returned to an explanation of the subconscious first sought in his *Potomak* (1913).

Cocumilia, name of a kind of plum found wild in Calabria. It has the reputation of being a powerful febrifuge, and the bark is much used for the cure of intermittent fevers.

Cocytus (modern Vuvo), riv. of Epirus, trib. to the Acheron, which flows into the Ionian Sea 20 m. N. of the gulf of Arta. In Gk. mythology it was held to be one of the rivers of Hades, and the name, which means wailing, refers to the cries of the dead. Hence Milton's 'Cocytus named of lamentation loud.'

C.O.D., see CASH ON DELIVERY SYSTEM.

Cod, or *Gadus morhua*, important species of bony fish in the same genus as the haddock, whiting, and pollack. Other representatives of the family Gadidae are the hake, ling, and turbot, but the cod surpasses all these in economic importance; as a food it is much valued, and cod-liver oil is of great repute in medicine. The distinguishing features of the C. are the large mouth, of which the upper jaw is the greater. The distinct tail, elongated dorsal and anal fins, the wide gill-opening, the four gills with a slit behind the fourth, the free-lom of the gill membrane from the isthmus, the absence of pseudo-branchiae, and the presence of an air-bladder. The body is generally of a dark grey hue, is elongated in form, and covered with small, soft scales, while a small barbel depends from the chin. It

drink. The root is sometimes chewed as a narcotic; the young terminal bud, palm cabbage, is a delicious vegetable; the sap, in various stages of fermentation, forms toddy, palm wine, and arrack, and is boiled down to form a sugar known as jaggery. The leaves serve as thatch, and are plaited for mats and baskets; the trunk supplies a valuable timber known as porcupine wood; and the coir, or outer husk, is made into ropes, cordage, etc. The kernel also contains 70 per cent of a fixed oil, which is obtained by pressure or boiling from the dried and broken nuts. It is largely used in the manuf. of candles and marine soap, and is also used as a substitute for lamp-oil, lard, and cod-liver oil for various purposes.

Coco-nut Beetle, or *Batocera rubus*, species of Cerambycidae found in the E. The larvae do much damage by eating the young coco-nut trees, and are themselves eaten by the natives.

Coco-nut Oil, or Coco-nut Butter. The oil is obtained from the fruit of the palm-tree, nearly three-quarters of the kernel being composed of it. It is a solid white buttery substance, and when made into soap it lathers well in sea-water. It is used in cooking in the tropics, and is also manufactured into candles and ointment. A large amount is exported from Ceylon.

Cocoon (from Lat. *concha*, shell), pupa-

inhabits the deeper parts of the sea, and at the bottom betrays its carnivorous instincts, its food consisting of such animals as crabs, molluscs, worms, herrings, and a few members of its own family. It is the largest of the Gadidae, attaining a length of 4-5 ft. and weighing as much as 100 lb. The C. is found in the temperate regions of the N. hemisphere, along the N. European coasts, not farther S. than Gibraltar, and on the Amer. coast, the fisheries off Newfoundland being especially famous. Other C. fisheries are those of the Lofoten Isles off the N. coast of Asia. It spawns in the early part of the year between Feb. and April, and is very prolific, one fish producing as many as eight or nine million eggs. Of these, however, very few are ever fertilised, and the young C. are quite small, being less than an inch long when first produced. C. fishing was an important industry five or six centuries ago, and was carried on by people of various nationalities, among them Fr. and Eng., on the shores of N. Europe and Iceland. The largest C. fisheries in the world at the present day are those of the Grand Banks of Newfoundland (about 500 fish being caught in eleven hours), while in Europe the industry is at its height on the coast of Norway, though these fisheries are not so rich as they were. The C. are caught principally by lines and bait, long lines and hand lines both being employed. A large quantity of the C. caught off Newfoundland is dried and salted, and is then exported—a considerable amount—to the countries of S. Europe. In addition to this the fish furnishes other useful products, isinglass being obtained from the air-bladder, and cod-liver oil, as mentioned above, from the liver, this oil being used largely as a medicine for lung complaints. In some parts the heads of the fish are used as a food for cattle, and the roe alone is used for human food.

Cod, Cape, *see* CAPE COD.

Coda (Lat. *cauda*, a tail, through It.), in music, a term applied to a passage concluding a composition or one movement of it. It was originally only a few simple chords, but it has been developed, notably by Beethoven, into an important and elaborate feature of a composition.

Code. This word is now most commonly used to denote a collection of laws. There are sev. kinds of Cs. A C. may be made by merely collecting and arranging in a chronological or systematic order the existing laws of a state. Such a collection is either promulgated by public authority, as was the case with the Theodosian C. and Justinian's Cs., or by private individuals, as the Gregorian and Hermogenian C. Different Cs. have been made with different objects. Theodosius's motive was to promote the study of law, and with that end in view he pub. a collection of the constitutions (decisions) of the emperors from the time of Constantine. It was modelled on the earlier and private collections compiled by the jurists, Gregorianus and Hermogenianus. Justinian's first C. (A.D. 529) was founded on that of Theodosius, while

the second was a revision of the first with the addition of a book of fifty decisions (A.D. 534). A considerable number of Cs. sprang from Rom. law, e.g. the Romano-Barbarian Cs.—Edictum Theodorici, the Breviarium Alaricanum (q.v.), and the Lex Burgundionum (Fr. Loi Gombette). The influence of the breviary of Alaric, according to Prof. Muirhead, was so great in Europe that until the twelfth century it was from it rather than from the Justinian collections that W. Europe acquired such knowledge as it had of Rom. law. A C. by which the legislative power makes a new system of laws—so far as that is possible—is very different from a mere compilation of existing laws. Of this latter kind are the C. Napoléon (q.v.) (1804-10) and the Germanic civil C. (1900). The C. Napoléon, however, was based largely on the civil or Rom. law, and the Prussian C. borrowed its technical language from the Rom. law. Austin says the Fr. C. was never expected by its compilers to supersede all other law, but was meant to be supplemented or ckeed out by anct. customs and general principles of law and equity. With all its faults, and in spite of the fact that its original *projet* was drawn up in four months, its remarkable precision has caused it to be adopted as a model by sev. other European states. There is another but cognate sense in which C. is used to denote bodies of law credited with a divine origin, e.g. the Mosal dispensation of the Pentateuch, and the Islamic law of the Koran. But a C., though it may adopt many existing laws or rules of law, is now generally used to express a comprehensive body of law suited for all the purposes of the community for which it is intended; and it may contain new principles and new rules of law.

Codeia, or Codeine ($C_{17}H_{19}ON(OCH_3)$), (OH), alkaloid forming 0.3 per cent of opium. It is identical with *methylmorphine*, and resembles morphine in its hypnotic effects. It is obtained, in orthorhombic colourless crystals, with one molecule of water of crystallisation. It is insoluble in alkalis, but dissolves readily in alcohol, ether, and chloroform. In medicine C. is used as a soporific, but, like morphine, it must be employed with caution and only under the supervision of a medical man. It is used to allay the irritation causing cough when a paroxysm is likely to prove dangerous, and has been employed to this end in whooping cough. It is useful also in *diabetes mellitus* where it tends to prevent the excretion of sugar.

Code Napoléon, or the Civil Code of Fr. law. The term C. N. was suppressed in 1814, but re-established in 1852 out of respect for Napoleon's memory. Since 1870 the name Code Civil has come into general use. Before the Revolution there existed no unified system of laws, and France was divided between the *droit coutumier* in the N. and the *droit écrit* in the S., based on Rom. law. Under the Fr. constitutions of 1791 and 1793 it was promised to codify the laws, but it was not until Napoleon became First Consul

that five commissions were set up in 1800-1802 to codify the laws under five heads, of which the first is the Code Civil or C. N. Three jurists—Tronchet, Portails, and Bigot—were entrusted with the task of drafting the code, and, being from the N. they drew largely upon the *droit coutumier*, but some sections of Rom. law were incorporated. The first fourteen laws were passed by the Assemblies in 1803 and the remaining twenty-two in 1804. The third and authoritative ed. of the C. N., still in force, appeared in 1816. Napoleon is said to have been prouder of the C. N. than of his many victories. The code is clearly expressed in a straightforward style and is well arranged. It is divided into three books preceded by a preface. Book I. (articles 7-515) is concerned with persons, and is subdivided into eleven sections, which deal with the distinctions between Frenchmen and foreigners, with civil domicile and with absence, with marriage and divorce, with paternity, adoption, and paternal authority, and with minority and majority. Book II. (articles 516-710) is divided into four sections, concerned with classification of property, with ownership, usufruct, and easements. Book III. (articles 711-2281) details the different ways ownership may be acquired. It has twenty sections, which come under seven main heads: successions; gifts *inter vivos* and wills; the theory of contracts or obligations; the marriage contract; other contracts (sale, hire, loan, bail, etc.); priorities and mortgages; and prescriptions. The C. N. has been trans. into Eng. by E. Blackwood Wright and others. See CODIFICATION.

Codex Argenteus, see ARGENTEUS.

Codex Bezae, see BEZA, THEODORE.

Codex Sinaiticus, see SINAITICUS, CODEX.

Codex Vercellensis, see VERCELLI BOOK.

Codiell, writing by way of supplement to a will, and which is to be considered as part of it, whether for the purpose of explaining, altering, or adding to the provisions of the will. In the Rom. law Cs. were small tablets on which memoranda or letters were written, giving directions to the heir, especially in regard to creating *fidei commissum* or trusts. By the Rom. law a testator could not alter his will unless he made an entirely new will. Hence the utility of Cs., which in Rom. law could be made whether there were a will or not. Such C. differed from the Eng. C., therefore, in that it did not mean a supplement to a will, but obligatory directions by tablets. Where a Rom. C. was confirmed by testament, it was operative to give legacies as well as to create *fidei commissum*. Rom. Cs. had to be made in the presence of five witnesses. In Eng. law a will when once signed and attested cannot be altered without being re-executed except by a C. The execution of a C. operates as the re-execution of the will, and hence a C., duly executed as a will, will render a will which was not duly executed valid, provided the C. clearly refers to the will. Where a will is revoked by actual destruction, no C. can revive it. A C. forms part of the will,

and is incorporated with it in the probate. If in any way inconsistent with the will, the C. prevails. A C. must be executed with the formalities of a will, that is, signed in the presence of two witnesses. See WILL.

Codification means the process of classifying laws or reducing them to a system or digest. Such process marks the matured stage in the development of any legal system. In its modern connotation C. is a word importing no change in the substance of law, but rather a process of addition and subtraction effecting such a change in form as will render law more intelligible and coherent, and less redundant and prolix. Law is essentially progressive. The assumption that it is static leads inevitably to supplementing the code by constant additions that finally deprive the code of all pretensions to finality. For example, Justinian not only expressly reserved in his code the right to make any legislative reforms he might see fit, but, in fact, within the space of thirty years added 163 *novellæ* or new laws. The element of truth in the above popular definitions of C. is that undoubtedly the law as codified is up to that point complete and exclusive. The most conspicuous modern instances of C. are: (1) The Code Napoléon (Code Civil) of 1804-7: a code which has been much animadverted on as the product of ill-considered haste and fallacious brevity. Following it were the Code de Commerce, Code Pénal, Code d'Instruction Criminelle, and various procedural codes. (2) The Code Frédéric of 1751, aimed apparently at the power of the advocates and intended to make law knowable to all. It purported to explain the Rom. law, Saxon law, and other foreign subsidiary laws and statutes, but left unimpaired the prov. laws of the Germanic states, which last fact is usually explained by reference to the want of homogeneity between the various states themselves. The avowed object of the above codes was to frame a common system in place of sev. systems, rather than to restate in exact and exhaustive form the whole of the existing laws. Eng. law reformers have generally been satisfied with the solution of this last and less ambitious problem (see CODE AND CONSOLIDATION OF STATUTES). (3) The code of the state of New York. This came nearer the desired Eng. solution of the problem of an exhaustive restatement. But it affected to provide 'for every possible case, so that when a new case arises it is better that it should be provided for by new legislation.' As regards the Brit. Empire, India seems to have been the *corpus vile* for codificatory experiments. The Indian Evidence Act of Stephen (see EVIDENCE) and the Penal Code drafted by Macaulay seem to have worked well, but they certainly would not suit Eng. exigencies and were rightly rejected here. Those latter codes are characterised by a profusion of illustrations by way of graphically presenting the principles in more concrete form. The extent to which England itself has gone

in the direction of codes will be seen in reference to the article on CONSOLIDATION OF STATUTES. The arguments for and against C. are legion. Austin appears to have been the first Eng. jurist to state in clear terms the desirability of C., with refutations of the current objections. The current objections and his answers may be summarised as follows: (1) That a code cannot be complete so as to anticipate all conceivable cases. Austin denied that such a desideratum was the object of C. at all, for the mere assumption of its possibility was tantamount to a supposition that the existing morality was incapable of amelioration, and to the erroneous belief that the enactment of one Parliament can bind all future Parliaments. (2) That a code would give rise to conflicting analogies to the number of its provisions, and that these latter would be so numerous as to be unknowable. Austin answers this by pointing out that the incompleteness of statute law or any law is not obviated by making no law at all. It is clear, too, that all legal principles, or any principles for that matter, give rise to competing analogies. The choice between them is essentially the function of a judge. (3) Austin then speaks of the alleged failure of the Fr. and Prussian codes. He answers this by pointing out that they were not fair examples of what they might have been had less haste been shown in producing them. Like the Rom. Code, however, there was a lack of scientific precision in the Code Napoléon and it is marked by the same curious juxtaposition of principles, maxims, and philosophical speculation. None the less it is the basis of the systems of most of the Lat. races. Austin was for C. himself, and thought it was entirely a question of time and place. But a set-back was given to the cause of C. by the somewhat extraordinary ideals of Bentham. Bentham's age was essentially one of ideals. The contrast between his Utopian schemes and the chicanery of his times was too great to admit of the comprehension of the possibility of such reforms as he advocated; whence the tardiness which has attended their development. Bentham sets up the beau idéal of possible codes. The desire for C. in England is not prompted by the same reasons as have existed in other countries. The Ger. Code was the expression of a desire for national unity; the Fr., the manifestation of hatred for the old order of things. In England the desire is the merely practical if prosaic one of rendering law more accessible and coherent instead of being diffused over a vast mass of reports, text-books more or less accepted as authorities, statutes, and vaguely defined usages.

Codigoro, tn. of Emilia, Italy, on the Po di Volano, 23 m. E. of Ferrara, 8 m. from the Adriatic. Since the draining of the extensive marshes it has become a thriving agric. dist. Pop. 14,800.

Cod-liver Oil, marine oil extracted from the liver of the cod-fish (*Gadus morrhua*). It is sometimes, however, adulterated

with oil from the ling or turbot, but the latter are not officially recognised. The chief exporting countries are Norway and Newfoundland, the former utilising fish from the North Sea and the latter those of the Newfoundland banks. The processes of manuf. have improved greatly of recent years, and, in place of the old coloured and disagreeable fluid the best medicinal varieties are almost colourless and tasteless. Healthy and fresh cod livers are taken and placed in barrels and the exuding oil ladled out. Gentle heating brings out more oil. These products, however, are not equal in value to that obtained in the next process, which consists in leaving the livers in rooms with freezing mixtures, when the oil which remains unfrozen is taken off and constitutes the best variety of oil. A coarse variety is next obtained by boiling down the remains of the livers. It is of dark brown colour and is used for treating leather. In the operation of stuffing, dubbin (a mixture of tallow and C. O.) is rubbed into the leather to make it waterproof and supple. C. O. has a great value as a food, and consequently has great vogue in wasting diseases such as consumption. It is the best fat food except cream, and is easily digested, especially when in the form of an emulsion—that is, in small globules. This is probably due to the existence of free oleic acid to the extent of about 5 per cent, which is a good emulsive agent. There are also olein (80 per cent) and palmitin and stearin, which are valuable glycerides. Owing to the repulsive nature of the oil to some stomachs, the doses should begin in small quantities of a teaspoonful and gradually increase to a tablespoonful.

Codogno, tn. of Milan prov., Lombardy, Italy, between the Po and the Adda, 8 m. N. of Piacenza. It manufs. silks and the cheese known as Parmesan. Pop. 12,000.

Codoripo, tn. of Venetia, Italy. Pop. 8000.

Codrus, son of Melanthus, and the last king of Athens. He lived about the eleventh century B.C. When the Dorians had invaded Attica he is supposed to have acted on the advice of the oracle, and to have given his life for his country.

Codrington, Christopher (1668-1710), Eng. soldier, commonly called **Codrington** of All Souls, son of Christopher C., a captain-general of the Leeward Is., and grandson of the first Christopher C., who lies buried in the par. of St. John, Barbados, with which is the C. family was closely associated. C. of All Souls was b. in St. John, Barbados, son of an immensely wealthy father whose fortune had in fact been made in the W. Indies and whose spacious stone ancestral home in the Cotswolds still stands. In contrast to his father's turbulent life in camps and hard living amongst planters, C. grew to young manhood among the élite of Oxford scholars and the literary stars of London and Paris. He was the close friend of Addison, John Boyle, earl of Orrery, Atterbury, James Garth, Anthony

Wood, and many others. Educated at an Enfield school and at Christ Church, Oxford. Elected to All Souls as a probationer fellow (1690), where already he showed his bibliophile taste by collecting valuable books. While still retaining his fellowship he followed King William to Flanders (1694) and, fighting with distinction at Huy and Namur, was made captain of the 1st regiment of foot guards by the king. Though C. gained the reputation of a wit and scholar it is as a W. India governor and captain-general that he is remembered. It was in 1699 that the king made him captain-general and commander-in-chief of the Leeward Is. in succession to his father. After war broke out with France and Spain C. led an expedition against Guadeloupe, but notwithstanding his skill and personal gallantry the attack, owing to the fact that the navy would not co-operate, ended in disaster, much in the same way that his father's expedition against the Fr. failed. C. then resigned his governorship and spent his few remaining years in seclusion and the study of philosophy and Church hist. at his estab. in Barbados. By his will he left a large legacy in cash and books to All Souls College, a legacy which was enough to build and endow a large library, in the middle of which may be seen his statue by Sir Henry Cheere. He left his Barbadian estates to the Society for Propagation of the Gospel for the foundation of a college in Barbados 'on monastic lines'; this, C. College, is the oldest college in the W. Indies and is affiliated to Durham Univ.; but C.'s monastic idiosyncrasies were rightly ignored by the legates. Buried in All Souls Chapel. See V. T. Harlow, *Christopher Codrington, 1688-1710*, 1928.

Codrington, Sir Edward (1770-1851), Brit. admiral, b. at Dodington in Gloucestershire, and entered the navy in 1793. At Trafalgar (1805) he commanded the *Orion*, and subsequently took part in the Walcheren expedition. Rear-admiral in 1814, he led the fleet at Washington and Baltimore in the Amer. war. In 1826 he commanded the combined fleets of Great Britain, France, and Russia at the battle of Navarino, in which he destroyed the Turkish navy, but was held to have exceeded orders and recalled. He became admiral of the red in 1837, and in 1839 was appointed commander-in-chief at Portsmouth.

Codrington, Sir William John (1804-1884) Brit. general, second son of Sir Edward C. (q.v.). During the Crimean war he distinguished himself at Alma and Inkerman, and was in 1855 raised to the rank of commander-in-chief in the Crimea. Afterwards became governor of Malta (1859-65).

Cody, Samuel Franklin (1862-1913) ('Colonel Cody'), aviator and inventor of a triplane, was b. at Birdville, Texas. His aviation began in England in 1908; he competed at various meetings, including Doncaster and Bournemouth. Won War Office prize, 1912. He was killed in an aeroplane crash near Aldershot, Aug. 7.

Cody, William Frederick (1845-1917),

famous all over the world as Buffalo Bill, and one of the last of the picturesque figures of the far W. in the U.S.A. before it became a settled agric. country, *b. Scott co., Iowa, U.S.A., Feb. 26*. In the days before the great transcontinental railways were built across the prairies and through the mts. to the Pacific coast, C. became noted in the sixties as one of the chief riders for the famous Pony Express. This was organised by a company which undertook to forward the U.S.A. mails from St. Joseph, Missouri, to Sacramento, California, by means of intrepid men who rode relays of ponies through country often dangerous because of hostile Indians. Upon the outbreak of the Civil war, C. became one of the most skilful scouts and guides for the N. troops operating in the middle W. Upon the close of the war, when Congress gave huge land grants to companies undertaking to construct railway lines to the Pacific coast, C. obtained the contract to supply the railway workmen, who were laying the lines, with fresh supplies of buffalo meat. The buffalo, or more correctly the bison, then roamed the prairie lands in thousands. It is recorded that C. killed 4820 bison in eighteen months. Ever afterwards he was known as Buffalo Bill. After that, he again served his country in the wars against various Indian tribes. Then looking around for fresh worlds to conquer, Col. C. recalled that the youth of two continents had been fascinated by tales regarding the Indians, the cowboys, and the trials of settlers who were attacked by the red men. He gathered together a band of cowboys, who were expert riders and lasso-throwers, and also secured a large number of Indians of various tribes through arrangements with the U.S. Gov. This was the beginning of his famous travelling entertainment Buffalo Bill's Wild West Show. It was an enormous success in the E. states of the U.S.A. Col. C. then took the huge organisation to England and to the leading countries of Europe, and repeated his success, the show being different to anything ever being offered in the Old World. C. d. in Denver, Colorado, Jan. 10, 1917.

Coedfrano, tn. of Glamorganshire, Wales, on Neath Canal, 1 m. N. of Neath. It has copper mines. Pop. 9327.

Co-education, education of the two sexes together in school or college. The term mixed education should be used to describe schools where boys and girls are taught under the same roof, and occasionally together, purely from motives of convenience, and C. reserved for those schools which offer a genuinely shared upbringing, as far as may be, both in and out of the classroom, from a belief in its value as a training in mutual understanding and help, and as a basis for a right adult relationship between the sexes. This latter method has been practised only rarely in the hist. of European education; though it had the strong support of Plato, it finds little or no mention in the pages of the classical educationists, Quintilian, Elyot, Ascham, Milton,

Locke, Rousseau, Pestalozzi, Herbart, Froebel, and Spencer. Yet, historically speaking, segregated education may be held to be an accident: most schools were founded at a time when education was thought unnecessary or even improper for girls. C. was very rare in the ant. world; the spread of Christianity fostered it, and the pioneer court schools of Charlemagne (A.D. 782) and Alfred the Great (c. A.D. 900) were co-educational, as was the famous Renaissance school of Vittorino da Feltre at Mantua (1423). The 'new' humane education of the nineteenth century, deriving largely from the theories of such writers as Luther, Rabalais, Malcaster, Rousseau, Pestalozzi, and Froebel, and protesting against narrowness of curriculum and brutality of treatment, was theoretically favourable to C., but its development (dating in England from the sixties) has been very gradual. Bedales, founded by J. H. Badley in 1893, was the earliest whole-hearted co-educational boarding school. Statistics of co-educational practice in different countries are apt to be misleading, since much of it is only mixed; broadly speaking, it is strongest where the prevailing religious obedience is Protestant or the form of gov. democratic (e.g. all the Scandinavian countries, the U.S.A. and—an interesting exception—Portugal), weakest in Catholic or authoritarian countries (e.g. Eire, Spain, France, the U.S.S.R.). In England, the proportion of mixed state secondary schools (mixed primary education is everywhere normal) is 27 per cent, and of recognised private secondary schools 27 per cent also; but almost all the numerous unrecognised private schools are segregational. All branches of univ. education now practise C. in a greater or lesser degree, as did the first univ., Plato's Academy; but women are still generally admitted in severely restricted numbers. See C. Grant and U. Hodgson, *The Case for Co-education*, 1913; A. Woods, *Advance in Co-education*, 1919; J. H. Badley, *Bedales, a Pioneer School*, 1923; B. A. Howard, *The Mixed School*, 1928; L. B. Pekin, *Co-education*, 1939.

Coefficient, in algebra, denotes the numerical quantity preceding an algebraic term and by which the term is to be multiplied. It is also used to denote the ratio of the increase or decrease of any quantity with a change in a variable quantity which determines its condition. Thus the linear C. of expansion of any material with temp. denotes the increase in length per unit length for one degree rise in temp. We may also regard it as the quantity by which the length of the material must be multiplied to give its expansion for one degree rise of temp. Similar Cs. are the C. of pressure, viscosity, volume, etc. Of course the value of a C. will depend on the unit employed in the independent variable.

Coshoorn, small bronze mortar invented by Menno van C., the engineer, and named after him.

Coshoorn, or Coshoorn, Menno, Baron van (1641-1704), Dutch engineer. He

inherited from his father a taste for military learning. During the Seven Years war, his bravery at Maestricht and Seneffe, and the works of defence which he had constructed made him famous. In 1673, at the siege of Grave, he used a mortar of his own invention. After peace had been declared in 1678 C. devoted his time to engineering work, and fortified many tns. in Holland. When war began again he was to the front, as before, and met Vauban at the siege of Namur, where he had to surrender—but he was present at its recapture, and later on was made lieutenant-general. He commanded a corps in Marlborough's army, 1701-3. D. suddenly of apoplexy. For a description and critical appraisal of his engineering theories, see Marini, *Biblioteca di Fortificazione* (1810) and Honomer, *Essai général de Fortification* (1814).

Coelacanthus (Gk. *koilos*, hollow, and *akantha*, a thorn or prickly). A genus of fishes believed, until 1939, to have been extinct for millions of years. In that year a 5-ft. specimen was caught off the coast of S. Africa by a trawler fishing in 40 fathoms near East London, Cape Province. This specimen was described as being a brilliant steel-blue colour, with large dark-blue eyes. It weighed 127 lb. and was found to be unusually oily. The so-called fossil genus of C. was founded by Agassiz and is the typical one of the family Coelacanthidae or Coelacanthini (in Huxley's classification of the Crossopterygidae raised to the position of a sub order) and occurs in the Carboniferous formation and in the Magnesian Limestone (Trias) of the N. of England.

Cœlenterata (Gk. *κοίλος*, hollow; *έντερον*, alimentary canal), name of a large phylum of invertebrate animals, differing greatly in both structure and habit. All are aquatic, and the great majority are marine. The name was given to them because of the peculiarity of the animals in having their enteric and body cavities closely related and not distinct from one another. A very general feature is the presence of stinging-cells, and nearly all the cœlenterates are radially symmetrical. The nervous and vascular systems are absent or rudimentary, and the body-wall consists of an inner and outer layer of cells, called respectively the endoderm and ectoderm. Reproduction is often sexual, but vegetative multiplication by budding and fission is also common. Both medusoid and polypoid types occur in the C., and in the latter a limy skeleton is frequently developed, and thus forms a coral. The group is divided into three classes, the Hydrozoa, Scyphozoa, and Anthozoa (or Actinozoa). The first class is represented by many well-known animals, e.g. the fresh-water *Hydra* (q.v.), sev. corals and small jelly-fishes, and the Portuguese man-of-war. The second contains the large jelly-fishes often cast up on Brit. shores or found floating in the water, and dreaded by bathers on account of their stinging powers. The third class includes the sea anemones, dead men's fingers, and other corals. The Ctenophora, e.g. *Beroë* and

Cydippe, are regarded by many zoologists as a div. of the cœlenterates, while others regard them as belonging to a separate phylum. The species are very widely distributed, some are free-swimming, others are sessile, and a few are parasitic. Small organisms constitute the greater part of their diet, and in obtaining their food the stinging organs are frequently called into action.

Cœlestinus, see CELESTINE.

Coele-Syria (modern El Buká'a Beka'a, or Bika), valley of Syria, between the ranges of Lebanon and Anti-Lebanon. Altitude 2600-3000 ft.; length about 100 m. Through it flow parts of the Nahr-el-Litany (anct. Leontes) and the Nahr-el-Asi (anct. Orontes). Called Hamath in the O.T.

Coelho, Francisco Adolpho (1847-1921), Portuguese philologist, noted for his profound studies of the Romance languages. Like the brothers Grimm, the celebrated Ger. philologists, he has also pub. a collection of fairy tales, *Contos Populares Portuguezes* (1879). Philological works: *Origem da Lingua Portuguesa* (1870); *Questões da Lingua Portuguesa* (1874); *Os Dialectos Romanicos na Africa, Asia, e America* (1880-82).

Cœlius, or Cœlius, Antipater, Lucius, lived in the second century B.C., and was a Rom. lawyer and historian. He was the first who introduced an ornamental style into his writings, which were highly rhetorical. He wrote the hist. of the second Punic war, and the historian Livy has quoted from his works.

Coello, Claudio (c. 1630-93), Sp. painter, b. at Madrid, who became painter to King Charles II. His masterpiece was 'Charles on his Knees among the Nobles of his Court' (the altarpiece for the sacristy in the Escorial representing the 'Transfer of the Eucharist'). When Luca Giordano was given a commission by the king, C. fell into a melancholy state, imagining that his brother artist was preferred. He was a great painter, and some of his best works are at Madrid and Salamanca.

Coeln (Köln), Wilhelm von, Ger. painter of the fourteenth century. His chief works were mural paintings, the most important being in a chapel of Cologne Cathedral. There are also various other works in different picture galleries which are said to be his.

Cœlogenys, or Paca, S. Amer. genus of rodent mammals in the family to which the agoutis belong. There are only two species; these differ from the agoutis in having five digits on all the limbs in opposition to the three digits of their allies. The animals are remarkable for a curious structural peculiarity in the skull, the jugal arch being greatly developed and almost concealing the lower jaw. *C. para*, the spotted cavy, is one of the largest of rodents, measuring about 2 ft. in length, 14 in. in height; the body is covered with short, stiff wiry hairs, and the tail is greatly reduced. It is nocturnal and vegetarian, lives in a superficial burrow in forests near water, the female produces a single young one at a birth, and the flesh is much sought after as food.

Cœlomata (Gk. κοίλωμα, cavity), wide term, comprising all animals which possess a cœlom, or body cavity, and it thus excludes only a few lower organisms, viz. the Protozoa, Porifera, Cœlenterata, and doubtfully the Platyhelminthes, Nemertea, Nematelminthes, and Potifera. The cœlom is a part of the enteric cavity which has retained its connection with the enteron, but has lost connection with the part that constitutes the alimentary canal. It performs the functions of producing the reproductive cells and secreting the nitrogenous waste.

Cœlostet, instrument for reflecting the light of a heavenly body in a constant direction despite the rotation of the earth on its axis. It is a mirror, mounted and adjusted on an axis which points to the pole. It revolves at half the apparent diurnal motion of the stars, so that the image of the sky reflected in it shows the stars at rest.

Cœmptio (joint-purchase), in Rom. law, a form of civil marriage, so called from the mutual fictitious sale of the two parties. The ceremony took place before five witnesses and a *libripens* (holder of the balance).

Cœnobites, or Cenobites (Lat. *cœnobita*; Gk. κοινός, common, *bios*, life), members of a religious order living a community life as opposed to hermits. See MONASTICISM.

Cœnurus, now known to be merely the asexual stage in the life-hist. of certain Cestoda, or tapeworms, was formerly considered to be a distinct animal. This bladder-worm lives in an intermediate host which is eaten by a vertebrate before the parasite matures. *C. cerebralis* is the bladder-worm which is found in the brain of a sheep and gives rise to staggers, a disease which often works great havoc among a flock. *Tænia cœnurus* occurs in the dog.

Cœrullgnone, see CEDRINET.

Coesfeld, tn. of Westphalia, Germany, 19 m. W. of Münster, with a textile industry. The greater part of the tn. was completely destroyed in the Second World War. Pop. 12,000.

Coethen, see CÖTHEN.

Cœur, Jacques (c. 1395-1456), Fr. merchant and financier, b. at Bourges. A celebrated trader of the reign of Charles VII., who inaugurated an extensive trade between France and the Levant. He was made the king's master of the mint, and from 1436 was in charge of the Fr. royal finances, advancing large sums to the king for carrying on his wars. C. amassed a huge fortune. Founded colleges in Paris, Montpellier, and Bourges, and controlled the trade of the whole country. At the height of his fortunes his enemies prevailed on the needy king to desert him and his fall was as swift as his rise. The king seized the opportunity afforded by the sudden death of Agnes Sorel, the king's mistress, to accuse C., who had been appointed one of her executors, of having poisoned her. This and other allegations were without foundation but C. was condemned to confiscation of his whole fortune. In 1455 he succeeded in escaping to Rome, but some say he was

exiled there. According to some accounts Calixtus III. put him in command of a fleet of galleys for the relief of Rhodes but C. was taken ill at Chios and d. there. See P. Clement, *Jacques Coeur et Charles Sept*, 1858, Vallet de Vireville, *Charles Sept et son Epoque*, 1862-5 and Michelet's *Histoire de France*.

Coffee, and **Coffee Trade** (Turkish *kahreh*, from Arabic *qahwah*, wine, the coffee-beverage), beverage made from the roasted seeds of the C.-tree (*Coffea arabica* being the best known of some twenty species of *Coffea*, few possessing such commercial value). Originally a native of Abyssinia and Arabia, this tree has been introduced to very many parts of America, Central Africa, and is now

COFFEE

extensively cultivated in a belt about 25° N. and S. of the Equator. The *Coffea* (*Coffea*) genus belongs to the order Cinchonaceae. When wild, the tree is tall and slender with few branches, but the cultivated kind is pruned to a height not exceeding 6-10 ft., and trained in a pyramidal form with horizontal branches. The leaves are evergreen and shiny. They grow opposite, are leathery, and oblong in shape; the flowers are snow-white and small, clustered in the axils of the leaves, and very sweet-smelling. The ripe fruit is a dark scarlet colour, and contains two cells, each with a single seed. These seeds, called also C.-beans (from Arabic *bunn*, C.), C.-nibs, or C.-berries, are hard semi-ellipses. The *Coffea mauritiana* has bitter, slightly emetic seeds. The Liberian C.-plant of W. Africa seems more hardy than *C. arabica*, and better able to withstand the ravages of the leaf-disease which proves so injurious to C. plantations. It flourishes in well-drained, sandy, or gravel soils, and on highlands, 1000-3000 ft. above sea level. In Peru and Ecuador it is cultivated at a height of 6000 ft., but escapes frosts. C. plantations are usually laid out in quadrangles, one-year-old trees, 12-16 in. high, being set in rows. They are pruned

to the same height, the ground being kept clear of weeds. Shade is needed, especially at first, and always in hot, dry climates, when irrigation is also necessary. The water supply should be lessened as the fruit ripens. Normally the first crop is yielded in the third year (amounting to as much as 2 lb. of seeds), and the trees live forty years. In the W. Indies and Brazil three ann. gatherings are made. The beans are put on mats, dried by the sun, and often turned. They are passed between rollers to remove the dried pulp, freed from impurities, and put in bags for export. A wet method is also used extensively for *C. arabica*. The quality and price depend largely on the care expended in the process of preparation. Used in Ethiopia from the earliest times, C. was introduced into Arabia by the fourth century, soon spreading to the rest of the E. Ranwolf made it known to Europeans by an account of his travels, printed 1573. The plant was taken from Mocha to Batavia by Wieser, burgomaster of Amsterdam, in the seventeenth century, and thence spread to Martinique (1720, from France), and has flourished in the W. Indies ever since. The chief different kinds of commerce are Mocha (from Arabia, with yellow-brown beans), Java (with large yellow beans), Jamaica and E. Indian (with large blue-green beans), Surinam (which has the largest beans), and Bourbon (with pale yellowish-white beans). There are numerous ways of preparing C. for the table, the W. idea being to get the liquid free from all sediment by means of strainers of different kinds. The Turks drink their C. thick.

A number of cheaper substitutes are frequently used instead of C., or mixed with the ground berries, notably chicory root, dandelion root, cereal, carrot, yellow iris seeds, etc. The seeds of *Astragalus histicus* are known on the Continent as Swedish C. All these lack the chief constituent, caffeine, and are much inferior (see ADULTERATION). Real C. is very refreshing, stimulating the system and diminishing the waste of tissues (see TEA). It is an antidote to opium or alcohol poisoning. Its four chief constituents are caffeine, volatile oil, caffeotannic and caffeic acids. The C. T. is very important, Brazil being by far the chief producer; some four-fifths of the world's ann. crop is produced in that country. C. is also largely exported from Mexico, Central America, Java, Sumatra, India, Ceylon, Arabia, Hawaii, and the W. Indies. A great deal of the C. consumed in Britain comes from E. Africa. Receipts from the customs on C. and cocoa are somewhat fluctuating, but show a marked decrease since 1927, the largest return being roughly £908,000. The consumption of C. per head in Great Britain and N. Ireland was 0.76 lb. in 1936, but had trebled by 1949. *Bibliography.* See G. C. W. Lock, *Coffee: its Culture and Commerce in all Countries*, 1888; W. H. Ukers, *All about Coffee*, 1922; J. H. McDonald, *Coffee Growing: with Special Reference to East Africa*,

1930; E. Windle, *Modern Coffee Planting*, 1933; H. Jacob, *The Saga of Coffee: The Biography of the Economic Product*, 1935.

Coffee-houses, first known in Cairo, were estab. in Constantinople during the latter part of the sixteenth century, and are referred to in the writings of Burton (1821) and Bacon (1827). In the second half of the seventeenth century they were estab. in many European cities: Marseilles (1671), Hamburg (1679), Vienna (1683), Nuremberg (1686), Augsburg (1713). The first Eng. coffee-house was opened in Oxford in 1650 by a Jew named Jacobs, while the first London one dates from 1652, and was opened in St. Michael's Alley, Cornhill, by a Ragusan, Pasqua Rosee. They very speedily became extraordinarily popular and were much frequented. In 1675 Charles II. attempted to suppress them as being the place of resort of the politically discontented. They served to a great extent as clubs. Among the most famous were Garraway's and Jonathan's, both in Change Alley, the former the scene of many a rash speculation during the time of the S. Sea Bubble, the latter, according to the *Tatler*, 'the general mart of stock-jobbers, Lloyd's; the Jerusalem, which also served as a news-room; Don Saltero's, with its attached museum of curiosities; Wills's, which Dryden visited; the St. James's, where the members of the Whig party met and Goldsmith originated his *Relaxation*; Button's, the favourite resort of Addison and Pope; and Tom's, in Birchin Lane, Cornhill, which Garrick frequented. At the present time cafés are merely eating-houses without licence for sale of intoxicants, and exist throughout the Brit. Isles. In France the *café chantant* is merely a kind of informal music-hall.

Coffer, see CHEST.

Cofferdam, structure used by an engineer in the building of bridges, piers, and any other such erection whose foundations are under water. The purpose of the C. is to keep these foundations watertight, and it is made, as a rule, of two rows of piles, the distance between them being variable, sometimes 6 ft. and sometimes less. This distance is filled in with clay puddle, which thus resists the force of the water and ensures that the part protected is water-tight. If there is very little pressure of water and no current, a very simple form of C. may be used. This is made entirely of clay; but the piles are more generally used, as they effectually prevent the force of the water from driving in the walls. If a permeable soil overlies a hard rock, the former should be dredged so that there may be no leakage in the foundation. See D. H. Lee, *Sheet Piling, Cofferdams, and Caissons*, 1945.

Coffey's Still, apparatus for separating substances of different degrees of volatility from a liquid mixture. Different varieties of the C. S. are used in the spirit, ammonia, and coal-tar industries. In whisky distilleries the still consists of one or two vertical columns separated into chambers by perforated copper plates.

Steam is introduced at the base of one column and passes upwards through the perforations in the copper plates. The wash, or dilute alcohol, is introduced at the top of a column, is prevented from passing through the perforations by the pressure of the steam, and descends from chamber to chamber by means of a pipe, whose mouth stands slightly above the level of the copper plate. By this means the steam is kept in contact with the wash, and the more volatile constituents, including the alcohol, pass with the steam to the base of the cooling column, where they condense at different levels according to their boiling-points. At the level above which the alcohol condenses, the chamber floor is not perforated, so that the alcohol collects and is carried away by a special pipe. The still more volatile constituents are conducted to a water-cooling chamber. The strength and quality of the distillate are controlled by regulating the pressure of the steam and the rate at which the wash is pumped up to the analysing column.

Coffeyville, city of Montgomery co., Kansas, U.S.A., on the Verdigris R., 19 m. S.E. of Independence. The centre of natural gas area, oil, and coal-fields. It has numerous mills and factories. Pop. 17,300.

Coffin (Lat. *cophinus*, basket or chest), receptacle in which dead bodies are buried. The earliest known use of Cs. is in anct. Egypt, where they were made of wood and stone. The word is used only once in the Bible, referring to the burial of Joseph. The Gks. and Roms. seem to have used Cs. in anct. times, but later resorted to cremation. The Gk. Cs. were of various shapes, and usually made of baked clay; the Rom. *arcas*, or *loculi*, were frequently made of a limestone from the Troad which was believed to have a corrosive action on the flesh (see SARCOPHAGUS). The early Christians in Rome always buried their dead in Cs., which were either hewn out of the living rock or formed of sculptured stone. Cs. appear to have been used by other European nations from prehistoric times. These have been found in Scandinavia, both of hollowed tree-trunks and of stone slabs lining the grave. This latter form, known as the *kistnaen*, has also been discovered in Britain. In medieval times in England the lower classes seem to have simply buried their dead wrapped in a cloth; but the wealthier people employed tapering stone Cs. and occasionally leaden ones. The light wooden C. now used is of recent origin. Wicker Cs., which have many sanitary advantages, have been introduced, but with little success.

Cogalniceanu, Michael (1817-91), Rumanian statesman, b. at Jassy; studied at Paris and wrote at the age of twenty his *Histoire de la Valachie et de la Moldavie* (1837). Upon his return to Moldavia he did much by his writings to pave the way for the revolution of 1848. He was a staunch advocate of the union of the two principalities of Wallachia and Moldavia,

and in 1859 was chosen by Prince Cuza as his Prime Minister. His administration was of an enlightened character, and he introduced a better educational system, secured distribution of land among the peasantry, and abolished serfdom. He pub. a collection of old Rumanian chronicles in 1872, and his *Esquisse sur les Teiganes* in 1873.

Coggeshall, tn. of Maldon div. of Essex, England, on the R. Blackwater, 6 m. S.E. of Braintree. Its manufs. include silk, velvet, and isinglass. Pop. 2500.

Cognac, tn. of France, in the dept. of Charente, with anct. church and old buildings, including a castle which is now filled with brandy. C. is the centre of the production of and trade in brandy and the making of casks and corks. Only brandies produced within a region specified by Fr. law may be termed C. It was for long one of the Huguenot strongholds. Pop. 17,400.

Cognates (Lat. *cognatus*). In Rom. law C. were persons who were sprung from a common marriage, through either male or female antecedents, whereas agnates were persons related through males only. The foundation of C. was thus the legal marriage, while agnates were such persons as were under the same *paterfamilias*, or would be, were he still living. Those who were of the same blood by both parents were sometimes called *germani*; *consanguinei* were those that had a common father only, and *uterini* those that had a common mother only. In reckoning the nearness of C. reference is made to the common ancestor. Each generation is counted up to and including the common ancestor and thence down again along the other line, so that an uncle and a nephew are C. of the third degree, first cousins of the fourth degree, and so on. In Scots law C. are persons related through the mother, and agnates those related through the father.

Cogne, tn. of Turin prov., Piedmont, Italy, in the C. valley, 9½ m. S. of Aosta. There are deposits of iron ore in the neighbourhood. Pop. 2000.

Cognisance, see under **BADGE**; **CREST**.

Cognovit, plea in an action at law operating after the manner of a recognisance, by which the defendant acknowledged or confessed the justice of the plaintiff's claim (*cognovit actionem*). The effect of a C. was to obviate the necessity of a trial, judgment being allowed to go by default for the plaintiff. Cs. are obsolete at the present day, the same result being attained by the simple process of signing judgment by consent.

Cohan, George Michael (1878-1942), Amer. playwright, actor, and song-writer. B. at Providence, Rhode Is., U.S.A., son of Jerry John, actor, and Helen Frances (Costigan), actress. C. made first stage appearance at age of nine, at Haverstraw, New York, in *Daniel Boone*; appeared in *Peck's Bad Boy* (1890). By his early twenties he was appearing on Broadway and writing plays in which he took the chief part. Became famous in vaudeville in *The Four Cohans*. Acted in his own plays *Little Johnny Jones* (1904-6)

and *George Washington, Junior* (1908-7). Other plays of his were *The Wise Guy*; *The Governor's Son*; *Running for Office*; *Forty-five Minutes from Broadway*; *Popularity*; *The Talk of New York*; *Fifty Miles from Boston*; *The Man who owns Broadway*; *The Yankee Prince*; *The Little Millionaire*; *Hill-the-Trail Holiday*; *The Tavern*; *The Song and Dance Man*; *American Born*; *The Merry Malones* (musical play). He visited London, and among his comedies which were produced there were *Get-rich-quick Wallingford*, at the Queen's in 1913; *Broadway Jones*, at the Prince of Wales's, and *Seven Keys to Baldpate*, at the Apollo, in 1914; and *Baby Cyclone*, at the Lyric, in 1928. But he will probably be best remembered in this country for the patriotic song *Over There*, which he wrote for the Amers. in the First World War. In recognition of his patriotic service in composing that song and also the song *A Grand Old Flag*, Congress voted him a gold medal, which was presented to him by President Roosevelt at the White House in 1940. He wrote and composed hundreds of songs, many of which were known all over America and sung by millions. Films were made of some of his plays, and in 1932 he appeared on the screen in *The Phantom President*.

Cohen, Ernst Julius, Dutch (Jewish) chemist, b. 1869, at Amsterdam. Studied under Arrhenius in Stockholm, Moissan in Paris, and van't Hoff in Amsterdam. In 1898 he was prof. of chem. at Montreal, in 1901 he was at the Amsterdam Univ.; in 1902 he succeeded the famous van't Hoff at Utrecht Univ. In 1899 he discovered that tin exists in three allotropic forms, confirming Aristotle. He has pursued research into the allotropy of metals, and into piezochemistry. Also has written *Jacobus Henricus van't Hoff, his Life and Work* (1912).

Coherer, instrument used for detecting signals in the early days of wireless telegraphy. It consisted essentially of loosely packed particles which conducted an electric current only when under the influence of electromagnetic waves. On the passage of electric oscillations from the receiving circuits these particles (or metallic filings) 'cohered' and offered a lower resistance to the passage of current in a local circuit which included a bell, relay, or other device.

Cohesion, molecular force which keeps the particles of a body together and resists rupture. It is strongest in solids, weaker in liquids, and almost insensible in gases. It varies with the nature of the substance and with its temp. It is thought by some to be a specific force acting only at inappreciable distances, but Lord Kelvin has said that it involves no other force than the force of gravitation, and is proportional to the product of the masses concerned, and inversely proportional to the square of the distance between them. The C. of the particles of a solid body is due to the close contact brought about by the solidification from a liquid state, crystallisation out of solution, electrochemical deposition, etc. Great pressure

will cause two similarly constituted bodies to cohere; but as it is necessary to force the surfaces to fit each other exactly, more force must be used than that which, exerted in a contrary direction, would cause a rupture. Two smooth surfaces of the same substance, however, can be made to cohere with but little pressure. *Adhesion* usually refers to the attraction existing between the surfaces of dissimilar substances. *C.* In a liquid means the attraction between the particles in the interior of the substance; the adhesive forces at the surface bounding a liquid and some other substances are dealt with in *SURFACE TENSION* and *CAPILLARITY*.

Cohn, Ferdinand Julius (1828-98), Ger. botanist, who improved the microscope, and with it made far-reaching discoveries as to the growth of plant and animal cells. Made a special study of lower algae and fungi. He contributed greatly to the overthrow of the doctrine of abiogenesis or spontaneous generation, and made preliminary researches upon the value of bacteriology in infectious diseases. He may, indeed, be justly held to be the founder of bacteriology, and pub. sov. works on insect epidemics, infusoria, and plant diseases.

Cohoes, manufacturing tn. with water power from the falls of the Mohawk in the co. of Albany, New York, U.S.A. It is situated on the R. Hudson, on the Erie Canal, and possesses large cotton and woollen mills, and manufs. machines, pulp, and hosiery. Pop. 21,900.

Cohort, term used to denote a portion of a legion in the Rom. army. Ten Cs. made up a legion, which usually consisted of 6000 men. The first *C.*, sometimes numbering 1200, had charge of the standard of the legion.

Coif (Fr. *coiffe*, a cap), head covering, more especially the distinctive badge of the serjeant-at-law. It was at first a close-fitting cap of white lawn or silk, but upon wigs becoming commonly worn it was represented by a small black patch with a white border worn on the crown of the wig.

Coil, inductance, in which wire is wound round an iron case. *Induction C.* is the technical name for the small transformer used in a telephone box to separate the microphone direct current from the receiver. (See *ELECTRICITY*, *Electromagnetic Induction*.) *Choking Cs.* steady rapid fluctuations in alternating currents. *Resistance Cs.* offer definite resistance to the passage of current. *Search Cs.* carried by aeroplanes are an aid to landing in fog.

Coimbatore, dist. and tn. in the Madras presidency, India, with an area of about 7842 sq. m. To the W. lie the W. Ghats, and a branch of the same range forms the N. boundary. Salem and Trichinopoly are on the E., and on the S., Madura and Travancore. The dist. is well watered and fertile. Rice, tobacco, cotton, and sugar are grown. The chief tns. are C., Erode, and Coorer. The tn. has sev. high schools and an active trade. Pop. of tn. 66,000.

Coimbra: 1. Dist. of Beira, Portugal, with an area of 1499 sq. m. The soil is

fertile, millet and wine being the chief productions. Cattle are reared in large numbers. Pop. 411,600. 2. city of Portugal, and cap. of the dist. of C. It is situated on the r. b. of the R. Mondego, 24 m. from its mouth, 115 m. N.N.E. of Lisbon, and is noted as being the seat of the one univ. of Portugal, which was transferred from Lisbon in 1527. There are five faculties and 1400 students. The tn. library contains about 80,000 vols., and there are museums and laboratories. C. is an episcopal see and possesses two cathedrals. There are manufs. of earthenware, linen, and leather. Lamprey fishing is carried on. Pop. 28,000.

Coin, tn. in Málaga, Spain, about 20 m. W.S.W. of Málaga. It is situated in a dist. abounding in orchards, and is known as the garden of Andalusia. There are marble quarries near by. Pop. 12,500.

Coin, pieces of metal stamped with various devices, and intended to circulate as currency. See *CURRENCY*; *MINT*; *MONEY*; *NUMISMATICS*; *TRADESMEN'S TOKENS*.

Coining is in England, as in all civilised states, a prerogative of the sovereign power, and therefore the crime of counterfeiting the current coinage is severely punished. Under the old statutes it was made a form of treason. In 1861 the statutes relating to this offence were codified and unified for the whole United Kingdom by the Coining Offences Act, and this was further amended by the Counterfeit Medals Act of 1883. The Coinage Offences Act, 1936, consolidated without amendments in substance, the Acts dealing with coinage offences. The following offences are high crimes, punishable by penal servitude to the extent of life: counterfeiting or making coins to resemble or pass for the current coin of the realm; colouring, casing, or washing over any coins or metals with intent to make them pass for gold or silver coin; buying, selling, receiving, or passing counterfeit coin at a lower rate than its denomination imports; knowingly importing counterfeit coin; making, mending, buying, selling, possessing, or conveying out of the Royal Mint any *C.* instruments. The clipping or lightening in any other manner of current gold and silver coin is a crime punishable with not more than fourteen years' imprisonment. The following offences are punishable with not more than seven years' imprisonment: unlawful possession of clippings, etc., taken from gold and silver coin; unlawfully making, mending, buying, selling, or possessing instruments for so doing; buying, selling, or bringing into the country such counterfeit coin at a lower value than its denomination imports; possessing three or more counterfeit gold or silver current coins with intent to utter them. Various minor offences are punishable with imprisonment or penal servitude for varying periods all under seven years. Such are the exportation of counterfeit current coin; the counterfeiting of foreign coinage, and the knowingly uttering counterfeit current copper coinage.

Coining, see also **FORGERY**.

Colins, **Foreign**, see **WEIGHTS AND MEASURES**, *Table of Foreign Montes*.

Cofir, fibrous covering of the coco-nut. Stripped off lengthwise, the fibres are manufactured into matting, ropes, cables, etc. It is prepared as follows. After soaking for months in water, until soft, the fibres are beaten to remove the superfluous matters, and then are spun into yarn and woven into articles or twisted into cables. Compared with hempen cables these are buoyant and of great strength and elasticity.

Coire, or **Chur**, the cap. of the canton of the Grisons, Switzerland, still contains many fifteenth- to seventeenth-century buildings. The cathedral of St. Lucius was begun in 1178. The episcopal court occupies the site of the Rom. *castrum*, which commanded the roads leading over the passes. The tn. is mentioned as a bishopric in 452, and was freed from the bishop's rule in 1464. The townsmen embraced the Reformation in 1524. The painter Angelica Kauffmann (1741-1807) was born here. Although C. is 1952 ft. above the sea, the climate is very mild. Pop. 17,000.

Cojedes, state of Venezuela. Pop. 83,000. Cap. San Carlos. Pop. 7000.

Cojutepeque, tn. of San Salvador. Central America, cap. of Cuscatlán dept., 15 m. N.E. of San Salvador. It is situated near the volcano and lake of the same name. Has potteries, weaving and cigar trade, and large market. Pop. 17,000.

Cokayne (or **Cokain**), Sir Aston (1608-1644), poet, was b. in Derbyshire, and belonged to an old Derbyshire family. He was educated at Trinity College, Cambridge. Although rather a dissolute man, he was a strong Royalist, and stood firm to his religious opinions. There were four issues of his poems and plays: *Small Poems of divers Sorts*, embracing, besides poems, a *Masque . . . presented on Twelfth Night*, 1634, and *The Obstinate Lady* (a comedy) (1658); a reissue in 1659, entitled *A Chain of Golden Poems*, etc., including *Trappolin Creduto Principe*, or *Trappolin suppos'd a Prince* (an It. tragi-comedy); a third issue in 1662, entitled *Poems*, etc., to which was now added *The Tragedy of Ovid*; and a fourth (reissue) in 1669.

Coke, Sir Edward (1552-1634), lawyer, came of a Norfolk family and was b. at Mileham in that co. He was educated at Norwich School and Trinity College, Cambridge, and was called to the Bar in 1578. The following year he distinguished himself in the libel case *Cromwell v. Derby*, and soon after in *Shelley's case*, having been previously made reader of *Lyon's Inn*. In 1582 he married Miss Bridget Paston, receiving with her a large fortune, and in the course of a few years sev. very important appointments were conferred on him. In 1586 he was made recorder of Norwich, in 1592 reader of the Inner Temple and solicitor-general, in 1593 Speaker of the House of Commons, and in 1594 attorney-general, thus being successful over his rival, Bacon, who wished to be appointed to the last-named

office. In 1606 he became chief justice of the common pleas, and in 1613 chief justice of the king's bench. In 1598 C.'s wife d., and he married Lady Hatton, granddaughter of Cecil, Lord Burghley. This was his second success over Bacon, for the latter was refused by Lady Hatton. The marriage, however, proved a very unhappy one for C. Just after this he conducted sev. important trials, among them that of Sir Walter Raleigh, but this one does not redound to his credit, as his treatment of that nobleman was both discourteous and full of injustice. In his office as chief justice of the common pleas C. maintained a vigorous defence of the law, for when the eccles. courts wished to claim more power and King James was

SIR EDWARD COKE

inclined to support them, he was on the defensive, and was successful in winning the king over on his side. He was also opposed to James on sev. other occasions, as he had no exaggerated notion of the royal prerogative. He firmly estab. the fact that the king could neither make laws without the consent of Parliament, nor could he declare any action to be an offence unless it were contrary to the law of the land. In the case of *Peacham*, who was accused of high treason, C. found himself in opposition to the king, this time with very little result. The opposition was continued by C.'s declining to refer to the king difficult cases in the court of chancery, and also in his contesting James's right to grant common laws, and in refusing to await the king's pleasure with regard to that granted to the bishop of Lichfield. For these reasons he was dismissed from his office in 1616. He again took up public duties in 1620, when he was returned to Parliament as member for Liskeard. During this part of his career he concerned himself mainly with the reform of abuses. He opposed the marriage of Charles with the Infanta of Spain, and was insistent on freedom of

speech for Parliament, thus alienating himself more and more from the king. After the death of James O. vigorously opposed Charles I. in his illegal means of obtaining money. He was also instrumental in drawing up the Petition of Right, and at the time of the Grand Remonstrance he pointed out in Parliament the evil caused in the country by the duke of Buckingham. After this C. spent his time in retirement at Stoke Poges, where he d. See Lord Birkenhead, *Fourteen English Judges*, 1926.

Coke, Thomas (1747-1814), Methodist bishop, b. at Brecon and studied at Oxford. He made the acquaintance of John Wesley, and commenced a series of open-air services that led to his dismissal from his Somerset curacy. Allied then to the Methodists, he became president of the Eng. conference, and later superintendent (bishop) of the Methodist societies in America, whither he made sev. voyages between 1784 and 1803. He pub. a *History of the West Indies* (1808-11), and jointly with Henry Moore, a life of Wesley in 1702.

Coke, Thomas William, see LEICESTER, EARL OF.

Coke, form of fuel composed of the carbonaceous substance left when coal is heated in a confined space. The volatile constituents of the coal are thus lost, and a hard, brittle, porous substance, with a slight metallic lustre, is left. It does not soil the fingers when touched, and burns with an intense heat and no smoke. These advantages, together with the facts that it is relatively free from sulphurous fumes and does not produce sparks, render it a valuable fuel for use in metallurgy and various industrial operations. C. is produced in the manuf. of coal-gas as a by-product, but this variety is of inferior quality, and the regular method of manuf. is by means of either mounds or ovens. In the former case a caking variety of coal is stacked in a large heap round an open chimney covered with wet C.-dust, and fired from above. When all smoke has ceased to appear, the air-holes are closed, and the mound is extinguished and cooled with water. The same principle is employed in closed ovens, which, however, yield a better quality with a considerable saving of time and expense. See also CARBONISATION.

Colao, tn. of Polwarth co., Victoria, Australia, on Lake C., 50 m. S.W. of Geelong. Coal, iron, and limestone are found near. Pop. 5000.

Cola di Rienzi, see RIENZI.

Colard, Mansion, first printer of Bruges, d. in 1484. His pubs. consisted of twenty Fr. and one Lat. work.

Colban, Adolphe Marie (1814-84), Norwegian authoress, née Schmidt, whose works were very widely read in their day. Best known among them are *Lærerinden* (1869); *Tre nye Noveller* (1875); *Jeg lever* (1877); *Thyra* (1882).

Colberg, see KOLBERG.

Colbert, Jean Baptiste (1619-83), Fr. statesman, b. at Rheims. Probably spent some of his youth in the house of a banker. He was entrusted by Mazarin

with his most important commissions. In 1659 he began his scheme for the reform of finances, and at the same time his letter to Mazarin contained a bitter attack on Fouquet, which led to a quarrel finally settled by Mazarin. In 1661 he succeeded Mazarin, and in 1668 became minister of marine and also minister of commerce and of the king's household, having previously been made controller-general. He had, in fact, almost supreme power over the financial affairs of the country. The finances of the country at this time were in a deplorable state, and C. reformed the whole system by doing away with extortion and unjust taxation, and by revising the method of collection.

JEAN B. COLBERT

Engraving after a painting by V. Mignard.

He next turned his attention to commerce, and did all that he could to increase the manuf. of the country instead of importing manufactured goods from abroad. The lines on which he worked, however, were exceedingly narrow, and did not make for progress. The inspection as to quality and measure of articles was most rigid, and the protective tariffs hampered the trade considerably. Credit is due to C., for his reconstruction of the Fr. Navy. He not only increased the number of men and ships, but also reconstructed Toulon and Rochefort, and fortified Dunkirk, Brest, and Havre. He turned his attention also to learning and art, being the founder of the Academy of Science and of the Observatory, the reorganiser of the Academy of Architecture and of the Botanical Gardens, and he encouraged scholars and artists from all parts of Europe. He had public buildings and monuments set up in Paris, and added pictures to the Louvre. He experienced great difficulties from Louvois, his rival, who had control of the war dept. Peace was necessary to C. so that his reforms

might be effectual, and in his later days he carried on a constant struggle to cut down the king's extravagances to this end. Louis XIV., however, transferred his favour to Louvois, and C.'s influence gradually declined till he died, stricken with a fever which had attacked him at intervals for sev. years before his death. *See* life (1846) by Pierre Clément, who, in 1861, also pub. the first of the nine vols. of the *Lettres, instructions, et memoires de Colbert*. The historical introductions to each of these vols. were pub. by Mme Clément in 1874.

Colborne, Sir John, first Baron Seaton (1778-1863), Brit. general, who took part in the battle of Corunna. He afterwards fought with Wellington, and was wounded at Ciudad Rodrigo. He also took part in the battle of Waterloo, 1815. In 1838 he put down the rebellion in Canada.

Colburn, Henry (d. 1855), publisher, produced the *New Monthly Magazine* and *Universal Register* (1814); *Keely's Diary* (1818); *Pepys's Diary* (1825); and *The United Services Magazine* (1829). He also pub. the *Modern Standard Novels* (1835-1841). Was in partnership with Richard Bentley, 1830-32, and retired from business in favour of Messrs. Hurst & Blackett.

Colburn, Zerah (1804-40), mathematical prodigy, b. in Vermont, U.S.A. In his earliest years he displayed such extraordinary powers of rapid calculation that from 1810 he was publicly exhibited by his father, and came to Great Britain and France. He studied from 1816 to 1819 at Westminster School at the expense of the earl of Bristol. On the death of his father he returned to America, and was from 1825 prof. of languages in Norwich Univ., Vermont.

Colby, Frank Moore (1865-1925), Amer. editor, b. in Washington, dist. of Columbia; son of Stoddard Benham C. Graduated at Columbia Univ., 1888. Held appointments in connection with hist. and economics in Columbia Univ. and Amherst College; and was prof. of economics at New York Univ., 1895-1900. On the editorial staff of *Johnson's Cyclopaedia* and *Nelson's Encyclopaedia*. Ed. *International Cyclopaedia*, 1898 ed., and *International Year-Book*, 1898-1902. Ed. *New International Encyclopaedia* from 1900; revision 1913-16, and supplement 1923-24; also *New International Year-Book* from 1907. He wrote *Outlines of General History* (1900); *Imaginary Obligations* (1904); *Constrained Attitudes* (1910); and *The Margin of Hesitation* (1921); *Essays* (1924).

Colby, Thomas Frederick (1784-1852), Brit. major-general, who was connected with the ordnance survey, of which he became director.

Colchagua, prov. in Chile, extending from the Cordilleras to the Pacific Ocean. Its cap. is San Fernando (pop. 10,100). The prin. crops are cereals; wine and cattle are produced. Pop. 296,000. Area 3856 sq. m.

Colchester, Baron. This title was borne by the family of Abbot from 1817 to 1919, when the third baron d. Charles Abbott,

the first baron, was Speaker of the House of Commons from 1802 to 1817.

Colchester, municipal bor., mkt. tn. and riv. port of Essex, England, 52 m. from London on a main line of the E. div. of Brit. railways. It stands on the R. Colne, which is navigable by vessels of 150 tons to the Hythe, 1 m. S.E. and 9 m. from the sea. The recorded hist. of C., which is the oldest recorded tn. in Great Britain, goes back to the coins of Cunobellinus (Cymbeline), who reigned from 5 B.C. till his death, A.D. 43. These are inscribed C A M V for Camulodunum, the Brit. name of C. (meaning the hill or fort of Camulos, god of war). On the Rom. invasion in the year 43 Camulodunum became the headquarters of the Romans. It was burnt and devastated by Boadicea in A.D. 61, when that queen led a rising of the Trinobantes and Iceni against the Romans. Soon afterwards the Rom. Wall was built to protect the tn. A mile and a half or more of this wall is left. It can be seen to advantage on Balmerne Hill and at the Balmerne Gate, the old Rom. gateway at the top of the hill; also at the steps leading up to the church of St. Mary-at-the-Walls in Balmerne Lane. The Rom. occupation of C. lasted till about the year 367. The importance of the settlement is shown by the enormous quantity and rich variety of Rom. remains found in C., and exhibited in the C. and Essex museum, the Brit. Museum, and elsewhere. Historical and numismatic evidence make it clear that Camulodunum, the cap. of Cunobellin, or Cymbeline, must have been in the C. area. (*See Camulodunum: First Report of the Excavations at Colchester, 1930-39, Society of Antiquaries of London, 1948.*) The castle is, of course, the most important of the tn.'s anct. monuments. It dates from 1070 and its keep is the largest Norman keep in the country. There are numerous other buildings of historical interest, the best known being the ruins of the twelfth-century St. Botolph's Priory church, situate off St. Botolph's Street, and the gateway of the eleventh-century monastery of St. John, on St. John's Green.

There are two museums, one being housed in the castle keep, containing chiefly, though not exclusively, Romano-Brit. antiquities. It is one of the finest collections of its kind in N. Europe. On the ground floor are miscellaneous objects, including Rom. tessellated pavements found in C., a re-erected Tudor fireplace, and various medieval and later exhibits. The galleries on the first floor are devoted to a great collection of Rom. remains mostly found in C. The other museum is housed in the Holly Trees mansion, an early Georgian mansion in close proximity to the castle. The objects include noteworthy collections of 'Bygones,' chiefly domestic articles of the seventeenth, eighteenth, and nineteenth centuries, carved chests, samplers, exhibits connected with agric. industries, costumes, china, furniture, and many old prints and maps; also a valuable collection of Peruvian antiquities and various oriental exhibits. A valuable library, especially

intended for students and presented by the Rev. Dr. G. H. Rendall, a former headmaster of Charterhouse, is on the first floor.

C. is a municipal bor., the earliest charter being that of Richard I. (1189), and for parl. purposes is in the C. div. of Essex. Corn and cattle markets are held and the chief industries now carried on are engineering and the manuf. of clothing. The Colne oyster fishery, which produces the Pyefleet oysters, belongs to the council, and C. is also noted for its roses. Among the more modern buildings should be mentioned the tn. hall, the co. hospital, and the new public library. The latter building was completed in 1939, and was used for emergency purposes during the war. Pop. (1931) 48,701.

Colchicum, genus of Liliaceæ, containing over two dozen plants, which grow wild in Europe, Asia, and Africa. In Britain it is represented by the well-known *C. autumnale*, the meadow saffron or autumn crocus. The large pale purple flowers spring up in the autumn without any leaves, and expand with their orifice, together with the anthers and stigmas, just above the surface of the soil while the tubular part, with the ovary and filaments, remains below ground and is thus protected from cold. The ovary becomes mature before the stamens, and pollination is effected by means of bees. In the springtime the foliage makes its appearance in the form of an erect tuft of broad, oblong, shining, sheathing leaves and the capsular fruit is elevated above the soil by its lengthened footstalk. The corm of the C. is irregularly egg-shaped, and covered with a dry, brittle, brown skin; in size it compares with a hazel-nut or walnut, and it consists of a white fleshy succulent substance. When fresh, it has a nauseous, radish-like odour, when dried there is no odour; the taste is sweetish-bitter, leaving an acrid sensation in the throat. Both corms and seeds abound in a stimulating, deleterious principle, and large quantities are annually consumed in the manuf. of various medicinal preparations. The C. acts as a diuretic and purgative, and when given in large doses is poisonous. It is most used in cases of dropsy, gout, and rheumatism. The bitter, poisonous, alkaloid 'colchicine' is obtained from *C. autumnale*, and this, heated with concentrated hydrochloric acid, produces colchic acid.

Colchis, in auct. geography, was a country in Asia, situated between the Caucasus on the N., Iberia on the E., Armenia on the S., Pontus on the S.W., and the Euxine on the W. It was noted in Gk. mythology as the home of all sorcery, the land of Medea and the Golden Fleece. Its inhab. were from earliest times engaged in the linen manuf. The modern prov. of Mingrelia and a part of Abasia correspond with the auct. C.

Cold, absence of heat. This being radiant energy, molecular movement is held to cease at -273° C., the temp. of absolute C. Helium is liquefied within $2\frac{1}{2}^{\circ}$ of this absolute minimum (see further under THERMODYNAMICS). In medical

practice C. applied to the body subdues pain, reduces inflammation and feverish temps., arrests bleeding, and stimulates by cold bathing. An attack of catarrh is generally called a C.

A C. (*Coryza*) indicates inflammation of the mucous membrane of the nose by which the secretion of mucous fluid is increased. It causes hoarseness, running at the nose, and sore throat. The condition of the person is made worse by the chilliness which accompanies the ailment and the general feeling of depression and feverishness. It is infectious and will spread throughout the household unless every care is taken. Quinine has a preventive value. A hot mustard bath with a hot drink of whisky and water, lemon or black currant juice, etc., and rest in a warm bed will also prove beneficial in the early stages. A C. in the head can best be relieved by inhaling menthol or Friar's balsam in boiling water, or by the use of a nasal douche. A C. in the chest should be treated by rest in bed in a warm room, by steam kettles, hot applications with thermogene wool, linseed poultices, etc., and by hot, demulcent drinks. A C. should never be neglected, since many ailments begin with what seems to be only a 'common cold.' It should be stopped before passing down on to the chest and inflaming the bronchial tubes. Chronic sufferers should consult a doctor, as vaccine inoculation may sometimes be indicated; or there may be some such cause as septic tonsils, or adenoids, which should be cut or enucleated. The feet may be bathed in hot mustard and water.

Cold Cream, or **Rose-water Ointment**, cooling dressing for the skin. It may be prepared by melting together 125 gm. of spermaceti, 120 gm. of white wax, 560 gm. of expressed oil of almonds, and then mixing in 190 gm. of stronger rose-water. A few grammes of sodium borate should be dissolved in the rose-water unless some other metallic salt of remedial properties is desired. The ointment constitutes a soothing application for chapped face and hands, abrasions, etc.

Colden, Cadwallader (1688-1776), was a Scot and a member of the medical profession. He went to America and practised medicine there, first in Pennsylvania and later in New York, and in 1781 he was made lieutenant-governor of that city. His chief works are *History of the Five Indian Nations depending on the Province of New York in America* (1727) and *An Explication of the First Causes of Action in Matter and of the Cause of Gravitation* (1745).

Cold Harbor, vil. of Hanover co. Virginia, U.S.A., 9 m. from Richmond, 2 m. from Chickahominy R. The battle of Gaines's Mill was fought near by (1863), the Federals, under McClellan, being defeated by the Confederates under Lee. There was another battle fought between Gens. Grant and Lee, 1864, considered indecisive, though the advantage was on Gen. Lee's side. Pop. 3000.

Coldingham, par. and vil. of Berwickshire, Scotland, $2\frac{1}{2}$ m. from Eyemouth, $1\frac{1}{2}$ m. from C. Bay. It has the remains

of a famous priory, founded in 1098 by Edgar of Scotland. Fast Castle, the Wolf's Crag of Scott's *Bride of Lammermoor*, is about 2 m. off. C. is 2 m. from St. Abb's Head, 3 m. from Reston junction. Pop. par. 2830, vil. 495.

Cold Storage, see under REFRIGERATION.

Coldstream (formerly Lennel, Leinhall), par. and burgh of Berwickshire, Scotland, 13 m. from Berwick, on the R. Tweed and the N.-E. Region railway. Smeaton's five-arched bridge (1763-68) crosses the riv., and near by is the famous ford of the Tweed, often crossed by Scotch and Eng. armies. It was once, like Gretna Green, a refuge for runaway couples. Pop. 2000.

Coldstream Guards, Brit. regiment in the foot-guards, forming part of the Household Brigade. It is the second regiment in age of the Brit. Army, the oldest being the Royal Scots. The C. G. were known first as Monk's Regiment, from Gen. Monk, who founded the regiment in 1660. They definitely received their name when given to Charles II. to form part of his household brigade. During the reigns of Charles II. and James II. detachments of the regiment served in Flanders, at Tangiers, and in Virginia, and under William III. it served at the siege of Namur, 1695. Some companies helped to hold Gibraltar in 1704-5 after its capture by Rooke. It served under Marlborough at Oudenarde and Malplaquet, under George II. at Dettingen, and under Abercrombie in Egypt in 1801. A string of battle honours for the Peninsula and Waterloo testify to its service under the great duke of Wellington. It next saw service in the Crimea 1854-1856, this being followed by the Egyptian campaign of 1882 and Suakin in 1885, and then the Boer war of 1899-1902. During the First World War it served with great distinction and gallantly upheld its proud motto, 'Nulli secundus,' seven V.Cs. being won. Five battalions served at various periods in France and Flanders, notably at Mons (1914), Zandvoorde near Ypres (1914), Neuve-Chapelle (1915), and in the later battles of Ypres, 1917. In the Second World War the C. G. fought in N.W. Europe and in Italy. As part of the Guards Armoured Div. in France in 1944 they were prominent in the passage of the Orne into the Caen plain in the battle of Normandy. Other units were in the Eighth Army (q.v.) which fought in numerous battles up the It. peninsula. The C. G. can be distinguished from other Guards by the white band round their hats and by the buttons on their tunics being grouped in pairs.

Coldwater, cap. of Branch co., Michigan, U.S.A. on Lake Shore and Michigan S. railway, 34 m. from Adrian and 103 m. from Detroit. It contains a court-house, high school, and state public school, and manufs. leather, furniture, Portland cement, liniment, and agric. implements. A riv. of the same name enters St. Joseph R., 12 m. from the tn., which stands on it. Pop. 7300.

Cold Water Test, or, more usually, **Hydraulic Test**, in engineering, is a pressure

test for totally enclosed vessels to determine their power of resistance. The vessel is filled with cold water, and the pressure progressively increased to twice the normal working pressure.

Cold Wave, sudden and general fall of temp., usually following a winter storm and caused by a cool wind blowing towards the equator. It generally lasts only for two or three days, and is common in U.S.A. In the E. United States C. Ws. from the N. plains often cause a fall of 18° F. or more, bringing the temp. below freezing-point. They cross the border between Lake Superior and the Rockies.

Cole, see RAPE.

Cole, George Douglas Howard (b. 1884), Eng. writer on economics, b. Sept. 25, and educated at St. Paul's School and Oxford Univ. Univ. reader in economics at Oxford. He is a leading authority on labour questions and economics in relation to industry. Vice-president of Workers' Educational Association and a member of the Economic Advisory Council. Pubs. include *Self-government in Industry* (1917); *The Payment of Wages* (1918); *Chaos and Order in Industry* (1920); *Workshop Organisation* (1923); *Labour in the Coal-mining Industry* (1923); *Organised Labour* (1924); *A Short History of the British Working-class Movement* (1925-27); *The Next Ten Years in British Social and Economic Policy* (1929); *Gold, Credit, and Unemployment* (1930); *What Marx really meant* (1934); *Principles of Economic Planning* (1935); *Socialism in Evolution* (1938); *British Working-class Politics, 1932-1914* (1941); *Fabian Socialism* (1943); *A Century of British Co-operation* (1945). Collaborated with his wife Margaret Isabel, nee Postgate (b. 1893), in detective stories, novels, etc., including *The Brooklyn Murders* (1923); *A Lesson in Crime* (1933); *Last Will and Testament* (1936); *Greek Tragedy* (1939); *Counterpoint Murder* (1941) also *Samuel*; *Butler* (1947).

Cole, George Vicat (1833-93), Eng. landscape painter, especially of Surrey and Thames scenes, was b. at Portsmouth, and from 1853 contributed frequently to the Royal Academy exhibitions. He was elected R.A. in 1880. 'The Pool of London,' which however, is not a characteristic specimen of his art, is in the Tate Gallery, London. See life by Chignell.

Cole, Sir Henry (1808-82), Eng. official, art critic, and editor, b. at Bath, and educated at Christ's Hospital. Appointed assistant keeper of the records, he helped to establish the Record Office. Did valuable service in promoting art exhibitions, especially the Great Exhibition (1851). He was a founder of S. Kensington Museum and later its director. He was also one of the founders of the National Training School, afterwards reorganised as the Royal College of Music, 1882. See *Autobiography* (1884).

Cole, Thomas (1801-48), noted Amer. landscape painter. He went from England to the U.S.A., 1819; from Ohio to New York, 1825. He travelled to London,

Florence, and Rome between 1829 and 1832. He aimed chiefly at historical or allegorical landscapes (for examples see New York Historical Society's rooms). Among his works are 'Views of the Catskills and White Mountains,' 'The Voyage of Life' (four pictures), 'The Course of Empire,' 'View of Mount Etna taken from Taormina,' and 'Kenilworth Castle.'

Cole, Timothy, Amer. wood engraver, b. in London, England, in 1852. In 1875 he began to work for the *Century Magazine* (then *Scribner's*). His work attracted widespread attention, and he was sent to Europe to make engravings after the old masters, which met with great success. He received medals at the Paris and St. Louis exhibitions.

Colebrooke, Henry Thomas (1765-1837), Sanskrit scholar, son of Sir George C., b. in London. His father, who was chairman of the E. India Company, secured his son a post in the company's service. During his residence in India C. made a close study of Sanskrit, publishing sev. books in this language, among them his trans. of Sir Wm. Jones's *Digest of Hindu Law* (1798). This led to his being appointed president of the bench in Calcutta. He was also made a prof. of Hindu law, and in return for this he wrote his Sanskrit grammar, pub. in 1805. He returned to London in 1814, and presented the India House with his Sanskrit MSS. In 1823 he helped to found the Royal Asiatic Society.

Colecotomy, in surgery, the name given to the operation of removal of part of the colon or large intestine, and the consequent reuniting of the severed ends, so as to complete the circuit. This course is rendered necessary in cases of tumour or stricture in the part.

Coleford, par. and mrkt. tn., 8 m. N.W. from Lydney, Gloucestershire, in the mining dist. of the Forest of Dean. The tn. hall was built in 1662. The Speech House, where the Verderers' Court is still held sev. times a year, is now an hotel. The court room possesses a musicians' gallery. Pop. urb. dist. and par. 2800; eccl. dist. 5000.

Colemanite, hydrated calcium borate, $\text{Ca}_2\text{B}_6\text{O}_{11} \cdot 5\text{H}_2\text{O}$, one of the chief sources of borax and boric acid. Important deposits are found in the S.W. of California. They are found in hot springs and lakes associated with volcanic activity.

Colenso, vil. and railway station, Natal, S. Africa, 70 m. from Pietermaritzburg, on R. Tugela, which is here spanned by a bridge. It was the scene of Buller's unsuccessful attempt to cross the Tugela, Dec. 1899, during the Anglo-Boer war, 1899-1902. A great power-station in connection with the electrical working of the Natal railway has been erected here. White pop. 600.

Colenso, John William (1814-83), bishop of Natal and a celebrated mathematician, b. in Cornwall. He was educated at Cambridge, where he was second wrangler in 1836. From 1838 he was assistant master at Harrow, and from 1842 tutor

at Cambridge. In 1846 he became rector of Farningham St. Mary, Norfolk, and pub. mathematical textbooks on arithmetic, algebra, and plane trigonometry. His *Village Sermons* appeared in 1853, in which year he was appointed bishop of Natal. He at once studied the Zulu language, and after a while prepared a grammar and dictionary, and trans. part of the Prayer Book and Bible. In 1861 he pub. his *Translation of St. Paul's Epistle to the Romans, commented on from a Missionary Point of View*, in which he set forth his objection to the doctrine of eternal punishment. His next work, *The Pentateuch and Book of Joshua critically examined* (1862-79), made him the apostle of the higher criticism, and provoked a storm of protest. His book was condemned by both Houses of Convocation as heretical (1864), and he was declared (Dec. 1863) deposed from his see by Bishop Gray of Cape Town. The Privy Council, however, declared the deposition null and void. Bishop Gray then publicly excommunicated him, and in 1869 appointed Dr. Macrorie bishop of Maritzburg, with authority over practically the same diocese. Later C. opposed the oppressive measures taken by the Boers and Cape officials against the Zulus, and the policy of Sir Bartle Frere during the Zulu war. He pleaded the cause of the chiefs Langalibalele and Cetewayo, and was regarded by the Zulus as their protector. Other works by him are *Ten Weeks in Natal* (1855), *The New Bible Commentary: Literally Examined* (1871-1874), *Lectures on the Pentateuch and the Moabite Stone* (1873), *Sermons*, (1873). See Sir G. W. Cox, *The Church of England and the Teaching of Bishop Colenso*, 1888.

Coleone, Bartolomeo, see COLLEONI.
Coleoptera (Gk. *κόλεος*, sheath, *πτερόν*, wing), order of insects known familiarly to us as beetles. The species have four wings; the front pair, the elytra, are hard and leathery, and when at rest they fit together closely over the hind wings, and a straight suture lies between them; the hind pair are used in flight and are membranous. The mouth parts are biting and have mandibles, the lower lip is not divided along the middle. The metamorphosis is complete, the larva is a grub and develops into a pupa which exhibits the external structure of the perfect insect. There are known to scientists about 150,000 species, of which over 3000 belong to Britain. See BEETLE.

Colepeper (or Culpeper), John (d. 1660), Eng. Royalist politician, first Lord C. He was a member of the Long Parliament (1640), siding against Strafford, supporting episcopacy, and opposing the Scottish demand for religious union. Privy Councillor and chancellor of the exchequer in 1642, he became Charles I.'s adviser, and fought for him at Edgehill. He accompanied the prince (later Charles II.) to France (1646), and supported him ever after. See Clarendon's life, and *History of the Rebellion*, 1641.

Coleraine, par. and tn. of Londonderry co., N. Ireland, on R. Bann, 4 m. from the sea. It is noted for linen manufs., and

has shirt and collar factories. There are also good salmon fisheries. Pop. 8000.

Coleridge, Derwent (1800-83), author and educationalist, son of Samuel Taylor C. He was ordained, and appointed master of Helston Grammar School, Cornwall, one of his pupils being Charles Kingsley. Here he pub. his largest work, *The Scriptural Character of the English Church*. C. was appointed first principal of St. Mark's College, Chelsea (1841), and did much to advance elementary education.

Coleridge, Hartley (1796-1849), son of Samuel Taylor C., was b. at Clevedon, Somersetshire. He early showed uncommon gifts and a temperament still more remarkable. He is the subject of two passages in his father's poems, *The Nightingale* and *Frost at Midnight*, and of an exquisite but painfully prophetic address from Wordsworth, who was his lifelong friend. After the separation of his parents, he was brought up in Southey's family at Greta Hall, being educated chiefly at Ambleside, where he was judged of sufficient intellectual promise to justify a univ. career. Urged by Southey, his well-to-do relatives sent him to Oxford. Intensely sensitive, impatient of control, shy and awkward, of a somewhat bizarre appearance, and infirm of will, Hartley got into trouble with the college authorities, and lost an Oriel fellowship through intemperance. He received a gift of £300 from the college, but the blow was intolerable, and left him for the rest of his life despondent, self-reproachful, and lacking in concentration. After two ineffectual years in London, Hartley returned to the Lake country, where he made two widely separated attempts at school-teaching. In the interval (c. 1830) he lived for some time at Leeds in the family of F. E. Bingley, a publisher, with whom, according to a contract, he produced a biographical work on *Lives of Illustrious Worthies of Yorkshire* (1835), a part of the *Biographia Borealis* or *Lives of Distinguished Northerners*, previously pub. in 1833. He is, however, best known for his verse, which, if lacking in power, is singularly fine in mood and happy in expression. His sonnets are among the most perfect in the language. From 1838 Hartley lived at Grasmere, spending his time in study and reverie. His chief literary effort was an ed. of Massinger and Ford (1840), including valuable biographies of the dramatists. He d. of bronchitis, and was buried in the place chosen for him by Wordsworth, who was laid beside him a year later. Four vols. of his prose and poetry were ed. by his brother Derwent (1851). As a critic Hartley is delicate and suggestive; as an essayist quaintly humorous, resembling Charles Lamb; and in conversational powers, according to tradition, second only to his father. See *Poems*, with a memoir by his brother, D. Coleridge, 1851; E. L. Griggs, *Hartley Coleridge, his Life and Work*, 1929; E. Blunden, *Coleridge the Less*, 1931.

Coleridge, Herbert (1830-61), philologist, son of Henry Nelson and Sara C., was b. at Hampstead. In 1853 he began

practising as a chancery barrister at Lincoln's Inn. His leisure hours he devoted to philological studies—Sanskrit, the N. tongues, and particularly the Icelandic language and literature. In 1857 he was elected a member of the Philological Society, to which he contributed two papers. The society was planning a supplement to the standard dictionaries of Johnson and Richardson, which soon developed into a scheme for a complete new Eng. dictionary. C. was appointed honorary secretary of a special committee 'formed for the purpose of collecting words and idioms hitherto unregistered.' His new duties, for which he was admirably fitted, practically constituted a general editorship of the work; the results of his researches are embodied in his *Glossarial Index to the Printed English Literature of the Thirteenth Century* (1859), which he describes as the foundation stone of the proposed dictionary. The scheme developed into the *New English Dictionary* (Clarendon Press).

Coleridge, Sir John Duke, first Baron Coleridge (1821-94), Eng. jurist, son of Sir John Taylor C., was b. at Ottery St. Mary. Among his friends and contemporaries at Balliol were Archbishop Temple, Matthew Arnold, Arthur Clough, and Principal Shairp. He was called to the Bar in 1846, and soon gained practice, thanks to his musical voice, his eloquence (which earned him the nickname of silver-tongued C.), and his powers of persuasion. He became recorder of Portsmouth, Q.C., and M.P. for Exeter, as a Liberal, from 1865 to 1873. He supported the Bill for the abolition of religious tests in the univs., and took part in the debates on the disestablishment of the Irish Church. He became lord chief justice of England in 1880. His chief forensic triumph was in the famous Titchborne case, his speech for the defendant lasting twenty-three days. He wrote sev. papers on legal and literary subjects, and was the author of *in memoriam* notices of Matthew Arnold, Principal Shairp, and others. See E. H. Coleridge, *Life and Correspondence of Lord Coleridge*, 1904.

Coleridge, Samuel Taylor (1772-1834), Eng. poet and philosopher, was the son of the Rev. John C., vicar of Ottery St. Mary, Devon. He was only nine years old when his father d. A presentation to Christ's Hospital being obtained, he was a scholar there from 1782 to 1790, among his fellow pupils being Charles Lamb, with whom he formed a lifelong friendship. His love of the classics, especially Lat. authors, attracted the notice and esteem of the headmaster, Dr. Boyer, but strangely enough, for nearly two years (about 1787-88) he was so engrossed with theological and metaphysical studies that, as he himself says, 'everything else became insipid.' What is still more wonderful, he was relieved from this obsession by reading the sonnets of Wm. Lisle Bowles, a very popular poet of his day. He acquired a considerable knowledge of GK., and at Jesus College, Cambridge, which he entered in Feb. 1791,

he won the Browne gold medal for a Gk. ode on the slave trade. But the fatal desultoriness which clouded his after-life showed itself thus early; his studies were irregular, and his rooms were the constant resort of friends who came to enjoy his conversation on all kinds of subjects, especially politics, in which he took intense interest. In 1793, a friend of his being expelled for Unitarianism and sedition, he too left the univ., went to London, and being without resources enlisted in the 15th Dragoons under the name of

SAMUEL TAYLOR COLERIDGE
The painting by Peter Vandyke.

N.P.G.

Silas Tomkins Comberbatch, or Comberbacke. His life as a recruit not being happy, he wrote one day on the stable wall: 'Eheu, quam infortunati miserrimum est fulesco felicem!' (an adaptation from Boethius), which, attracting the notice of an officer, led to inquiries. Friends obtained his discharge, and he returned to college. Visiting Oxford in June, he made the acquaintance of Southey, and the two evolved a delightful scheme of pantisocracy, suggested by certain visionary Fr. philosophers. An ideal community was to be estab. on the banks of the Susquehanna, where brethren (and sisters) should dwell together in altruistic unity. But the colony was never founded. The two friends also collaborated in writing *The Fall of Robespierre*, a drama full of bombastic rhetoric, which was pub. about the time that C. finally left Cambridge, without a degree, towards the end of 1794. He next delivered in Bristol a course of political lectures, very Jacobinistic, and exceedingly virulent in their attacks on Pitt. He also wrote some poems, pub. by his

friend Joseph Cottle, the Bristol bookseller (to whose reminiscences we owe the account of C. in these years), which, while containing some promise of future distinction in style, were often weak, conventional, and, as even their author allowed, turgid. In Oct. 1795 he married Miss Sara Fricker, whose sister Edith soon after became Mrs. Southey. He settled at Clevedon for a short time, but returned to Bristol. He was soon tired of Bristol, and went to Nether Stowey, where he met Wordsworth. C.'s marriage was an unfortunate one; his wife, though an excellent woman, being incapable of affording him intellectual and spiritual companionship, or the support which his moral weaknesses unhappily required. Projecting in 1796 a paper to be called the *Watchman*, which was to be a Herald of Truth, and, to avoid the stamp-tax, was to appear every eighth day, C. started off on a tour to canvass for subscribers, preaching Unitarian sermons as he went, probably the strangest canvasser ever seen. His adventures, as told in his *Biographia Literaria* (1817), are very amusing. The *Watchman* appeared, reached its tenth issue, and died a very natural death. Within the next two years he wrote the *Ancient Mariner*, the first part of *Christabel*, *Kubla Khan*, the *Ode to France*, in fact nearly all his finest poems. The first-mentioned was included in the *Lyrical Ballads* (1798), a vol. planned by the two poets in conjunction. C. was to deal with the supernatural, Wordsworth with subjects of everyday life; the *Ballads*, however, contained only a few pieces by the former. The little vol. was very ill received. Among other notices, the *Monthly Review* spoke of the *Ancient Mariner* as 'the strangest story of a cock and a bull that we ever saw on paper.' It may be observed also that nearly twenty years later, when *Christabel* and *Kubla Khan* appeared, the same *Monthly Review* sagely remarked: 'That so much superior genius should be corrupted and debased by so much execrable taste must be a subject of sincere lamentation to every friend of poetry.' In 1798 Josiah and Thomas Wedgwood allowed him £150 per annum on the implied condition that he should abandon preaching (he had accepted a Unitarian ministry in Shrewsbury) and devote his time to literature. His revolutionary enthusiasm had been disillusioned by the course of events in France, and, desirous of studying Ger. philosophy, he spent about nine months at Ratzelburg and Göttingen, mastering the language, attending the lectures of Prof. Blumenbach, and enjoying glorious hours of oratory and disputation among his fellow students. Returning to England in 1800, he produced his excellent translation of *Wallenstein*. This sold so badly that the publishers, Messrs. Longman, disposed of the greater part of the ed. as waste paper. During this year the *Morning Post*, which had already pub. his *Ode to France* and other pieces, engaged him to write a series of political articles. His articles appeared irregularly

for two years, and then ceased. In the summer of 1800 he removed with his family to Greta Hall, Derwentwater, to be near Wordsworth, who had removed there. But he had been a frequent sufferer from rheumatism ever since boyhood, and the Westmorland climate affected him severely. In the spring of 1801 he began to take opium to relieve his pain; the habit rapidly increased, and, as De Quincey says, 'killed him as a poet.' He became restless and miserable, doing little work, but projecting grandiose schemes which all died in thinking, such as that for an immense *Bibliotheca Britannica*, outlined by him in a letter to Southey, Aug. 1803. Friends came to his assistance; Southey took Greta Hall off his hands, Wedgwood, Wordsworth, and others were full of kindness, and in 1804 he received an invitation to Malta, where he had barely arrived when he was invited to become secretary to the governor, Sir Alexander Ball, a position which he filled with the greatest capacity. This appointment he held for ten months, but his health did not improve, and he went on to Naples and Rome. About midsummer 1806 he was perturbed by a rumour that he was in danger from emissaries of Bonaparte, on account of his anti-Napoleonic essays in the *Morning Post*. This story has been ridiculed, but it so impressed C. that he speedily departed from Leghorn, taking passage in an American ship. Arriving home safe, but miserably broken in mind and body, the record of his next ten years is a painful story of suffering, weakness, and vacillation. Estranged, though not altogether separated from his wife, he moved from place to place, sometimes alone, sometimes with his family. At Bridgewater in 1807 he met for the first time with De Quincey, who was so impressed that, through Cottle, he sent C. an anonymous gift of £300. A series of lectures begun in London, Jan. 1808, on 'Poetry and the Fine Arts,' was a failure, and it is not quite clear how he got through the year, but in 1809 he started a magazine, the *Friend*, under such impossible conditions that its life of eight months was remarkable for length rather than brevity, yet it contained some of C.'s finest prose. Some lectures on Shakespeare and other poets were, however, successful, and he wrote regularly for the *Courier* (1811-12), while his play *Remorse* was well received at Drury Lane. Nevertheless he was continually in pecuniary difficulties; opium had wrecked him morally and physically, and at one time his family was left almost entirely on the hands of Southey and a few other friends. It was now recognised that to give money to C. himself was merely to furnish him with the means of self-degradation. In 1814 he was taking two to three quarts of laudanum per week, or even more, and he had not sufficient will-power left to break off the habit. From 1816 to 1819 he lived with his friend Morgan at Caine, and finally was persuaded to put himself under the charge of a medical man, Mr. Gillman of Highgate, as a resident patient. He could not

possibly have been in better hands; the fatal vice was gradually subdued, a warm attachment grew up between doctor and patient, and Mr. Gillman's house was C.'s haven of safety, which he seldom left during the rest of his life. While he was at Caine he prepared for the press *Christabel and other Poems* (1816), written nearly twenty years before, and other works followed at intervals, including *Sibylline Leaves* (a revised reprint of his poems with a few additions), *Lay Sermons*, and the *Biographia Literaria* (1817). Fourteen literary lectures, delivered in 1818, were successful in every way, and a remarkable account is given by Mr. Gillman of an extra one, delivered extemporarily, the subject, 'The Growth of the Individual Mind,' being given to the lecturer at the last moment. The discourse, says Mr. Gillman, was 'brilliant, eloquent, and logically consecutive,' a wonderful achievement. Unfortunately few of his lectures have been preserved except in the shape of rough notes, but these and his *Literary Remains* prove him to have been one of the greatest poetical, and especially Shakespearean, critics. *Aids to Reflection* appeared in 1805, *Church and State* in 1830, but his finest prose work, *Confessions of an Inquiring Spirit*, was pub. posthumously in 1840. He began life as a warm supporter of the Revolution, and his first vol. of verse emphatically proclaimed his democratic enthusiasm. But disillusion soon came and, like his friend Wordsworth, he turned, politically, to Conservatism. With Wordsworth, however, a strong interest in concrete humanity outlived the chaos of his early hopes. C. however, while always interested in the general affairs of the nation, lacked Wordsworth's intense sympathy with individual men and women. This tendency was to live among abstractions, a tendency intensified by his application to metaphysics and theology. As a philosopher he founded no school, yet exercised a great energising and spiritualising influence on Eng. thought. As a poet he is *sui generis*. In his theory of poetry he stressed the æsthetic quality as the primary consideration, and regarding the language of poetry, he concurs with Wordsworth's 'remonstrance in behalf of truth and nature,' though he entirely rejects his special theories. C.'s *Ancient Mariner*, *Christabel*, and *Kubla Khan* stand by themselves, pictures from magic realms, lit with 'the light that never was on sea or land,' while the metrical theory on which *Christabel* is constructed was the beginning of a new era in Eng. poetry, helping perhaps more than any other single agent to break the fetters of eighteenth-century correctness and monotony. Heartily abused at first, it soon found disciples, among others Scott and Byron. C.'s prose style is brilliant and profound, but diffuse. Hazlitt has well characterised it in the following mischievous paragraph: 'One of his sentences winds its "forlorn way obscure" over the page like a patriarchal procession with camels laden, wreathed turbans,

household wealth, the whole riches of the author's mind poured out upon the barren waste of his subject. The palm-tree spreads its sterile branches overhead, and the land of promise is seen in the distance.' As a conversationalist C. was unrivalled, fascinating all who met him. His personal appearance has been described by many of his friends, including Dorothy Wordsworth, De Quincey, and Southey, and mostly their descriptions agree. Southey says that the power of his eye, forehead, and brow was astonishing, but that nothing could be more imbecile than the rest of his face. C. himself says to Thelwall (in 1796): 'My face, unless when animated by immediate eloquence, expresses great sloth, and great, indeed, almost idiotic, good nature. 'Tis a mere carcase of a face, fat, flabby, and expressive chiefly of inexpression. Yet I am told that my eyes, eyebrows and forehead are physiognomically good' (*Letters*, ed. E. H. Coleridge, No. 64). In 1797, Dorothy Wordsworth in describing him speaks of the plainness of his features, but adds: 'If you hear him speak for five minutes you talk no more of them.' And even in his decrepitude Carlyle speaks of him as 'the most surprising talker extant in this world. See J. D. Campbell, *Samuel Taylor Coleridge*, 1894; Sir A. T. Quiller-Couch, *Coleridge*, 1918; H. L. A. Fausset, *Samuel Taylor Coleridge*, 1926; J. H. Muirhead, *Coleridge as Philosopher*, 1930; Sir E. K. Chambers, *Samuel Taylor Coleridge*, 1938.

Coleridge, Sara (1802-52), daughter of Samuel Taylor C., was b. at Greta Hall, near Keswick, where she lived under the care of Southey and in the frequent society of Wordsworth. She pub. (1821) an excellent trans. of Dobrizhoffer's *Lat. Account of the Abipones*, an equestrian people of Paraguay, and also trans. the *Memoirs of the Chevalier Bayard* (1825). Her *Pretty Lessons in Verse for Good Children* appeared in 1834, and *Phantasmion*, an imaginative fairy tale, in 1837. In 1843 her husband, Henry Nelson C., d. and she continued his task of editing and annotating her father's works. She left a son and a daughter, who pub. *Memoir and Letters of Sara Coleridge*, 1873.

Coleridge-Taylor, Samuel (1875-1912), musical composer of Anglo-African descent, b. in London. His father was a native of Sierra Leone, his mother an Englishwoman, and he was brought up under Eng. influences. He distinguished himself at the Royal College of Music, winning the composition scholarship in 1893, and studying under Villiers-Stanford till 1896. He organised a series of successful orchestral concerts at Croydon, and wrote for the Three Choirs festivals and the Birmingham and Leeds festivals. His first real recognition as a composer was when Elgar recommended his name to the Gloucester Festival committee, which resulted in the composition and performance of his orchestral *Ballad in A minor*. In 1898 his choral-orchestral *Hiawatha's Wedding Feast* was performed at a concert of the Royal

College of Music. After this, notwithstanding continued difficulty in making an adequate income, his reputation was estab. with the remainder of his trilogy, namely *The Death of Minnehaha* (1899), and *Hiawatha's Departure* (1900). Other works include *The Blind Girl of Castel-Cuillé* and *Meg Blane*; *A Tale of Old Japan* (1911), a cantata; *The Atone-ment*, sacred cantata; works for orchestra, for chamber combinations; Negro melodies for piano; incidental music for plays; and songs. His early death is to be deplored, as it is probable that his full development had not been attained (Scholes).

Coleroon River, N. branch of the Cavery (Cauvery or Kaveri) R., India, near its delta. It enters the bay of Bengal at Devicotta, 24 m. from Tranquebar. For some way it forms a boundary between the Madras dists. of Tanjore and Trichinopoly.

Coles, Cowper Phipps (1819-70), Eng. naval architect and officer, who served at Sebastopol with distinction, 1854, becoming captain, 1856. He invented shot-proof rafts of floating batteries, and was keenly interested in the construction of turreted ships. His claim to be the originator of the *Monitor* type of ironclads must be yielded to Ericsson and others. C. was drowned in the capsizing of the *Captain* in a gale off Finisterre.

Colesberg: 1. Dist. of N. Cape Colony. 2. Also cap. of above, 57 m. from Middelburg, 142 m. from Bloemfontein, with eight churches and synagogues. It is high, dry, and a health resort, and has sulphur springs. It was the scene of active operations in the Anglo-Boer war, 1899-1902. Pop. white 1000, native 1000.

Coleseed, see RAPE.

Coleshill, mkt. tn. and par. of Warwick, England, Tamworth div., 8 m. from Birmingham, on the London Midland Region railway, and R. Cole. Pop. 3000.

Colet, John (d. 1519), dean of St. Paul's, was probably b. in 1467. He was educated at Oxford, where he took his M.A. degree and had two or three benefices conferred on him when he was quite young, as this was the custom for those destined for a clerical career. About 1493 he made a tour on the Continent, where he studied law and literature, and it is said became acquainted with Savonarola. In 1496 he returned to England, and was for a time resident in Oxford, where he lectured on St. Paul's epistles. In 1498 Erasmus was in Oxford, and he and C. then became friends, and in 1505 C. was made dean of St. Paul's, thus becoming acquainted with Sir Thomas More. In the same year he inherited a fortune from his father, and with some of this money he founded St. Paul's School. In 1511 he made a pilgrimage with Erasmus to Canterbury, and the next year preached in Westminster Abbey when Wolsey was installed as cardinal. He d. four years later, and was buried in St. Paul's. It is rather for his learning and attitude to the advancement of knowledge than for his own writings that C.

has a place in the hist. of literature. The 'New Learning' or Humanism, as it was called to distinguish it from the old scholasticism, reached its zenith in the reign of Henry VIII., its supreme exponent, Erasmus, being the appreciative friend of the Eng. humanists, chief of whom were More, C., and Fisher. C., like More, was well grounded in Gk. erudition, and it was through his influence and that of More and Linacre that Erasmus applied himself to Gk.. C. in especial giving him a new understanding of theology and with it the hope of a peaceful reformation in the Church. The influence of C. and other humanists on education and culture steadily grew in this period, though its effects could not then begin to be felt in Eng. literature; but the knowledge of Gk. mythology and the inspiration of the Gk. classics, vital factors in the grandeur of Elizabethan literature, owed everything to the humanists, and the strongest personality among them all was that of Dean C. See J. H. Lupton, *Dean Colet, the Founder of St. Paul's; a Lecture*, 1887.

Colet, Louise (née Revoll) (1810-76). Fr. poetess, novelist, and miscellaneous writer. In 1834 she married the musician, Hippolyte C. Her first vol. of poems, *Fleurs du Midi*, appeared in 1836 and attracted considerable attention. On several occasions her poems were crowned by the French Academy. Mme C. was intimate with Cousin, de Musset, Villain, and Flaubert. Among her poems are *Les Chants des vaincus* (1840); *Charlotte Corday et Madame Roland* (1842); *La Religieuse* (1856). Her prose works include *La Jeunesse de Mirabeau* (1841); *Lui, roman contemporain* (biography disguised as fiction) (1859); *Les Derniers Abbés* (1868). She also gained notoriety by being involved in various public controversies.

Colette, pseudonym of Sidonie Gabrielle Claudine Colette (Mme Henri de Jouvenel) (b. 1873), Fr. writer. Her earliest works include a series of stories of a semi-autobiographical character, entitled *Claudine à l'École* (1900); *Claudine à Paris* (1901); *Claudine en ménage* (1902); *Claudine s'en va* (in collaboration with M. Willy, 1903). Among her novels are *L'Ingénue libertine* (1905); *La Retraite sentimentale* (1907); *La Vagabonde* (1910); *L'Enlèvement* (1914); *Chéri* (1920); *La Fin de Chéri* (1926); and *La Châtelaine* (1933). She also written short stories, essays, and some plays. Chevalier of the Legion of Honour.

Colgate University, Amer. institution for the higher education of men. Founded in 1819 in Hamilton, New York, it was incorporated as Madison Univ. in 1846. In 1890 the name was changed to C. U., on account of benefaction received from the C. family, and in 1893 Hamilton Theological Seminary was united to it. An interesting account of the early days and of students is given in *The First Half-Century of Madison University* (1872).

Colic, spasmodic or crampy affection of the muscular fibre coat of the intestines.

The patient is subject to great pain, with intervals free from it, and at the same time there is obstinate constipation and sometimes vomiting. There is no inflammation or fever, and a peculiarity is that it is relieved by pressure on the abdomen, thus distinguishing it from inflammation of the bowels. The disease is most likely due to passive congestion, and is due directly to sev. causes. Indigestion is the most common cause, especially in children, and the eating of large quantities of indigestible food, such as raw greenstuff, generally may be found to have preceded the attack. Other causes are cold in the stomach due to insufficient warm woollen clothing on that part, and a particular variety known as painter's C. is due to lead poisoning. The pain is very severe, and causes the patient to draw up his knees to the stomach, and the first care is to relieve this pain. The general method of palliation is by means of opiates, which are generally administered in large doses. Then the bowels must be evacuated, an obstinate process that, by reason of the pain, the patient is unable to perform for himself. For C. in horses, see under HORSE (DISEASES).

Coligny, François de (d'Andelot), (1531-1568), fourth son of Gaspard de C., maréchal de Châtillon, and Louise de Montmorency (d. 1522). He, like his brothers Gaspard and Odet, adopted the Reformed faith, and was an ardent promoter of the *livres de boucliers* of 1560, 1562, and 1567. He was poisoned at Saintes, probably at the instigation of Catherine de' Medici.

Coligny, Gaspard de (1519-72), Fr. soldier and admiral, was the third son of Gaspard. In 1543 C. began his career by taking part in military affairs, and was wounded at Montmédy and Bains. In the following year he served in Italy and did distinguished service at Ceresole. In 1547 he was appointed colonel-general of the infantry, a position of considerable importance in France, and while holding this office he carried out many reforms. In 1552 he was made admiral, and in 1557 he was captured at St. Quentin— and was imprisoned in the fortress of L'Écluse, but subsequently ransomed. During this time he began to embrace the doctrine of the Reformers, and constituted himself the champion of the Protestants, sending out colonies of Huguenots, one of them to Brazil. He then took up arms against the Guiseas, and fought at Dreux, St. Denis, Jarnac, and Montcontour, in most of which battles he was defeated. In 1570 peace was signed at St. Germain, and C. returned to court. He counselled King Charles IX. to lead an expedition against Spain, but the queen-mother feared that her prestige with Charles was declining owing to the favour shown to C., and contrived that the expedition should not be successful, the result of her intervention being the massacre of St. Bartholomew, Aug. 24, 1572. On this date C., who had been shot at two days before at the instigation of the queen-mother, but only slightly

injured, was again the subject of an attack—this time at his house—and was slain by a Ger. named Besme. See L. J. Delaborde, *Gaspard de Coligny, Admiral of France, 1879-82*.

Coligny, Odet de (c. 1517-71), second son of Gaspard, brother of François (d. 1569). He was created cardinal, 1533; archbishop of Toulouse, 1534; and bishop of Beauvais, 1535. He did not openly profess Protestant views till 1560, and even afterwards was still known as Le Cardinal de Châtillon. In 1561 he abjured Catholicism, and was excommunicated by the pope, 1563. C. was plenipotentiary of the Huguenots during the civil war of 1567-68, and was forced to flee to England to escape from Catherine de' Medici. He was poisoned, probably at her command, at Hampton Court, when intending to return to France, after the declaration of peace (St. Germain, 1570). See Brantôme, *Mémoires*, 1665-66; L. Moreri, *Le Grand Dictionnaire historique*, 1759; J. F. Michaud, *Biographie universelle*, 1843-66; Mariet, *Le Cardinal de Châtillon*, 1883.

Collima: A state of Mexico, bounded by Jalisco on the N., the Pacific Ocean on the S.W., and Michoacan on the E. The surface is mostly mountainous. Among its productions are sugar, maize, pulse, rice, tobacco, palm-oil, indigo, corn, cotton, and rich fruits. It exports much coffee, hides, and palm-leaf hats. There are salt deposits in the coast region, and ore deposits in the mts. Area 2275 sq. m. Pop. (1940) 79,000. 2. Cap. of above, 30 m. from Manzanillo, the chief port, 145 m. from Guadalajara, in the valley watered by C. R. It is a great commercial centre. Pop. 30,000. Also a volcano near by, 12,750 ft. (in eruption in 1869), and a snow mt., 14,364 ft.

Colin, Alexander (1526-1612), Flemish sculptor, was b. at Malines. Ferdinand I. commissioned him to help with a monument erected to Maximilian I. at Innsbruck, and the greater part of the work on this tomb was done by him. C. held the post of sculptor to the emperor, and in the church where Maximilian's tomb is are those of the Archduke Ferdinand and Bishop Jean Nas, both the work of this sculptor.

Coliseum, see COLOSSEUM.

Colitis, inflammation of the mucous membrane of the colon, which is that part of the large intestine extending from the cæcum to the rectum.

Coll, is. forming a par. of the same name in Argyllshire, Scotland, one of the Inner Hebrides on the W. coast of Mull, 10 m. from Ardnamurchan Point. Length 12 m., breadth 1-4 m. It has sev. small bays and a harbour, at Avinagour. The is. has a wide reputation for its cheese. Pop. 400.

Colladon, Jean Daniel (1802-92), Swiss engineer, b. at Geneva. He won the Grand Prix at the Academy of Science in Paris in 1827 with *Mémoire sur la compression des liquides et la vitesse du son dans l'eau*, and two years later received the professorship of mechanics at the School of Arts and Manufs. in that city.

He invented a dynamometer which was adopted by the Brit. Admiralty, and developed the use of the energy stored in compressed air in tunnelling operations in 1852. His most important work is *Mémoires des savants étrangers* (1838).

Collagen, protein of white elastic fibres and of bone, which, boiled with water, produces gelatine.

Collapse, moderately severe condition of shock (q.v.). A patient suffering from shock lies in a state of utter prostration. The face is pale and drawn, the body cold and clammy, the pulse is quick, but barely perceptible, and the breathing short and gasping, being at times suspended. It may result from any shock to the nervous system, causing an arrest of the heart's action, while it also precedes death in cases of cholera and other exhausting diseases. Cardiac stimulants such as strychnine are used, and artificial heat is supplied, in cases of this sort. Rectal injections of warm saline solution, or injection of blood or saline solution into a vein, are necessary in cases caused by hæmorrhage.

Collapse, Pulmonary, or Apneumatosi, term used to signify that condition when a portion of a lung ceases to expand and contain air with inspiration. It may be caused in two ways, either, as in the case of an effusion of fluid in pleurisy, by pressure being exerted on the outside of the lung, or, as in the case of a blocking of the bronchial tube by a tumour, by an obstruction preventing the access of air to the lung. Suffocation may be caused by this state, of course, and the chances of recovery largely depend upon the strength of the patient and the severity of the C. Ipecacuanha or other drugs are used to promote expectoration in order to remove the mucus blocking the way, together with, in many cases, stimulants such as aromatic spirits of ammonia.

Collatio, or Mosaicarum et Romanarum Legum Collatio, or Lex Dei, compilation comparing the law of Moses and Rom. law in sixteen titles, probably dating from the sixth century A.D. Each title is headed thus by legal rules from the law of Moses, 'Moses dicit.' There follow, by way of comparison, rules of Rom. law from the five Rom. jurists, Papinian, Paulus, Gaius, Ulpian, and Modestinus (third century A.D.), and from the three compilations which preceded Justinian's *Corpus Juris Civilis* (sixth century A.D.), *Gregorianus Codex*, *Hermogenianus Codex*, and *Theodosianus Codex* (from the time of Constantine to that of Theodosius II., first pub. A.D. 438). The C. is valuable for its extracts from the above sources. It is printed in Schulting's *Jurisprudentia Vetus Ante-Justiniana*, 1717. An ed. by Blume appeared in the Bonn ed. of the *Corpus Juris Ante-Justinianei*, and a separat. ed. in 1833.

Colle, Raffaellino dal, It. painter b. at Colle near Borgo San Sepolcro about 1490. He was a pupil of Raphael and then of Giulio Romano. He assisted Raphael in the decoration of the Vatican. In his school at San Sepolcro, Gherardi, Vecchia, and other artists received their

training. Grace and conscientiousness characterise C.'s work.

Collect, brief prayer, offered up for some special purpose or on some special day. The etymology of the word is uncertain, though it is evidently derived from Lat. *colligere*, to collect. One explanation is that the prayer collects or gathers up in a comprehensive form the petition of all the people assembled. Thus it was offered up before the whole congregation, *ad collectam*, and was distinguished from prayers offered up during mass, *ad missam*. Some argue, however, that the prayer was so called because it collected or gave a brief paraphrase of the teaching of the epistle and gospel, which it immediately preceded. The form of the C. is very simple. It begins with an invocation to God, contains one single petition, with special reference to the day or event celebrated, and closes in praise to Jesus Christ. The Cs. of the Common Prayer Book were composed at a very early date. Eight were added in 1661, and most of those for saints' days were written at the Reformation. Many are derived from the sacramentaries of St. Leo (A.D. 440-61), of St. Gelasius (492-98), and of Pope Gregory (590-604). The Cs. for Advent, Christmas Day, Ash Wednesday, and a few others, have been adapted from ancient prayers. See Canon Bright, *Ancient Collects*, 1857; S.P.C.K., *On the Collects*, 1862; F. Procter and W. H. Frere, *A New History of the Book of Common Prayer*, 1905.

Collections at Churches. In Scotland up to 1845 the contributions made at par. churches formed the prin. fund for the support of the poor. A proclamation of Aug. 29, 1693, ordained that one-half only of the sums collected at par. churches and of the dues received by the kirk-session, should be paid over by them into the general fund for the relief of the poor. No directions were given as to the objects to which the remaining half was to be applied, but in practice it was used by the kirk-session for grants by way of temporary relief in cases of sudden distress and pending admission to the permanent roll of the poor. The courts also allowed as proper charges against the fund the session-clerk's salary and the cost of a new tent for field preachings. C. received at dissenting meeting-houses did not form part of the poor's fund, but were at the sole disposal of the congregation by whom they were supplied. The collection of contributions at church doors was properly the province of the minister and elders; but when they neglected that duty, the heritors used to officiate in their stead. C. at C., eked out in a number of pars. by mortifications, and mortcloth dues, and by assessments on heritors, formed practically the sole fund for the maintenance of the poor down to the middle of the nineteenth century, when it broke down through the rise of large tns. and the increase of religious dissent. Then came the Poor Law Act, 1845, which gave all par. councils certain powers for the relief of the poor, and although the system under that Act is not

compulsorily imposed on Scottish pars., it became almost universally adopted. In England at the present day C. at C. are made as they have been made for a great number of years by passing round a plate or bag. But, except in regard to the provisions as to the offertory, there have never existed any statutory or other legal provisions as to the destination of the sums so collected. By an Act passed in the twenty-seventh year of Henry VIII.'s reign, it was provided that money collected for the poor should be kept in the common coffer or box standing in the church of every par.; and Canon No. 84 enjoins on the churchwardens the duty of setting up a 'strong chest, with a hole in the upper part thereof,' in a convenient place, 'to the intent the parishioners may put into it their alms for their poor neighbours.' The present rubric substitutes a basin to be provided by the par. Alms collected at the offertory—which was anciently an oblation for the use of the priest and changed at the Reformation into alms for the poor—whether in churches or chapels, were, according to the rubric, at the disposal of the incumbent and churchwardens, who are to distribute the money to such pious and charitable uses as they think fit.

Collective Security, concept which grew out of the Geneva conferences on disarmament after the First World War (see DISARMAMENT) and acquired an added emphasis during the Italo-Ethiopian war. Literally, C. S. meant that, under the covenant of the League of Nations (see COVENANT OF THE LEAGUE OF NATIONS), the member states of the League should together guarantee the security of each individual member. When Mussolini threatened Abyssinia, a special committee on C. S. was formed with a view to curbing not only his aggressive designs but also to check the menace implicit in Ger. rearmament. Fundamental difficulties which had, however, previously arisen over the concept culminated in the fiasco of the League's vain efforts to prevent Italy from making war upon Abyssinia. For it now became evident that, even if the League could ensure resistance to a war of territorial aggression—and experience in 1939-40 was to show that it could not—it could not compel nations to compromise on issues which they felt to be vital to their national interests, and, generally speaking, no other issues really mattered. A further effort to construct a new system of C. S. through a series of multilateral politico-military alliances, all aimed against Hitler's policy of naked aggression, proved equally futile. On the constitution, functions, and powers of the Security Council of the United Nations, which has replaced the machinery of the covenant of the League, see UNITED NATIONS CHARTER.

Collectivism, word of modern origin, first used apparently by Bakunin to express the distinction between his tenets and those of Karl Marx, has since come to convey the same idea as Socialism, and is the theory that industry should be

carried on with collective capital under the control of the community. See ANARCHISM and SOCIALISM; on the collectivisation of farms in Russia see under RUSSIA.

Colle di Val d'Elsa, tn. of Italy, in the prov. of Siena. It is situated on the Elsa, 22 m. S.S.W. of Florence. It is an episcopal see, and has a fine medieval cathedral and a number of old palaces. In the new part of the tn. there are paper and glass factories. Pop. (com.) 10,000.

College, in Rom. law, an association of persons for a specific purpose, a body of colleagues. The C. corresponded roughly with our corporation; it had to be incorporated by some public authority, springing from either senate or emperor. Collegia might exist for purposes of trade (cf. gilds), for religious purposes (e.g. Cs. of augurs, pontifices, etc.), or for political purposes (e.g. *tribunorum plebis collegia*). By Rom. law a C. must have at least three members. With us a C. is an incorporation or society of persons joined together generally for educational literary, or scientific purposes, and frequently possessing peculiar privileges. Such are the Cs. of Oxford and Cambridge (see UNIVERSITIES), C. of Physicians, C. of Surgeons, Heralds' C., etc. Educational Cs. seem to have grown out of the voluntary association of teachers and students at the univ. They seem to have been more numerous and flourishing than anything we know now; we hear of 300 halls or societies at Oxford, and 30,000 students. Men of wealth and culture, especially the political bishops and chancellors of England, obtained charters from the Crown for the incorporation of societies of scholars, and these gradually became the places of abode for students attending the univ. Later the univ. and the C. became co-extensive; every member of the univ. had to belong to some C. or hall, and was obliged to matriculate in the univ. The corporation consists of a head or master, fellows, and scholars. The governing body is the head and fellows. All eccles. or educational corporations have a visitor, whose duty it is to see that the founder's statutes are obeyed, and to decide disputed cases, provided they do not come under the common laws of the country or have to do with trusts attached to the C. The visitorship usually resides in the founder and his heirs or in the Crown. The fellowships, scholarships, etc., of Cs. are subject to various restrictions, which are gradually being abolished. Some of the public schools are Cs., and many secondary schools are so called. In Scotland and in the U.S.A., the C. is not distinguished from the univ., and we hear of Cs. granting degrees.

Collège de France, The, was founded in Paris by Francis I., about 1520-45, in opposition to the scholasticism of the univ. Erasmus was asked to be its principal, but he refused. It was first known as the Collège de Trois Langues, because originally the teaching embraced only three languages—Gk., Heb., and Lat. The univ. of Paris has frequently tried to

obtain control, but without success. Until the time of the revolution it was regarded as a royal college. It is now under the control of the minister of public instruction, but it is autonomous. There are no fees, no examinations, and no degrees or diplomas. Scientific research work is particularly encouraged. Its famous profs. have numbered Rollin, Saint-Iliaire, Laboulaye, and Gaston. At the present day there are over forty chairs, and every branch of learning is taught. See C. P. Gouyet, *Le Collège royal de France*, 1758; and Bouchon-Brandely, *Le Collège de France*, 1873.

College Point, formerly a post vil. of Queen's co., New York, on Long Is. Sound. Since 1898 it has been recognised as part of New York city.

Colleges, Training, see TRAINING COLLEGES.

Collegiate Church (from Lat. *collegium*, assembly), one to which is attached a body of clergy, differing from a cathedral in that it is not the seat of a bishop. It is supervised by the bishop of the diocese. There were many on the Continent before the Reformation, the most famous one being that of Aix-la-Chapelle. After the Reformation, nearly all of those in England were suppressed by Edward VI. Ripon and Manchester have since been constituted cathedrals for new dioceses. In Scotland the term is applied to a church which has two incumbents in the par.

Collembola, name given by Sir John Lubbock to the minute wingless insects known as spring-tails. Their chief characteristic is the power possessed by most of them of taking sudden leaps when alarmed, made possible by a curious apparatus on the under part of the body. See Sir J. Lubbock, *Monograph of the Collembola and Thysanura*, 1873.

Colleoni, or **Colseone**, **Bartolommeo** (1400-1475). It. soldier, b. at the castle of Solza, near Bergamo. In the war between the Milanese and Venetians his services were in great request by either side, and he fought for both. In 1446 he was imprisoned as a spy by Philip Visconti, duke of Milan. In 1451 he definitely joined the Venetian army and became generalissimo of the Venetian state, when he showed his brilliant military talents. Near the church of ss. Giovanni e Paolo in Venice there stands an equestrian statue in his memory, executed by Andrea del Verrocchio.

Colles, **Abraham** (1773-1843), Brit. surgeon, b. at Millmount, near Kilkenny, Eire. He was appointed prof. of anatomy and surgery in the Irish College of Surgeons (1804-36), and discovered what is known as C.'s fracture of the radius. He pub. sev. papers on medical and surgical subjects, including *The Use of Mercury in Venereal Complaints* (1837).

Colles, **Jenny Cope** (1879-1943), Eng. musical critic. Educated at Royal College of Music and Worcester College, Oxford. Became assistant music critic to *The Times* in 1906, and chief critic in 1911. Wrote a number of valuable books on music and ed. the third and fourth eds. of Grove's *Dictionary of Music*.

Colle-Salvetti, com. in Tuscany, Italy, 10 m. S.E. of Pisa. Pop. 11,000.

Collesano, tn. of Sicily, 25 m. E.S.E. of Palermo. Jasper and agate are quarried. Pop. 8000.

Collett, Jakobine Camilla (*née Wergeland*) (1813-95), Norwegian novelist, sister of the poet Henrik Wergeland. She was the chief exponent in Norway of the emancipation of women, and her writings deal largely with the suppression of a woman's personality in married life. Her novels give a realistic picture of Norwegian domestic life. Her first, *Amtmandens Døttre* (1885), is perhaps the best. Others are *Fortællinger* (1861); *I de lange Nætter* (1863); *Sidste Blad* (1868-72); and *Mod Strømmen* (1879, 1885).

Colletta, Pietro (1775-1831), lt. statesman and historian, b. at Naples. He took part in the rising of Ferdinand of Naples (1799), and served with distinction in the army of Joseph Bonaparte till 1806. In 1815 his troops suffered defeat from the Austrian army at Casalanza, but his services were retained. His great historical work, *Storia del Reame di Napoli dal 1734 sino al 1825* (1834), was trans. into Eng. in 1858 by Horner. Consult the memoir by G. Capponi in the 2nd ed. of the *Storia*, 1848.

Colley, Richard, see WELLESLEY, MARQUESS.

ROUGH-COATED COLLIE

Collie, sheep-dog used to protect and control flocks. The Scottish C. is one of the most popular breeds, on account of the affectionate faithfulness it exhibits towards its owner. Renowned for its sagacity and intelligence, and with a snappy temper, it was formerly used chiefly in Scotland and N. England purely as a sheep-dog. During the middle of the last century, and until the 1920s, he was popular as a domestic companion, and was seen in tns. as frequently as on the mt. side. His popularity as a pet or show dog, however, has declined in recent years. There are two kinds of Scottish Cs., rough and smooth haired. The chief points to be looked for are a long head with a sharp nose; ears small, and folded back at the tips when in repose; eyes bright and dark, set obliquely somewhat close

together; fore-legs straight; hocks bent; feet strong and round. The rough-coated variety should have a very thick, soft under-coat, hanging from which a long and wiry outercoat; a full mane and deep frill round the neck; fore-legs a little feathered; hind-legs smooth below the hocks; a long and bushy tail. The smooth-coated C. has no feathering on tail, ears, and legs; his coat is flat but thick. The average height for dogs is 22 to 24 in., for bitches, 21 in.; the average weight for dogs is from 50 to 65 lb., for bitches from 40 to 50 lb. The colour varies considerably, from black and tan, tan and white, sable and white, to pure white. The Welsh bob-tailed C. has a long, shaggy, blue-grey coat, and stands 25 in. high. Its tail is cropped when young. Cs. are often crossed with black-and-tan setters.

Collie, tn. in coal-fields, 122 m. from Perth, W. Australia. Pop. 4500.

Collier, Arthur (1680-1732), Eng. metaphysician, who wrote *Clavis Universalis*, or *A New Inquiry after Truth*, being a demonstration of the Non-Existence and Impossibility of the Eternal World (1713); *A Specimen of True Philosophy* (1730), and *Logology, or a Treatise on the Logos* (1732).

Collier, Sir George (1738-95), Brit. vice-admiral, b. in London. He entered the navy in 1751, and in ten years was promoted to the rank of commander. He was appointed senior officer at Halifax, Nova Scotia (1776-79), and, when commanding the *Rainbow*, captured the Amer. frigate, the *Hancock* (1777). In 1779 he relieved Penobscot and did much damage to the Amer. ships. He took part in the relief of Gibraltar, when he was successful in capturing the Sp. frigate, the *Leocadia* (1781).

Collier, Jeremy (1650-1726), Eng. religious writer and indomitable assailant of the gov. of his time. He was b. at Stow-cum-Quy, Cambridgeshire, educated at Caius College, and took orders in 1677. On leaving college he became rector of Ampton in Suffolk, and afterwards lecturer at Gray's Inn and preacher of the Rolls. He was an extreme high churchman, and at the revolution refused to take the oaths to gov. For writing a pamphlet in defence of the de throne monarch he was committed to prison, and again in 1692 for a series of pamphlets against William. He was released without trial, and again he returned to the charge, harassing the gov. by violent pamphlets, and openly exulting at any reverse suffered by it. In 1696 he went so far as to pronounce absolution without confession on the scaffold at Tyburn to Friend and Parkyns, executed for plotting the murder of the king. To avoid recognising the authority of government by giving bail, C. absconded when the matter was brought before the court. For this he was outlawed, and he remained under the ban for the rest of his life. He now gave himself up principally to literary work. He wrote *The Great Historical, Geographical, Genealogical and Political Dictionary*, trans. chiefly from

Moréri (1701); issued essays upon many moral, religious, and political subjects, a vol. of practical discourses, and a trans. of the *Meditations of Marcus Aurelius* (1701); and *An Ecclesiastical History of Great Britain, chiefly of England, 1708-14*. His famous treatise, *A Short View of the Profaneness and Immorality of the English Stage* (1698), roused against him the violent opposition of the theatrical world, and led him into a long and triumphant controversy with Congreve and Vanbrugh. Lord Macanlay eulogises this treatise in these words: 'There is hardly any book of that time from which it would be possible to select specimens of writing so excellent and so various.' C. was a man of profound and extensive learning, of great ability, and honest, though somewhat bigoted. His persistent opposition to the gov. probably alone stood in the way of his being raised to the highest eccles. dignities.

Collier, John (1708-86), Eng. poet and painter, b. at Urnston, near Manchester. In early life he was apprenticed to a Dutch weaver, but in 1729 obtained a position in a law school at Milnrow, near Rochdale, which he held till his death. He excelled in caricature-drawing and in rhyming satire. Under the name of 'Tim Bobbin,' he pub. *The Blackbird* (1739), *View of the Lancashire Dialect* (1746), *Truth in a Mask* (1757), *The Fortune-Teller* (1771), two skits on John Whitaker's *History of Manchester*, in collaboration with Col Townley (1771, 1773); and a vol. of twenty-six humorous engravings, with rhyming descriptions, entitled *The Human Passions delineated* (1772-73). Consult the life by H. Fishwick, prefaced to his works, 1895.

Collier, John (1850-1934), Eng. painter. He was b. in London Jan. 27, being the second son of Sir Robert Porrett C., afterwards Lord Monkswell, and was educated at Eton. Thereafter, at Heidelberg, he was chiefly interested in duelling. He studied art at the Slade School and at Paris and Munich, and had some hints from Alma-Tadema and Millais. He exhibited at the Academy from 1877, and obtained considerable fame and popularity through his 'story-telling' pictures—e.g.: 'The Last Voyage of Henry Hudson' (1881); 'A Glass of Wine with Cæsar Borgia' (1893); 'Urban VI' (under the torture-chamber window) (1896); 'A Confession' (1902); 'The Prodigal Daughter' (1903); 'Mariage de Convenience' (1907); 'A Fallen Idol' (1913). But his best work is in portraiture—e.g.: Rudyard Kipling (1891); Prof. Huxley (1891); Prof. Burdon Sanderson (1894); The Duke of York (i.e. George V.) (1901); Prof. E. Ray Lankester (1904); Lord Alverstone (1912). He pub. works on the art of painting, including *A Manual of Oil Painting* (1903), and *The Art of Portrait Painting* (1905).

Collier, John Payne (1789-1883), Eng. Shakespearian critic and commentator, b. in London. He was called to the Bar in 1820. His first publication, *The Poetical Decameron*, appeared in 1820; in 1825-1827 he prepared a new ed. of Dodsley's

Old Plays, to which he added six which had not hitherto been in print. Henceforward he devoted his life to the study of Elizabethan literature, but gave most of his time to the plays of Shakspeare. He issued *The History of English Dramatic Poetry to the Time of Shakspeare*, and *Annals of the Stage to the Restoration* (1831); *New Facts; New Particulars*; and *Further Particulars on Shakspeare*, in three vols. (1835-39); an ed. of the poet in eight vols. (1842-44); and *Memoirs of Actors in the Plays of Shakspeare* (1846). C. was one of the founders of the Shakspeare and Camden Societies, for which he ed. many old texts. In 1852 he pub. a vol., entitled *Notes and Emendations to the Text of Shakspeare's Plays*, which caused a great sensation among Eng. and Ger. scholars. He possessed a copy of the 1632 folio, since known as the Perkins folio, because on it is inscribed 'Tho. Perkins his Booke.' C. asserted that the notes written in the margin of his folio dated from the middle of the seventeenth century, and adopted them as emendations of the text. It was afterwards proved that the marginal notes were forgeries. These and other forgeries of his are carefully enumerated in Sir Sidney Lee's *Life of Shakspeare* (appendix 1.) C. also wrote a *Bibliographical and Critical Account of the Rarest Books in the English Language* (1865), *An Old Man's Diary, Forty Years Ago* (1871-72), and ed. seventeenth- and eighteenth-century Reprints, and the works of Thomas Heywood and Edmund Spenser. See H. B. Wheatley, *Notes on the Life of John Payne Collier*, 1881.

Collier, Robert Porrett, see MONKWELL, BARON.

Colliery, see under COAL MINING, and COAL SUPPLIES.

Collimation, adjustment of a telescope in such a manner that the line of sight (optical axis) is exactly perpendicular to the axis of movement. One common method of obtaining C. is by adjusting the telescope in its ordinary position, and when it is reversed in the bearings the angular discrepancy is noted, and one-half of that gives the error of collimation. A collimator is an auxiliary telescope used to detect and correct errors in C. It is fitted with cross wires and mounted before the transit instrument. When these threads coincide with the axes of the telescope, then it is collimated both vertically and horizontally. In determining the nadir point, a telescope may be its own C., if it is fitted with a collimating eye-piece.

Collings, Jesse (1831-1920), politician, was until 1879 head of the firm of Collings and Wallis, merchants, Birmingham. Elected as member for Ipswich, 1880. It was C.'s Small Holdings amendment to the Art. Press—an amendment involving the Radical scheme for 'three acres and a cow,' which secured in 1886 the downfall of Lord Salisbury's Ministry. In the same year he first represented Bordesley (Birmingham) in the House, and for a short period acted as parl. secretary to Joseph Chamberlain, president of the

Local Gov. Board. Besides founding the Rural Labourers' League, and the National Education League he played an active part in the municipal life of Birmingham. *D.* at Edgbaston Nov. 20.

Collingswood, bor. 3 m. from Camden, New Jersey, U.S.A., a residential t.n., pop. 9000.

Collingwood: 1. City in Bourke co., Victoria, Australia, situated on the R. Yarra-Yarra, and forming a N.E. suburb of Melbourne. Pop. 35,000. 2. Lake port of Ontario, Canada, situated in Simcoe co. on the S. shore of the Georgian Bay, Lake Huron, 72 m. N.W. of Toronto. It is a terminus for two lines of steamers from Huron to Lake Superior ports, and possesses a large dry-dock and shipyard. An important trade in grain and lumber is carried on, and there are numerous factories. Pop. 11,000.

Collingwood, Cuthbert, Admiral Lord (1750-1810), *b.* at Newcastle. He went to sea when eleven years old, became lieutenant in 1774, was appointed commander of the *Badger* in 1779, and soon after post-captain of the *Hinchinbrook*. He served under his friend Lord Nelson in the Sp. main in 1780, and again in the W. Indies in 1783-86. In 1793 he was captain of Rear-Adm. Bowyer's flagship the *Prince*. He was actively engaged under Howe at the great battle of June 1, 1794, and under Jervis off Cape St. Vincent on Feb. 14, 1797. His extraordinary valour and judgment in these two engagements caused him to be held in great honour by the whole fleet. In 1799 he was made vice-admiral, and from 1803 he was constantly on active service. At Trafalgar he was second in command, his vessel, the *Royal Sovereign*, was the first engaged, and to him much of the honour of the victory was due. On Nelson's death he took supreme command of the fleet and was raised to the peerage. For three years his fleet maintained a blockade of Cadiz, the straits of Gibraltar, and the adjoining coast. To the end of his noble life he remained, although worn out, at his post, his country refusing to release him.

Collins, Anthony (1676-1729), writer and controversialist whose opinions roused violent opposition from the orthodox of his time. *Priestcraft in Perfection* (1709) attacks the 20th Article of the Church of England, *A Discourse of Free-thinking* (1713) attempts to prove the uncertainty of the principles of the clergy. The *Discourse* gave rise to so much excitement that C. found it expedient to take a trip to Holland. On his return he became, not without hostile demonstrations, J.P. and deputy-lieutenant of the co. of Essex.

Collins, Arthur Pelham (1863-1932), Eng. theatrical manager, *b.* in London, son of H. H. C., a city architect. Educated at City of London School, and in Hanover. Worked first in his father's office; in 1881 apprenticed to Henry Emden, scenic artist at Drury Lane Theatre. Became stage-manager, and produced the dramas and pantomimes there, 1887-96. On death of Sir Augustus

Harris, he obtained lease of the theatre, and became managing director of the limited company formed to work it. Produced all the dramas and pantomimes 1897-1924.

Collins, Charles Allston (1828-73), Eng. painter and author, second son of Wm. C. the painter. He married Kate, the younger daughter of the novelist Dickens, in 1860. In early life he showed much talent in his painting on pre-Raphaelite principles. In 1860 he pub. *The Eye-witness*, in 1862 *A Cruise on Wheels*, and various other works.

Collins, John (1625-83), Eng. mathematician, son of a nonconformist divine, *b.* in Oxfordshire and apprenticed to a bookseller in Oxford. Obtained a clerkship in the employment of John Marr, clerk of the kitchen to the Prince of Wales, where his immediate employer, taught him some mathematics.

The outbreak of the civil war, however, drove him out of the country on the high seas in the service of the Venetian republic. He devoted his leisure to the study of mathematics and of merchants' accounts and, later, set up in London as a teacher, writing sev. works on merchants' accounts, the use of quadrants, geometrical dialling and mariners' plain scales. After the Restoration he was appointed successively accountant to the exchequer, accountant in chancery, and secretary to the council of plantations. He had a large family by one of the daughters of Wm. Austen, head cook to Charles II. and his means of subsistence became ever more precarious; and he *d.* in 1683 of asthma and consumption. An enlarged ed. of his *Doctrine of Decimal Arithmetick* had occupied his attention a year before his death. His *Arithmetick in whole Numbers and Fractions, both Vulgar and Decimal* was pub. by Thomas Plant in 1688. He was elected a fellow of the Royal Society in 1667. For his zeal in collecting and diffusing scientific information and in urging the use of improved methods in the various branches of science he was, not undeservedly, styled the 'English Mercennus.'

Collins, John (1742-1808), actor and writer: was a playmaker, but took to the stage, in which he was fairly successful. He also gave humorous entertainments and pub. *Scriptorapologia* (1804) a book of verses. He is worthy of mention for the little piece, *To-morrow*, beginning 'In the downhill of life when I find I'm declining,' characterised by Palgrave as 'a truly noble poem.'

Collins, John Churton (1848-1908), Eng. literary critic *b.* in Gloucestershire and educated at King Edward's School, Birmingham, and Oxford, who for many years was a prominent univ. extension lecturer, and contributed regularly to the prin. reviews. His first book was a study of Sir Joshua Reynolds (1874) and later works included: *Bolingbroke, a Historical Study; and Voltaire in England* (1886); *The Study of English Literature* (1891); *Illustrations of Tennyson* (1891); *Jonathan Swift* (1893); *Ephemeris Critica* (1901); and *Studies in Shakespeare* (1904). In

1901 he ed. Dryden's *Satires*, and also pub. eds. of *Cyril Tournier's Plays and Poems*, 1874, etc. See L. C. Collins, *Life and Memoirs of John Churton Collins*, 1912.

Collins, Michael (1890-1922), Irish revolutionary general, b. at Woodfield, Clonakilty, co. Cork, youngest son of the family of eight of John C. farmer—whose wife was forty years his junior. Educated at a national school, entered Eng. civil service at fifteen—was in London G.P.O. and afterwards in a London accountant's. On Easter Monday, 1916, he took part in the seizure of Dublin G.P.O. The same week he was captured. He was sent to Stafford jail, and afterwards to Frongoch camp, Merioneth—whence he was released before Christmas, 1916. In 1918 he was imprisoned in Shigo jail for a seditious utterance; and elected for co. Cork, to Dail Eireann, which proclaimed an Irish republic. The president, De Valera, escaped from Lincoln jail in March 1919, C. assisting. C. was minister of finance; also head of the intelligence dept. of the army. By 1920 an offer of a reward of £10,000 was out for his arrest for he was noted for the fearlessness with which he went about and escaped capture. Principally through his influence, in 1921, the Brit. terms for an Irish Free State were accepted by the Dail. De Valera's successor Griffith dying suddenly, C. became head of the Irish Gov.; and he entered into discussions with Protestant Ulster while fighting republican irreconcilables in the S. By the latter he was ambushed and shot dead while motoring from Skibbereen to Cork, Aug. 22, 1922.

Collins, Mortimer (1827-76), Eng. novelist, son of a solicitor of Plymouth. For a time taught mathematics in Guernsey. Settled in Berkshire to adopt a literary life, writing chiefly for periodicals. Also wrote occasional and humorous verse. His chief novels are *Steel Anne Page* (1868); *Two Plunges for a Pearl* (1872); *Mr. Carrington* (1873), under the pseudonym of 'R. T. Cotton'; and *A Fight with Fortune* (1876).

Collins, William (1721-59), Eng. poet, b. at Chichester, son of a prosperous hatter there. Became a scholar of Winchester, and there formed a close friendship with Joseph Warton. In 1740 he went to Oxford, matriculating from Queen's College, shortly before Warton went to Oriel, and the following year he obtained a demyship at Magdalen. Graduated in 1743 and then went to London in pursuit of a literary career. There he endured much privation and even suffered imprisonment for debt. Johnson befriended him, and he was intimate with Thomson. In 1749 he was relieved by an uncle's legacy, but it was too late, for he was too broken in health and spirits, and from despondency he fell into insanity and d. a physical and mental wreck at Chichester, in the home of his sister. The beginning of his melancholy began with disappointment over the reception of his poems, especially his *Odes*. Posterity has signally reversed the judgment of his contem-

poraries and has placed him at the head of the lyrists of his age. He did not write much, but all that he wrote is the precious outcome of a warm heart allied to a pure sense of beauty. His first pub. work was a small vol. of poems, including the *Persian* (afterwards called *Oriental*) *Elegues* (1742); but his principal work was his *Odes* (1746; dated 1747), including those to *Evening* and *The Passions*, which will live as long as the language. His other works are *Verses address'd to Sir Thomas Hanmer* (1743); *Ode on the Death of Thomson* (1749); *Dirge on Cymbeline* (1749); and the unfinished *Superstitious of the Scottish Highlands* (written 1749; printed 1788, after discovery by Dr. Alexander Carlyle). In poetical taste C. was in full sympathy with Warton, but so far outshines him that it may be assumed that Warton's critical work owes everything to C. and, if that be so, C. was the real innovator in literary criticism and the chief herald of the Romantic school. C.'s poetry is distinguished by high imaginative quality, and by exquisitely felicitous descriptive phrases. Johnson's criticism was harsh, but it expressed the contemporary opinion of C., who was b. before his time (in his *Persian Elegues* he might almost seem to have written his own epitaph: 'Deform'd, unfinished, sent before my time into this breathing world, scarce half made up'). What Johnson could not see was that C.'s revival of obsolete words such as 'lorn,' 'westering,' and others came naturally to him, were a genuine part of the dialect in which C. thought, and were a necessary revival if the language was to regain its power of true poetic expression. Historically, perhaps, the most remarkable of all C.'s poems is the *Ode on the Superstitions of the Highlands*, a most important poem in the early Romantic movement and the return of imagination to Eng. poetry. See memoirs prefixed to A. Dyce's ed. of the *Poetical Works*, 1827; M. Thomas's *Aldine* ed., 1858-1894; H. W. Garrod, *Collins*, 1928.

Collins, William (1788-1847), Eng. landscape and figure painter, b. in London. In 1807 he became a student at the Royal Academy, and in 1820 was elected R.A. His picture of the 'Young Fifer' was sold for eighty guineas in 1811, and his 'Sale of the Pet Lamb,' the following year, realised 140 guineas. His finest work is in his two pictures entitled 'As Happy as a King,' 1834, and 'Early Morning,' 1846.

Collins, William Wilkie (1824-89), Eng. novelist, was the eldest son of Wm. Collins, R.A., and received the name Wilkie, by which he was commonly known, from the great contemporary painter, Sir David Wilkie. At an impressionable period (from the age of twelve to fifteen) he lived with his parents in Italy, a period from which he clearly drew his inspiration for *Antonina* (1850), his earliest novel. C. wrote this book under the spell of Bulwer Lytton's romances. Fortunately, the MS. of *Antonina* so delighted his father that Wilkie was allowed to desert the tea business, to which he

had been articled, in order to study law. Still, his attainment of a barrister's degree in 1851 did not encourage him to adopt a legal career. For in 1818 he pub. a diffuse but worthy biography of his father, who had d. the preceding year, and his meeting with Charles Dickens in 1851, a meeting destined to sow a lifelong friendship between the two, finally confirmed him in his determination to pursue a literary career. C., who always strove—and with success—to give a dramatic or rather melodramatic setting to his stories, used often to take part in the theatricals organised by Dickens at Tavistock House, and it was here that his dramatised version of one of his own stories (pub. in book form in 1874), *The Frozen Deep*, was first performed (1857). Spurred on by his friend's generous appreciation of his novel *Hide and Seek* (1851), C. gladly contributed to Dickens's periodical, *Household Words*, and later to *All the Year Round*, with which the former became identified. Thus in the first, *After Dark* (1856) and *The Dead Secret* (1857) both ran as serials, a style of publication eminently suited to C.'s unique gift of riveting attention and sustaining interest, whilst his most successful ventures, *The Woman in White* (1860), *No Name* (1862), and *The Moonstone* (1865), all appeared in *All the Year Round*. Count Fosco in *The Woman in White* is almost inimitable, and unlike the almost burlesque characters of John Betteridge and Captain Wragge, is singularly free from that exaggeration of merit and defect which mars so many of his figures. Others of his pub. were *Arundale* (1866) in the *Cornhill*, *The New Magdalen* (1873) in *Temple Bar*, and some dramatised versions of his most popular stories. He collaborated with Dickens in *No Thoroughfare*. Failing health and optimismating probably account for the poverty of talent displayed in his later works. A good deal of adverse criticism has been meted out to his method of telling his tale by means of diaries, documents, and personal narratives, a method resorted to in order to give his fiction the guise of truth. See W. T. Shore, *Charles Dickens and his Friends*, 1909.

Collinson, Sir Richard (1811–83). Eng. admiral, who sailed in the *Enterprise* for the relief of Sir John Franklin. He was not successful, but in spite of this fact his addition to geographical knowledge was considerable. He ed. *Three Voyages of Martin Frobisher* for the Hakluyt Society, 1867.

Collinsville, tn. 2 m. from St. Louis, Illinois, U.S.A. Produces coal and zinc. Pop. 9700.

Collio, tn. of Italy in the prov. of Brescia, situated on the R. Mella, 14 m. N.N.E. by rail of Brescia. There are iron mines in the vicinity. Pop. 3000.

Collioure, seaport tn. of France, in the dept. of Pyrénées-Orientales, arron. of Céret, on the Mediterranean, 15 m. from Perpignan. It is N. of Port Vendres, was defended by forts till 1866, and has fishing and coasting trade. Pop. 3100.

Collision of Ships. Owing to the danger

of ships following the same or intersecting courses running into each other, 'rules of the road,' covering the conduct of neighbouring vessels in varying circumstances, have been adopted by all civilised nations. The most important of these are as follows: Any vessel overtaking another must keep out of its way. A steamship must always keep out of the way of a sailing vessel. In the case of two sailing vessels, the one running free keeps out of the way of the one close hauled; or, if both are close hauled, the one on the port tack keeps out of the way of the one on the starboard tack; the one with the wind free on the port side keeps out of the way of the one with the wind free on the starboard side, or, if both have the wind free on the same side, the one to windward keeps out of the way of the one to leeward, while the one with the wind aft keeps out of the way of the other. In the case of two steamships, when meeting end on, both turn to starboard; when crossing, the one having the other on its starboard side keeps out of the way of the other. An elaborate system of lights and signals exists to minimise the danger at night, and sirens and hooters are employed in fogs, when the chances of collision are greatly increased. The increasing use of radar (*q.v.*) navigational guides on vessels and in harbours is permitting the attainment of a high degree of safety under such conditions. Of recent years the lane system, of Amer. origin, by which each line of vessels is required to keep to a definite track, has come into vogue, particularly among the trans-Atlantic steamers. Notwithstanding all the precautions, however, the proportion of casualties due to collision, especially in the fairways leading to crowded harbours, etc., is high. With regard to the legal aspect of collisions, when the fault cannot be brought home to either party, the cost of the damage done is usually shared between the two. When the collision is clearly the fault of one party, that one bears its own loss, and pays for the damage done to the other. Collision comes within the scope of marine insurance.

Colloidion, thick colourless liquid, obtained by dissolving pyroxylin in a mixture of ether and alcohol. This liquid evaporates quickly on exposure to air, leaving a film of pyroxylin, which is colourless and rough. It is used in photography (*q.v.*). There are sev. forms of C., each with its particular use in medicine. If a little castor oil and Canada balsam be added to the solution, a flexible or flexible C. is obtained which is used for protecting wounds from the air, etc. Again, salicylic acid and Indian hemp added to the ordinary C. give salicylic C., which is used as a corn cure.

Colloids, name originally given by Thomas Graham in the middle of the nineteenth century to certain substances which, in apparent solution, do not possess the power of passing through a parchment membrane. Glue is a typical example; hence the name colloid (Gk., κόλλα, glue). Other C. are gum, starch,

caramel and white of egg, as well as protoplasm, the actual seat of life in all living organisms. More recent work has shown that any substance can be obtained in the colloidal state under suitable conditions; thus water, alcohol, and various metals have all been made to behave as C. In a colloidal solution it is believed that the particles of the colloid, which are electrically charged, are so small as to be kept in suspension by molecular bombardment from the liquid. The colloid is easily coagulated or precipitated from its solution, e.g. by the addition of alum, though coagulation can be rendered more difficult, if stability is desired, by the addition of certain protective substances such as tannin or gelatine. Coagulation may also be effected in many cases by the action of heat, as, for example, when white of egg is heated to about 70° C. A colloidal solution that retains the liquid form is known as a *sol*, but many C. can retain the colloidal state even when the solutions set to a jelly or *gel*. Ordinary cooking gelatine represents such a gel; although it appears to be dry it nevertheless contains a large quantity of water—about one-seventh of the total weight. A study of C. has thrown much light on the mechanism of life processes and has also proved of great assistance in sev. industries, notably the rubber industry and the manuf. of artificial silk.

Collo *d'Herbois, Jean Marie* (1750-96). Fr. revolutionist, b. in Paris. In the early part of his life he was a prov. actor, but on the breaking out of the revolution he was drawn to Paris. He became a Jacobin, a member of the national convention, and of the Committee of Public Safety. He was sent to crush the Girondist revolt at Lyons, and gained much ill fame by his bloodthirsty proceedings there. In 1794 he became disgraced, was banished, and d. at Cayenne.

Collo*type*, or **Phototype**, one of the photo-mechanical processes for obtaining illustrations in printing, being largely employed for facsimile reproductions, book illustrations, and pictorial post cards, and for the reproduction of paintings in colour to a great degree of accuracy. A lithographic type of machine is used for the actual printing. A film composed of an ordinary gelatinous layer and, above, a sensitive bichromated gelatine is spread on glass and allowed to dry. Exposure to light under a reversed continuous tone negative hardens the unprotected portions according to the amount of protection which the negative gives. In the printing press, after the bichromate has been washed from the soft parts, these will take up moisture in proportion to the action of the light. If an ordinary ink roller is applied to the film, the unmoistened and hard portions will freely absorb ink, and the remaining parts proportionately to their degree of wetness.

Collusion, in a wide sense, connotes any agreement between two or more persons to defraud another person of his rights, or to attain an object forbidden by law. In a narrower sense it denotes the particular fraud of a secret bargain between

two or more persons whereby one person agrees to bring a bogus action against the other or others, so as to obtain a judgment, verdict, or decision which could not be obtained if the court knew all the facts. A judgment obtained by C. is void, but in the former state of Eng. real property law, and in most ant. systems of law, collusive or fictitious suits to obtain a result not obtainable by existing principles of law were effectual under certain conditions. In a still narrower sense C. denotes an agreement between a husband and wife, whereby one spouse agrees to commit or to appear to commit a breach of the marital duties so as to enable the other to obtain a divorce or judicial separation. Such an agreement is an absolute bar to divorce, and by the Matrimonial Causes Act, 1857, the court is bound to dismiss the petition. Before the law was amended by the Matrimonial Causes Act, 1937, the court was bound to satisfy itself that the petitioner had not 'connived at or condoned' the adultery. Under this Act the petitioner must satisfy the court that 'there has been no collusion, connivance, or consent.' Though the Act uses the word collusion for the first time in a statute, it does not state how the court should exercise its duty of inquiry. It would seem, however, that if the court is not satisfied, it should, before dismissing the petition, either ask for witnesses to be called who might be able to assist, or call on the king's proctor. But even if the respondent were called, he (or she) could not be compelled to answer any question tending to show that he had committed adultery, unless he chose to admit it or gave evidence in denial. There is no narrow definition of collusion, but it exists where the originating of the petition is founded on an agreement between the parties or their agents. An agreement by the respondent to abstain from defending is also C., as is an agreement to pay the costs of all parties and to maintain the children of the marriage in consideration of no defence being put in. The practice of the divorce court requires both petitioner and respondent to file affidavits denying collusion.

Colm, see **COLUMBA STREET**.

Colman, George, the Elder (1732-94), was the son of Francis C., Brit. envoy at the Tuscan court, by his wife, *née* Mary Gunley, sister to the countess of Bath. Educated at Westminster and Oxford, he was called to the Bar in 1757. He did not practise, however, having succumbed to the glamour of the stage, so far as the writing of plays was concerned. A friend of Garrick, he had no difficulty in inducing that actor-manager to produce *Polly Honeycombe* at Drury Lane Theatre in 1760. The success of this piece confirmed him in his intention to devote himself to the composition of dramatic literature, and during his life he wrote a great number of plays, the best of which are, perhaps, *The Jealous Wife* (1761), and (in collaboration with Garrick) *The Clandestine Marriage* (1766). Possessed of considerable private means, he led a very pleasant existence, finding his greatest

delight in the company of Johnson, Goldsmith, and other members of the club of which he was a member. For many years he had a *liaison* with Miss Ford, a minor actress, whom eventually he married, and by her he had a son, George C., the Younger (1762-1836), who was educated at a private school, and afterwards at Oxford and Aberdeen. Like his father, he was destined for the Bar, but he, too, abandoned his legal studies and wrote for the stage. His first production in 1782, was *The Female Dramatist*. A prolific writer and adapter, the list of his plays and other works is very long. They include *The Heir at Law* (1797) and *John Bull* (1803). The father had at one time had a share in Covent Garden; the son in 1794 purchased the patent of the Haymarket Theatre; both were singularly unfortunate in their managerial ventures. In 1820 George IV. appointed him lieutenant of the yeomen of the guard, but allowed him subsequently to sell this post. He was appointed examiner of plays in 1824, which office he held until his death twelve years later. The plays of these writers, though many of their productions were successful in their day, have not held the stage, and it is doubtful if any one of them repays perusal. The younger man pub. his *Random Recollections* in 1830. See J. Genest, *Some Account of the English Stage from 1660 to 1830*, 1832; R. B. Peake, *Memoirs of the Colman Family*, 1841; and E. R. Page, *George Colman the Elder*, 1732-94, 1935.

Colman, Samuel (1832-1920), Amer. landscape painter, b. at Portland, Maine. He came to Europe and studied at Paris, Rome, and Dresden. He was the founder of the Amer. Society of Painters in Water Colours in 1866. Nearly all his works are seascapes, such as his 'Venetian Fishing Boat,' 'Two Boats on the Hudson,' and 'Sunny Afternoon in the Harbour of Algiers.'

Colmar (Ger., *Kolmar*), tn. and arron. of Alsace, and cap. of the dept. of Haut-Rhin, France), on the R. Lauch, 40 m. S.W. of Strasbourg. A branch of the Rhine and Rhone canal passes through the tn. The manufs. include cottons, woollens, silks, jute, and soap, and there are dyeing, brewing, tanning, and coach-building industries. From 1697 to 1871 the tn. was held by the Fr.: in 1871 it passed to Germany, becoming Fr. again in 1919. Pop. 46,100; arron., 95,400.

Colmenar de Oreja, tn. in Spain, 30 m. S.E. of Madrid. It possesses quarries and potteries. Pop. 6700.

Colne, tn. of Lancashire, England, situated on a trib. of the Calder, 26 m. N. of Manchester. There are manufs. of calico and mousselines-de-laine. In the fourteenth century the woollen manuf. flourished here. In the vicinity are slate and limestone quarries. Pop. 23,700.

Colne, small riv., a trib. of the Thames. It waters the co. of Essex, flowing chiefly in a S.-E. direction and passing through Colchester; the length of its course is 35 m.

Colney Hatch, hamlet in Middlesex, England, 1 m. W. of New Southgate.

Here is one of the co. of London mental hospitals (opened 1851), with accommodation for 2000 patients. In 1903 the Jewish wing of the building was destroyed by fire, which involved a loss of over fifty lives.

Colobus (Gk. *κολοβός*, docked, stunted), genus of monkeys, differing from other monkeys by the more or less complete suppression of the thumb. The C. inhabits the mt. forests of Central Africa, and is sought chiefly for the beauty of its skin which is jet-black, though the tail is white and the face brown.

Colocynth, or **Coloquintida**, **Bitter Apple** or **Bitter Cucumber**, *Citrullus Colocynthis*. It is a gourd fruit of tropical Asia somewhat similar to an orange. The pulp in which the seeds are enclosed is used as a cathartic. From it a bitter compound, colocynthin, is extracted.

Cologna, tn. of Italy, in the Verona prov., 20 m. S.E. of Verona, with a trade in silk, hemp, wine, almonds, and grain. Pop. 10,000.

Cologne (Ger. *Köln*), city, archbishopric, free port and important commercial tn. of Germany. It is situated on the l. b. of the Rhine, 362 m. W.S.W. of Berlin, in the Rhineland; it was connected by bridges, mostly blown by the Gers., in retreat in 1945, with sev. suburbs on the r. b. Its pop. in 1939 was 768,000, and in 1946 488,000, four-fifths being Rom. Catholics. After 1882 great and important hygienic undertakings embellished and rendered wholesome the narrow, tortuous, evil-smelling streets of old C., and its extent was great augmented by the addition of the land occupied by the demolished fortifications ceded to the tn. by the State; further developments followed until 1921. C. (as indicated below) was largely destroyed in the Second World War, but the following description will indicate the chief features of the city as it was before the war. The Gürzenichstrasse, which runs along the S. side of the Gürzenich, from the suspension bridge, to intersect the old tn. from E. to W., was a recent improvement, completed in 1914. The anct. buildings of C. were of great interest, especially those of the Middle Ages, which offered fine examples of the Romanesque and Transitional styles. Among these were the church of St. Maria im Kapitol, built on a trefoil-shaped ground plan; St. Gereon, containing the relics of St. Gereon and of the 350 martyrs slain under Diocletian's persecution; St. Peter's, with its famous altar-piece by Rubens; the Minorite church, containing the tomb of Duns Scotus; and St. Ursula's Church, where were said to be the bones of St. Ursula and of the 11,000 virgins martyred near C. while on a pilgrimage to Rome. The church of St. Pantaleon, founded by Bruno, and used as a Protestant church till 1918, was handed over to the Rom. Catholics in 1922. Among the most interesting of the secular buildings of the same period were the Rathaus, with beautiful Gobelin tapestries and a five-storied tower (1407) which was furnished with a carillon in 1913; the Spanischer Bau

(Sp. building, 1611-17), by the Rathaus chapel, which was remodelled in 1921, and its upper floor used for meetings of the tn. council; the Tempelhaus, later the chamber of commerce, but formerly the seat of a patrician family; and the Wallraf-Richartz Museum. Of later date were the Zeughaus (arsenal), the Imperial Bank, and the municipal library and archives (Stadtarchiv). Almost all of these were either destroyed or damaged: only one anct. monument, the Eigelstein tower, escaped; and the Stadtarchiv was

tributed generously to the funds for carrying on the gigantic work. It was finished in 1880, and the opening ceremony took place in the presence of William I. and all the reigning princes of Germany. The two architects who successively directed the work during the nineteenth century were Zwirner, who d. in 1861, and Voigtel. The whole edifice covers a space of 7370 sq. yds., its nave of five aisles is 445 ft. long, and its transept with three aisles is 282 ft. wide; the height of the nave is about 202 ft., and that of the two towers

D. McLeish

THE RHINE AND HOHENZOLLERN BRIDGE, COLOGNE, 1939

little affected. Generally, however, movable fittings and works of art were adequately protected *in situ* or removed to safety in repositories in other parts of Germany. But by far the prin. object of interest in C. was and remains its Dom or cathedral, one of the finest specimens of Gothic architecture in Europe. Its corner-stone was laid by Archbishop Conrad of Hochstaden in 1248, the sanctuary was dedicated in 1322, the nave was ready for use in 1388, the S. tower had reached a height of about 180 ft. in 1447. Then the work was interrupted entirely for 400 years. In the nineteenth century it was resumed chiefly through the efforts of Sulpice Boisseree, who prevailed upon the crown prince, afterwards Frederick William IV., to use his influence to get the cathedral completed. Great popular enthusiasm was roused and all—Catholics and Protestants alike—con-

tributed generously to the funds for carrying on the gigantic work. It was finished in 1880, and the opening ceremony took place in the presence of William I. and all the reigning princes of Germany. The two architects who successively directed the work during the nineteenth century were Zwirner, who d. in 1861, and Voigtel. The whole edifice covers a space of 7370 sq. yds., its nave of five aisles is 445 ft. long, and its transept with three aisles is 282 ft. wide; the height of the nave is about 202 ft., and that of the two towers

C. was founded by the Ubii, who were

compelled by Agrippa to migrate from the right to the left bank of the Rhine. In A.D. 51 Agrippina, mother of Nero, founded here the Colonia Agrippinensis, a colony of Rom. veterans. In 308 Constantine began a stone bridge, which was afterwards destroyed by the Normans. From the end of the fifth century C. belonged for a long time to the Franks. Charlemagne raised its bishopric to an archbishopric. During a long period the archbishops and the citizens were continually at variance, but municipal independence was finally estab. by the battle of Worringen, 1288. Its univ., which was estab. in 1388, had before the First World War some 2600 students and about 200 profs. and teachers (1936). The theological faculty was Protestant. The modern univ. was built in 1904 as a commercial academy and was re-founded in 1919. The first commercial fair, the Kölner Messe, was held in 1924, on the Rhine below the Hohenzollern Bridge. An academy of practical medicine was estab. in the univ. in 1919 by the municipality. In the thirteenth, fourteenth, and fifteenth centuries C. maintained a great commercial prosperity; this was completely lost after the sixteenth century. By the peace of Campo Formio, 1797, the tn. was incorporated with France. Under Prussian rule after 1815 it made rapid progress to its subsequent position of high commercial prosperity. C. was connected by direct service of cargo steamers with London and other Eng. ports. The prin. pre-1914 industries of C. were the manuf. of sugar, chocolate, tobacco, snuff, and cigars, liqueurs, eau de Cologne, carpets, tapestry, furniture, vinegar, wax, soap, paints, lacquers, varnish, oil, silk, velvet, woollen and cotton fabrics, gutta-percha articles, machines, carriages, ropes, pumps and hydraulic presses, zinc, lead and marble ware, hats, paper, musical instruments, jewellery, etc., many of which industries during the Nazi rearmament of Germany gave place to munitions. All these industries, luxury or munitions, suffered in the destruction of the city in the Second World War.

History (1919-15).—C. was garrisoned after the armistice of 1918, by the Brit. Rhine Army of Occupation, and this occupation continued until 1925, when the forces were transferred to Wiesbaden. Previous to the setting up of the Inter-Allied Rhineland High Commission, the C. zone was placed under Sir Charles Fergusson as military governor. The Brit. cavalry patrols entered C. on Dec. 6, 1918, and Sir Charles Fergusson made his formal entry on Dec. 11, and on Dec. 12, the Brit. troops took possession of the Rhine bridgeheads. Later, on the estab. of the commission, the regime of the governor was replaced by that of a general officer commanding-in-chief, with headquarters in the famous Dom, Gen. (later Field Marshal) Sir Wm. Robertson being the first commander-in-chief of the Rhine Army. The area of the Brit. occupation was about 1034 sq. m. and the civil administration was under the C. sub-

commissioner of the Inter-Allied Rhineland High Commission, who was assisted by a number of Kreis officers. The civil administration was grafted on to the Ger. system, of which the Kreis, or dist., was the unit. Civil order was maintained partly by the Brit. military police and partly by the C. civil police. By the terms of the Rhineland agreement (which the high commission was called into being to administer) 75 per cent of the police had, for military reasons, to be recruited from the Rhineland area itself. The occupation of C. was, throughout, of a peaceful nature, and the Brit. regime was marked by a spirit of moderation. The Brit. military governor's first difficulty was in dealing with a series of strikes. The governor estab. arbitration courts, equitable solutions of labour troubles were found, and the time came when the Ger. workmen appealed to the Brit. authorities as a matter of course, for the care of the commission throughout its existence was the ever-recurrent strike. Later, under the regime of the commander-in-chief, Brit. military courts were also set up, to try all offences committed within the occupied zone. These courts gave satisfaction, and a high tribute was paid to their sense of justice at the close of the occupation, and also to the orderliness of the occupation generally, by Dr. Adenauer, the Oberbürgermeister of C., and Graf Adelmann, the Regierungspräsident, the high official responsible for the Ger. administration in the Brit. zone. A delicate period supervened when the Fr. and Belgian troops entered the Ruhr (see RUHR). The military and civil authorities in the C. area had to keep their zone free from incidents which were daily occurring in the Ruhr and in other parts of the Rhineland, as a result of the Ger. policy of passive resistance. The relations between the Brit. Army and the people of C. were always correct, and if there was no attempt by authority to promote social relations between the army and the inhab., it was because a service order was implicitly obeyed; but none the less as between the Brit. soldier and the *hausfrau* of his billet in C. relations were cordial. One beneficial effect of this sequel to the war on C. was that, for the first time in its hist., the city was free from the fetters of fortress works. For, by the peace treaty, fortification of C. was prohibited, and the fortress works existing were accordingly razed. This gave the city municipal authorities a golden chance of getting clear of C.'s encircling bonds and so extending its development laterally with the Rhine. This opportunity they were not slow to seize, as was evidenced by the tn.-planning and riv.-harbour schemes.

Bombing and capture of Cologne in the Second World War.—C. was frequently bombed in the Second World War by the R.A.F., beginning with a heavy assault on the night of March 13, 1942. On the night of May 30, 1942, over 1100 planes of all types were concentrated in a mass attack against the city lasting 90 min. It was a blow which devastated nearly

one-tenth of the entire metropolitan area, practically destroying the old tn., and wrecking whole industrial areas. This raid cost the R.A.F. some forty-four planes. There were three more devastating raids beginning June 28, 1942, in which the R.A.F. destroyed over 80 per cent of the central city area and 75 per cent of the other fully built-up dists. on the W. bank of the Rhine. In all about eighty factories were hit in the three raids. Railway communications also suffered, over 1000 wagons and 300 coaches being damaged. Cable works, shell-tube factories, chemical works, and an aluminium foundry were hit. The factories of three well-known firms—Humboldt-Deutz, makers of internal combustion engines, lorries, and tractors; Gottfried Hagen, makers of accumulators and submarine batteries; and Felten & Guillaume, cable and wire hawser makers—were all badly damaged. Some eighteen aircraft were lost in a further night attack on Oct. 15, 1942. In the first three months of 1943 C., with its U-boat equipment plants, was raided sev. times. There was a higher proportion of heavy bombers in use than in the raid of May 30, 1942, which meant that a greater weight of bombs could be dropped by fewer planes and with proportionally smaller losses. By the summer of 1943 there had been 116 raids on C., this being more than the number on any other tn. in the Ruhr (Duisburg being next with sixty raids). There were yet more attacks in 1944, and by 1945 C. was over 60 per cent destroyed, with more than 2000 ac. laid in ruins.

Amer. forces began to advance towards C. in Nov. 1944, but were held up by Rundstedt's counter-offensive in the Ardennes. When this attack was checked the Allies launched a counter-offensive in the general direction of Bastogne-Cologne. In March (1945), while the Amer. Ninth Army was pushing to the Rhine in its sector, the First Amer. Army was exploiting its successful crossing of the Roer and thrusting towards C. In the First Army drive towards the city heavy opposition was for a time encountered E. of the Erft canal, but the three Ger. armoured formations blocking the allied advance were dispersed by strong allied air attacks, and on March 5 the advance elements of 7th Corps were entering C. By the afternoon of March 7 the city was entirely in Amer. hands, the Ger. resistance having collapsed once the allied forces had reached the outskirts. This success had a profound effect on subsequent operations, as the divs. which would have been used to invest C. became available to assist in exploiting the great opportunity dramatically offered by reason of the Remagen crossing. (See further under WESTERN FRONT IN SECOND WORLD WAR.)

'Cologne Post.' The newspaper of the Brit. Rhine Army during the occupation of C. and Wiesbaden (see COLOGNE; RHINE ARMY, BRITISH). It was first issued as a daily (Mondays excepted), the first number being dated March 31, 1919. Its founder and first editor was

Capt. E. Rolston, of the E. Kent Regiment, and early in its career it received the warm co-operation of Sir Wm. Robertson and the general staff. During the taking of the plebiscite in Silesia, a daily ed. was pub. at Oppeln. The paper was printed on a flat-bed machine by Ger. compositors. When the Brit. Army of the Rhine moved to Wiesbaden, the paper ceased for a brief period, but was re-established as a bi-weekly in that tn. as the *C. P. and Wiesbaden Times*. The last number was issued on Nov. 3, 1929. The *C. P.* brought off one big 'scoop'—the text of the prin. clauses of the treaty of Versailles.

In Koblenz, the Amer. army of occupation during the brief period of its stay in Germany conducted a similar venture, called the *Imaroc News*; while the best known of the papers of the Fr. army of occupation was the *Rhin Illustré*.

Colomb, Philip Howard (1831-99), Brit. vice-admiral, inventor, and biographer, b. in Scotland. In 1852 he took part in active service in the Burmese war. He was the inventor of the system known as C.'s flashing signals, which has been universally adopted all over the world. He wrote *Essays on Naval Defence* (1893), and other works.

Colombes, tn. of France in the dept. of Seine, 7 m. N.N.W. of Paris, on the railway route from Paris to Havre. There are oil refineries, printing works, and foundries. It is noted as the place where d. Henrietta Maria, wife of Charles I. of Engl. ad. Pop. 61,000.

Colombia, N.W. republic of S. America. It is situated between 2° 40' S. to 12° 25' N. lat. and 68° to 79° W. long. It is bounded on the N. by the Caribbean Sea, on the E. by Venezuela, on the S. by Brazil and Peru, on the S.W. by Ecuador, on the W. by the Pacific Ocean, and on the N.W. by the gulf of Darien. It is divided into fourteen depts., two intendencies, and seven commissariats. Its area is estimated at some 1,600 sq. m., and there are 1100 m. of coast on the Caribbean Sea and 1040 m. on the Pacific. The earliest records of C. go back to about the year 1500, when the Sp. navigator, Alonso de Ojeda, settled on the coast near the snow-covered range of Santa Marta, which had already been discovered by another Spaniard, Rodrigo de Bastidas. But the coast is generally said to have been visited in 1502 by Christopher Columbus—whence its name. This ter. was granted to Ojeda by the Sp. Crown, and soon after the portion adjoining was bestowed upon another explorer, Nicuesa. These two ters. called respectively Nueva Andalucía and Castilla de Oro, became united in 1514 into the prov. of Tierra-firme, with Pedro Arias de Avila as its governor. With the estab. of these colonies and the discovery of the South Sea by Balboa, a direction was given to the exploration of C. The large Rs. Atrato, Cauca, and Magdalena were explored and conquered in 1536-37. Quesada penetrated along the Magdalena as far as Bogotá, the chief tn. then, and still the cap. To this part

of the country the name of New Granada was given, and this continued to be the official name until C. won its independence. Next followed expeditions to the E. and S.E. in search of the 'Gilded Man'—'El Dorado'; from this an extension of geographical knowledge was the only result. By the middle of the century Sp. power was fairly estab., and flourishing coastal tns. were springing up. In 1563 New Granada formed part of the Sp. viceroyalty of Peru, but after many vicissitudes it was constituted a separate viceroyalty in 1751. Extreme measures of taxation and exorbitant duties provoked a revolt against Spain, and from

assisted by a Cabinet of six ministers. The Congress is composed of a House of Representatives, elected by direct vote, and a Senate, elected (before 1945) by indirect vote, but, by an Act of 1915, the senators are now elected by direct vote of the electorate instead of indirectly by the departmental assemblies. Congress meets annually at Bogotá in July. Women, though conceded citizenship, are expressly debarred from voting (as are members of the army and the police) and from elective office. The prolonged Panama dispute between C. and the U.S.A. was concluded in 1922. Panama had seceded in 1856, rejoined the republic

Dr. Wilson Popenoe

A TYPICAL ANDEAN ROAD NEAR FACATATIVA, COLOMBIA

1811, when the revolution became formal, till 1821, when New Granada, Venezuela, and Ecuador became united under the name of C., incessant war was waged with Spain. The union was effected by Simón Bolívar (*q.v.*), but at his death in 1830 Venezuela and Ecuador seceded, and in 1831 C. called itself the Republic of New Granada. In 1861 it became the Republic of C.

Like all the republics of America, it is divided into two factions, the Conservatives, whose object is centralisation, and the Democrats, whose aim is decentralisation, with complete autonomy for each state. Up to 1886 its constitution was that of a federal republic; at that date its states became depts. From 1880 to 1902 civil war was waged intermittently and resulted in the triumph of the centralist forces over the revolutionaries. At the present day the executive authority is vested in a president elected for four years,

again, and again seceded in 1903. The U.S.A. recognised the independence of Panama, but it was not until 1922 that a treaty was ratified whereby the independence of Panama was estab., while C. received an indemnity of \$50,000,000 as compensation. There was another dispute in 1925, with Ecuador, arising out of a treaty recognising Peru's claim to sev. thousand sq. m. of ter. in the Amazon valley which Ecuador had ceded to C. In 1931 a boundary commission began the work of delimiting C.'s boundaries with Brazil and Venezuela as agreed by treaties, thus terminating disputes of more than a century's standing. The surface of C. is exceedingly varied. In the W. there are lofty mts.; in the E. there are vast llanos and forest plains, watered by tribs. of the Amazon and Orinoco. The mt. system of the country consists of the three spurs of the Andes, which spring out fan-like from the plateau of Pasto in the S.W.; these are the W.,

Central, and E. Cordilleras. Besides these chief ranges there are, in the N., the Sierra Nevada de Santa Marta and the low Jando range along the N.W. coast and extending into Panama. The prin. rvs. are the Magdalena and its trib. the Cauca, rising in the Central Cordillera and flowing into the Caribbean Sea; sev. tribs. of the Amazon in the E.; and the Patia, flowing into the Pacific, after making its way through a gorge 10,000 to 12,000 ft. high in the chffs. One of the tribs. of the Patia, the Carchi or Upper Guatara, is spanned by the Rumichuca Arch or Inca's Bridge of natural stone. On the Funza is the great fall of Tequendama, 480 ft. high. Other rvs. are the Cauqueta and the Putumayo. The climate of C. is determined by the double influences of lat. and altitude. Situated entirely in the tropical zone, its days and nights are of equal length, and it has two seasons—the wet and the dry. The country includes every altitude, from sea level to upwards of 18,000 ft. in the region of perpetual snow; it has therefore every temp., from that of the torrid zone to that of the frigid. The lowland portions, covered with dense forest, have an intensely hot climate; the inland mt. region is comparatively cool. The wide-stretching plateaux of the E. Cordilleras have a cool and healthy climate. This region is the most thickly populated of the republic; in it is Bogotá, the cap., 8694 ft. above the sea. The climate of the ter. of Panama is exceedingly unwholesome, and in parts of the depts. of Bolivia and Magdalena marsh fevers are rife. Sanitation is now being satisfactorily developed.

The pop. of C. is estimated at 9,521,000, of which only 160,000 are Indians. More than half are whites and half-castes and the chief centres of pop. are the upper valleys of the Magdalena and Cauca, where the climate is delightful and grain grows. The white pop. is of Sp. descent, and there are besides these the mestizos, of mixed Sp. and Indian blood, and the Indians. Slavery was finally abolished in 1852. Primary education is, and has since 1870 been, free but is not compulsory; and there are nearly 9,000 public elementary schools, with upwards of 580,000 pupils. There are 450 high schools with 10,000 pupils; and a number of vocational, agric., art. and religious schools; besides 63 colleges and univs., with 7600 students. The National Univ. in Bogotá was founded in 1572; in the depts. are four other univs.: Antioquia at Medellín, Bolívar at Cartagena, Cauca at Popayan, and Nariño at Pasto. The state religion is Rom. Catholic. The chief industries are agriculture and mining. The forests are extensive; among the trees are mahogany, cedar, fustic, and other dye-woods, and medicinal plants. The prin. productions are coffee, cotton, plantains and bananas, and, in some parts, tobacco, wheat, and other cereals. Banana exports in 1941 were over 2,250,000 stems, but owing to disease exports ceased in the following year, but in 1946 reached a total of 40,000

tons. C. is the largest producer of mild coffee, the demand for which is not affected by over-production in Brazil. Nearly two-thirds of the coffee goes to the U.S.A. Oil was discovered in 1922 and the chief wells are at Barranca on the Magdalena R., whence a pipe line runs to Cartagena, 360 m. away, with a daily capacity of 50,000 barrels. The output in 1941 was over 24,500,000 barrels. The mineral wealth is great, especially in Antioquia. There is a large annual output of gold and silver, and rich deposits of copper, lead, mercury, iron, platinum, and salt (from the mines in Zipaquirá covering hundreds of sq. in.) are found. The famous emerald mines of Muzo and Cósquez are a gov. monopoly, the former, however, is Amer. run. The manufacturing industry is relatively unimportant, but in the larger tns. many articles in common use are produced; among these are cotton textiles, shoes, hosiery, matches, sugar, liquors, flour, and bricks. The exports, in addition to gold, are coffee, petroleum, bananas, hides and skins, and platinum. The imports are textiles, machinery, metal manufs., curs and lorries, and chemical manufs. In C. there are some 2040 m. of highways, and some 4000 m. of motor highways, but though some improvement has been made in recent years in railroad and wagon road communication and riv. navigation, railways and roads are still in their infancy owing to the mountainous character of the country, which makes construction costly and difficult. The navy consists of two destroyers and five gunboats, with personnel 1500; the standing army consists of about 10,000 men. There is a daily passenger and mail service between Bogotá and Barranquilla and a bi-weekly service in concert with Pan-Am. Airways to the U.S.A. New York can be reached in two days and mail gets to England a week or nine days after leaving Bogotá. There are wireless stations at Barranquilla, Bogotá, Cali, and Cúcuta. In 1926 C. was elected to membership of the council of the League of Nations and is now a member of the United Nations Organization. The chief tns., with their pops., are Bogotá (1942), 395,000; Medellín, 199,000; Barranquilla, 159,000; Cali, 121,000; Cartagena, 90,000; Manizales, 89,000; Ibagué, 63,000; Cúcuta, 60,000; Bucaramanga, 53,000; Pasto, 50,000; Santa Marta, 50,000; Popayan, 10,000. See F. L. Petre, *The Republic of Colombia*, 1906; H. Bingham, *Journal of an Expedition across Venezuela and Colombia*, 1909; P. J. Eder, *Colombia*, 1913; L. Lévine, *Colombia*, 1914; G. Arboleda, *Historia Contemporánea de Colombia* (Bogotá) 1919; R. B. Cunningham-Graham, *Cartagena and the Banks of the Sinú*, 1920; B. Niles, *Colombia, Land of Miracles*, 1925; E. Taylor Perks, *Colombia and the United States, 1765-1934*, 1935; J. M. Henao and G. Arrubla, *History of Colombia*, 1938.

Colombo, one of the finest and largest sea-ports of Asia, and the cap. of Ceylon, with 285,000 inhab. The harbour, which has an area of 1 sq. m., and is

protected by four magnificent breakwaters, affords shelter for forty-five ocean-going steamers during the S.W. monsoon and thirty-nine during the N.E. There are a graving-dock and a coaling depot. The city extends from the Kelani R. on the N. to the fourth mile on the Gallo Road on the S., and covers 8617 ac. The European quarter is called the Fort, although the Portuguese and Dutch fortifications were demolished in 1869 as obsolete. C. has broad streets, fine buildings belonging to European firms, hotels, and cathedrals. E. of the fort lies the native business quarter, called Pettah, with mean dwellings, countless shops, and a very busy traffic. To the N. extends the quarter of St. Paul, with extensive Catholic and Anglican colleges. E. of Pettah is a nearby rural dist. covered with native huts in hedges of banana, areca, and coco-palms. The very picturesque suburb of Kutwal is chiefly inhabited by Rom. Catholic fishermen. Wolfendale church is the most interesting and complete of the few relics of the Dutch occupation. A tortoise said to have lived for 200 years is preserved in the museum in the Victoria Park, and a colossal stone lion on which the king sat to administer justice. The univ. has 300 students, and there are seven Eng. and two Sinhalese newspapers. C. is mentioned in 1346, the Portuguese took it in 1517 and named it C. in honour of Christopher Columbus. The Dutch took it from them in 1636 and surrendered it to the Brit. in 1796. C. is a port of call for all vessels bound to Australia, the bay of Bengal, and the Far E. C. was raided by seventy-five Jap. planes, operating from carriers, on April 5, 1942. Low-level and dive-bombing attacks were made on the harbour and in the Rotmainada area. At least thirty planes were destroyed. Damage was comparatively negligible.

Colon, see COLITIS and INTESTINES.

Colón, city in Matanzas prov., Cuba. 52 m. S.E. of the tn. of Matanzas. Large sugar refineries comprise the chief industry. Pop. 9000.

Colon, earlier **Aspinwall**, at the N. entrance of the Panama Canal, with 57,200 inhab. Formerly very unhealthy, it has, since the opening of the canal, a complete system of sanitation, and has greatly thrived. The trade is mostly in the hands of Syrians and Chinese. Many foreigners travel by the railway to Panama.

Colón, official designation of the Galapagos Archipelago (q.v.).

Colón Archipelago, see GALÁPAGOS ISLANDS.

Colonel (It. *colonello*, the leader of a column). In the Brit. Army the chief commander of a regiment; the grade of officer next to that of general. In 1588 the title of C. was substituted for that of captain to designate the chief officer of a regiment. In the artillery and engineers the C. is always the real acting commander, but the lieutenant-C. is the real commander of an infantry battalion or of a cavalry regiment. In the latter case the

office of C. is a sinecure, but it is to be noted that this applies only to a regimental C. as distinct from a C. on the staff. A regimental colonelcy carried with it the pay of £1000 a year, and was given to a general on his retirement and as a reward for long service. But, as the result of a decision of 1888, this rule died out and only those having at that date a vested right to such an appointment came under the old order of things. Henceforth those officers only may become Cs. who have received a brevet for distinguished conduct. There are besides certain appointments which carry with them the rank of C.; those of aide-de-camp to the sovereign, of assistant adjutant-general, and of commander of a regimental dist. being the chief. After the First World War the rank of C.-commandant displaced that of brigadier-general in the Brit. service, but in 1928 brigadier displaced C.-commandant. Cs. of regiments are now selected from any officer of the rank of full C. and upwards who has served with distinction in the particular regiment. They retire on attaining the age of seventy years. At present Cs.-commandant of the Royal Artillery, Royal Engineers, etc., correspond somewhat to the C. of a regiment. In substantive rank they are general officers with distinguished service records. In the King's Royal Rifle Corps and in the King's Royal Rifle Corps and Rifle Brigade they are equivalent to Cs. of regiments. The rank of C.-in-chief of a regiment is an honorary office, and is held in various regiments by the king and other members of the royal family, by foreign kings and princes and other persons.

Colonia, dept. in Uruguay, on the Plata, with an area of 2185 sq. m. There are fertile plains and valleys, which are under cultivation. European colonists have settled there, and are engaged in stock-raising and agriculture. Pop. 100,000. C. del Sacramento, on the Plata, opposite Buenos Aires, is the cap., and possesses a fine harbour, with capacious docks. Pop. 8500.

Colonial Agents, name given to agents in England who act on behalf of the different Brit. colonies. (See under CROWN AGENTS FOR THE COLONIES.) The agent-general is an official who represents a Canadian prov. or Australian state in London, and acts for the crown colonies. Most of the N. Amer. colonies before their separation had special salaried agents in England to superintend their affairs.

Colonial Civil Service. Service in the crown colonies, protectorates, and mandated terr. is by selection by the secretary of state for the colonies through the appointments dept. of the Colonial Office. The service includes a considerable number of specialists in tropical medicine, agriculture, forestry, etc., and of the 200,000 employees in the colonial service some 20 per cent of appointments are made from Whitehall, the remaining 80 per cent, which includes most of the minor posts, being made by the local or

colonial gov. concerned. The service is now regarded as a unified service with pay and conditions of service assimilated as far as practicable so that transfers from one colony to another may be made without loss of emoluments or pension rights. See Sir A. Bertram, *The Colonial Service*, 1930; Sir C. J. Jeffries, *The Colonial Empire and its Civil Service*, 1938.

Colonial Conference, African, first gathering ever held of the political

hear at first hand something of the problems, hopes, and expectations of the metropolitan power; and to discuss policies for education, improvement of agriculture, health, public relations, and economic development. The conference was not intended to produce answers to so many different practical questions demanding solution in every African colony. The general answer to all such questions was the same—the need of men, money,

AT BUCKINGHAM PALACE

On the left of the King is Chief Nana Sir Taibu Darku (Gold Coast); and on his right, the Emir of Katsina.

leaders of Brit. colonial Africa met at Lancaster House, London, in Oct. 1948. In all there were some seventy delegates, including chiefs from the four W. African colonies, emirs from Nigeria, tribal leaders from the E. African ter. (including mandated Tanganyika). Europeans representing the interests of trade and mines, and Arabs and Indians settled permanently in Brit. African colonies. The conference had three objectives: to give the delegates from different countries an opportunity to know each other, this being the first occasion on which W., E., and Central Africans, white and black together, have ever met in formal conclave; to enable African delegates to

and initiative and co-operation. The main purpose of the conference was achieved by enabling the delegates to return to their countries with a clearer idea of the difficulties, the knowledge that others shared their problems, and with the conviction that they were part of a greater community and had behind them the goodwill and the practical resolution of the Brit. nation.

Colonial Corps, bodies of troops raised in the colonies in which they are intended to serve, and officered by officers belonging to the regular army of the country to whom the colony belongs. Formerly they were, as a general rule, kept entirely in the colony in which they were raised and never

used for foreign operations. But in both world wars Fr. native levies fought outside their own continent, and Brit. W. and E. African native troops served in various African campaigns outside their own countries. In the First World War Brit. native W. African troops were in the campaigns against the Gers. in the Cameroons and Ger. E. Africa. In 1910 the Nigerian and Gold Coast regiments of the Royal W. African Frontier Force went to Abyssinia and fought through the campaign there against the best It. forces. Following the collapse of It. resistance in E. Africa it was decided to send a substantial force of E. African troops (askaris) of the K.A.R. (King's African Rifles (*q.v.*)) to Asia to fight against the Jap. Early in 1942 the first E. African troops sailed for Ceylon. It was not possible to send any W. Africans since all the troops available, both those who had served in the E. African campaign (Abyssinia and It. Somaliland) and those who had remained in W. Africa, were needed to protect the Brit. W. African colonies from attack through Vichy W. Africa. One brigade of E. Africans took part in the successful allied invasion of Madagascar. Many W. African troops—largely mechanised—fought in Libya and, with the turn of the tide at El Alamein and the N. African landings, it became possible for the first time to use large numbers of African troops in the Far E. In 1943 it was decided to send a W. African expeditionary force of two divs. to Burma. Additional E. African brigades were sent to the Far E. but it was the 81st W. African Div. which, first of all the African troops, found themselves fighting the Jap. The capture of Akyab and Pagoda Hill were among the exploits in which they took part. Other units of this force were part of Wingate's Chindits in central Burma. Meanwhile the 11th E. African Div., having completed intensive training in Ceylon, went to Burma and took over the spearhead of the allied attack in the Tamar area from the 23rd Indian Div. These askaris fought their way through the appalling weather conditions of the monsoon, down the Kalaw valley, taking Kalembo and Kalewa, and opening a way for the later advances into the heart of Burma. The great expansion in the African forces meant that many thousands of European officers and N.C.O.s had to be found to serve with them. Although any African is eligible for a commission, all officers in the E. African forces and all but a handful in the W. African forces still have to be found from Europeans. Other well-known C. C. are the Malayan Volunteer Defence Force (composed of Europeans, Chinese, and Malays) and the Hong Kong Regiment. Since the First World War conscription has been introduced for whites in Kenya (for home defence); and in 1939 a measure of conscription was introduced in Hong Kong.

Colonial Development and Welfare, policy of the Brit. Colonial Office in handling the economic and social problems of the dependent empire. In

the last decades of the nineteenth century the issue appeared to be simple, for in every country, Burma, Malaya, W. or E. Africa, the Pacific Is., bloodshed and slavery had been replaced by peace, freedom, order, and even-handed justice. But early in the twentieth century an expanding electorate began to demand drastic measures to cure the economic and social dislocations and injustices which the upheaval of the industrial revolution had produced, and that demand has, in course of recent years, been voiced on behalf of colonial peoples in accordance with the Brit. conception of trusteeship in relation to native people (*see* COLONIAL TRUSTEESHIP), acceptance of which denotes a sense of moral obligation. The colonies, however, suffered from the want of capital. For though they have a value as fields for investment, with the added advantage that the investor can operate in a sphere in which his own gov. has the political control, it is nevertheless true that, with few exceptions Brit. capital has avoided the modern colonial empire and favoured more lucrative investment in foreign countries. It is estimated that in 1938 the total listed investment in the Brit. colonies amounted to about £172,000,000 in public loans and £209,000,000 in private enterprises, whereas the total Brit. overseas investment was estimated at no less than £2,592,000,000. The amount of Brit. capital invested in the colonies is therefore only a small proportion of our total overseas investment. Of public loans raised by colonial govts. some 75 per cent has been devoted to railway and port developments and the colonies have had the benefit of rates of interest only slightly higher than internal United Kingdom loans. The need of the colonial empire, with its 60,000,000 people, is for far more capital for development and social services. The dependent ters, which can attract capital by reason of rich mineral and other natural resources are very few. The rest are poor countries struggling under a burden of intractable tropical diseases, such as trypanosomiasis, malaria, yaws, leprosy, beriberi, and so forth; crop pests, such as leaf spot, the ruin of banana crops, and locusts; malnutrition, isolation, and ignorance. In these areas the prerequisites of an adequate standard of living—reasonable immunity from disease, a wholesome diet, improved education, housing, and transport—have not yet been achieved. Such ters, could make little headway within the limits of their own revenue resources. In 1929 a Colonial Development Advisory Committee was appointed by the secretary of state for the colonies, under the authority of the Colonial Development Act, 1929. Its function was to consider and report on applications for assistance from the Colonial Development Fund, in furtherance of schemes likely to aid and develop agriculture and industry in the colonies, protectorates, and mandated ters, and thus promote commerce with, or industry in, the United Kingdom by any of the means specified in the first

section of the Act. These means were comprehensive and, as exemplified by applications made by various colonial govts., were wide enough to include the construction of deep-water harbours; afforestation; hospitals and hospital equipment; improved medical services; development of schools for both European and native children; estab. of malarial research units; public health schemes; railway development; housing schemes for natives; stations for coffee and sisal research and research into plant ecology generally; erection of factories; construction of new telegraph and telephone units. The committee's duty was to examine the advantages of any particular schemes proposed, and, generally, the allocation of cost as between imperial and colonial funds. The ultimate sanctioning authority was (and is) the Treasury. But the amounts obtainable under this Act were very restricted and, broadly speaking, schemes for development of capital works were out of the question unless the particular colony submitting such schemes was prepared to maintain such works out of its own current financial resources. Early in 1940 the Brit. Gov., which had already made a number of special grants for technical research and had, from time to time, advanced loans to help hard-pressed colonies to balance their budgets, made an important statement of policy. 'It,' it declared, 'full and balanced development is to be obtained, and if colonial governments are to be placed in a position to maintain administrative, technical, and social services at proper standards, some assistance from outside is necessary at this stage.' With this statement came the Colonial Development and Welfare Act, which authorised expenditure up to £5,000,000 a year for a period of ten years, and an additional grant up to £500,000 a year for research. At the same time, some £10,000,000 worth of loans previously advanced to the colonies was cancelled because the payment of interest would have imposed too severe a strain on colonial funds. In 1943 a Colonial Products Research Council was set up to deal with the problems of research for which the £500,000 a year had been allocated. The function of this council is to investigate the uses which can be made of raw materials produced in the colonies and to initiate and supervise research with the object of increasing their uses. An Act passed in 1945 extended the grant period from 1951 to 1956, more than doubled the rate of expenditure, and abolished the practice of surrendering the unexpended portion of the ann. grant to the Brit. Treasury. Within the Colonial Office steps were taken to set up two committees—a Development Committee and an Economic Policy Committee. The first of these committees will consider the ten-year plans for development sent in by all the colonies, and the second will consider how the colony should organise its economy so as to be in a position to defray the expenditure involved in the plan. The work of these two committees

is co-ordinated by a new Colonial Economic and Development Council presided over by the secretary of state for the colonies. See H. E. Egerton, *British Colonial Policy in the XXth Century*, 1922; H. W. Foster and E. V. Bacon, *Wealth for Welfare*, 1943; A. G. Russell, *Colour, Race, and Empire*, 1944; D. Tangye, *One King*, 1944; Lucy Mair, *Welfare in the British Colonies*, 1944; J. Huxley and Phyllis Deane, *The Future of the Colonies*, 1944; *Social Policy in Dependent Territories* (International Labour Office), 1944; *Fabian Colonial Essays*, ed. by R. Hinden, 1945; J. S. Furnival, *Colonial Policy and Practice: a comparative Study of Burma and Netherlands India*, 1948. See also COLONIAL CONFERENCE, AFRICAN.

Colonial Issue. The issue of the ownership of colonies in terms of economic or political internationalism. In this, its wider significance, the issue, so far as the nations owning great colonial empires are concerned, is only of academic interest, especially to Britain, whose colonial empire, in which all nations are free to trade on equal terms, in no sense a challenge to the rights and dignity of other nations. In its narrower meaning, it referred to the Ger. claim to the restoration of the colonies she lost under the treaty of Versailles—a claim which was advanced when the Nazis acquired control in Germany and reiterated with threats up to the outbreak of war in 1939. It is this aspect only of the C. I. that will be considered in this article.

The chief products from the ters. shown in the table on p. 71 are S.W. Africa, diamonds, hides, livestock, butter, and vanadium; Tanganyika, sisal, cotton, coffee, and ground-nuts; Camerouns and Togoland, cocoa and palm oil; New Guinea, gold and copra; Pacific Is., gold and copra; W. Samoa, copra; Nauru, phosphates. The total gold output averaged £1,715,000 in the years 1934–36; and diamonds £503,000 for the same period. The total value of exports in 1936 into Germany from these former colonies expressed as percentage of Ger. imports of the same kind from all sources was as follows: phosphates, 75 per cent; oil seeds and ground-nuts, 14 per cent; flax, hemp, and sisal, 63 per cent; coffee, 11 per cent; cocoa, 36 per cent; hides and skins, 3½ per cent; bananas, 27 per cent; tropical wood, 23 per cent; rubber, 3½ per cent; and cotton, 2 per cent.

The claim to the restoration of the Ger. colonies was ostensibly based on the now familiar *Lebensraum* theory. The Ger. political leaders averred that a nation of 65,000,000 people must have colonial living-space and, further, that colonies were essential for the production of foodstuffs. But, from the foregoing statistics, it will be seen that, even to-day, the white pop. is comparatively trifling. No obstacle has ever been placed in the way of Ger. trade with their former colonies. The restrictions on Ger. colonial trading were due solely to exchange difficulties created by the Ger. Gov. The hollowness of the Ger. pretensions on their economic side was exposed by the Reich's rejection of

the offer to have their economic claims examined by the League of Nations. So small was the percentage (not more than 2) of pre-war Ger. colonial trade to the total Ger. import trade, that the inference may be drawn that the colonies were wanted mainly for strategic purposes and for reasons of prestige. At Nuremberg, in Sept. 1937, Hitler reiterated the Ger. claim 'to have colonies to supply her with food and raw materials.' Asked at this Nazi congress by foreign journalists whether Germany, if colonies were acquired, intended to construct naval bases there, Hitler replied that Germany had never had naval bases in her colonies before the war and that colonies were worth nothing if an enormous armed force had to be maintained to protect them.

mandates; and the official answer was always to the effect that the mandates, having been conferred by the allied and associated powers, were, juridically, interminable (*see further under MANDATE SYSTEM*). In 1937 Mr. Neville Chamberlain, then chancellor of the Exchequer, indicated that the colonial question was not one which could be considered in isolation, but was only part of the much larger questions implicit in the then disturbed international situation; and further, that Britain was not the only colony-owning power, and that the colonial issue could only be raised in conjunction with other colonial powers. In Dec. 1938 Mr. Chamberlain (as Prime Minister) quoted with approval his predecessor, Mr. Baldwin's, dictum of 1935—

THE PRE-VERSAILLES TREATY GERMAN COLONIAL EMPIRE

	Area sq. m.	Population		Total Exports (1936) £	Mandatory
		White	Native		
Ger. E. Africa: Tanganyika Ter. Quanda and Urundi	374,100	9,100	8,500,000	5,000,000	Great Britain Belgium
Ger. S.W. Africa Cameroons (Kamerun)	317,700 200,000	30,700 2,700	300,000 3,200,000	3,000,000 2,500,000	Union of S. Africa Great Britain (part) France (part)
Togoland	35,000	400	1,100,000	750,000	Great Britain (part) France (part)
New Guinea	93,000	3,800	500,000	2,000,000	Australia
W. Samoa	1,150	600	55,000	250,000	New Zealand
Pacific Is.: Marlann Is.) Caroline Is.) Marshall Is.)	740	100	50,000	1,000,000	Japan
Nauru	—	200	2,000	500,000	Great Britain, Australia, and New Zealand jointly
Total	1,042,190	47,900	13,707,000	15,000,000	

At Augsburg, in Nov. 1937, he again raised the 'demand for colonial living room,' saying that 'what people do not care to hear to-day, they will be unable to ignore in a few years,' and he even claimed that the most difficult part of the preparatory work had already been accomplished in impressing the world with Germany's vital need for colonies. In these and similar characteristic utterances it will be observed that Hitler was gradually introducing a more and more menacing note in his demands, though later at Munich he told Mr. Chamberlain that Germany would never go to war with Britain over the C. I. It may be noted here that Hitler preferred his claims solely against Britain, his palpable object being to indicate to Germany that Britain was her real enemy; while his Anti-Comintern Pact (*q.v.*) made it impossible for him to raise the issue with Japan.

In the Brit. House of Commons many questions were asked in the intervals decades on the duration of the

that no Brit. ter. and no ter. under Brit. protection or mandates would be transferred from Brit. sovereignty or authority without the fullest regard being paid to the interests of the pops. of the ters. concerned—an answer which was characterised by a certain element of ambiguity and led, among other things, to the formation of the Tanganyika League of Europeans, pledged to oppose any changes in that ter. Gen. Smuts, at Maritzburg (1938) was more explicit. 'South-West Africa,' he said, 'was entrusted to the Union as a sacred trust by the League. If the necessity arose we would fight for it because it is essential for the safety of South Africa.' In the same year M. Daladier, the Fr. Prime Minister, said that there could be no question of any cession of Fr. overseas ter.; and in the Fr. Cameroons the Union Camerounaise, consisting of both European and native leaders, had, like the Tanganyika League, also taken up a strong stand against any transfer of ter. Both bodies contained

numerous Ger. members, and would, doubtless, have contained most of the Ger. nationals but for the fact that those who refused to acknowledge the Nazi regime thereby jeopardised the personal security of their relatives in Germany. Addressing the so-called Greater Ger. Reichstag in the Kroll Opera House, in Jan. 1939, Hitler said: 'One thing or the other will happen. Either property will be distributed on the basis of force, and then force will revise distribution, or distribution will be based on right and reason, and then it will be impossible for a few powers for ever to possess all the colonies.'

Colonial Law. The law to which a colony becomes subject on its foundation depends on the mode of acquisition of the colony, whether by settlement, conquest, or cession. Eng. subjects are said to carry their law not only to new and uninhabited colonies, but, to a certain extent, also to ceded and conquered colonies; but they carry no more of the Eng. law than is adapted to the particular circumstances of the infant colony, e.g. the Mortmain Acts (*q.v.*) were inapplicable to New S. Wales, the Marriage Acts to India, but the Bankruptcy Act, 1882, has been held to be of universal application. The Eng. eccles. law applies to settled colonies because there is no estab. church in them. By the provisions of the British Settlements Act, 1887, the king may, in the case of barbarous and desolate colonies having no legal form of gov., make law and establish courts and delegate all necessary powers of gov. to any three or more persons resident there. When a settled colony has been granted a legislative institution the Crown stands in the same position to that colony as it does to the United Kingdom. In the case of conquered and ceded countries, the existing law remains until changed by the conqueror, e.g. O.F. law applies to civil matters in Canada unless altered by the dominion legislature. Laws at variance with the fundamental principles of the Brit. constitution cease at the moment of conquest or cession. The king has power by Order in Council, or by charter of justice under the Great Seal, to make new laws. But having once granted legislative powers to a colony, he ceases to have any legislative power in regard to local matters. The king's legislative powers are the same in most respects as regards both ceded and conquered countries, but ceded colonies may have made conditions as to maintaining local laws, customs, and, in general, such conditions will be binding. By the Colonial Laws Validity Act, 1865, a C. L. is invalid only to the extent to which it may be repugnant to any Act of Parliament having reference to the particular colony, and no C. L. is to be deemed void by reason merely of instructions given to the governor by any instrument other than the instrument authorising him to give his assent to the passing of laws. By the same Act every colonial legislature has power to establish courts of Judicature, and to make laws respecting the constitution, powers, and procedure of

such legislature. A change in the operation of dominion legislation, especially in the direction of giving such legislation extraterritorial effect, was foreshadowed by the decisions of the Imperial Conferences, 1926 and 1930. The sequel was the famous Statute of Westminster, 1931. By virtue of this Act, the Colonial Laws Validity Act, 1865, no longer applies to any law made after Dec. 1, 1931, by a dominion Parliament; so that no law so made will be void or inoperative for repugnance to Eng. law or to any future Act of Parliament of the United Kingdom, and a dominion Parliament now has power to repeal or amend any such Act in so far as it is part of the law of the dominion. No Act passed after Dec. 1, 1931, will be deemed to extend to a dominion unless it is expressly declared in the Act that the dominion consented to its enactment. But the new Act confers no power to repeal or alter the constitution or the Constitution Act of Australia or the Constitution Act of New Zealand otherwise than in accordance with the pre-existing law; nor can the Australian Commonwealth Parliament legislate on any matter within the authority of the states of Australia not being a matter within the authority of the Parliament or Gov. of the Commonwealth. Similarly, there is a saving clause for the British North America Acts, 1867-1930, which Acts are, in effect, the constitution of Canada. It is further provided that none of the sections 2 to 6 of the statute will apply to Australia, New Zealand, or Newfoundland unless their Parliaments expressly adopt the statute. Australia delayed adoption until 1912, when by an Act of that year it adopted the material sections with effect from Sept. 3, 1930. New Zealand, in 1946, set up a committee to consider the question and the effect on the laws of New Zealand. Newfoundland (*q.v.*) has now joined the Confederation of Canada. The report of the conference of 1929 on the operation of dominion legislation (Cmd. 3479) also considered the advantages which might accrue from the estab. of a commonwealth tribunal as a means of determining differences and disputes between members of the Brit. Commonwealth; and the Imperial Conference agreed that the tribunal should be constituted *ad hoc* in the case of each dispute to be settled, and that it should consist of five members, including the chairman, neither the chairman nor the members to be drawn from outside the British Commonwealth of Nations. No such tribunal, however, has yet been convened, though the Brit. Gov. offered to refer the Irish land annuities dispute to such a body (*see* VALERA, EAMON DE; EIRE). Broadly speaking it may be said that the states which have most readily availed themselves of the Act are those like the Union of S. Africa and Ireland, in which there is a strong republican or nationalist element hostile to continued membership of the Brit. Commonwealth of Nations. The outbreak of the Second World War, however, showed that in the result the

greater part of S. Africa co-operated in the Brit. war effort. Eire remained neutral.

Colonial Office. In England the earliest separate organisation for the administration of colonial affairs was a committee of the Privy Council appointed by the king in council in 1660 'for the Plantacons.' By 1695 certain limited powers in regard to the colonies were vested in a commission known as the Board of Trade and Plantations, but the executive work was done by the secretary of state for the S. dept.

In 1794 the secretary of state for war had assumed control, but in 1854 the outbreak of the Crimean war led to the appointment of a secretary of state for the colonies to relieve the war secretary of colonial business, and the secretariat for the colonies has continued a distinct dept. ever since. The office, the importance of which was greatly enhanced under the secretaryship of Joseph Chamberlain at the end of the last century, later comprised three depts.: (1) The dominion dept., which dealt with self-governing colonies and the imperial conferences; (2) the dept. for the Crown colonies and protectorates; and (3) the general and legal dept. After the First World War a Middle E. dept. was set up to deal with business relating to the mandated ters. of Palestine and Mesopotamia (re-named Iraq, q.v.). In 1925, a new secretaryship of state for dominion affairs was created, and as a result the Dominions Office was formed to take over from the C. O. business connected with the self-governing dominions, including Irish Free State (now Eire), the self-governing colony of S. Rhodesia and the S. African ters., Basutoland, Bechuanaland, and Swaziland, and business relating to the imperial conferences (see IMPERIAL CONFERENCE). For some years both secretaryships were held by one minister, but in 1930 a separate minister was appointed to the dominions secretariat, with a separate parl. under-secretary. The administrative powers of the colonial and dominions secretaries do not embrace India nor the Channel Is. and the Isle of Man, the two latter being under the Home Office. The affairs of Egypt and the Sudan are under the charge of the Foreign Office. But with these exceptions the two secretaries of state speak for the whole of the Brit. oversea dominions, colonies, protectorates, etc., upon all matters arising in Parliament in regard to such dominions, etc. Colonial governors are appointed by the Crown on the recommendation of the secretary of state for the colonies, while other executive and all judicial appointments are made directly by the secretary of state. United Kingdom High Commissioners in the various dominions are appointed by the secretary of state for dominion affairs. Governors-general are appointed by the king on the advice of his ministers whether in the United Kingdom or in the dominion concerned. In recent years, especially since the close of the Second World War, the staff of the C. O., consistently with the advance of public opinion on the economic

development and social welfare of the colonies, has been considerably expanded, especially in the number of its specialist advisers. At present the secretary of state for the colonies has (apart from legal and medical advisers) advisors on development planning, agriculture, animal health, education, engineering appointments, fisheries, forestry, and labour. The enhanced importance of economics and sociology in the administration of the colonial empire is reflected in the formation of a number of new depts.—commercial relations and supplies, finance and development, research, social service, and welfare. See further under COLONIAL DEVELOPMENT AND WELFARE.

See Sir A. W. Renton, 'The History of the Colonial Office' (*Juridical Review*, July, vol. 1, 1889); H. E. Egerton, *A Short History of British Colonial Policy, 1660-1909*, 1922; Sir C. V. Fiddes, *The Dominions and Colonial Offices*, 1926; Sir A. Bertram, *The Colonial Service*, 1930; W. P. Morrell, *British Colonial Policy in the Age of Peel and Russell, 1841-52*, 1930; J. Garvin, *The Life of Joseph Chamberlain* (vol. iii.), 1934; H. L. Hall, *The Colonial Office*, 1937; C. Jeffries, *The Colonial Empire and its Civil Service*, 1938; Sir H. Stanley, *Colonial and Dominion Office Administration*, 'Public Administration', Oct. 1938; and 'Work of the Colonial Office' (*The Story of the Brit. Empire*, part v.), 1939.

Colonial Trusteeship. In the broader sense, the concept of C. T. originates in Burke's famous declaration, in his speech on the India Bill, 1785, that Britain had become directly responsible for the welfare of the Indian peoples 'as a sacred trust'. Acceptance of that principle laid the foundations for the nineteenth-century Brit. doctrine of C. T. With varying degrees of success this principle has in course of time led to the present position when self-gov. for India is in sight (see further under INDIA). In the Brit. colonial empire proper (i.e. as opposed to the dominions), the principle was implicit in the long political campaign for the abolition of the slave trade and, later, of slavery, in the Brit. W. Indies and, under Sir John Kirk's influence, in E. Africa where the Arab slave trade was the chief factor in directing Britain's attention to that region (consult R. Coupland, *The Exploitation of East Africa*, 1939; and also *The British Anti-Slavery Movement*, 1933). Sierra Leone may be regarded as an illustration of the principle, for the original settlement was formed for the benefit of liberated African slaves in 1792. Reinforced by a growing interest in Christian missionary effort, the movement for the abolition of slavery led the nation as a whole to accept a new standard of conduct towards subject peoples. As has been aptly said by Lord Hailey: 'The principle of trusteeship speedily became the touchstone applied by humanitarian interests in the assessment of colonial policy and by statesmen in justifying their conduct in its administration.' Again and again it has exerted its influence when issues have arisen in which native interest

have been at stake, and has often done so with decisive effect.' In the Brit. tropical dependencies in Africa the doctrine gained fresh impetus from the classic work, *The Dual Mandate*, by Frederick (later Lord) Lugard (1929), the fundamental theory of which is that the white man's trust has a dual purpose: the development of indigenous resources for the benefit of all nations, and the promotion of native welfare. Trusteeship is also implied in the principle of 'indirect rule,' which institution owes so much to Lord Lugard. The principle underlying this policy of 'indirect rule,' which is followed in the Brit. African dependencies and in the Federation of Malaya, is that native institutions are in themselves of value as agencies of gov., and that a replica of European political institutions in Africa or elsewhere is not the aim of policy most to be desired even in a distant future (Hailey). The policy of indirect rule is peculiarly Brit. in conception, and its validity has been challenged by other colonial powers as late as 1939, notably by France and Italy. As it has developed in practice . . . emphasis has shifted from the preservation of native institutions to their development for new functions to fit them to play their full part in the modern world. The concept of C. T. is also illustrated in the administration of Kenya in the principle of the 'paramountcy of native interests' as enunciated by the Devonshire White Paper of 1923 (Cmd. 1922), where it is stated that 'primarily Kenya is an African territory, and His Majesty's Government think it necessary definitely to record their considered opinion that the interests of the African natives must be paramount, and that if and when those interests and the interests of the immigrant races (i.e. the British, Indians, Arabs, and others) should conflict, the former must prevail. . . . In the administration of Kenya His Majesty's Government regard themselves as exercising a trust on behalf of the African population, and they are unable to delegate this trust, the object of which may be defined as the protection and advancement of the native races.' But it had always been made clear that the paramountcy of native interests is not to be interpreted as justifying neglect of the vital interests of the European community, and that the ultimate trusteeship of the imperial gov. does not preclude the grant to that community of a share in the gov. of territories which they have made their home. The Churchill White Paper of 1927 (Cmd. 2904) dealt with these two points by enunciating the principle of the 'dual policy' of economic development—increasing native production in the native reserves *pari passu* with that of European plantations—and the imperial gov.'s 'desire to associate more closely in the high and honourable task (of trusteeship) those who, as colonists or residents, have identified their interests with the prosperity of the country.' The principles implicit in the concept of C. T. have received practical application in recent

years, partly through the stimulus of the writings of the Fabian school of thought, in the form of greatly extended social services and colonial welfare generally, through the operation of the provisions of the Colonial Welfare and Development Act, 1910. Trusteeship, on the political side, and the dual mandate on the economic, have in these days been merged in the more constructive relationship of senior and junior partners. The principle of C. T. is also implicit in the concept of mandates (see MANDATE SYSTEM), by which provision was made, after the First World War, through the League of Nations, for the administration by the Allied and Associated Powers of enemy colonies—the underlying principle being that in the strenuous conditions of the modern world these territories, stood in need of special mandatory gov. by way of tutelage, subject to the moral supervision of the Permanent Mandates Commission of the League of Nations to prevent exploitation of their peoples by the mandatory.

United Nations' Declaration on Colonial Policy and the International Trusteeship System.—During the 1930s when the colonial demands of Germany and Italy seemed to show that the possession of colonies was one of the causes of international friction, some publicists and politicians thought the solution of what was known as 'the colonial question' lay in bringing all colonies alike under some form of international control, so as to ensure that the non-colonial powers could enjoy the same range of economic opportunities as the colony-owning powers. But in the preoccupations of the Second World War the matter ceased to excite any special interest, though interest revived to some extent through Amer. criticisms of Brit. 'imperialism.' The more dispassionate section of Amer. public opinion, however, could not accept the Brit. conception of C. T. where the trustee was not accountable to some third party's judgment, i.e. some international body after the manner of the Permanent Mandates Commission. As confidence in victory deepened towards the later stages of the war, the opinion in Britain strengthened that no form of international intervention in the administration of the colonies could be tolerated, and indeed some hoped it would be possible to abolish the mandates altogether rather than subject all colonies to a mandatory regime.

The San Francisco decisions of 1945 (see SAN FRANCISCO CONFERENCE) respecting colonies were a compromise between the more extreme points of view. The conference drew a clear line between the treatment of the colonies proper and of those areas which were held under mandate or which might at any time be brought under a similar regime. The conference (see UNITED NATIONS CHARTER) did not propose to subject colonies to any system of control—probably it bore in mind Mr. Churchill's famous declaration that what Britain had it held, and that he did not think he had been called upon to be Prime Minister

in order to preside over the liquidation of the empire. The United Nations Charter restricted itself to an agreed declaration on colonial policy, which recognises that the interests of the colonial peoples are paramount and commits the colonial powers to promote self-gov. 'according to the circumstances of each ter. and its peoples and their varying stages of advancement'—a declaration which contains nothing new to Brit. colonial policy and which indeed would seem almost to be modelled upon that policy, especially as the charter concedes the principle that progress in free institutions must evolve in harmony with social and economic advance. The charter does, however, require that colonial powers should regularly transmit to the United Nations Organisation statistical and other information regarding colonial conditions. The element of third-party control is, in fact, limited to that class of ters. which are to be brought under the international trusteeship system: i.e. ters. then held under mandate; those which might be taken from enemy states after the war; and those which might be voluntarily put under the system by the states then controlling them. Assuming that Britain would decline to offer any part of her colonial empire for inclusion in this system, the areas which would come under it would in terms of pop. be under one-tenth of the whole Brit. colonial empire.

The international trusteeship system, however, differs in many particulars from the mandatory regime. The Trusteeship Council, which replaces the Permanent Mandates Commission, is composed of member states administering trust ters., major signatories not holding such ters. (at that date these were U.S.A., U.S.S.R. and China), and such number of elected member nations as would ensure that trust-administering nations were not in the majority. Each member nation nominates one qualified person to be its representative; whereas in the old mandatory system, there was no rule prescribing the countries which should nominate members, and it was a recognised convention that the commission's members should be regarded as individuals exercising an independent judgment, not as national representatives.

The council's stated functions as to receiving petitions and information are not wider than those of the old commission, save that the council has formal authority to provide for periodic visits to the trust ters. But there is a change in the way in which ters. may be brought under the new system: each is to be the subject of a separate agreement, which is to be made by 'the states directly concerned,' including a mandatory power, and approved by the United Nations. The object of this arrangement is to secure flexibility in the terms of the trusts over ex-enemy ters., but may cause difficulties in securing agreements between a mandatory and the 'states directly concerned,' whose identity is obscure. These agreements, however, are to be made

within the framework of the declared objectives of the trust system, which indeed are similar to those of the colonial charter or declaration. But two points of practical significance arise in relation to certain limitations on the old mandates, viz. the prescription of the obligatory open door in A and B mandates—applicable to tariffs, investment of private capital and immigration—and the prohibition against raising forces locally or constructing fortifications or bases except for purely local defence. The trust system maintains the open-door principle, though it does so in such terms as imply a possible departure in the interests of the people of the ter.; but the restriction on fortification is discarded. Despite all that the charter may be designed to achieve, it is probable that experience will show that, as in the past, the sure guarantee of the interests of the peoples of mandated ters. lies in the character and conscience of the administering authority' (Lord Hailey, in *The Times*, Oct. 3, 1945).

Colonies, Zoological, are formed when a low organism gives rise to sev. buds which adhere to the parent and continue to reproduce after this manner. Such colonies, occasionally found among the Protozoa, are very usual among the Porifera or sponges, and among the Coelenterata the fresh-water *Hydra* forms such an aggregate of individuals temporarily, while many other forms, e.g. dead men's fingers, or *Alcyonium digitatum*, and most corals, are permanently colonial. In many cases the individuals which make up a colony perform identical functions, but in the condition known as polymorphism the functions are specialised and allotted to various persons. Thus the individuality of the members is frequently lost, and they become almost like organs instead of whole living creatures.

Colonies, Epileptic, see under EPILEPSY. **Colonna** is the name of one of the oldest and most illustrious families of Italy, which has produced popes, cardinals, princes, and generals, and belonged to the Ghibelline party.

Colonna, Cape, see COLONNES.

Colonna, Fra Francesco, Dominican, b. at Venice. He is famous chiefly as the writer of a mysterious allegorical romance, *Hyperboreanus Poliphili, ubi humana omnia non nisi somnium esse docet*, which would probably be forgotten but for a rare ed. with engravings by Giovanni Bellini and for Paul de Saint Victor's illustrations. An abbreviated version of this romance was pub. by Sir Richard Dallington in 1592 under the title of *The Strife of Love in a Dream*. See also Linda Elzer-David, *Der Liebestraum des Poliphilo: ein Beitrag zur Psychologie der Renaissance und der Moderne* (Zürich), 1948.

Colonna, Giovanni Paolo (1640–95), It. composer, b. at Bologna. He composed mostly church music. On four occasions he was elected principal of the school of music at Bologna. Some of his compositions are still in MS. at Bologna and some at Vienna, but a fair number of them were printed in 1681–94.

Colonna, Pompeo (1479-1532). It. cardinal, nephew of Prospero C., It. condottiere. After having been a soldier in his youth, Pompeo C. entered the Church, and was made bishop of Rieti in 1508. For inciting the people to revolt against Pope Julius II. he was deprived of his office, but was pardoned by Pope Leo X., and created cardinal in 1517. He held the office of viceroys of Naples from Charles V. from 1529 until his death. He had some talent as a poet; his celebration of the famous It. poetess, Vittoria C., entitled *De Laudibus Mulierum*, is his prin. work.

Colonnade, one or more ranges of columns symmetrically disposed, in front of, or surrounding a building either outside or inside.

Colonne, Guido delle, Giles, or Gilles de Colonne, Egidio Colonna, or Egidius Romanus (d. 1316). It. theologian and writer, b. at Rome. He became tutor to the dauphin of France, Philippe le Bel, for whose use he wrote a treatise entitled *De Regimine Principum* (pub. in folio at Rome in 1492). In 1292 he was elected general of the Augustinian order, and later became bishop of Bourges. He was an exceedingly learned man, and was called

THE COLONNADE, ST. PETER'S, ROME

D. McLeish

Colonna, Prospero (1152-1523). It. condottiere who offered to help Charles VIII. of France when that king invaded Italy in 1494-95. He was an extremely able general, and later on entered the service of the pope, and among his many victories he won the battle of Vienna in 1513 against the Venetians, and the battle of Bicocca in 1522 against the Franco-Ger. forces under Lautrec. Sismondi gives a good account of this man in his *Histoire des républiques italiennes au moyen âge*, an extract of which came out in Eng. in 1830.

Colonna, Vittoria (1190-1517), marchioness of Pescara. Italy's most celebrated poetess, daughter of Fabrizio C. She was betrothed at the age of four to Francesco de Avalos and was brought up in the mansion of Costanza d'Avalos, Francesco's aunt, where Tasso and most of the intellectual men of the time were constant guests. She was remarkably beautiful, very intellectual, and well educated; her first poetry was written at an early age. From 1512 she led a very lonely life, her husband being absent with the fighting army; he is the one subject of her verse during this time. After his death she lived in retirement for ten years. Later she lived for four years in a monastery at Orvieto, then in a convent at Viterbo. Michelangelo, between whom, in his later years, and Vittoria C. existed a warm friendship, wrote some of his finest sonnets to her. The *Rime spirituali* are her most characteristic poems.

by his contemporaries 'the well-founded doctor.' He wrote sev. books on philosophy and divinity. A life of him by Angelo Rocca is prefixed to an ed. of his work, *Defensorium*, pub. at Naples in 1644.

Colonnas (Colonna), Cape (It. 'column'; formerly *Sunium Promontorium*), also called *Sunion* or *Kolonos*, is a southern point of Attica, Greece. At the cape's extremity are ruins of a temple (269 ft. above sea level) dedicated to Athene, of which thirteen marble columns still stand, and from these the tn. derives its name.

Colonsay and Oronsay, two Inner Hebridean is., off Argyllshire, Scotland. C. measures 8 m. by 3 m., and possesses a college, which was founded by St. Columba. St. Columba landed at O. from Ireland in 563 and afterwards removed to Iona. There are extensive remains of a priory founded in the fourteenth century. Pop. 300.

Colonus, or Kolonos Hippios, site in Attica, Greece, about 2 m. N.W. of Athens. Sophocles was born there, and immortalised it by the description which he gave of it in the *Edipus at Colonus*. Two most famous archaeologists, Charles Lenormant and Otfried Müller, are buried in the cemetery upon the hill-top.

Colony (Lat. *colonia*, from *colere*, to till), name applied to a country which is peopled by immigrants, who remain subject to or connected with their parent state. The anc. Gks. colonised extensively along the coast of Asia Minor,

Thrace, S. Italy, N. Africa, Sicily and the Crimea, a Gk. C. was called *πατρίδα*, and the colonists *πατρίοι*, i.e., literally, 'people from home.' The cause of emigration from Athens was usually political dissension. The band consulted the oracle and chose a leader, called *οἰκιστής*, who took sacred fire from the Prytaneum, that the new city might be patterned after the *μητρόπολις*. The city thus founded was entirely self-governing and independent, and was connected with Athens only by ties of sentiment and religion. The *κλήροι*, i.e., literally 'allotment,' on the other hand, though it had a certain amount of internal self-gov., remained in close connection with the mother city, the citizens being recognised as Athenian citizens. The Phoenicians and Carthaginians were great seafarers, but their purpose was purely a commercial one, and they aimed at building trading centres, rather than at establishing Cs. The Romans, who were a great colonising race (strictly speaking a *colonia* is a farm, or cultivated land, but the meaning was extended to embrace any public settlement of Rom. citizens, and later it acquired a military sense), began their Cs. in the neighbouring cities. Whenever Rome conquered or acquired new ter., she left behind her a handful of citizens to act as a garrison. These citizens were frequently veteran soldiers. They were given the land as a reward for past services, and had to answer to Rome for the loyalty and good behaviour of the *colonia*. The Romans had a genius for organisation and administration. Some Cs. were rewarded with the high privilege of Rom. citizenship, while others remained in the humbler position of dependencies, and still others grew into large Rom. provs. The gov. was modelled on the republican gov. of Rome, and the Cs. were governed by the same kind of officials. The highest men in the state were rewarded with the governorship of a prov. or C. After the fall of Rome, Cs. were not heard of again till early in the sixteenth century, when Spain and Portugal took the lead, followed closely by England, Holland, and France. During the Renaissance men were inspired by a high, adventurous spirit. Those who came back across the Atlantic filled the minds of their fellow countrymen with stories of a wonderful land, where unlimited gold might be found. The possibilities of the New World seemed to be unlimited, and every country which had any maritime power wished to be there first and possess the best of everything. Portugal had, as early as the fifteenth century, placed trading factories along the W. coast of Africa, which she later extended as far as India. Portugal now developed her empire in S. America, as well as in Africa, her great rival in the former country being Spain. The Cs. of Spain and Portugal were directly subject to the gov. at home; they were ruled by highly paid, self-seeking officials, whose one ambition was to make so much out of the new country that they might return, enriched with their gains, to their

former home. The Sp. colonists were chiefly engaged in mining. The Portuguese aimed at placing factories at convenient ports for trading purposes. Neither country aimed at cultivating the land it had seized, and neither was successful at ruling the natives nor at settling down and making a home in the new conditions. By the end of the eighteenth century Portugal had lost everything except a few tus. of little note in India, a strip along the coast of Africa, and Brazil, which later asserted its dependence and became a republic (1822). Spain eventually lost her possessions in S. and Central America during the nineteenth century, and her other Cs. she ceded to the U.S.A. after the war of 1898-99. The earliest Brit. C. was Newfoundland, annexed by Sir Humphrey Gilbert in 1583. During the sixteenth and seventeenth centuries Great Britain was, of course, urged to send her sons across the seas by a spirit of rivalry with other European states. But other causes made it imperative that they should find a permanent home in the New World. Religious differences at home was one of these causes, and led to the sailing of the *Mayflower* from Plymouth to New England in 1620. The settlers in N. America were organised as chartered companies, with royal letters patent. They remained under the supervision of the gov. at home, but developed according to their own needs. They traded almost entirely with Great Britain, to whom they sent raw materials, receiving in return manufactured products. The Brit. empire in India, which was not technically a C., having a secretary of state of its own, began through the commercial industry of the E. India Company, which was incorporated in 1600. The new possessions which accrued to Great Britain during the eighteenth century were, chiefly, trophies of war. Gibraltar, the gate to the Mediterranean, and as such of invaluable importance to a maritime country, was captured in 1704. Through the victories of Clive and Wolfe, before the end of the century Great Britain reigned supreme over India and Canada, which did much to compensate for the loss of the U.S.A. The nineteenth century was a period of development and consolidation. Australia, first used as a dumping-ground for convicts, had grown greatly in prosperity, and its different provs. were united into an autonomous commonwealth in 1901. After the rebellion of 1837-38, responsible self-gov. was given to the Cs. of Brit. N. America, the last to receive it being Brit. Columbia in 1863. In Africa, after the Transvaal war (1899-1902), the Cs. in the S. were united under the name of the Union of S. Africa, with a representative gov. of its own. Other Brit. Cs. which have (or have had) self-gov. are New Zealand and Newfoundland. Newfoundland's administration was vested in 1934 in a Commission of Gov. under the supervisory control of the Imperial gov., but in 1949 the Is. joined the Canadian Confederation. (See further NEWFOUNDLAND.) It is to be observed that in

official language the term colony no longer applies to Australia, Canada, New Zealand, S. Africa, and Ceylon, which are styled dominions (see DOMINION STATUS). (The Statute of Westminster, 1931, provides that the expression 'colony' shall not, in any Act of the United Kingdom Parliament passed after 1931, include a dominion or any prov. or state of a dominion.) The Brit. Parliament has no veto over the legislation made in the dominions or with self-governing Cs. such as S. Rhodesia, but the Crown appoints the governor, who is responsible to the imperial gov. A dominion gov. may make recommendations as to the appointment of a governor-general, as was done in the case of Sir Isaac Isaacs, who was made governor-general of Australia in 1931, and a few years later, in the case of Sir Patrick Duncan, the governor-general of the Union of South Africa and his successor Maj. G. B. van Zyl. Certain other Cs., such as Barbados, have representative institutions, but the Crown has the right of election to all public offices. Crown Cs., such as K. C. Trin., Gibraltar, are under the legislative control of the home gov. Modifications of this control are continually being made in order to give the people of the colonies a much greater part in the control of their affairs. Thus, in 1949, a new constitution for Trin. provided for nine additional elected members of the Legislative Council and a clear majority of elected members in the Executive Council. In most cases, however, reserve legislative powers are vested in the governor, to be used only when a question of public order or good gov. is involved. (See also COLONIAL LAW.) On emigration see EMIGRATION; EMPIRE SETTLEMENT ACT. The dominions and Cs. of Great Britain have loyally supported the mother country in time of war and have also generously contributed towards her navy. For detailed accounts of the hist. of Cs. see articles on the chief countries, Great Britain, Spain, etc.; see also the articles on the various dominions or Cs. See also bibliographies for BRITISH EMPIRE or BRITISH COMMONWEALTH OF NATIONS; COLONIAL DEVELOPMENT AND WELFARE. Consult H. Brougham, *An Inquiry into the Colonial Policy of the European Powers*, 1803; A. H. L. Heeren, *Manual of the Political System of Europe and its Colonies*, 2 vols., Eng. trans. 1834; J. A. Colophon, final paragraph found in some MSS. and in printed books before the introduction of title-pages, giving the name of the author, the date and place of production, and the name of the copyist or printer, pious remarks being frequently added in the case of old MSS.

Colophon, anct. Ionian city in Asia Minor, near the coast, between Lebedus and Ephesus. The bp. of the poet Mannermus.

Colophony, or **Common Resin**, or **Rosin**, exudes from certain species of pine in a semi-liquid state. This is the crude article, and consists of the resin proper and turpentine. On distillation the turpentine is obtained and the resin left behind. This is a brittle, solid, and semi-transparent substance, varying from pale yellow to dark brown in colour. It is insoluble in water, but dissolves in alcohol, chloroform, etc. It burns with a smoky flame and melts easily, decomposing if heated much, giving resinoid as a chief product. It is used extensively in yellow soap manuf., the sizing of paper, and as a protective in soldering.

Colorado, one of the States in the Mt. Div. of the U.S.A. It is bounded on the N. by Wyoming and Nebraska, on the E. by Nebraska and Kansas, on the S. by Oklahoma and New Mexico, on the W. by Utah; its lat. is 37-41° N. and its long. 102-109° W., its area 104,207 sq. m., and its pop. in 1940 was 1,123,296. The Indian pop. is 1360. C. is crossed from N. to S. by ranges of the Rocky Mts., having close upon fifty peaks upwards of 14,000 ft. in altitude; Elbert, the highest, is 14,420 ft.; the next highest, Blanca, being 14,363 ft., and at least 300 peaks are estimated to exceed 13,000 ft. Six of the many passes which cross the ranges are at an altitude of upwards of 12,000 ft.; the Argentine Pass is at a point 13,000 ft. high. Railways cross many of the passes, traversing valleys and canyons in their course and presenting examples of great engineering skill. The Denver and Rio Grande W. railway crosses Marshall Pass at 10,856 ft., and in 1928 the Moffat Tunnel, 32,150 ft. long, was opened under

James Peak. In the central mt. region are the marvellous *parks* or rich mt. valleys, canyons, and hot springs which have so often been described. The E. rive. of the state belong to the Mississippi valley, the W. to the C. R. Of the former the most important are the S. Platte, the Arkansas, and the Rio Grande del Norte, draining the Atlantic slope; while to the latter belong the Bear and the Gunnison or Grand rivs., which drain the Pacific slope. The climate of C. is very salubrious and regular; its atmosphere is remarkably dry, rendering sojourn there most beneficial to consumptives and asthmatics. Its many medicinal (chalybeate, sulphur, and soda) and thermal springs, too, contribute to make the state a very valuable health resort. Agriculture is the prin. industry; mining and cattle raising coming next in order. Until 1910 C. was the leading state for the production of gold, then, however, it was outstripped by California; Montana, Utah, and Nevada alone surpassed it in output of silver. Coal also is produced in large quantities, the state being eighth among all the coal-producing states and first among those W. of the Mississippi. C. coal has been in very great demand for many years for the railways between C. and the Mississippi; its 'coking coal' has become important in the manuf. of steel and iron. The ann. output of coal is 6,000,000 tons; zinc 30,000 tons; lead 15,000; and copper 1350. Other minerals are manganese, radium, molybdenum, and tungsten. The production of petroleum is nearly 12,000,000 barrels a year. The development of irrigation has made agriculture prosperous. Wheat, oats, maize, barley, hay, potatoes, and beet-sugar are the staple agric. productions. The locust and the C. potato-beetle have hitherto been very inimical to the labours of the agriculturist, but headway is being made against these pests. Stock-raising is mostly confined to sheep and cattle, and the export of dead meat is an important industry. Part of C. was acquired by the U.S.A. from France in 1804 and part from Mexico in 1848. In 1858 the discovery of gold brought settlements of Eng.-speaking people to the dist.; these pioneers came from Kansas, Nebraska, and Missouri. Immigration went on in a continuous stream during 1860-62, when it was checked for some years by the warlike attitude of the native Indians, to be resumed again in 1865. C. was admitted as a state in 1876. The pop. is of mixed origin, but is largely made up of immigrants from the older Amer. states; there is a small Sp.-speaking colony in the S. The chief tns. are Denver, state cap., pop. 322,000, Pueblo, 52,000; C. Springs, 36,000.

Colorado Beetle, or Potato Beetle, N. Amer. member of the family Chrysomelidae. The chief characteristics of the beetle are the longitudinal stripes of black and yellow, i.e. stripes running from the front to the tail and *not* across the insect. The bright pink or red colour of the grubs will serve to identify them, provided

they are found eating potato leaves, since there is no similar insect in this country that feeds on potato leaves. A further characteristic sign of both beetles and grubs is the black and rather messy excrement (frass) which is left on the potato leaves. The C. B. spends the winter buried deeply in the soil—10-12 in. in average soils. In late spring or early summer it works its way to the surface and flies in search of potato crops, travelling distances of sev. miles if necessary. On reaching a crop the beetles feed upon the potato leaves, and the females lay clusters of eggs on the leaves, the majority

Text and illustration reproduced from Ministry of Agriculture and Fisheries' advisory leaflet by permission of the controller of His Majesty's Stationery Office.

COLORADO BEETLE AND GRUB

being attached to the under-side. In a few days the eggs hatch into grubs, which also feed upon the potato leaves. After about three weeks the grubs are fully grown, and descend into the soil, where they turn into pupae. Ten to fifteen days later they undergo a further and final change into adult beetles. Towards the end of July and during Aug., these beetles come up to the surface, feed, and if the weather is warm, lay eggs that produce a further generation of beetles before the haulm dies off in the autumn. With the end of summer the beetles burrow down into the soil again, and stay there for the winter. The effect upon the potato crop depends upon the number of beetles and grubs present. When there are many, the haulm is completely stripped of leaves, and no tubers worth digging are formed. It is by the destruction of the haulm that the pests do damage; they do not burrow into the tubers themselves. The C. B. is notable for its ability to adapt itself to different climatic conditions, and for the way in which it can spread rapidly, both by flight and by making use of trains,

boats, or other forms of transport. These two characteristics explain how it is that an insect formerly restricted to a semi-desert region of the W. U.S.A. has already occupied most of the N. Amer. continent, and has now colonised many European countries, including France, Belgium, Holland, Germany, and Switzerland. Since 1933 there has been a number of outbreaks in England, but by the exercise of drastic measures the pest has so far been prevented from establishing itself. The kinds of insect most frequently confused with the C. B. are the useful ladybird beetles (marked with black spots on an orange or red ground colour), and their grubs and pupæ; the burying or sexton beetles (much larger than the C. B., and marked on the back with orange-red and black bands from side to side); and the cockchafer (*g.v.*) (yellowish-buff in colour).

Colorado Desert, immense desert in the S. of California, U.S.A., situated to the W. of the Colorado R. It contains the Coachulla valley, the lowest part of which once formed the San Felipe Sink, about lake of 8000 sq. m. in the Coachulla valley. This to some extent dried up afterwards. 300 ft. below the level of the sea. In 1891 the flooding of the R. Colorado formed a

Colorado River, large and remarkable riv. of S.W. U.S.A. It is formed by the union of the Green R., which rises in Wyoming, and the Grand R., which rises in Colorado, where it is known as the Gunnison. Before its junction with the Grand R., the Green R. receives the Yampuh and the White R., and then flows for 150 m. without any further important augmentation; the Grand R., which drains a large portion of Colorado, receives the Bunkara and the Dolores. The united stream flows through Utah, receiving there the San Juan, and then passing through Arizona it is joined by the Colorado Chiquito, or Little Colorado, the Bill Williams, and the Rio Gila, all from the left. From a generally southerly direction the riv. turns due W. to cut through the mt. ranges, then again due S., entering the gulf of California after a course of about 2000 m. The C. R. is unique in the world by reason of the wonderful channel it has carved out for itself. It flows for miles at a time at the bottom of a deep trench or canyon, which it has cut out through stratum upon stratum of rock. The walls of these canyons are often from 4000 to 7000 ft. high, sometimes rising sheer from the stream; sometimes there has been a fall of rock which breaks up the perpendicularity, and which now and then gives rise to a strip of fertile ground. The most remarkable of these ravines is the Grand Canyon, which is the most extensive not only of the Colorado canyons but of any in the world. This occurs after the junction of the Colorado Chiquito with the main stream. The riv. makes its way for about 200 m. through a great plateau, and the Grand Canyon is the result. Further down is the Black Canyon, whose height is about 1000-1500 ft., and whose length is 25 m. In this dist. are to be found numbers of

abandoned prehistoric dwellings, some on cliffs in the canyons, others on high ridges. This seems to indicate that at some distant time it was more adapted for the support of human life than it is now. Navigation of the C. R. is possible only for about 600 m. Tortoises abound at the mouth of the riv. in April and Aug.

Colorado River, Texas, U.S.A.; rises in the table-lands in the N.W. by many heads, the chief being N. Fork and Salt Fork; flows S.E. for about 650 m., entering the bay of Matagorda just S.W. of Matagorda. Chief tns. on its banks: Austin (state cap., at the head of steamboat navigation), Bastrop, and La Grange.

Colorado Springs, cap. of El Paso co., Colorado, U.S.A., 65 m. S.E. of Denver. It is a favourite summer and health resort, standing in lovely scenery, at an altitude of 6000 ft., and sheltered by mts. on the N. and N.W. The climate is mild, and in the vicinity are the Manitou mineral springs, and the Garden of the Gods, a dist. of red sandstone peaks. There are sawmills and a trade in cattle. Pop. 36,000.

Colorado University, Amer. state institution for the higher education of both sexes, founded in 1876 at Boulder, Colorado, and formally opened in 1877. In 1914-45 there were approximately 5900 students. In addition to the library of over 210,000 vols., there are numerous pamphlets and a large collection of maps.

Colorno, tm. of Parma prov., Emilia, Italy, on R. Parma, 59 m. N.E. of Parma. Pop. 2500 (commune, 7000).

Colossal Cavern, cavern, Kentucky, U.S.A., whose entrance is 14 m. from the Mammoth Cave; its formation is due to the chemical and mechanical action of water; it has a number of domes and pits.

Colosseum, name given to a celebrated amphitheatre in Rome, one of the most important monuments of Rom. antiquity. It was begun by Vespasian, finished in A.D. 80 by Titus, and was known originally as the Flavian amphitheatre, Flavius being the family name of these two emperors. The name C. was first employed by Bede in the eighth century, in reference, no doubt, to its colossal size; it was the colossal building *par excellence*. The C. was used for combats of gladiators and wild beasts; after the shows the arena was often filled with water and used for nautical displays. It is now in ruins—a gigantic stone carcass. Sev. times ravaged by fire and always restored, it served the barbaric pleasures of the Romans until the end of the sixth century. Since then it has suffered pillage at the hands of the barbarians, has been used as a fortress by brigands of noble Rom. family, has been transformed into a huge quarry, marble for the Forum being calcined there in lime-kilns, and its own stones have been carried away for building purposes. Pope Benedict VIII. saved it from further devastation by consecrating it to the memory of the Christian martyrs and by erecting crosses and oratories within its walls. Popes Pius VII., Leo XII., and Pius VIII. further preserved it by buttressing the walls, etc. In form the C. is

an ellipse whose axes measure 615 ft. and 510 ft.; its height is 160 ft. to 180 ft., and the arena about 281 ft. by 177 ft. It is estimated to have held seats for 87,000 persons and standing room for 20,000 more.

Colossians, Epistle to the, epistle addressed by St. Paul to the church at Colossæ. This epistle is generally believed to have been written in Rome about

which was the work of Chares of Lindus, and represented the god Apollo. This figure was about 100 ft. high, took twelve years to erect (292 to 280 B.C.), and cost 300 talents, which is about £70,000. The statue was placed at the entrance to the harbour, but not with a leg on each side as often stated. In 224 B.C. an earthquake cast it to the ground, where it remained until A.D. 672, when Moawiya,

Anderson

THE COLOSSEUM, ROME

A.D. 62, on the occasion of the springing up in the church at Colossæ of a Judeo-Gnostic heresy. The chief features of this heresy—probably Essenism—are angel-worship and asceticism. The Colossian church was mainly Gentile, and this doctrine was taught by converts from Judaism, who tried to impose its ceremonial observance upon their Gentile brethren. Epaphras, the founder of the church at Colossæ, informed St. Paul of this state of things, and in reply the apostle wrote the epistle. In it he combats this invading 'philosophy' and earnestly contends for the supreme dignity of Christ. The epistle was dispatched by the hands of Tychicus, who also bore the epistle to the Ephesians at the same time.

Colossus, word originally used by the Greeks, and afterwards adopted by the Romans, to designate statues that were more than life size, and particularly those of gigantic proportions. The name was especially used to signify the celebrated enormous statue known as C. of Rhodes,

a general of Caliph Othman IV., sold it to a Jew of Edessa who took it away in pieces on 900 camels.

Colotomy, that operation which involves opening into the colon; it is usually performed in cases of stricture.

Colour, sensation excited by the action of rays of light on the retina of the eye. Light is transmitted by a wave motion of the all-pervading ether of space, and its properties depend upon the wave-length of the waves. Of the whole group of radiations of the same nature, ranging from long wireless waves on the one hand penetrating short wave to X-rays and gamma-rays on the other, the eye is sensitive to only a narrow band of wave-lengths. In this band the longest waves excite the sensation of red and the shortest that of violet. Ordinary white light from the sun or from an incandescent solid or liquid can be resolved into its components to form a spectrum in which the radiations of each particular wave-length are concentrated at one point. In this way it is shown that the radiation that excites in

the eye the sensation of white consists of a mixture of radiations which separately produce sensations of C. Seven different Cs. (red, orange, yellow, green, blue, indigo, and violet) are conventionally distinguished in the spectrum, but as each shades off gradually into its neighbours there is no sharp demarcation between them, and most observers find difficulty in accepting all these Cs. as distinct, preferring to regard the blue, indigo, and violet, for example, as shades rather than as separate Cs. Certain Cs. such as brown and purple are not found in the spectrum, and are not induced as sensations when light of any one wave-length falls on the eye.

Although ordinary white light consists of a mixture of all the spectral Cs., the sensation of white can also be produced by other mixtures such as that of blue and yellow lights of appropriate intensities, or by red, blue, and green. This fact may be used in the production of white light by electric discharge lamps, the light from which appears to the eye to be indistinguishable from ordinary white light, although the intensities of the various Cs. present are not necessarily the same in the two cases. In the same way lights of such wave-lengths as separately produce the sensations of pure spectral Cs. may give, when mixed, a sensation indistinguishable from that of another spectrum C., or of a C. not found in the spectrum. A mixture of green and red lights, for example, produces the sensation of yellow. The Cs. of non-luminescent objects therefore depend upon the nature of the light falling on them, upon their action on this light, and upon the reaction of the eye to the light transmitted to it from the objects. With few exceptions the action of a coloured object upon the light falling on it is merely one of subtraction of one or more spectral Cs. Thus when white light falls on a red glass the glass appears red when viewed by transmitted light, because the light passing through it is such as produces in the eye the sensation of red. This light may be either radiation of a narrow band of wave-lengths at the red end of the spectrum, or a wider band in which red is the predominant C., because the red light is of a higher intensity than the orange and yellow. Similarly a blue glass appears blue because it absorbs all the rays except those at the blue end of the spectrum, while if the red and blue glasses are superimposed any radiation transmitted by the one is absorbed by the other, with the result that the combination looks black. Opaque objects act in a similar way. The light reflected to the eye penetrates the surface of the object for a short distance while undergoing reflection, and in doing so some of its Cs. may be absorbed. If there is no preferential absorption the object appears white when viewed in white light, and when viewed in coloured light appears to be the C. of the light. A blue object on the other hand appears blue in white light because it absorbs light of the red end of the spectrum, and reflects only

that from the blue end. If viewed in blue light the light is reflected and the object still appears blue, but if only yellow light falls on it none is reflected, and it appears black. Most blue objects, however, reflect appreciable amounts of green light as well as blue, and therefore appear green in a pure green light. When two pigments are mixed both may continue to absorb the same Cs. as before. Thus when white light falls on a mixture of blue and yellow pigments the blue particles absorb all but the blue and green light, and the yellow all but the red, orange, and yellow. The only light not absorbed by either is therefore green, so this is the C. seen by the eye.

C. has three varying properties: it may be said to possess *hue*, *purity*, and *luminosity*. Its hue or tint gives it its name, as, for example, ultramarine and indigo blues. The purity or richness of a C. is determined by the amount of white light which is diluting the tint, and according to its purity we talk of the paleness or deepness of a given C. Again the luminosity determines the shade of a C. and gives it its quality of darkness or brightness. Various theories as to the mode of C. perception have been put forward, but all meet with difficulties. Young and Helmholtz believed that the retina consists of three kinds of nervous elements. Each of these is excited by only one C., and it is supposed that there are three physiologically primary Cs. Opinions differ as to what these Cs. are, but we may take them as being red, green, and violet. According to this theory, if the elements sensitive to all three Cs. be simultaneously excited, according to the proportion of excitation of each set of elements, then the resultant impression may be either a simple C. or white. Similarly, simultaneous excitation of the elements sensitive to green and violet would result in some C. in the spectrum, ranging between green and violet, according to the proportion of the excitation of the two elements. This theory will account for the appearance of consecutive coloured images. For example, if a red object be viewed for a long while, the eye becomes fatigued to red, and in darkness an image composed of green and violet will result in an after image of a pale greenish-blue hue. Viewing an object in white light with the eye fatigued to red, then, causes one to see an intense complementary image coloured by a blend of green and violet. See also INTERFERENCE; LIGHT; SPECTRUM; VISION; DEFECTS OF. See A. H. Church, *Colour*, 1901; W. de W. Abney, *Researches in Colour-vision*, 1913; E. R. Watson, *Colour in Relation to Chemical Constitution*, 1918; W. H. Bragg, *Universe of Light*, 1933.

Colour, Accidental, see ACCIDENTAL COLOUR.

Colour Bar, phrase which connotes differential or discriminatory legislation or regulations by colony-owning powers against coloured races, and in this, its technical sense, it is of very recent origin. The first legal definition in the Union of S. Africa, where it is most in evidence, is

to be found in a series of Acts begun in 1912, which culminated in 1926 in the passing of the Mines and Works Amendment Act, empowering the gov. to make regulations discriminating against the Bantu solely on the ground of their race and colour. The origin of C. B., of course, goes back centuries, or, in its wider implications, it may be regarded as merely a corollary to slavery. It was but natural that the white man's more efficient technical equipment and more advanced intellectual achievements should tend to make him contemptuous of native, and especially African native, manners and customs and culture generally. This 'superiority' attitude towards the coloured races does not, however, explain the present-day discriminatory legislation, which is motivated by the white man's determination to retain his privileged position, whether in administration, land tenure, or commerce, in those colonial dependencies where it operates. In this article, therefore, the term C. B. will be used in this technically accurate and factual sense as defined above, rather than in the vague sense of the various forms of discrimination, social, religious, economic, and educational, official and unofficial, which are believed by some to characterise the general relationship between the white man and the coloured; or in that of the moral justification for the white man's repression or domination of the coloured races, whether in fear that his supremacy is likely to be prejudiced by the advance of the native or in the real interests of the natives themselves, threatened by the industrial development of the colonies and by urbanisation with all its attendant evils of de-tribalisation.

Discriminatory or differential laws and regulations are mainly found in Africa—in the Union of S. Africa, S. Rhodesia, and to a limited extent in the Brit. dependencies in E. Africa—and in the S. states of the U.S.A. In the Brit. W. Indies or other parts of the world under Brit. dominion the C. B. is almost non-existent. To a much smaller extent W. Africa, not being suitable for white settlement, also is markedly free from colour restrictions, especially as there exists a large independent pop. of peasant proprietors. C. B. may be said to be non-existent in the Fr., Belgian, and Portuguese African and other dependencies; but this would not be true of the Dutch colonies, especially the Dutch E. Indies where (before the Second World War) there was a strong Nationalist movement founded largely on the disparity, social and economic, between the Dutch or other Europeans there and the natives. In the Asiatic dependencies of other European powers the C. B. question does not arise, though in S. Africa and Kenya there are discriminatory laws against the large Indian immigrant pop. in those two ters. The C. B. legislation in the Union of S. Africa, begun in 1912, had an important psychological effect as it, morally speaking, justified all the unwritten C. Bs. which had developed in the previous century or

more in that country, so that the force of official example soon spread to other spheres than the mines, spheres where previously it had been unofficial practice. It became a process which soon excluded natives from employment on the railways and other forms of gov. employment and led finally to the abolition of the Cape native franchise which began in Cape Colony in 1853 and ended in 1936.

The C. B. in S. Africa had its foundation in the clause of the original constitution of the Transvaal: 'There shall be no equality between black and white, either in Church or State,' the very antithesis of the political ideal implicit in Cecil Rhodes's phrase: 'Equal rights for all civilised men south of the Zambesi.' In 1912 a political philosophy, based on the segregation of natives and Europeans, was put forward by the S. African Labour party, a policy which assured the permanent maintenance of the white community in a position of political and economic supremacy and the preservation of the standards of European civilisation by reducing the contacts of the two races to the minimum which the economic system necessitates. Gen. Hertzog (q.v.) came into office on this programme in 1924, and developed it to the full. But this C. B. policy only works effectively where there are big industries or mines, especially where white labour is organised. The number of natives residing in urban areas is rigorously controlled and their locations kept separate from the European residential area. It is, at the same time, assumed in S. Africa, as in S. Rhodesia, which has adopted the same principles, that within the sphere of the native reserves the professions and skilled trades shall be fully open to Africans. Union policy has strongly influenced not only S. Rhodesia, but also to some extent determined the attitude of European settlers in the highlands of Kenya, and it seems probable that the C. B. may be pressed for in the copper belt of N. Rhodesia as white labour gradually becomes organised under union influence. Most of the Brit. ters. in tropical Africa, however, are climatically unsuitable for white settlement and their development has been characterised by a different philosophy. But local opinion in Kenya has favoured the S. African segregation policy, while public opinion in Britain has taken the view that native interests deserve more explicit consideration. In Fr. colonial ters., C. B., as we have noticed above, does not exist, for economically the aim of the Fr. is that the mother country and the colonies should form a unit—a centralising attitude bound up with the 'assimilationist' theories which had their origin in the egalitarian doctrines of the Fr. Revolution and which remain as the foundation of Fr. colonial philosophy.

Although in S. Africa the operation of the legal C. B. is confined to the mines, the trade union system applies in practice a C. B. discrimination in most of the skilled trades. The state, moreover, supports this, the so-called civilised

labour policy, by legislation designed to prevent natives from entering into the higher grades of skilled employment, and thereby reducing the openings available to European labour and, in this connection, may be mentioned the law embodied in the previously mentioned Mines and Works Amendment Act, 1926, the most conspicuous C. B. measure, and the one that is generally known by the name of the C. B. law. This law authorises gov. to make regulations providing that certificates of competency in certain occupations shall be granted only to Europeans and certain classes of coloured persons; in practice the regulations apply to the grant of certificates of competency for certain operations in mining. The 'civilised labour' policy exists in principle in S. Rhodesia, but in the absence of any large 'poor white' community, and of large industrial organisations, it is less in evidence than in the union; but there is none the less a considerable body of differential legislation, particularly in relation to land apportionment, trade unions, marketing systems, and the regulation of the movements of natives by the 'pass' system. The pass laws appear in their most conspicuous form in S. Africa—there are trek passes to enable a native to leave his reserve, an identification pass to satisfy the police, a travelling pass to buy a ticket, a monthly pass serving as a contract of service, a daily labourer's pass, and sev. other kinds. These passes were originally in the nature of police regulations, but were later utilised to assist in securing a supply of labour, and to prevent desertion and, in their latest stage, while still used to safeguard the labour contract, they have become part of the machinery of the segregation policy, being instrumental in restricting the influx of a native pop. into urb. areas. The pass system also exists in S. Rhodesia and Kenya, but in both cases the regulations are simpler and less exacting. In Kenya the use of pass laws originally arose in the need to check wandering tribesmen and stock thieves, and it was only later that they were used to meet labour difficulties. Despite the C. B. tendencies in imitation of S. Africa, there is no actual C. B. legislation in S. Rhodesia; but the Industrial Council Act and the strength of organised labour in transport and skilled occupations there have been able to prevent the rise of any large class of native skilled workers, occupied in the European economic system. Kenya does not show the same conflict of interests between the European and African as in the industrial development of the Union of S. Africa. Such conflict with European interests as does exist has arisen from the position claimed by Asiatics in the political field and in regard to land settlement; and in the industrial sphere the settler community has supported the tendency of Africans to replace Asiatic skilled labour. These considerations largely explain the nature of the differential laws applicable to natives in Kenya; they deal primarily

with the place of the native in the European farming areas and have only in a small degree been motivated by apprehensions of the result of contact in the industrial and social fields.

Whether there is any biological justification for the assumption of coloured inferiority in intellectual capacity to the white man, or even whether there is any real biological foundation for the concept of 'race,' are questions which are outside the range and purpose of this article. They may be studied in such books as Huxley and Haddon's *We Europeans*; Ruth Benedict's *Race and Racism* (1942); A. C. Haddon's *The Races of Mankind*, or other works written in refutation, not indeed of the C. B., but of the racialist heresies of Gobineau, Lapouge, and others.

Unlike the old Transvaal Constitution (quoted above) the Amer. Declaration of Independence, 1776, proclaimed as a self-evident truth the fact that all men were created equal and endowed by their Creator with certain inalienable rights, including 'liberty.' But evidently the framers of this constitution regarded Negroes as property and therefore incapable of having rights. After the Civil war the whites of the S. feared that if the Negroes had the vote they might outnumber them; hence it was decided that only those who paid a certain sum in taxes could vote, and this is still the law in most of the states where there are large numbers of Negroes—a law which, even though the tax applies to all voters, is essentially discriminatory in view of the poverty of the Negro. But while in the S. the Negroes are made to keep apart from the whites in all public places such as railway stations or public conveyances, and in the N. contact is reduced to a minimum, there exists no actual C. B. legislation and it is difficult to see how, in the light of the constitution, such legislation could be constitutional. There is, however, in view of the strong social taboos founded on an inexorable public opinion, no need for such legislation. It appears that at the outset of the defence programme in the U.S.A. during the Second World War, Negroes (together with Mexicans and Jews) were practically excluded from employment in the aircraft industry, but that in 1941 the situation began to change so that by early 1943 there were three aircraft assembly plants with over 2000 coloured employees and three additional plants with over 1000 Negro workers. The fact that Amer. Negroes were enlisted in large numbers in the Amer. armed forces for service in the Second World War prompts the question whether or no that fact will serve to improve 'the segregated subordinate status they occupied in civilian life (see C. H. Thompson (ed.), *The American Negro in World Wars I. and II.* (Washington), 1943).

There is an extensive literature on the question of racial problems, especially in Africa. Consult J. W. Gregory, *The Menace of Colour*, 1925; R. L. Buell, *The Native Problems in Africa*, 1928; J. H.

Oldham, *White and Black in Africa*, 1930; G. St. J. Ordo Browne, *The African Labourer*, 1933; I. Schapera (ed.), *Western Civilisation and the Natives of South Africa*, 1934; I. L. Evans, *Native Policy in Southern Africa*, 1934; W. G. Pallinger, *Race and Economics in South Africa*, 1934; W. M. Macmillan, *Warning from the West Indies*, 1936, and *Africa Emergent*, 1938; I. D. MacCrone, *Race Attitudes in South Africa*, 1937; M. R. Dilley, *British Policy in Kenya Colony*, 1937; Lord Hailey, *An African Survey*, 1938 (the most reliable authority); D. Bush, *Colour Prejudice*, 1949.

Colour-blindness (Achromatopsia), affection of the eyes which renders them unable to distinguish certain colours or shades of colour; in an extreme form everything appears grey. C. may be either acquired or congenital. More common to the male than the female sex, it is said to be transmitted from grandfather to grandson. Congenital C. is often accompanied by long-sightedness. There are two distinct forms of C.: in the first there is no differentiation of colours whatever; in the second the spectrum is shortened at the red end, so that from a distance red is not easily distinguishable, and red, orange, yellow, and green appear green; violet appears blue; in green-blindness the red, orange, yellow, and green are all yellow, or it may be red. As there are various theories concerning the colour-sense, so there are various theories of causation. The grey cells in the brain and the nerve fibres connecting them with the eye are concerned, as are also the rods and cones of the retina and the visual purple. For true C., no remedy has, up to this time, been discovered. An acute sense of colour distinguishes seven colours in the spectrum, whereas only five or six are visible to the average eye. There are various test-cards used in the Mercantile Marine service and for railways, which show the colours of the spectrum, and candidates for appointment are required to pick out the various colours as they are named. Holmgren's test consists of matching and naming five finely matched shades of each of twelve different coloured wools, which are handed over, well mixed up, to the examinee. The distinguishing feature of the Jap. Ishihara tests (9th ed. 1949; H. K. Lewis, London) is the application of

the peculiarity of red-green-C. which sees blue and yellow more brightly than red and green. The test plates consist of groups of tiny circles in varying colours and intensities of the same colours. Some of these form a numeral which may be read off correctly or incorrectly as it is seen by the person being tested. See also HEREDITY, *Types of Inheritance*.

Colour Photography, see PHOTOGRAPHY.

Colour Printing is of three styles: relief, intaglio, and lithography. Relief is the oldest style, and includes printing from wood blocks, photo-engraved surfaces, and stereotype and electrototype plates. Intaglio work began in the fifteenth century, and includes engraving on copper or steel, etching, mezzotint process, and photogravure. Printing in colour may have been practised even before the time of John Gutenberg of Mainz, the reputed inventor of printing, and some authorities think that the Romans used a process of copying by engraving on ivory and then making tinted reproductions on canvas by means of plates. Even if this is mere speculation, as indeed is the assumption that C. P. was known in the Far E. before the eighteenth century, there is extant a fifth-century work, the 'Gospels of Ulphilas,' now in the Univ. Library, Upsala, the text of which is in gold and silver on vellum of a mauve hue. There are also in the Victoria and Albert Museum some examples of fabrics whose patterns would appear to have been made from wood blocks in the eleventh century; and again, in the fifteenth century a Venetian decree was issued for the protection of the local industry of making coloured playing-cards and pictures of saints. But according to the leading authorities, notably R. M. Burch, C. P. had its origin in attempts to imitate by mechanical means the colour decoration of the MSS. which furnished the text for the earliest printed books (see ILLUMINATION OF MANUSCRIPTS). It is doubtful whether, in the earlier period of C. P., any separate pictures in colours, as distinct from rubricated typography and other coloured type, were produced, one difficulty, however, being to distinguish in the extant MSS. where the printer's work ends and hand-work begins. The chief printers in colour at this period were those of Venice, London, Mainz, Paris, and St. Albans. The sixteenth century, however, saw the rise of the art of printing pictures in colours by the method which is known to this day as *chiaroscuro* (q.v.). Among the earliest printers in *chiaroscuro* were Ugo de Carpi, who is believed by older writers to have been the inventor of the process, and Jost de Necker, an Antwerpian, believed by Bartsch to have invented the process; but there are other names anterior in date to these, including Maïr of Landshtut, a Ger. artist, and Francisco Dentato, a Venetian, who printed in a dark brown colour; but it was also practised by many of the great masters of engraving, painting, and drawing, who were contemporary with the inventor, whoever he was, of the process. These included

Burgkmair, Cranach, Dürer, many of whose drawings, engravings, and woodcuts suggest chiaroscuro work. Colours in chiaroscuro printing were evidently applied by the press at this time, hand-colouring or stencilling being a later process used to supplement the press colouring and chiefly for colouring playing-cards, though to some extent it was used in the sixteenth, seventeenth, and eighteenth centuries for book illustrations. The art of producing prints in the original chiaroscuro style appears to have died out with John Skippe, of Ledbury, about whom little is known beyond the fact that he was educated at Merton College, Oxford. Skippe, who lived in the eighteenth century, used three or four tone blocks, generally browns, ochres, or olive greens in varying shades. With the eighteenth century comes the rise of intaglio-printing processes. Mezzotint engraving was invented by Louis van Siegen, an officer in the service of William VI., landgrave of Hesse, in the seventeenth century, but the printing of mezzotinted plates is a late eighteenth-century art, and, together with it, two other processes—stipple engraving and aquatinting—were invented. The latter are 'grain' processes, i.e. the grain is formed by a series of dots so arranged as to conform to the planes and modelling of the subject (see under ENGRAVING). The first engraver to practise stipple work was Johann Lutma, a seventeenth-century Ger. silversmith, sev. of whose plates are extant. Notable Fr. engravers in stipple were Jean François, of Nancy (b. 1717), Louis Bonnet (b. 1743), and Gilles Demarteau (b. 1722), the two latter being engravers in the crayon style. The first Eng. stipple engraver was Wm. Wynne Ryland (b. 1732), who, after completing his training in Paris, became engraver to King George III. Improvements on the process were made by a London engraver, Robert Laurie (b. 1749), who invented a method of producing copper-plate pictures in colours at one impression, by inking the plate with stump brushes—a combination of mezzotint and stipple designed to produce book illustrations at a low cost. Aquatint, or the latest of the intaglio engraving processes not dependent on photography, is really tone etching, the graving being effected by the use of acid, so that there need be no lines. The authorities ascribe the invention to Jean Baptiste le Prince, a Fr. painter and engraver, who d. in 1781, and give the date of the first adaptation of the aquatint method to C. P. as about 1768. In England the earliest exponent was Paul Sandby (b. 1725), whose work was in monochrome only. Other notable names in the art of aquatinting are P. L. Debn-court, court painter to Louis XVI., whose 'Promenade in the Gallery of the Palais Royal' is famous; J. F. Janinet (b. 1752), a fine draughtsman and designer; and J. T. Prestel (b. 1739), a Ger. artist. Some of the most familiar eighteenth-century Eng. prints in colour are Wheatley's 'Cries of London,' of which modern copies are still produced.

Jap. colour prints, made from wood blocks, were well advanced by the early eighteenth century, the greatest of the earlier exponents being S. Harunobu, who was imitated by Utamaro, the latter's prints initiating the craze for Jap. prints which is not entirely passed even to-day. Hokusai (b. 1760) was the most famous of all Jap. colour-prints artists, his *Manga*, a book depicting Jap. customs, best exemplifying his work in black and red. (See JAPAN, Art.) In the nineteenth century there was a notable revival of the old chiaroscuro process in a new form known as chromo-xylography, and the most famous name in this connection is that of George Baxter (b. 1804), the son of a Lewes typographer, whose process, really only printing in colours from wood blocks, consisted in colouring an impression from an outline or key block, which was either a copper or steel plate, or a litho stone, by successive impressions from colour blocks of wood or metal. He certainly achieved his object, which was to produce ornamental prints in colours which resembled highly coloured painting in water colour or oils, and for some time he held the field alone. Later names in chromo-xylography were those of Charles Knight, the pioneer of cheap illustrated magazine literature, and whose coloured plates for *Old England Worthies* (1847) were well known; George C. Leighton (b. 1826), the printer-publisher of the *Illustrated London News*, in 1884; Henry Vizetelly (b. 1820), who engraved pictorial subjects for popular books; Edmund Evans (b. 1826), the best known of all the wood engravers for colour work except Baxter, whose coloured line engravings, e.g. those after pictures by Kate Greenaway, are remarkable for daintiness, and who will always be remembered as the pioneer in the production of cheap colour-illustrated children's books; Benjamin Fawcett (b. 1808), whose coloured prints in the illustration of the books he pub. on Brit. birds, moths, and butterflies, exemplify his process of fine printing in colours; and the Knoller brothers (b. 1859 and 1861) of Vienna, whose beautiful colour prints soon became familiar in the windows of London art dealers. The nineteenth century also witnessed the introduction of an entirely new colour-printing method, chromo-lithography (for the principle see under LITHOGRAPHY). The application of the principle of lithography to C. P. consists, as in chromo-xylography, in first preparing the design, and determining the number of tints in which it is to be reproduced, and then drawing on a litho stone that portion of which is to be in a particular colour, and so on, with each of the other colours, the print being made up by the successive impressions from all the colour stones. This process is considered to begin with the issue of the *Pactis Monumentum*, a record of the facts of the peace of 1815, by J. A. Barth, of Breslau, produced in 1816. Other notable names in the earlier period of chromo-lithography are those of Engelmann, Hullmandell, Owen Jones,

Michael Hanhart, and Wm. Day. The later stage is chromo-lithography, dating from the middle of the nineteenth century, when lithographic printing machinery was introduced. After this comes the adaptation of photography to chromo-lithography, said to have been suggested by Mr. Burnett, a member of the Edinburgh Photographic Society, in 1857 — called photo-chromo-lithography, and later perfected under the name of photochromy. A 'photochrom' is a colour photograph, the base of which is generally a collotype print, produced direct from the film or through the medium of a transfer on to stone. Modern Fr. chromolithographs are among the best examples of this process, especially those of Pierre Vidal. Modern colour processes in printing are developments of processes for making photography the means of reproducing natural colours as far as this is possible, and the early years of the twentieth century saw many improvements in working the three-colour half-tone process, while in America especially the four-colour process has been developed. Photogravure, a mechanical intaglio process which superseded the hand-engraved copper plate, is now widely used for colour reproductions, especially in popular journals. See also COLLOTYPE; ENGRAVING; LITHOGRAPHY; PHOTOGRVURE; PRINTING; PROCESS WORK. See W. Gamble, *Line Photo-Engraving*, 1909, and *Photography and its Applications*, 1920; V. Preissig, *Zur Technik der Farbigen Radierung u. des Farber Kupferstichs*, 1909; R. M. Burch, *Colour Printing and Colour Printers*, 1910; L. C. Martin, *Colour and Methods of Colour Reproduction*, 1923; E. J. Wall, *The History of Three-Colour Photography*, 1925; H. Curwen, *Processes of Graphic Reproduction*, 1934; T. Griffiths, *Colour Printing*, 1919.

Colour-sergeant (so called because he attended on the colours), was the non-commissioned officer of highest rank in a Brit. infantry company. He wore on his sleeve a badge of crossed colours over the usual sergeant's chevron. He was the channel by which communication was kept up between captain and men. The rank was abolished in 1912.

Colours, Military, flags and standards borne by most infantry regiments and battalions, and sometimes also by other troops. From the very earliest times banners or similar devices have been used by fighting bodies both on land and sea to act as a rallying-point and a signal. From the very fact of this practical value as a rallying-point, the banner or standard began to exercise a moral influence. This is already seen in fully developed form in the days of the Rom. Empire, when the loss of the eagle was the greatest disgrace a legion could sustain. Similarly, the flags of later times became, as it were, an embodiment of the spirit of the regiment, the link binding the soldiers of the time with the veterans of the past. The loss of the standard was the break-up of the regiment. The colours, then, were invariably taken into battle until the last

quarter of the nineteenth century, but now the systems of modern warfare have led to the colours being left at home by Brit. regiments. According to the present arrangement, dating from the time of Queen Anne, each Brit. regiment or battalion has two colours, the king's colour and the regimental colour. The former is a Union Jack, except in the case of foot guards. The regimental colour is a flag of the same colour as the facings of the regiment, with the name and titles of the regiment, together with the names of its victories and exploits, blazoned thereon. Both colours measure 3 ft. 9 in. by 3 ft., the staff being about 8 ft. 6 in. Lancers, hussars, rifle regiments, engineers, and artillery do not carry colours, but some cavalry regiments bear guidons in place of colours.

Colours of Animals. The greatest use which the colour of an animal has is that of protecting it against its enemies, or in some cases enabling it to attack its prey without being first discovered. In considering this question what must be taken into account is the general effect produced by contrasting colours on the same animal as well as by the same colour with no contrasts. The general rule is that the colour of an animal is very similar to that of its surroundings, either the earth or the plants near which it lives, thus enabling it to escape detection in the case of 'protective resemblance,' or to catch its prey in the case of 'aggressive resemblance.' Usually the upper part of an animal's body is dark in colour, while the under part is much lighter, the reason for this being that the dark parts appear lighter because of the light shining on them, and the light under parts tend to dispel the shadows, thus doing away to a certain extent with the solid appearance of the animal and helping it to become somewhat invisible. Some animals, however, are the exact opposite of this. The resemblance of the animal to the part of the earth on which it lives may be produced by colouring identical to that earth, as is seen by the colour of all animals which inhabit desert regions, their coats resembling the sand in colour, or by a decided contrast. The zebra is an interesting example of the latter, being rendered invisible in the moonlight on account of its strongly differentiated patches of colour, and so being preserved from its enemy, the lion, whose habit it is to hunt by night. In the case of the tiger the resemblance is found between his stripes and the jungle in which he lives, and in this way he is enabled to track and kill his prey before being discovered. The fox also illustrates this 'aggressive resemblance,' and in snowy regions the coats of these animals and those of some others turn white to match the snow. Spots also are a great help to the animals so marked, owing to the spots of sunlight blending with their spotted coats. Another characteristic is that of resembling something else which would not attract the enemy in any way. Thus, some butterflies exactly resemble a withered leaf on the under side of their wings, and in some instances insects are

exactly like the twigs of a tree; the eggs of birds may resemble the stones amongst which they are laid. Other animals, again, use their colour with quite a different object in view—namely, to act as warnings to their enemies. The skunk is an excellent example of this. It is, in itself, very conspicuously coloured, and makes no attempt to conceal the fact, but as in the case of other animals so clothed, its colour is accompanied by a very disagreeable quality—the power of emitting a liquid with a most objectionable odour, so that no enemy would continue to attack it. This is known as ‘warning coloration.’ In certain cases a conspicuous colour helps to keep the members of the same species together for their own protection, but this is not nearly so common. Another method pursued by some animals is that of mimicry. This consists in resembling some other animal which is very unpleasant to its foe, and in this way enabling itself to escape unhurt. This is the case with certain flies which resemble bees for the purpose of protecting themselves, hence the ancient belief in the spontaneous generation of ‘bees’ from the carcasses of cattle; in reality the so-called bees were the flies formed from eggs laid in the carcasses. This mimicry is sometimes that of colour, and at others that of form or movement. Some butterflies and moths, not closely related, have come to mimic one another, thus sharing the expense, as it were, of educating birds to avoid them. The C. of A. have also been said (by Darwin) to play a large part in sexual selection, the theory being that the most brilliantly coloured males will be selected by the females, so that these colours will be perpetuated and increased. This theory of sexual selection is not now held in much favour. The colours in animals may be due either to their structure or to certain pigments. In the case of some birds, and also of some fish, the colour is due, in part, to the effect produced by the light on the animals and in part to a certain pigment, which is also affected by the light, while in some insects it is due to uric acid. In some animals a pigment exists which produces a greenish colour, and in certain cases chlorophyll is found with this colouring, apparently being formed by means of the food. There remains, however, a great deal to be discovered with regard to these pigments. See H. B. Cott, *Adaptive Coloration in Animals*, 1910.

Colours, Primary, red, yellow, and blue, in practice, in contrast to the red, green, and violet of pure physics.

Colours, Secondary, colours produced by a mixture of pigments, representing the primaries. These are orange (a mixture of red and yellow), green (blue and yellow) and violet or purple (red and blue).

Colours, Tertiary, colours produced by a mixture of two or more of the secondaries; generally dark and tending to greys or browns, but in practice lightened or darkened by the addition of white or black pigment.

Colquhoun, Sir Iain, seventh Baronet of Luss (1887–1949), former Lord High Com-

missioner of the General Assembly of the Church of Scotland. Chief of his clan, C. served with the Guards Brigade in the First World War. In 1913–14 he became light-weight boxing champion of the Brit. Army. An enthusiast for sport and playing fields, C. became a member of the Scottish Boxing Board of Control and served as chairman of the Scottish Committee of the Playing Fields' Association, and of the National Advisory Council for Scotland on physical training and recreation. Had a long association with Glasgow Univ. and was returned as rector in 1934.

Colt, Samuel (1811–62), Amer. inventor, b. at Hartford, Connecticut; went to sea, and later lectured on chem. In 1835 he obtained his first patent for a six-barrelled rotating breech revolver, and founded the Patent Arms Company at Paterson, New Jersey, for the manuf. of these weapons. In 1852 he built the enormous works of the Colt's Patent Fire-Arms Manufacturing Company at Hartford.

Coltsfoot, popular name of *Tussilago Farfara*, a herb of the order Composite, growing wild in Britain. Its leaves are heart-shaped and denticulate. Stems bear a head of bright yellow flowers. The leaves form the basis of herb tobacco used as a remedy for asthma.

Coluber, genus of ophidian reptiles (snakes). The fifty-odd species are all non-poisonous, and occur in Europe, Asia, and America. The eye is large, the pupil round, the scales are either smooth or keeled. The species attain a great length and are oviparous. *C. quatuorlineatus*, a native of S. Europe and the Tyrol, is 6 ft. long; *C. longissimus*, the Aesculap snake, of S. and S.E. Europe, attains a maximum of 5 ft.; *C. leopardinus* is a beautiful snake found in Europe and Asia Minor.

Columba, Columbidae, see PIGEON.

Columba, St. (521–97), known also as Columkille and Colm, is said to have been b. at Gartan in co. Donegal, in the N. of Ireland, of very noble birth. He early learned the principles of asceticism under St. Finnian of Clonard, and in 546 was ordained priest. About four years later he founded the great monastery of Durrow, as well as many smaller ones, including that of Derry. In 562 he was excommunicated by an Irish eccles. synod, on the charge of having caused the sanguinary battle of Culdreimhne. In consequence of this he set out in the next year, and with twelve followers made his way to the little is. of Ily or Iona, off the W. coast of Argyllshire, and planted a monastery there. He then settled down to the work of his life, the conversion of the Picts dwelling beyond the Grampians. Through his teaching, example, and miracles the work progressed favourably, and C. settled monasteries in various parts, all subject to Iona and a rule which he himself compiled. In this strenuous supervision and in visits to his native land the saint passed some thirty-five years, during the last five of which his health was fast falling him. Then, early

in the morning of June 9, 597, when matins had just been chanted, he breathed his last, kneeling before the altar of his own church of Iona. Tremendous energy was the keynote to C.'s character. Adamnan tells us that he could not bear to remain idle a moment, and the somewhat warlike aggressiveness of some of his acts may be put down to the same cause. According to tradition as recorded in the Annals of Clonmacnoise he wrote some 300 books with his own hand, though

debert went into Italy. Here he settled among the Apennines and founded the monastery of Bobbio, where he d.

Columba Noachi (Noah's Dove), small constellation in the S. hemisphere, close to Canis Major and Lepus. Puppis, Pictor, and Caelum are also near by. Gould believes that it was so named as early as the sixteenth century.

Columbarium (Lat. *columba*, dove), name of the niches or buildings for the storage of sepulchral urns containing

The Iona Community

THE ABBEY CHURCH OF ST. MARY, IONA, AND MONASTERY BUILDINGS

The existing buildings were originally founded by Benedictines, c. 1203, near the site of St. Columba's church, c. 593. The church has been restored by the Church of Scotland, and the monastery buildings by the Iona Community.

there is scant authority for the identification of any. His life was austere in the extreme, yet everywhere his cheerfulness and virtue predisposed men in his favour. See W. P. Montalembert, *St. Columba*, 1868; W. P. Skene, *Celtic Scotland*, 1877; Adamnan, *Vita Sancti Columbæ*, ed. J. T. Fowler, 1894; W. D. Simpson, *The Historical Saint Columba*, 1927; Lucy Menzies, *St. Columba of Iona*, 1935.

Columban, or Columbanus (543-615). Irish monk and saint, b. in Leinster of a noble family. He entered the monastery of Bangor in Ulster, studying there under St. Comgall. When a man of middle age he led a band of monks on a missionary expedition to France, and preached with much success in Upper Burgundy, founding the two monasteries of Luxeuil and Fontaines. He was finally expelled from the latter by Thierry, king of Burgundy, whom he had offended by his unsparing denunciations of vice, and after visiting the courts of Clotaire and Théo-

ashes of the dead. The fancied resemblance between a dovecote and the niches round the walls of Rom. burial-chambers gave rise to the name. Such tombs were mainly used for the poorer classes, and were erected by wealthy families for their slaves, or by funeral associations under the empire. Examples near Rome are those of the Vigna Codini at the Lician Gardens. The *ustrina* were attached to the *columbaria*. In modern times C. means a room connected with a crematory, provided with niches for the funeral urns.

Columbia, or Oregon, with the exception of the Yukon, the largest riv. of the W. side of America, rises in Brit. Columbia, on the W. slope of the Rocky Mts. Its course at first is S. through various lakes, till it reaches the N. border of Washington. Here it receives the Clark's Fork on its l. b. It then continues its course irregularly to the Oregon frontier, before reaching which it receives, on the l. b., the

Spokane R. and the Snake R., the latter being its largest trib. It then turns W. once more, and flows along the N. border of Oregon, casting itself into the Pacific by an estuary about 35 m. long and from 3 to 7 m. wide. The C. passes through a mountainous country, and its scenery is remarkable. The salmon fisheries flourish, and there is a large cannery station at the mouth of the riv. The falls, however, make clear navigation possible for only 160 m., up to the Cascades. Above these there is another navigable stretch of 50 m. reaching to Dalles. The C. is 1400 m. long, and its basin has been computed at nearly 300,000 sq. m.

Columbia: 1. Cap. city of S. Carolina, U.S.A., on Congaree R. just below the falls; it is navigable to this point. C. is an important railway centre, has manuf. of cotton goods, cars, large iron-works, and trade in cotton. The state univ. was founded in 1805. There are many fine public buildings. It was occupied by Gen. Sherman in Feb. 1865, and much of it burnt. Pop. 62,000, many coloured. 2. City of Lancaster co., Pennsylvania, U.S.A., on the Susquehanna R., first settled by Quakers in 1726. Makes clothes, has iron works, and trade in timber. Pop. 11,500. 3. Cap. of Maury co., Tennessee, U.S.A., on the Duck R. 10 m. S.W. of Nashville, in a fine farming country. Many mules are raised and there are flour mills, etc. There was fighting here during the Civil war. Pop. 10,500. 4. Cap. of Boone co., Missouri, U.S.A.; here are the univ. of Missouri and numerous colleges. Pop. 13,600.

Columbia, British, see BRITISH COLUMBIA.

Columbia, District of, the seat of gov. of the U.S.A. It is an artificially rectangular piece of ter. of some 69 sq. m., within the ambit of the state of Maryland. After the Amer. colonies achieved their independence and formed themselves into a new nation, Philadelphia was at first the cap. But as there were in the beginning sharp jealousies between the various states, it was deemed wise to establish a cap. about midway between the N. and S. states along the Atlantic sea coast, this ter. at that time comprising all the then U.S.A. Originally an area of 100 sq. m. was ceded for this purpose by Maryland and Virginia, but in 1846 Virginia's portion S. of the Potomac was given back to that state. The Potomac R. flanks the dist. for its entire length to the S., and also flanks part of the perimeter of the city of Washington. Since an Act of Congress of 1895 the city of Washington has been coextensive with the dist. The dist. was formerly estab. by Acts of Congress in 1790-91. Under these Congress itself assumed entire jurisdiction. Congress first met in the dist. in 1800. John Adams, second president of the U.S.A., was inaugurated in Philadelphia, but was the first chief executive to live in the White House in Washington. Thomas Jefferson, third president, was the first one to be inaugurated in Washington. The feature of the dist. is that the gov.

is by Congress directly as to legislation and by three executive commissioners named by the President and confirmed by the Senate. Each house of Congress has a special committee on dist. affairs. The result is that the dist., and Washington in particular, have not grown up in a haphazard fashion, but according to a fixed plan, with the determination to make the cap. one of the most beautiful in the world. Another peculiarity about the dist. is that persons born there are practically disfranchised. There are no municipal elections, because the gov. is in the hands of the executive commissioners and Congress. In presidential elections natives of the dist. have no vote. The total pop. is 663,000, of whom about 28 per cent are Negroes. There are many industries in the dist., goods being produced primarily for local consumption. The revenue of the dist. is raised by real estate, personal, and business taxes, and from treasury grants in aid. There are five univs.: Georgetown, under the Jesuits; George Washington, non-sectarian; Howard, for coloured students; Catholic Univ. of America; and the National Methodist Univ.

Columbia University, New York city, U.S.A. Originally founded as King's College in 1754, and reorganised as C. College in 1784. It is one of the most important educational institutions in America, and owes much to the efforts of Nicholas Murray Butler (d. 1947, q.v.), who was its president for forty-four years. The leading residential colleges are C. for men undergraduates, Barnard (founded 1889) for women; Teachers; Seth Low Junior; and St. Stephens; which together house approximately 15,000 students. The school of journalism was founded in 1912, and the C. U. Press estab. 1903. The combined libraries amount to 1,025,000 vols. The faculties include arts, political science, philosophy, pure science, mines, engineering, chem., law, medicine, pharmacy, architecture, journalism, business. There is a teaching staff of 2462. Gen. Eisenhower became president in June 1948.

Columbine, or *Aquilegia vulgaris*, Brit. species of Ranunculaceae which grows wild and is cultivated as an ornamental plant. The leaves of the flowers are arranged in whorls, the five sepals are petaloid, the petals are prolonged into long spurs and are visited by long-tongued insects for the honey they contain; the stamens are numerous, and are arranged in whorls of five. The androecium matures before the gynoecium, and fertilisation is effected by means of humble-bees.

Columbine (from It. *columbina* and Lat. *columba*, a dove), short-skirted, fairy-like maid who, in all pantomimes, dances with the Harlequin, her lover.

Columbite, niobate of iron and manganese, containing some tantalum. It occurs chiefly in pegmatite veins, bearing tantalite, cassiterite, and wolframite in the Black Hills, S. Dakota, and in W. Australia.

Columbium, alternative and more usual

name for the chemical element Niobium (q.v.).

Columbus: 1. Cap. of Ohio, U.S.A., on the Scioto R., 103 m. N.E. of Cincinnati. The streets are handsome and broad, and there are splendid buildings, including the Capitol, the State Univ.—one of the best attended in the U.S.A., and a stadium with 72,000 seats, and public libraries with 600,000 vols. It is an important industrial centre. Iron and steel works, manufs. of machinery, automobiles, cigars, etc. There was a disastrous flood in 1913, and the city hall, which has since been replaced, was destroyed by fire in 1921. C. was named after Christopher C., because without him it could never have come into existence. Pop. 306,000. 2. City of Georgia, U.S.A.: one of the leading industrial centres of the S. of the U.S.A. The falls of the R. Chattahoochee generate electricity. There are manufs. of cotton goods, iron foundries, etc., and a large export of cotton. The first cotton-mill worked by electricity was in C., and artificial ice was first made on a commercial scale and industrial training provided here by public schools. Pop. 53,200. 3. Cap. of Bartholomew co., Indiana, U.S.A., on the Big R., has leather and machinery industries and saw-works. Pop. 11,700. 4. Cap. of Lowndes co., Mississippi, U.S.A., on the Tombigbee, has timber and cotton industries. The Mississippi College for women, with 1100 students, is here; 1500 soldiers, victims of the Civil war, were buried in Friendship cemetery. Pop. 13,600. 5. City of Platte co., Nebraska, U.S.A., raises agric. products and has sev. factories. Pop. 7600.

Columbus, Bartolomeo (d. 1514), brother of Christopher. An excellent cosmographer, who produced many ingenious globes, maps, and sea charts. He is said to have been deputed by Christopher to lay his project of exploration before Henry VII. of England, but to have been delayed by pirates till after the patronage of Ferdinand of Spain had been obtained. He took part in his brother's discoveries, and was honoured together with him in 1493. In 1494 he went to San Domingo, of which he became governor, and where, after sev. expeditions, he d.

Columbus, Christopher (Latinised form of It. Cristoforo Colombo; Sp. form, Cristóbal Colón) (c. 1436-1506), famous navigator and discoverer of the New World, b. near Genoa, where his father was a woolcarder. The exact date of his birth is uncertain, authorities varying from 1436 to 1457, but 1446 is the most probable. It is said that for a time he followed his father's trade, but he was certainly at sea before the age of fifteen. The accounts of his early voyages are doubtful and obscure, but they extended over a vast range, from the Levant to Iceland. In 1470 he was wrecked off the coast of Portugal, near Cape St. Vincent, but he came ashore on a plank, and settled in that country. Before 1480 he had married Felipa Moñiz, the daughter of Bartholomew Perestrelo, an important navigator and captain, first governor of Porto Santo. For some years

C. had been in correspondence with Paolo Toscanelli, the Florentine astronomer, as to the possibility of reaching Asia by sailing westward. This project was present in his mind as early as 1474, and had been fostered by the reports of seamen, rumours heard in Iceland, and the surmises of the ancients. His hypotheses were fairly correct. He realised the spherical form of the earth, but he underestimated its circumference. When, in addition to this, he over-estimated the size of Asia, his idea of the distance he must go was about one-third of the correct one. It was necessary for him to find some sovereign to support him in his

CHRISTOPHER COLUMBUS

enterprise. He applied first to John II. of Portugal, and then by letters to Henry VII. of England. He visited Spain and applied to the powerful dukes of Medina Sidonia and Medina Celi, and this latter nobleman referred him to Queen Isabella. After some seven years of persuasion, journeying, and doubt, the Genoese at last succeeded in obtaining the help he required. On Aug. 3, 1492, he set out from the tn. of Palos with one ship of 100 tons, the *Santa Maria*, and two caravels, the *Pinta* of 50 tons and the *Niña* of 40 tons. He first went to the Canary Is., and thence, on Sept. 6, the expedition really set out. His men were insubordinate and discontented from the beginning. Whatever happened they interpreted in an adverse manner, and the variations of the magnetic needle reduced them to great terror. On Oct. 12 an is. was sighted, and named by C. San Salvador, now probably Watling Is. The expedition then cruised in the neighbourhood, discovering Cuba and Hispaniola or Espanola (Haiti). On this latter is. the *Santa Maria* went aground, and had to be abandoned, and C. was compelled to return to Europe with the two caravels. Here he was received with the greatest enthusiasm, and honours were showered

upon him. After six months in Spain, he started westward once more, on Sept. 25, 1493, with a larger squadron and 1500 men. On this voyage the is. of Dominica was discovered. The great explorer, however, found the task of governing his colonies beyond his power, and after vexatious quarrels and illness, he returned to Spain in 1496. In 1498 he made his third voyage, on which he reached the mainland of S. America, though he had coasted it as far as the Orinoco before he discovered its character. Many complaints had meanwhile been sent home from the colonists, and Ferdinand withdrew his favour from C. In 1499 a governor was sent out to supersede him, and he himself returned to Spain in chains. On his arrival the tide of popular feeling again turned in his favour, and he was released with fresh honours, and in 1502 he made his fourth and last voyage in search of the passage to India. After exploring the gulf of Mexico he returned to Spain, and *d.* in none too prosperous circumstances at Valladolid. *See* Fernando C.'s life of his father (Eng. ed., 1867), and biographies by Washington Irving, 1828; Sir A. Helps, 1869; H. B. Adams and H. Wood, 1892; and Sir C. R. Markham, 1893. *See also* R. H. Major's trans. of his *Select Letters* (Hakluyt Society), 1847; H. Harrisse, *Christophe Colomb*, 1884, and *Christophe Colomb devant l'histoire*, 1892; M. André, *Christophe Colomb* (Eng. trans.), 1928; A. de Hevesey, *The Discoverer* (life and adventures) (trans.), 1929; *The Voyages: Journals of First and Third, and Letters concerning the First and Third Voyages* (including an account of the second voyage, by A. Bernaldez), ed. by C. Janes, 1930; S. de Madariaga, *Christopher Columbus*, 1939, 1949.

Columbus, Diego (c. 1480-1526), son of Christopher C., *b.* at Lisbon; in 1484 went to Spain with his father, and later obtained a post at court. In 1506, at his father's death, he became admiral of the Indies; in 1509 went to Hispaniola as governor of the Indies; in 1520, after long litigation, inherited his father's viceroyalty. He was recalled from the Indies in 1523, and *d.* at Montalban.

Columbus, Giacomo, or Diego (c. 1450-c. 1515), youngest brother of Christopher, *b.* at Geneva; went to Spain at the news of his brother's discovery, and accompanied him on his second voyage. In 1493 he commanded the commission entrusted with the temporary gov. of Hispaniola, but was unsuccessful, and was sent back to Spain as a prisoner in 1500.

Columbus, Samuel (1642-79), Swedish author. A favourite pupil of G. Stjernhjelm (*q.v.*). He is especially noted for his hymns, which are the first genuine ones in the language. Among his works are *Den Bibliske Verld* and *Odæ Succææ*, in which he follows the Ger. poet Opitz. *See* P. D. A. Atterbom, *Svenska diare och Skaldar*, 1841-43.

Columella, Lucius Junius Moderatus, Lat. writer on agriculture of the first century A.D. *B.* at Gades in Spain, lived partly in Syria, but chiefly at Rome;

probably *d.* at Tarentum. He was a contemporary of Seneca. His chief work, *De Re Rustica*, the fullest ant. treatise on practical agriculture, consists of twelve books in dactylic hexameters, and is addressed to a certain Publius Silius. The style is easy and copious, but the information is often of doubtful accuracy and seems to have been derived from books.

Columnkille, *see* COLUMBA, ST.

Column, in architecture, a vertical supporting member, cylindrical or approximately cylindrical in shape, composed of stone or of some similar material. A C. normally consists of three parts, the capital, the shaft, and the base, and the two former are always found, whereas the early Egyptian and Doric Cs. had no base. In the thirtieth century B.C. Cs. were in use among the Egyptians, and were either octagonal or polygonal. In these the idea seems often to have arisen from the imitation of a bundle of reeds tied together. Since, in all Cs., ornament is chiefly reserved for the capital, and this is the main decorative feature, it may be mentioned that the Egyptian capitals were generally square, lotus-, or vase-shaped, though there was great variety of form. In the architecture of Persia and Assyria, the C. is an unimportant feature, but it is of the highest importance in dealing with Gk. and Rom. work. In the classic orders the construction of each part of the Cs. was strictly according to rule, and the highest excellence of proportion was attained. In the Doric order (Rom.) the height of the shaft is six to eight times the diameter, in the Rom. Ionic eight or nine times, and in the Corinthian about ten times. The distinctions of the capitals are also important. The Doric has a plain squared capital, while the Ionic is characterised by its volutes, and the Corinthian by its leafage, combined with volutes. These are the three great classical orders, and Vitruvius speaks of no others. Two additional ones, the Tuscan and the Composite, are named by post-Renaissance writers. Of these the Tuscan is a particularly plain form of Doric, and the Composite is merely a variation of the Corinthian. All these Cs. taper from the base to the capital, while about one-third of the way up there is a slight swelling (the *entasis*), designed to prevent an optical delusion by which the C. would otherwise appear concave. Cs. are often carved with channels down the shaft, known as flutings. In Gothic architecture the Cs. generally do not taper, and are of infinite variety in all parts. Single Cs. are often erected to commemorate some great event, *e.g.* Trajan's C. and the Nelson C. (*See* illustration, p. 96.)

Column, military formation in which the units are arranged one behind the other, ser. ranks in depth. When military science was less developed, the European armies always fought in C., the soldiers of Napoleon invariably using this formation. The one exception was the Eng. Army, which always preferred the line. The advent of the breech-loading

EXAMPLES OF CAPITALS

A, Egyptian; B, Greek; C, Norman.

rifle, making it still more advantageous than formerly to have a long fighting front, led to the giving up of the columnar formation and the general adoption of the line. Reserves, however, still move in C., as this method is easier for movement. A Brit. battalion in C. has its four companies disposed one behind the other in parallel lines, the distance between each pair being equal to the front of one company. (Many infantry battalions, however, now have only three rifle companies, the fourth being a machine-gun company.) In half-C. this distance is halved, and in quarter-C. it is reduced to six paces. When cavalry are moving in squadron C., the four troops which compose a squadron are arranged one behind the other in such a manner that a wheel to either side would bring them into line. There are various other minor distinctions of columnar formation, according to the

kind of troops employed, and the term is often used somewhat vaguely to describe any body of troops moving rapidly. Thus we speak of Cs. of artillery, supply Cs., and Cs. under the command of a certain general.

Columna Rostrata: 1. The name given to the triumphal pillar in the forum at Rome commemorating the victory of Duillus over the Cathaginians at Mylae in 260 B.C. The name originated in the fact that the column was decorated with the beaks (*rostra*), of the vessels which had been captured. 2. A book of this name, dealing with the Brit. Navy, with special reference to the Dutch wars, was written by Samuel Colliber in 1727.

Colunga, tn. of Villaviciosa dist., Oviedo, Spain, on the N. coast, 20 m. S.W. of Gijon, with fishing and anthracite mining industries. Pop. 7800.

Colutea, genus of leguminous plants,

consists of hardy shrubs, all of which are found in S. Europe, in Palestine, and in the Himalaya Mts. *C. arborescens*, the bladder-senna, is often cultivated as an ornamental plant. The fruit is an inflated legume, and the leaves are frequently used in the adulteration of senna.

Colville, Sir Charles (1770-1843), Eng. general who served in the Irish insurrection of 1798, in the Ferrol expedition of 1800, the Egyptian expedition of 1801, the Peninsular war of 1810-14, and in Belgium, 1815. In 1819 he became commander-in-chief at Bombay, and in 1828 governor of Mauritius.

Colville, Sir Henry Edward (1852-1907), Brit. officer. His first experience of active service was in the Sudan campaign of 1884, where he took part in the engagements of El Teb and Tamai. During 1884-85, he served with the Nile expedition, being present at Abu Klea. He was acting-commissioner in Uganda from 1893 to 1895, and commanded the Unyoro expedition. In 1899 he went out to the Cape at the outbreak of the S. African war in command of a brigade of guards. He served under Lord Methuen at the battles of Belmont, Modder R., and Magersfontein, at the arrival of Lord Roberts on the scene of action he was given command of the 9th Div., and assisted in the operations leading up to the battle of Paardeberg in Feb. 1900. Owing to the unfortunate engagements at Sanna's Post in March and at Lindley in May, C. was superseded and recalled to England in July. Among his pub. works are *The History of the Sudan Campaign* (1886) and *The Work of the Ninth Division* (1901).

Colvin, Sir Sidney (1845-1927), Eng. literary and art critic, b. at Norwood. In 1876 he became director of the Fitzwilliam Museum, and in 1884 keeper of the prints and drawings at the Brit. Museum. His works include contributions to many leading periodicals and to the *Dictionary of National Biography*; *Landor* (1881), *Keats* (1887), both in the English Men of Letters series; *A Florentine Picture-Chronicle* (1898); *Drawings by Old Masters at Oxford* (1902-8); *Engraving and Engravers in England* (1906). He has also ed. *Selections from Landor* (1882); *Letters of Keats* (1887); *Works of R. L. Stevenson* (Edinburgh ed.) (1894-1897); *Letters of R. L. Stevenson* (1899, 1911); *John Keats: his Life and Poetry, his Friends, Critics, and After-fame* (1917); *Memories and Notes* (1921). See E. V. Lucas, *The Colvins and their Friends*, 1928.

Colwyn Bay, watering-place in Carnarvonshire and Denbighshire, Wales, 4½ m. N.E. of Conway, with a fine sandy beach. Pop. 21,000.

Colza, or Rape Oil, non-drying oil, used as a lubricant, for burning in lamps, and in the manuf. of soap. It is obtained from the seeds of *Brassica campestris oleracea*, by crushing and pressing, or by the use of a solvent. The cake which is left forms a valuable food for cattle. The oil when fresh is yellow and practically tasteless and inodorous, but quickly

becomes rancid. Its sp. gr. is about 0.912. The plant is much cultivated, and the oil extracted in France, Belgium, Holland, and Germany.

Coma (Gk. *κομα*, deep sleep), condition of heavy, unconscious sleep, differing from natural sleep in that it is most difficult or impossible to rouse the person in a state of C. The patient is either totally insensible to his surroundings, or has a dull perception of them, with delirium. The former kind of C. is brought about by diseases of the brain and in cases of narcotic poisoning. The second variety is observed in many fevers and frequently is the termination of them, when the patient passes from C. into death.

Coma Berenices (Berenice's Hair), in astronomy, a small cluster of stars in the N. hemisphere near the equinoctial colure. It is said to have been so named by Conon to console Berenice, the wife of Ptolemy Evergetes, for the loss of a votive lock of her hair which had been stolen from the temple of Venus. It is mentioned in the third century B.C. by Callimachus and Eratosthenes, and its definite location is generally ascribed to Tycho Brahe (1602). The cluster has now been accurately measured by Dr. Chase from Yale Observatory.

Comacchio, fort. tn. of Ferrara, Italy; in the midst of the lagoons (Valli di C.), 3 m. from the Adriatic, and 28 m. S.E. of Ferrara. A bishop's see. Chief industry, eel-fishing, and the extraction of salt. Pop. 9,000.

Comanches, tribe of N. Amer. Indians belonging to the stock variously known as Shoshonean, Snake, Padoucas, and Nimenim. At different times they have inhabited the Snake R. valley, the Middle Loup R. dist., and the Upper Kansas ter. (in the eighteenth century), and the region about the headwaters of the Brazos, Colorado, Arkansas, and Missouri Rs. In 1867 they were concentrated in the Kiowa, Comanche, and Wichita Reservation, Indian Ter., and in 1904 this was thrown open to white settlers as Oklahoma Ter. The C. now number a few hundreds, and are found in the Kiowa agency, W. Oklahoma. They were originally fierce, restless, and courageous prairie Indians, and were for long a constant terror to white settlers on the Mexican and Texan frontiers. In 1783 they were nominally subdued by the Sp. commander Anza, but continued to give trouble till their final surrender in 1875. They speak a pure Shoshone dialect, which was formerly used by a large number of tribes.

Comayagua, dept. of Honduras, Central America. Mountainous, with some fertile plains, and watered by the Sulaco and Humuya Rs. Contains numerous prehistoric remains. There is gold and silver mining and felling of timber trees in the primeval forest. Until 1880 the tn. of C. was the cap. of Honduras. Pop., dept. 27,000. tn. 4,800.

Comb, toothed toilet instrument, used for cleaning and arranging the hair, for keeping it in position when dressed, and as ornaments for the head. The use of the C. is of great antiquity, and specimens

have been found in anct. Egyptian, Gk., Rom., and early Christian tombs, and in Swiss lake-dwellings, being variously composed of wood, especially boxwood, bone, horn, and ivory. All these materials are still used in the manuf. of Cs., together with tortoiseshell, metal, india-rubber, xylonite, and celluloid. The one most commonly employed is horn, and there are two main methods of manuf. For both the horn is cut into rectangular pieces, damped and heated, and passed out flat. In the first method a series of fine slits, varying with the size of the teeth required, are cut on one side by a small circular saw, which has now superseded the 'stadda' or double handsaw. This involves considerable waste of material, but is the only method possible in dealing with some substances. The second method, known as 'twinning,' or 'parting,' invented by Lyne about 1828, utilises the wedges left between the teeth of one comb to form the teeth of another, so that all waste is avoided. Cs. of vulcanite, xylonite, celluloid, etc., are made by moulding the soft material and afterwards hardening it.

Combaconum, or **Kumbhakunam**, tn. of Madras, India, in the Cauvery delta, 20 m. N.E. of Tanjore. It was the anct. cap. of the Chola kings, and is regarded as a holy place by the Hindus. There are many temples. One pagoda is 147 ft. high with eleven storeys. One of the water-tanks in the tn. is commonly said to be filled with water from the Ganges every twelve years by a subterranean passage 1200 m. long; and it consequently forms a centre of popular attraction. So vast a concourse of devotees enters the water that the surface rises some inches. There are sixteen pagodas on its banks. There is a gov. college. Pop. 60,700.

Combat, Trial by, custom in England, according to the old laws, by which the two parties either in criminal or civil cases challenged each other to fight to decide the guilt or innocence of the accused. The idea was, that if the evidence were insufficient the result of the combat would declare the actual truth. If the case were a criminal one, the parties themselves fought, unless one of the two was a woman, or unfit in any way by reason of age or infirmity. In civil cases they were allowed to employ champions. In the beginning of the nineteenth century this custom was abolished, owing to the decision in the case of *Ashford v. Thornton*.

Combe, George (1788-1858), phrenologist and philosopher, b. in Edinburgh. His works include *Essays on Phrenology* (1819); *The Phrenological Journal* (founded 1824); *The Constitution of Man* (1828), his ablest work; *Notes on the United States of North America*, etc. (1841); *Notes on the Reformation of Germany* (1846). See life by C. Gibbons, 1878.

Combe, William (1741-1823), Eng. author; early life was that of an adventurer, later years being passed chiefly within the 'rules' of the King's Bench prison. He is chiefly remembered as the

author of *The Three Tales of Dr. Syntax*; the first, in search of the picturesque (illustrated by Rowlandson), came out in the *Poetical Magazine* in 1809 and onwards, and was brought out separately in 1812; the second, in search of consolation, was pub. in 1820; the third, in search of a wife, in 1821; and *Johnny Que Genus, the Foundling of the late Dr. Syntax*, followed in 1822. His *Diaboliad*, pub. either in 1776 or 1777, was an imitation of Le Sage, and although inferior to the work of that author, was a great success. His letterpress for Rowlandson's *Dance of Death and Dance of Life* appeared in 1815 (or 1814) and 1816 respectively. See Harold Child's account of the collaboration of C. with Rowlandson in *Cambridge History of English Literature*, xiv. 217-20.

Comber, tn. of Ireland in co. Down. There are flax mills and distilleries. Pop. 2600.

Combermere, Sir Stapleton Cotton, sixth Baronet, first Viscount (1773-1865), field marshal. At twenty-one years of age C. commanded the 6th Dragoon Guards. He served through the campaign against Tippoo Sahib in 1799, including the battle of Malavelly and the siege of Seringapatam. In 1808 he was dispatched to Lisbon, where he won great distinction in active service. He was second in command under Lord Wellington, and led the famous charge of Je Marchant's and Anson's heavy brigades in 1812. In 1826 he besieged and took Bharatpur, a fort which twenty-two years earlier had resisted even Gen. Lake's skill and was indeed, deemed impregnable. It was for this exploit that he received his viscounty.

Combes, Justin Louis Emile (1835-1921), Fr. statesman of the Democratic party. In 1885 he was elected to the Senate, where his vigorous attacks upon clericalism brought him into prominence. He was elected vice-president of the Senate in 1891, and later, when Waldeck-Rousseau resigned he was asked to form a ministry. This period was chiefly remarkable for the attacks on the Church, which C. desired to separate from the State. He made public speeches against the Vatican, and lost no opportunity of belittling the power of the Church. What Waldeck-Rousseau had outlined C. and Briand (q.v.) carried into effect. He resigned with his colleagues in 1895. His political nickname was 'le Petit Père.' Among his literary productions is *Une Campagne laïque*. He was in the Briand Cabinet of 1915-16.

Combin, Grand-Combin, or **Graffenreid**, peak between Italy and Switzerland. It is in the Pennine Alps, and lies E. of the Great St. Bernard, 9 m. S.E. of Martigny. Elevation 14,168 ft.

Combination, Laws of. Till 1824 the laws known by this name forbade as common law misdemeanours any combination of masters or workmen to raise or lower wages, or to increase or diminish the hours or quantum of work. There were, in addition, some thirty-five statutes directed to the prohibition of combinations of workmen against masters. An Act

passed in 1824 repealed all these laws, the rationale of which was the removal of all restraints on trade, and forbade all such combinations as were characterised by some element of violent interference. The effect of the Act, whether anticipated by its framers or not, was to legalise the formation of trades unions for the purpose of controlling masters in the mode of conducting their business. Some limitations on this result were enacted by a repealing Act passed the following year, but there are now no laws against combinations other than the common or statute law against such as amount to criminal conspiracies, as to which see CONSPIRACY.

Combination, in mathematics, see PERMUTATIONS AND COMBINATIONS.

Combinatorial Analysis, branch of mathematics concerned with a variety of problems in theory of numbers, algebra, and geometry, that is of considerable use in the theory of probability. See PERMUTATIONS AND COMBINATIONS.

Combine, term used in industrial warfare to denote temporary federation of employers, usually in any particular industry or related industries, for the purpose of protecting their common interests, whether by keeping up the price of commodities produced by them, or by reducing wages, or the hours of labour, or by any other way. Such a federation was formed in London in 1911 of a great number of employers in entirely different industries by way of mutual protection against the effects of the very prevalent strikes of that year. The basic principle of a C. is that of defence, and therefore it is to be distinguished from a trust (*q.v.*), which is an amalgamation for all or most purposes, usually with the ultimate object of forcing up the price of certain articles. A C., however, is not always of a temporary nature, but sometimes denotes a consolidation of business interests, practically analogous to a cartel, a merger (*q.v.*), or a trust. The permanent C. is either 'horizontal' or 'vertical.' The horizontal C. is the result of the union of a number of firms doing similar business who wish to organise their production on the same basis and to profit from the technical improvement which a united effort makes possible. The vertical C. is that which exists between firms dealing with the same material but at different stages in its manufacture. This combination between the interests of producer and manufacturer tends to suppress the middlemen's profits. Vertical Cs. are common in Germany and the U.S.A., and they have increased in England since the First World War, notably among the industries connected with iron, steel, shipbuilding, paper, and soap. If the C. is not the result of absorption of the smaller industries by the larger, one company, known as the holding company, may sometimes hold controlling shares in each of the other constituent companies in the C. A C. may exist between a number of unrelated businesses such as occurred with the famous Stinnes group in post-war Germany.

Combined Operations Command, formed in Britain during the Second World War and consisting of personnel of all three fighting services. Its primary function was to provide training for amphibian warfare, which comprises all kinds of offensive action from small raids to large assault landings. It was also the duty of the command to plan and carry out raids on the coasts of the enemy. A combined operation is defined as one in which 'two or more of the fighting services co-operate in order to strike the enemy with the maximum of effect at a chosen place and a chosen moment.' The C. O. C. had its own troops of which the 'commandos' formed a notable part. Combined operations are an inevitable consequence of sea power. Drake in the W. Indies in 1585, and Howard and Essex at Cadiz in 1596, showed how a combination of sea and land forces could inflict much damage on the enemy. Some 'conjunct expeditions,' to give them their eighteenth-century name, achieved permanent results, e.g. the capture of Gibraltar by Rooke and Byng (1704), of Quebec by Wolfe (1759), and of Cape Town (1795). Some, like the expeditions to Valcheren (1809) and in the Gallipoli (1915), were failures. Yet others, like the destruction of eighty Fr. ships in St. Malo (1758), were raids designed to inflict loss in men, ships, and stores. It is in this latter category that all combined operations against the Gers. fell until nearly the end of 1942, when an Anglo-Amer. army, supported by numerous ships and aircraft, landed in Fr. N. Africa (Nov. 1942) and, by so doing, altered the course of the war. Theretofore no more had been attempted than raids in varying strength on enemy coasts from Norway to France and Libya, though some, like the raid on St. Nazaire in March 1942, made hist. The first troops specifically chosen for raiding were independent companies formed from volunteers from all the regiments of the regular army and trained for urgent use against the Gers. in Norway. From these companies was developed the idea of forming guerrilla bands known as commandos from the Boer war parallel. It has been officially stated that commandos were formed, because at the time (June 1940) there was no existing unit of the Brit. Army which could be made available for raiding operations, for the most stringent economy in weapons had to be exercised, everything being subordinated to the task of organising the defence of the Brit. Isles against invasion. When the independent companies were replaced by special service battalions, and these in their turn were converted into the commandos, the original conception of their tactical use was preserved, i.e. that they were to be amphibious and learn first and foremost to co-operate with the navy. The physical conditions of commando training were strenuous, but not beyond the endurance of men who had passed a severe medical test. Among the most notable commando raids organised by C. O. C. were the raid on Bruneval

radiolocation apparatus, which was successfully destroyed Feb. 27-28, 1942; the raid on Vaagso, Norway (March 1942), which resulted in a minor battle over the fjords and some desperate street fighting; the raid on St. Nazaire (also in March 1942), the chief features of which were the smashing of the lock-gates by blowing up the ship *Cambeltown* filled with explosives and the firing of delayed action torpedoes; the destruction of a large fish-oil factory on the Lofoten Is. (March 1941); a raid by guerrillas landing from the sea on Gen. Rommel's headquarters at Cyrene, Libya (Nov. 1941); the storming of Diego-Suarez in Madagascar (May 1942); and the great raid on Dieppe (Aug. 18-19, 1942). This last-named operation was an ambitious venture involving an attack by over 5000 Canadian troops, aided by the navy and the R.A.F., the attack extending from Berneval and Belleville-sur-Mer to Varengeville (see also under COMMANDO; DIEPPE RAID).

Combining Weight or Equivalent of any element is the number of units of weight of that element which will react either directly or indirectly with one of the same units of weight of hydrogen. It is not possible always to make hydrogen compounds of all the metals, so sometimes the standard of comparison is taken as oxygen or even chlorine. But by the law of reciprocal proportions (see CHEMISTRY) it is easy then to determine the equivalent of the element; for the combining proportions oxygen and chlorine with hydrogen are respectively 8 and 35.5 (approximately). Occasionally C. Ws. of elements are the same as their atomic weights, although this is by no means universally true, e.g. the equivalents of carbon, oxygen, and sulphur are 6, 8, and 16 respectively, while their atomic weights are 12, 16, and 32. But from this it may be seen that the atomic weight is either the same as the equivalent weight, or is a multiple of it, the multiple depending on the valency of the element. See CHEMISTRY, and ATOM AND ATOMIC THEORY.

Comblès, tn. of France, in the dept. of Somme. During the First World War severe fighting took place about C. during the 1916 battle of the Somme. The Fr. and Brit. actually met in C. on Sept. 26, driving the Gers. before them. The Gers. swept over C. in their final advance of March 1918, and in the Allies' counter-offensive held it with great determination during Aug., its military importance being entirely due to its being the only tn. in that area. Owing to pressure on both flanks, however, they were eventually forced to abandon it. C. has breweries and weaving industries. Pop. 900.

Combours, tn. in the N.W. of France, situated in the dept. of Ille-et-Vilaine, 24 m. S.S.E. of St. Malo. Chateaubriand lived in the feudal castle at C. as a youth. Pop. 4600.

Combrailles, name of two dists. in France, one a plateau called La Com-

brailles du Limousin between Creuse and Cher, the other a dist. called La Combrailles de Bourgoigne, consisting of wooded hills.

Combustion may be said to be chemical action accompanied by the production of heat and light. If heat and light are produced without an accompanying chemical action, C. is not taking place. For example, the carbon thread in an electric glow lamp is never in a state of C. or burning although it glows, because it is *in vacuo*, and therefore undergoing no chemical change. If the amounts of heat and light developed in a chemical action are small, then the C. is said to be slow or incipient. On the other hand, should the amount be great, then it is said to be rapid or active. The phlogistic theory was generally held until 1775 to explain the theory of C. According to this theory, all bodies which were combustible contained a principle called phlogiston. According as the amount of phlogiston contained was large or small, so it was thought would the C. be rapid or slow. As a metal, for example, burned it was regarded as giving off this phlogiston into the air. The material left, which we know to be the oxide of the metal, was in those days called the calx. So calx together with phlogiston was considered to form a metal. Boyle showed that the calx was heavier than the metal, so that phlogiston, if it existed, must have negative weight, but when it was proved that water was formed by the C. of hydrogen in oxygen, the phlogiston theory was finally abandoned towards the end of the eighteenth century. In processes of C. it is usual to regard one body as being combustible and the other as the supporter of C. In this connection the surrounding substance is regarded as the supporter. Now the atmosphere is the most familiar supporter of C., and it is usual therefore to term bodies as being combustible or incombustible according as they will or will not burn in air. Similarly it is usual to talk of other gases as being combustible if they will burn in air, and as being supporters of C. if bodies that burn in air will burn in them. But scientifically this is incorrect. For example, hydrogen will burn in air or oxygen, but oxygen will also burn in hydrogen; coal gas burns in air, but air can be made to burn in coal gas. Similarly it must be remembered that air or oxygen is not necessary for C., e.g. hydrogen will burn in chlorine.

During any process of C. heat is evolved and a certain temp. reached. These are two separate features which are important. The temp. is, of course, measured with the aid of a thermometer, the amount of heat in calories. Now the temp. may vary according as the C. is slow or rapid, but the heat of C. is always the same for the same two substances. Thus iron rusting in air is a process of slow C., and because of this the heat is radiated away without any appreciable rise in temp. If, however, iron is heated and placed in oxygen, the C. is rapid, the temp. consequently rises greatly, because

the heat is evolved quickly, and light is developed and C. manifested. But in both cases the total amount of heat evolved is the same. Therefore the difference between slow and active C. is not in the amount of heat developed, but in the temp. which is attained. It is necessary to raise every substance to a definite temp. before it will take part in C., and that temp. is called the ignition point. Some substances are spontaneously inflammable, because this point is in their case below the normal temp. of the atmosphere. If the temp. produced by the C. of two substances be higher than their ignition point, then those substances, having started to burn, will continue without further application of heat. This is the usual process of C., and the chemical reactions in these cases are exothermic, i.e. are accompanied by the evolution of heat. If the ignition point be higher than the temp. produced, then heat must be continuously supplied in order that the process may be continued. This is because heat is absorbed in these chemical reactions, which fall under the heading endothermic. An interesting illustration of this is the case of nitrogen and oxygen. They can be ignited by the electric spark, but the ignition point of nitrogen in oxygen is higher than the temp. produced; therefore the inflammation does not spread to surrounding particles. If the ignition point were lower than the temp. produced, then the first flash of lightning in the atmosphere would have started a conflagration which would have removed all the oxygen from the air, replacing it by oxides of nitrogen, so rendering life impossible. When a fuel is burnt in a furnace or in an internal-C. engine, the carbon burns and passes off as carbon dioxide (CO_2), the hydrogen burns and forms water (H_2O), which passes off as steam, and the sulphur (if it is present) forms into sulphur dioxide (SO_2). If air is not present in large enough quantities, the carbon is not completely burned and passes off as carbon monoxide (CO); this is the case in internal-C. engines, and is the reason why the exhaust gases of the automobile are so deadly, since carbon monoxide is a very poisonous gas. In order to ascertain the state of C. of a furnace of large boilers, the amount of CO_2 in the flue gases is automatically recorded, the aim being to make the percentage of this gas as high as possible, under which condition the fuel is burnt most economically or, in other words, the most air and the least fuel are being burnt. This point is important in large electricity-generating stations in securing the greatest efficiency in the plant. In the flue gases the percentage of CO_2 sought by boiler engineers is from 10 to 14 per cent. The percentage of fuel wasted between these two points is from 10 to 20 per cent more fuel being wasted at the lower percentage of CO_2 . In the case of the internal-C. engine the percentage of CO_2 in the exhaust gases cannot be regulated definitely, since this would cause a loss of power due to the difference of pressure between the inlet

and exhaust valves. For further information see FLAME; SPONTANEOUS COMBUSTION.

Comedia, term used in old Sp. drama, meaning a tragedy or comedy in three acts. It can be divided into two sections: (1) *Comedia de capa y espada*, represented actors of middle class life in everyday incidents. The characters were clothed in ordinary dress—the cloak and sword of the civilian. (2) *Comedia de teatro*, or *de ruidos*, played by kings and princes. The actors were very richly dressed, and dramatic scenes were chosen.

Comédie Française, official name of the Théâtre Français, the national theatre of France, which dates its estab. from the year 1680, though we may carry it a little farther back. In 1658 Molière's company, playing under the name of L'illustre Théâtre, quitted the provs. and settled in Paris. At that time a rival company at the Hôtel de Bourgogne already held the field, but Louis XIV., who early took the new company under his protection, ordered the two to amalgamate in 1680 under the name of La C. F. This theatre, then the only one left in Paris, received an ann. subsidy of 12,000 livres from the king. In 1687 the C. F. moved from the rue Guénégaud to more commodious quarters in what is now known as the rue de l'Ancienne-Comédie, where a large house had been built for it. Here it remained for nearly ninety years, producing the plays of Molière and of contemporary dramatists. In 1771 the C. F. was removed to the Tuileries, where the company played in a hall built on the site of the Hôtel de Condé, afterwards to be rebuilt as the Odéon. It remained here during the early part of the revolution, but political events led to such dissensions that a split occurred about 1790, which led to the break-up of the old Française and the estab. of two rival companies, the Théâtre de la Nation and the Théâtre de la République. These came to an end in a few years, and a gap occurs in the hist. of the company until 1802, when it was re-estab. by an edict of Napoleon. When at Moscow in 1812, Napoleon pub. a further decree giving full regulations for the conduct of the theatre, and these regulations, with slight modifications, still govern the theatre. Sound films, however, have modified the veto on members appearing on any other stage. In March 1900 the C. F. was set on fire, and a considerable portion was destroyed, though the papers and works of art were saved. A grant of 220,000 francs was promptly made by the gov., and the work of rebuilding was immediately carried out. Many of the most eminent Fr. actors and actresses of recent years, whether of comedy or tragedy, have made their début at the C. F. or have been connected with it during part of their careers, e.g. Sarah Bernhardt, who made her first appearance there in 1862 and for nearly twenty years belonged to the company; Coquelin aîné, whose association with this theatre lasted for over thirty years; Réjane, Jane Hading, Mounet-Sully, Adrienne Lecouvreur,

Dumesnil, La Claron, Talma, Mars, and the Guityrs. The State owns the Théâtre Française and grants it to the Comédie with certain funds for maintenance, and with an administrator who is appointed by the minister of fine arts. Students after matriculation at the Conservatoire may become *pensionnaires* and receive a contract. Later they can become, and remain, *sociétaires* (i.e. *pensionnaires* co-opted by the partner-members). The training of the young players is severe; they must be versed in all styles of Fr. acting to deal with the classic repertory of the Comédie, both to deliver the exacting tragic tirades (e.g. of Racine) on the one hand, and on the other to catch the very spirit of Molière. On the evening of Oct. 20, 1930, the C. F. celebrated the two hundred and fiftieth anniversary of its official creation. Its leading artistes are content, mainly because their position enables them to earn extra money elsewhere and on the films, to receive from the C. F. no more than an average of £800 a year. Its traditions and fame ensure steady receipts, and it has the privilege of engaging at a very modest salary the prize-winners at the Conservatoire, who, as indicated above, are given a free dramatic training by the State and are bound to accept engagements offered at the C. F. In addition to these advantages it has an ann. subsidy of some £8000. See Fournier's *Le Théâtre Français*; De Julléville's *History of French Literature*, 1900, which not only deals fully with the literature of the period, but also supplies an excellent bibliography; J. Clarete, *La Comédie Française de 1680 à 1900*, 1901; F. Sarcov, *A Company of Actors*, 1926; L. Duboch, *La Comédie Française d'aujourd'hui*, 1926; and S. Scaud, *La Comédie Française*, 1936.

Comedy, see DRAMA.

Comedy Theatre, London theatre, situated in Pantion Street, Haymarket. It is a small building, holding no more than 1200 of an audience, and was opened in 1881 with a comic opera, *La Mascotte*. For sev. years this was followed by other operas. Hawtrey. Beerbohm Tree, Marion Terry. Penley. Winifred Emery. Violet Cameron, Cyril Maude, and Maxine Elliott are a few well-known actors and actresses who have appeared on the boards of this theatre, and Jerome, Barrie, Pinero, Grundy, Kitch, and Sutro are some of the playwrights whose works have been produced in it.

Comenius (properly **Komenski**), **Johannes Amos** (1592-1671), distinguished scholar and educational reformer, was b. at Comna, in Moravia, or, according to another account, Niwnitz in the same dist. His parents were poor adherents of the Moravian Brethren. Having studied at Herborn (1612) and at Heidelberg, and having made a tour through England and Holland, C. became rector of the Moravian school at Prerau in 1614. After that he was made pastor at Fulneck, where he remained until 1621, when the tn. was taken and sacked by the imperialists, his house and library being destroyed. He wandered into Poland,

and finally settled at Lissa, where he supported himself by teaching Lat. It was here that he worked out the educational system which was to make him famous, and produced his *Didactica magna* in 1632, the year in which he was chosen elder of the Moravian Brethren. The year before this he had pub. the *Janua linguarum reserata*, written in Lat. and Moravian, which had securely estab. his reputation. This work was trans. into twelve European languages and sev. oriental ones. It was followed in 1633 by the *Janua linguarum vestibulum*, which formed an introduction to it. In 1641

COMENIUS

he was invited to England by the Parliament, on the suggestion of Hartlib, to assist in the reformation of public educational methods. The outbreak of the Civil war put a stop to this design, and C. went on to Sweden, from which country he had received an invitation to aid in the same work. Oxenstierna, the great Swedish minister, commissioned him to prepare a plan for the regulation of Swedish schools, and settled him at Elbing with a pension. Here he remained until 1648, when he returned once more to Lissa, and was made Moravian bishop of that tn. In 1650 he went as educational reformer to Hungary. Here he found time to put together his *Orbis sensuatum pictus* (1658), the first book which tried to instruct children by pictures. In 1656 Lissa was attacked and sacked by the Poles, and C. again lost his house and books. He found a refuge at Amsterdam, where he remained till his death. He was buried at Naarden. In his *Pansophiæ prodromus* (1630) he attempted to give an encyclopedic digest of the humanistic learning of his time. In theology he was a fervent evangelical,

and pub. sev. works on his own sect. Towards the end of his life he inclined greatly towards mysticism under the influence of Boehme. See S. S. Laurie, *John Amos Comenius: Life and Educational Works*, 1881; M. W. Keatinge (trans.), *The Great Didactic*, 1896; P. Monroe, *Comenius and the Beginnings of Educational Reform*, 1900; and R. F. Young, *Comenius in England*, 1932.

Comet, heavenly body of a luminous and nebulous appearance which approaches to and recedes from the sun. The name is derived from the Gk. κομήτης, hairy, a name bestowed on these bodies because they generally possess a 'tail' or 'tails'; this tail in anet. times also being called a beard when the train preceded the nucleus, as is the case when the C. is receding from the sun. Most Cs. are divided into three parts, the nucleus and the coma, which together form the head of the C., and the tail. It is impossible to exactly define the limits of each of these parts, as they shade gradually into the other; quite often, too, a C. is without a tail, others again (as e.g. that of Cheseaux, 1744) may have half a dozen. The nucleus is the brightest portion, the coma which surrounds it is a hazy area of light, while the tail becomes more and more faint and attenuated until it fades out. How attenuated is the matter that composes a C. may be judged by the fact that stars have repeatedly been seen through the thickest parts, and that the earth has passed through the tail of a C. without any observable effect. Thus Sir J. Herschel records that in 1832 he saw a group of stars of the sixteenth magnitude through almost the centre of Biela's C. The composition of a C. as revealed by the spectroscope (which was first successfully applied to determine the constitution of Cs. by Sir Wm. Huggins in 1868) is of extreme tenuity, while metallic lines, such as those of sodium and iron, have been observed in the spectrum of the nucleus. The spectrum of a C. also shows that the light is partly reflected sunlight and partly original. About 800 Cs. have been recorded, the larger portion of them being telescopic only. More than half this number have had their orbits calculated, and are found to move in one or other of three out of the four conic sections, i.e. an ellipse, a parabola, or a hyperbola (see illustration). The number of Cs. moving on elliptical orbits is comparatively few, being about eighty. These short-period Cs. may be expected to return to the sun and therefore necessarily belong to the solar system (q.v.). Chief among these are Biela's, Encke's, and Halley's Cs. The rest of the Cs. move in parabolic paths, except about half a dozen, which, as the result of perturbations, have a hyperbolic movement. Cs. break up by the expulsion of matter from the head of the C. Large Cs. such as Halley's C. emit fresh matter forming new tails at each approach to the sun. The present view is that the cause of the expulsion is electrical in origin. The head of the C. contains reservoirs of the gases identified by spectroscopic analysis,

and as meteoric masses are found to contain hydrogen and other gases it is considered that the head of the C. is composed of meteors. Ultimately the C. will cease to exist when all the gases in its reservoir have been lost. One of the more recently discovered Cs. appeared on June 23, 1927, known as Pons-Winnecke, after its discoverer. A member of the Jupiter family, its nearest distance from the earth on that occasion was about 3,500,000 m., the closest approach of a C. in the past few centuries. Its period is six years. Regarded merely spectacularly and historically, Cs. have ever been the object of man's curiosity

ORBITS OF COMET

and sometimes his fear. Thus the dream of Julius Caesar and the battle of Hastings were believed to have been heralded by Cs., a representation of the latter C. appearing in the Bayeux tapestry. The Bayeux C. has been shown by calculation to have indubitably been Halley's C., and it is conjectured that Halley's C. was the one recorded by the Chinese annals as having appeared in 240 and 87 B.C. The periodic return of certain Cs. has been useful in fixing or confirming historical dates, that of Halley being the first to return as predicted, viz. in 1759 (see HALLEY'S COMET). The most spectacular of the Cs. of the nineteenth century was that found by Donati on June 2, 1858. It stretched over a space of 40°, or nearly a quarter of the sky, and its maximum width was about 10°. See METEORS and SOLAR SYSTEM.

Comfrey, *Symphitum officinale*, plant of the Boraginaceae family. It has hairy leaves and white or purple flowers. Both leaves and root are useful in medicine.

Comillah, tn. in the prov. of E. Bengal, Pakistan, in the Chittagong div. It is situated on the R. Guntl. Pop. 30,000.

Comines, tn. of the Nord dept., France, on the R. Lys, near Lille, with textile industry. Pop. 6400.

Comines, Philippe de la Clyte, Sire de (1445-1509), Fr. statesman and chronicler, b. at the château de Comines, near Lille. In 1461 he entered the service of Charles the Bold, but soon showed a desire to enter the service of Louis XI. of France, his master's adversary. He did this in 1472, and, the tempers of the two agreeing admirably, he soon rose in favour. On the death of Louis in 1483, C. was made one of the counsel in regency, but he incurred the displeasure of Anne de Beaujeu, and was condemned to lose all his

PHILIPPE DE COMINES

estates. However, C. was far too brave and experienced a man to be kept long in disgrace, and Charles VIII. soon recalled him. In 1493 we find him taking part in the treaty of Vercell and engaged on other diplomatic business. After holding sev. offices under Louis XII., he d. at his castle of Armenton. His *Mémoires* form a complete critical survey of the politics of the time. They are characterised by vigour and most acute observation and insight. Their psychological perception and vivid style unite to give them a rare value.

Cominform, the name given to the revival on Oct. 5, 1947, of the Communist International or Comintern (which had been formally disbanded on May 15, 1943) by nine European Communist Parties who, on that date announced their decision to set up an 'Information Bureau' (whence the name C.) in Belgrade. Between 1924-29, as the Soviet grew in power, the C. was increasingly drawn into the factional struggles through which Stalin gradually consolidated his personal dictatorship inside Russia—against Trotsky, Bukharin, and others, and gradually the dependence of international

Communism on the Soviet Union became more explicit. During those years free public discussion of Comintern policy began to disappear, and since 1929, when Stalin's nominees, Molotov, Maniulsky, and Kuusinen assumed the control of the Comintern apparatus, the C. has been exclusively an instrument of the Russian State and public discussion has played no part in the formation of Comintern policy. The dissolution of the Comintern in 1943—dictated by its propagandist effect on Allied public opinion—was entirely to the advantage of the Soviet Union, for the central direction and control of all Communist parties from a single source in Moscow remained unaltered. When the Second World War ended Communists tried to convert the National Liberation Fronts into National Front Govs. in which they could still retain the essential power, even if by remote control. But except in E. Europe, under the shadow of the Red Army (*q.v.*), this transformation could not be effected, for the fall of Hitler had removed the bond which united Catholics, Socialists, and Christians generally in resistance. Hence the necessity to revive the Comintern in a disguised form. The C. is intended to keep before public opinion the fact that Communism is an international movement working to a plan—and to exaggerate the strength of the movement in the eyes of its supporters and its enemies. In this respect the C. has not been unsuccessful, for there is scarcely any political disturbance from Alexandria to Bogota or from Burma to Indonesia which has not been attributed to the machinations of the C. and in this sense the C. has proved a most effective weapon in psychological warfare. But so far the existence of the C., by an ironically dialectical process, has on balance damaged the Communist cause far more than promoted it. Opposition to the Soviet Union has always been most firmly rooted in the belief that she is planning and supporting a world-wide revolutionary movement. The Comintern was dissolved mainly in order to destroy the popular ground for that belief. By founding the C., however blameless and nugatory its real activities, the Communists have resurrected the old spectre at the very moment when it can do most damage to themselves. The part played by the C. in speeding the passage of the Economic Co-operation Act through the Amer. Congress was some evidence of this fact, while at the same time leading public opinion to conclude that the C. was, as its name implied, little more than the information bureau of some nine Communist parties. The functions of the Communist International in directing and supporting the activities of world Communism remain, as before, the responsibility of the Russian State, a fact which was made evident in 1948 by the conflict with Marshal Tito over the industrialisation policy of Yugoslavia. The purpose for which the C. was founded was to exaggerate the strength and importance of world Communism, but by succeeding in this purpose, the C. has largely con-

tributed to the success of the policies which its sponsors wish to frustrate.

Comintern, popular name of the Third or Communist International. It was founded in 1919 in Moscow for the organisation of the revolutionary forces of the world. Membership obliged adherents to press vigorously all communist activities in each affiliated country. During the Second World War the C. proved more of a liability than an asset to Russia, and it voluntarily dissolved itself on May 15, 1943, when the Presidium of the executive committee of the C. decided that unity in the struggle against Germany could best be achieved by the 'vanguard of the working-class movement in each separate country, working within the framework of its own country.' In fact it had held no congress since 1935, while its executive had, with only very limited success, continued the role of mentor to the Communist parties in other countries. This dissolution did not, however, mean that the influence of Moscow over the Communist movement in foreign lands would disappear, but it was evident to Moscow that the formal existence of the C. had served as a rallying point for the reactionary forces in other states. See also ANTI-COMINTERN PACT; COMINFORM.

Comiso, tn. in the prov. of Syracuse in Sicily. It is 13 m. W. of Ragusa, has paper manuf. and a pop. of 33,000.

Comitan, tn. in the state of Chiapas, Mexico, close to the Guatemalan border, the centre of a large trade in sugar and cattle, and making a strong brandy from a maguey plant. Pop. 16,000.

Comitia, constitutional meetings of the Rom. people, summoned and presided over by a magistrate. These meetings are to be distinguished from the *contiones*, where the people gathered informally to receive some announcement from the magistrate. In the C. the people assembled in regular order and the object was the decision by vote of some question of legislation. The C. soon lost their representative character, and their importance declined. There were three kinds of C., named according to the way in which the people were arranged. These were: (1) The *C. curiata*, the original form of assembly, which first consisted in the meeting of the patricians in their thirty *curiae*, or wards. On the breaking down of the distinction between patricians and plebeians, this assembly lost its distinctive character. Though it still retained one or two unimportant privileges, most of its duties were transferred to (2) the *C. centuriata*, an assembly of the whole people in their centuries as arranged by Servius Tullius. To this king is ascribed the div. of the people into five classes, according to the amount of property they possessed, and the div. of each class into hundreds. To this body, the chief power belonged during the republic. It elected the higher magistrates, e.g. the consuls and censors; gave judgment in special cases of appeal, decided on wars of aggression, and passed laws. In 287 B.C., however, it lost much

of its power through the rise of the *C. tributa*. The *C. centuriata* was originally a military assembly, and its meetings could not take place in the city of Rome itself. They were held in the Campus Martius. Each century voted as a unit, according to the majority in itself, and so the decision was by centuries. (3) The *C. tributa* was the assembly of the people according to tribes, and the power of summoning it rested with the tribunes. Originally the city of Rome was divided into four tribes, but as its dominions increased the franchise was extended to comprise thirty-five tribes in all. Gradually power passed to the *C. tributa*, until it became the chief legislative assembly, and continued in a more or less shadowy form down to the third century A.D.

Comity of Nations. In the language of jurisprudence there can be no sanction other than that of arms for the due observance of engagements entered into between nations. There is no legal obligation either to respect the terms of a treaty or to apply foreign law in deciding cases in the courts of a state which is asked to recognise such law. Hence the *de facto* respect for such reciprocal undertakings, depending on a kind of morality, has been very generally ascribed to the comity or courtesy of independent states towards each other. In the light of modern civilisation, with its complicated blending of international interests and ever wider ramifications of reciprocal commercial enterprises, the phrase C. of N., though strictly logical from the standpoint of independent sovereignty, lost a great deal of its force, even before the First World War; and, after that war, the creation of the League of Nations further tended to relegate the phrase to the archaic. Some writers distinguish between C. of N. and private international law and holding that C. of N. comprises purely voluntary acts not due by treaty, which may advance the international policy of the nations so observing them; and including in private international law the application by law courts, in certain circumstances, of the principles of a legal system other than their own.

Comma, in music, is the smallest enharmonic interval, the ninth part of a tone. See *MUSIC*.

Commagene (Gk. Κομμαγενή), anct. prov. to the N.W. of Syria, bounded on the W. by Cilicia, E. by the Euphrates, N. by the Amanus Mts. Its limits have often varied, and its hist. has been full of changes. During the period of the Seleucids it formed part of the Syrian kingdom, and was celebrated as a rich and fertile country. Long before this it had attempted to gain its independence, and in the civil wars which arose between Grypus and his brothers this object was attained and C. became a separate state under a dynasty related to the Seleucids. It remained thus from 162 B.C. to A.D. 72, when it finally became a Rom. prov. under Vespasian. From this period, the years A.D. 17-38 must be taken out, for during this time it was also a Rom. prov. Its cap. was Samosata.

Commandant, title usually given to the officer in command of a besieged fortress or military station, without regard to his rank; otherwise. The name is also applied to the heads of most military schools. In conjunction with the rank of the officer the title is also given to an officer in charge of a greater number of men than his rank warrants, as for example, captain-commandant.

Commander, title given to the captain of the second rank in the Brit. Navy. A C. is generally given the command of a small vessel, but in a number of cases is the second in command of a large one. The responsibility of the navigation of a large vessel usually falls on a C. The title is also used in the U.S.A. to signify a naval officer ranking next to a captain.

Commander-in-Chief, formerly the highest staff appointment in the Brit. Army. Previous to 1855 the office was to a very large extent independent of the secretary of state for war, but since that date and up to its abolition in 1904 was subordinate to that minister. The title was held by the duke of Cambridge up to his death and afterwards by the Earl Roberts. It was resigned by the latter in 1904, and was discontinued. The duties of the office devolved upon the inspector-in-chief of the forces, a title first borne by the duke of Connaught. The title is now, in the Brit. service, borne in peace-time by general officers commanding first-class commands, e.g. Aldershot, E., S., and Middle E. In war-time it is usually applied to the commander of any force of a considerable size, or to the holder of an independent command, and is comparable to generalissimo in continental armies.

Commander of the Faithful (*Emir al Mumenin*), title of the caliphs, first assumed by Omar I., 634-644, and retained by his successors in the caliphate.

Commandery, dist. under a commander, in connection with the Templars, Hospitallers, and other religious orders. The Templars possessed twelve such Cs., which embrace whole kingdoms and provs. in Europe and Asia Minor, viz. Jerusalem (city and kingdom), Acre, Tripoli, Antioch, France, England, Poitou, Aragon, Portugal, Apulia, Hungary. The commanders, or preceptors were controlled by the grand master of the order, but were alone responsible for the treasure of their dist., to which the grand master was allowed no access.

Commandite, *Société en*, kind of limited partnership of a fiduciary character in which the managing partner or partners are responsible with their whole fortunes for the engagements of the concern, but have others associated with them who contribute only definite sums, and are not liable for anything beyond those sums, though they participate in the profits according to any rule which may be agreed on. It is a form of partnership prevalent in France, Belgium, Germany, Italy, Russia, and other continental states, and adopted in parts of the U.S.A. The names of the active partners (in Fr. law called *commandites* or *complémentaires*) alone appear before the public, and they alone manage the partnership business, the dormant partners (in Fr. law *commanditaires*) being usually interdicted from all interference. Such partnerships are not allowed by Eng. law, all the members of an Eng. firm being equally liable for the firm's debts, with no limitation of liability. In England, however, practically identical results can be secured by the formation of a small limited company, and, especially since 1901, by what is known as a 'private company' (see under COMPANY); the legalisation of the latter indeed depriving of a large measure of their weight the arguments of J. S. Mill on the indefensibility of the Eng. prohibition.

Commando, Raiding military forces or mixed naval and military forces, formed by the Brit. Army in 1940 and operating from ships for 'hit-and-run' attacks on the Gers. The Cs. owed their existence to the inspiration of Gen. Dill, chief of the imperial general staff, supported by the zeal and authority of Mr. Winston Churchill, and their immediate *raison d'être* was to find some effective means of helping the army, after the Dunkirk evacuation, to exercise its offensive spirit once again. The term itself was derived from the Boer Cs. of the S. African war, whose successful mobile guerilla tactics after the disorganisation of the main Boer Army suggested to the Brit. authorities in 1940 the adaptation of the idea to the conditions of modern warfare and the employment of analogous tactics against the Gers. then masters of the Continent. Freedom from cumbersome supply columns and reliance on winning their equipment and, if need be, their arms from the enemy were the dominant features of the Boer Cs., which proved highly effective for striking suddenly from the void and disappearing as suddenly. For the Brit. Cs. each trooper was picked for his individual qualities and taught to act on his own initiative—if need be without officers, without orders and nothing but his daring and common sense to guide him. In a raid on the Continent the trooper would have nothing but what he could carry and what he could forage for himself. It was decided that the Cs. should get no rations, no quarters and no transport from the army. Each man was to be allowed 6s. 8d. a day with which to find these things for himself. The O. leaders were picked first—men under forty and exceptionally well qualified in physical fitness and professional ability. The leader was given the rank of lieutenant-colonel and sent to command headquarters to raise his unit. From a list of officer volunteers each troop leader chose one other officer to act as his assistant; and then between them the two selected fifty N.C.O.'s and men who composed their troop. Each man retained the right to go back to his regiment after giving reasonable notice, but few did. As soon as a unit had its complement of officers and men it was concentrated at a seaside tn., and the men of the 'irregular army' joined up with their

corresponding numbers of the 'irregular navy.' These were the raiding flotillas of fast motor boats, commanded by R.N.V.R. officers, with yachtsmen and fishermen to form their crew. After rehearsal for a projected raid there followed the night dash across the sea, a few minutes for landing, then sharp fighting on shore, with E-boats and Stukas of the enemy in close pursuit, until in the end the C. returned home to restart training for the next attack. For these Cs. the 'no-man's-land' of the Boer C. was the sea; and with the small boat squadrons of the navy they began in 1940 to pave the way to the landing of great armies. Among the most noted C. raids were those on the Lofoten Is. and Vaagso in Norway; the landings on Crete; the attacks on Bardia and Tobruk; and the raids on St. Nazaire, Diego Suarez (Madagascar), Dieppe (*see* DIEPPE RAID), and Walcheren. *See also* KEYES of ZEEBRUGGE, BARON. *See* His Majesty's Stationery Office, *Combined Operations*, 1943.

Command Papers, documents like blue-books, comprising reports of royal commissions, returns, and other information collected or issued at the instance of the gov. are said to be 'presented to Parliament by command of His Majesty,' in contradistinction to papers issued by the order of either House of Parliament, such as drafts of Bills with their amendments. C. P. are usually pub. in alternate series of nearly 10,000, and numbered C 1, C 2, and so on up to the number issued, Cd 1, 2, etc., and Cmd 1, 2, etc.

Commandrio, Federigo (1509-75), It. mathematician, b. at Urbino. He was especially learned in the commentation and trans. of the anc. mathematicians, and pub. many eds. of Archimedes, Euclid, etc. The utility of his labours is proved by the fact that nearly all subsequent commentators made use of his works.

Commedia (Gk. *κωμῳδία*, from *κῶμος*, revel; *αἰδώς*, singer), It. word, derived from the Gk. through the Lat. *comedia*. In It. literature it is applied to a tale or romance with a happy ending, and is not used particularly of a tale in the dramatic form, as is the word *comedy* in Eng. literature. Thus Dante entitles his great poem *Divina Commedia*, and likewise some of Chaucer's *Canterbury Tales* are called comedies in this sense.

Commedia dell' Arte, in the hist. of It. drama denotes the popular comedy of masks prior to its transformation into literary shape by Gozzi and Goldoni. *Arte*, in this connection, is equivalent to actors' guild or profession. The stock characters (to give them the names of their familiar Eng. equivalents) were the Clown, Harlequin, Columbine, and Pantaloon. This type of improvised comedy, or *commedia a soggetto*, is supposed to have been originated by Francesco Chereza, hence called Terenziano (*see* TERENCE), the favourite actor of Leo X. Its scenes were written only in *scenario*, i.e. in skeleton form, being connected by the *fazzi* or bliffoineries of the *arlechino*, the representative

of the older Rom. *sannio*. It was in this kind of comedy that Harlequin (*Arlecchino*) reached the apex of his glory. The *C. dell' A.* was essentially an actors' play, the dramatist only wrote an outline plot and left the actors to fill in the parts. Each actor acted a particular mask part, such as those of Harlequin, Pulcinella, and Pantaloon, and always had his stock phrases and stock actions. More types were evolved in course of time, but they were all virtually comprised by the following, mostly developed from the older types: the Doctor, a poor ridiculous learned pedant; Pantaloon (Pantalone), named after Venice's patron saint, Pantaleone, and dressed in skin-tight trousers, who was sometimes an old bachelor but more often the husband of an unfaithful young wife or the father of vexatious young daughters, especially Columbine (Colombina, originally Frascotta), while Harlequin (*Arlecchino*) was sometimes his lackey (*see* HARLEQUIN); the Captain, a braggart poltroon taken from contemporary Sp. drama and modelled on the many unemployed Sp. soldiers of fortune then roaming Italy; the young lovers, often the sons of the old men, and their sweethearts; the lackeys or *zanni*, *Arlecchino*, *Brighella*, or others, of varying degrees of doltishness, brutality, and sly cunning. Variants of these were Pulcinella, ancestor of Punch; Scaramouche (It. *Scaramuccia*) (*q.v.*), Scapin, Mezzetin, Pierrot, etc., all of whom had traditional costumes and often wore masks. Towards the end of the sixteenth century, certain of the more famous It. troupes were invited to visit the various courts of Europe. In Italy, the *C. dell' A.* remained popular until the tradition of improvised acting appeared to die out, towards the end of the seventeenth century and was replaced from the time of Gozzi and Goldoni by regular comedy. In France the permanent It. company gave offence to the king, and their theatre was closed in 1697 but reopened about 1720 and continued playing throughout the eighteenth century. In England also this style of acting was reintroduced after the Restoration, but early in the eighteenth century it gave way to the more popular pantomime, in which the traditions of the *C. dell' A.* lingered on.

Pirandello, the modern It. psychological or metaphysical dramatist, has, to some extent, revived this traditional It. dramatic art or its later development in the masked comedy, for like the writers of *scenarii* for masked players, he delights in constructing fantastic plots with unexpected situations and in embroiling them to such an extent that the unravelling has to be left to some individual character in the role of chorus or interpreter. The initiation of this new movement of the 'Teatro del Grottesco' is, however, attributed to Luigi Chiarelli, a young dramatist who, in 1916, produced a play called *La Maschera e il Volto* (*The Mask and the Face*) which enjoyed great popularity.

Commelin, Isaac (1598-1676), Dutch historian, b. at Amsterdam; he occupied

himself exclusively in research concerning the hist. of Holland, and pub. many works on the subject, among which may be mentioned *Commencement and Progress of the Dutch East Indian Company* (1646); *Life of Frederick Henry of Nassau* (1651), etc.

Commelin, John (1629-92), Dutch botanist, son of Isaac C., was b. in Amsterdam. He there became director of the botanical gardens, which by his skill and labour became the finest in Europe. He pub. sev. books on horticultural subjects. The genus of tropical plants *Commelina* is named after him, as also the family *Commelinaceæ*, which includes this genus and *Tradescantia*, the spiderwort.

Commemoration (or *Encænïa*), concluding festival of the academic year at Oxford Univ., when benefactors are commemorated and honorary degrees conferred upon distinguished Eng. or foreign celebrities. It consists of an oration in Lat. in C. of benefactors; prize compositions are recited in verse or prose. The ceremony generally takes place on the third Wednesday after Trinity Sunday, and is held in the Sheldonian Theatre.

Commendam, anct. method of holding benefices, abolished in 1836. When a living fell vacant, the spiritual duties belonging to it were given to some priest until a suitable successor could be appointed, and the benefice was said to be held *in C.* The emoluments were later also given and the practice grew up of poor bishops thus holding sev. livings. *Commendators* were stewards appointed to take charge of the revenues when a benefice was vacant.

Commensalism (Lat. *com*=cum, together, *mensa*, a table), one of the many forms of intimate association between different animals, or animals and plants, by which one or perhaps both benefit (the term was used by Van Beneden). Care should be taken to distinguish it from parasitism (*q.v.*), for in this case the association is harmful to one of the two organisms; and from symbiosis (*q.v.*), the most intimate form of association, illustrated by the union of algae and fungi, or algae and animals. There are so many forms of C., that while it would be correct perhaps to reserve the term for those cases where the associated organisms share the same food and each benefits, it is better to use the term for those partnerships which do not involve injury to either of the organisms. Of the many forms one of the most interesting is that in which a crab becomes covered with shells or sponges, etc. The sedentary growth is carried about to new feeding grounds and the crab obtains a disguise which aids it to capture its prey. The most striking form, however, is the association between the sea-anemone and the hermit crab. With one species of hermit crab (*Eupagurus prideauxii*) which is found off the Brit. coast, a beautiful sea-anemone (*Adamsia palliata*) is found in association. The anemone envelops the mollusc shell which the hermit has taken, and if disturbed the

hermit withdraws into the shell, while the anemone throws out stinging threads. It is therefore a protection as well as a mask, and in return the crab carries it about and finds its food. The crab, as it grows, has to change its shell, and it takes the anemone with it. Then again in association with another form of hermit crab (*Eupagurus bernhardus*) is found a colony of zoophytes. In this case, however, the C. is not so perfect, for both organisms may be found existing separately. Again, even when they are associated, since the crab is carnivorous, and the zoophyte feeds on matter in the water, no sharing of food takes place, and

COMMENSALISM: COMMON HERMIT CRAB AND SEA-ANEMONES

On the left of the whelk shell is the hermit crab worn, which generally inhabits the upper whorls of the shell. Barnacles, other worms, and saddle oysters add to the hermit's retinue.

the mutual advantage is harder to understand. But when we bear in mind the fact that zoophytes obtain their food by means of slender waving tentacles, and they possess no means of setting up currents in the water, and the fact that the respiration of the hermit would keep the water constantly circulating, the advantage accruing to the zoophyte can be seen. The hermit, of course, in this case also, is masked from its prey. In this case, instead of the hermit moving as the shell becomes too small, the colony grow at the mouth of the shell and lay down matter which actually enlarges the shell, so prolonging the period during which the hermit can remain. Sometimes, again, as when a hermit has become associated with sponges, the commensal grows so large that the hermit can abandon its shell and depend entirely for protection on its associate. Further, when the commensal of the crab is a polype, which buds into a colony, dissolving the shell as it grows, the hermit finally is surrounded by the polype which yields as the hermit itself grows. But apart from these fixed commensals, a large number of organisms are in constant association without being connected.

This may be because the same environment suits each, or it may be that one alone is, or perhaps both are, gaining benefit. Thus little crabs (*Pinnotheres*) can be found inside bivalves, and the same thing is common with crustaceans. The little crab benefits by obtaining food and oxygen from the currents inhaled by the bivalve. It has been suggested that these crabs with their developed sense organs can, by some means or other, warn their hosts of impending danger, thus causing them to close their shells. It is probable, however, that the advantage is in this case on the side of the intruder, and that the host is unable to eject it, even should it wish to. While no damage is being done, it is easy to see how it is possible for C. to pass by slow degrees into parasitism. In a similar manner, not all insects visiting plants are parasites; very often they serve a good purpose by feeding on other visitors, and may therefore act as a defence for the plant.

Commensurable (Lat. *commensurabilis*). Two magnitudes are called C. when they are of the same kind and each contains a third magnitude exactly, examples being a foot and a yard, or the numbers 14 and 21. If no unit or common measure can be found, the magnitudes are incommensurable, examples being the diameter and circumference of a circle, and in arithmetic numbers which are prime to one another, as 17 and 23.

Commentry, tn. of France in the dept. of Allier, 10 m. E.S.E. of Montluçon. It has coal mines and iron works. Pop. 11,000.

Commerce, Chambers of, see CHAMBERS OF COMMERCE.

Commerce, Degrees in, see under COMMERCIAL EDUCATION.

Commerce Court (U.S.A.). The C. C. of the U.S.A., which was created for the purpose of passing on appeals from the decision of the Inter-State Commerce Commission, has jurisdiction in shipping and railroad cases, and in most cases involving questions of mercantile law. The legislative, executive, and judicial appropriation Bill before the sixty-second Congress contained a provision repealing the Act which created the C. C. From the decisions of the Supreme Court of the U.S.A. it appears that the C. C. amplified its jurisdiction beyond its legal limits, and that in a number of cases it gave judgments against shippers and for the railroads when the Supreme Court held the view that the judgments ought to have gone the other way. The president, however, took the view that there was a series of decisions of the Supreme Court that satisfactorily assigned the limits of the jurisdiction of the C. C. and that there was no reason to suppose the court would exceed that jurisdiction in future. The result was that the C. C. was saved. The personnel of the C. C. changes annually by the assignment of one of the C. C. judges to a circuit court of appeal and the designation of another circuit judge to fill the vacancy so created.

Commerce, Department of (American). Is one of the chief depts. of the organisation

for federal administration. The duties of its sev. heads are to promote commerce, mining, manufacturing, shipping, fisheries, patents, and transportation. The dept. includes branches of aeronautics, radio, navigation, lighthouses, standards, steamboat inspection, census, coast and geodetic survey, fisheries, and mines.

Commercial Court is not *de jure* a separate court estab. by law; the term C. C. applies to any court on the king's bench side to which may be assigned the disposal of cases included in the commercial list. Such as it is, the C. C. originated in the special arrangements made by the king's bench judges in 1895 for the dispatch of commercial business 'in accordance with the existing rules and orders.' There are no pleadings in the ordinary sense, but the plaintiff may submit 'points of claim,' to which the defendant may reply with 'points of defence'; nor is there a jury, the whole practice of the court being designed to ensure expedition in trial.

Commercial Education, an offshoot of technical education, is in England mostly under the jurisdiction of the Ministry of Education. The greater part is conducted in evening schools where junior, senior, and advanced classes are held. The subjects taught in junior classes are Eng., arithmetic, shorthand, geography, and sometimes elements of commerce. In senior classes the prin. subjects are shorthand, typewriting, book-keeping, accountancy and modern languages, while in advanced classes general economics, business management and methods of business, trade organisation, etc., are among the subjects studied. Important schools and colleges which supply a C. E. in England are the London School of Economics and Political Science (a.m.), now part of the London Univ.; the City of London College; Higher School of Commerce at the Regent Street Polytechnic; and the Manchester Municipal High School of Commerce. There are also faculties of commerce at the univs. of Manchester and Birmingham, while the univ. of Durham at Armstrong College, Newcastle, offers a commercial degree and Liverpool Univ. a B.A. degree for proficiency in commercial subjects. Other examinations in commercial subjects are held by the Royal Society of Arts, the London Chamber of Commerce, and the Union of Lancashire and Cheshire Institutes.

In the U.S.A. more attention is given to C. E. than in any other country. The high schools include commercial subjects in their curriculum, and nearly a hundred Amer. univs. and colleges have schools or depts. of business administration and commerce. At Harvard, where the School of Business Administration is for graduate students only, the case method of study is employed. Well-known cases which have occurred in commerce have been collected by Harvard profs., and they are studied in detail by the students. Both in England and the U.S.A. there are a number of private commercial schools, some with tuition by correspondence.

Commercial Intelligence Department was inaugurated in 1899 as a branch of the Board of Trade under a controller-general. The headquarters of the C. I. D. in London included an inquiry room, a sample room, and a reading room, and the purpose of the dept. was to collect all available information on all subjects of commercial interest and, for the benefit of Brit. trade, to reply authoritatively to all trade inquiries. Commercial statistics were also drawn up and pub. in the *Board of Trade Journal*. The dept. also supplies free of charge to firms and companies whose names are on a register, kept by the dept. for that purpose, any necessary confidential information such firms and companies may require concerning their particular trades and industries. It also publishes the fullest statistics and information relative to strikes and lock-outs, the condition of the working classes, the prevalent hours of labour and price of commodities. During the First World War increased gov. supervision of industry became necessary, and in 1917 a joint dept. was formed under the Board of Trade and the Foreign Office, called the Dept. of Overseas Trade. Into this dept. the C. I. D. was merged, and after the war the arrangement became permanent. The former functions of the C. I. D. in the collecting and distributing of commercial information remained intact, and as a branch of the Dept. of Overseas Trade its activities were extended in the direction of a commercial consular service for the benefit of traders abroad. The headquarters of the former C. I. D. at 73 Basinghall Street, London, E.C.2, were later the city branch of the Dept. of Overseas Trade under the management of the senior intelligence officer.

Commercial System, see **MERCANTILE SYSTEM**.

Commercial Traveller. The modern C. T. may be defined as the direct representative of a wholesale house employed to travel round specified areas to solicit orders from retail tradesmen. He usually carries samples or some other indication of the nature and quality of the goods he 'travels in,' takes orders not in his own but in his firm's name, and is paid either by salary or commission, or by both. The C. T. of the coaching days was generally known as a travelling chapman (cf. *Ger. Kaufmann*, merchant), and as the ponderous public vehicles traversed only the main roads, many of the travellers who desired to penetrate into remote parts of the country had their horses and saddlebags. Since the era of railways their number has increased enormously, and where formerly London, Manchester, and Glasgow trading houses sent one traveller to each tn. they now send many, each of whom deals with but one special dept. instead of soliciting orders for all the classes of goods dealt in by his principals. Among the C. T. organisations are the Commercial Travellers' Benevolent Institution, the Commercial Travellers' Christian Association, and the Commercial Travellers' Schools Institution.

Commercial Treaties. A commercial

treaty is a bilateral agreement between two nations under which each contracting party binds itself to observe a number of definite stipulations regulating their mutual trading relations. Such treaties have existed in one form or another from the earliest times. The text is extant of C. T. between Rome and Carthage as early as 500 B.C. C. T. during the period of Charlemagne, and in the tenth and eleventh centuries, existed in W. Europe in the shape of royal charters, or other documents from sovereigns, expressly permitting foreign merchants to carry on commercial intercourse within their territory. The purpose of these C. T. made in more turbulent times was rather, through the medium of promises for the protection of the person, effects, and privileges of the foreign merchant, to make commercial intercourse reasonably possible than to adjust mutual relations for the economic advantage of either party; and further, they were of certainty of duration. The modern C. T., in the sense of a bilateral arrangement for a fixed period regulating tariffs and differential duties, has its origin in the political and commercial rivalry of the medieval It. republics. The advantages derived from the greater certainty of a treaty over usage or the personal guarantees of a foreign monarch soon ensured the universal prevalence of C. T., providing for the greater security of navigation and commerce. At first C. T. were restricted to exclusive undertakings between the contracting states, the ultimate object being to destroy the competition of other nations in foreign markets, while at the same time excluding as far as possible all imports other than raw material. Later the most-favoured-nation article comes into vogue. This article, which is susceptible of varying forms, has for its object the mutual extension to each of the contracting states of whatever rights and privileges each has already granted or conceded to some third state or states. An early instance of the most-favoured-nation article is afforded by the Turkish capitulations (see **CAPITULATIONS**), under which Turkey conferred certain rights and immunities to the subjects of Christian nations resident in the Ottoman dominions. The endeavours of various European powers, especially France and Germany during the seventeenth and eighteenth centuries, to introduce schemes of tariff reform by means of C. T., led to the formation of a number of treaties between England, those powers, and other European states, designed to lower the prohibitive rates on Brit. exports. Before the First World War, Germany followed the old principle of exclusive C. T., having concluded or renewed in 1909 a number of treaties with Austria-Hungary, Belgium, Bulgaria, and Italy of a strictly protectionist character. The C. T. concluded between 1884 and 1900 regarding dials, and spheres of influence in various parts of E., W., and tropical Africa are universal in the recognition of the principle of most-favoured-nation treatment to the ex-

clusion of all exclusive privileges. The advent of the First World War brought about a tremendous upheaval in the world of commerce. Nations which had been on friendly terms for years were now ranged in opposing camps, and the C. T. by which they had been bound for long periods were treated as mere scraps of paper. The depression in trade, which naturally follows all wars, set in after the First World War and from 1930 began to be felt most acutely, not only in Europe, but in all quarters of the world. The World Economic Conference, held in London in 1933, was convened in the hope of accelerating the flow of international trade by mutual arrangements for the stabilisation of currencies and by devising ways and means of raising commodity prices. But the conference completely failed of its purpose and served only to intensify the economic nationalism of each great nation. But Great Britain having already reverted to a protectionist fiscal policy and concluded at Ottawa a series of trade agreements with the dominions (see OTTAWA CONFERENCE) was able in 1933 to conclude advantageous C. T. with sev. foreign countries, including Argentina and Denmark. See Hertslet's *Commercial Treaties*, 21 vols.

Commercy, *tu.*, France, in dept. of Meuse, on the Meuse, 20 m. E. of Bar-le-Duc; possesses a noted castle. Pop. 7300.

Commination, The Office of, solemn service and 'denouncing of God's anger and judgments against sinners' appointed to be read in the Anglican Church on Ash Wednesday. It is one of the last remains in the offices of the Church of the public acts of penitence which the primitive Church imposed at the beginning of Lent. The present office is based almost entirely on the earlier forms found in the Uses of Sarum and York. The curses contained in Deuteronomy xxvii. against impenitent sinners are read, and the congregation answer 'Amen' to every sentence as acknowledging the justice of the sentences.

Commings (Lat. *Convenae*), old div. of S. France between Armagnac and the Pyrenees.

Comminuted Fracture, one in which the bone is broken into sev. small pieces, and not merely in one or more places. It may be caused by a crushing blow, and is treated in a similar manner to a simple fracture. A C. F. may further be *compound* or *complicated* (see COMPOUND FRACTURE), when the condition is, of course, more serious.

Commiphora, see BAISAMODENDRON.

Commissariat, designated the dept. responsible for the supply of food and forage for the army in the field. The transport of these articles was also in the hands of this dept., as were the responsibilities for the horsing of the army medical wagons and the ordnance store depts. The C. as a dept. no longer exists; its functions are now carried out by the Royal Army Ordnance Corps which is responsible for equipment, stores, food,

etc., and the Royal Army Service Corps which is responsible for transport.

Commissary, generally the representative of another. An eccles. C. is the deputy of a bishop, by whom the jurisdiction of the latter is exercised in distant parts of the diocese. A military C. is an officer whose duty it is to supervise the provision of food and clothes to an army.

Commission, in business, denotes an agreed reward payable by a principal to his agent in consideration of the agent performing the particular business or service for which he was employed. The right of the agent to remuneration in the shape of C. may either depend on an express term in the contract of agency, or it may be implied from the custom in the trade, or from the general course of dealing between him and his principal. The agent is not entitled to make a personal profit out of the business into which he may enter on behalf of his principal other than the C. agreed upon. If the agent obtains such a profit he is bound to account for it to his principal (see also COMMISSION, SECRET), and further, the principal in such a case may not only repudiate the contract, but recover any C. he may have already paid to the agent. Some of the commonest kinds of agents for whose services C. is usually paid are factors and brokers. A factor is an agent employed by merchants to buy or sell goods or to discount or otherwise negotiate bills of exchange, bills of lading, etc. A factor employed to sell is customarily entrusted with the goods of his principal, and may or may not sell in his own name. A broker is also an agent employed to dispose of goods or property, but differs from a factor in that he is not usually put into possession of his principal's goods; but he may buy or sell in his own name without disclosing the identity of his principal. A distinction should be drawn between factors' and brokers' agreements on the one hand and agencies on the other. A C. agency is not an agency in the true sense of that word. It exists where a C. agent or merchant supplies goods to a foreign merchant, or undertakes to buy or sell goods for another on the best terms he can secure for the other party. It is true he gets not only the price from the other party, but also his C.; but the transaction differs from an ordinary contract of sale in that the C. agent sells to the other at the lowest price and looks to the C. for his profit. A broker differs from a C. agent in that he is no more than a medium for establishing privacy of contract between his principal and a buyer or seller of goods. A stockbroker furnishes an illustration of an agent whose right to C. or, as it is termed, brokerage, is usually implied in the agreement to buy or sell stock, being generally reckoned at one-eighth per cent. of the amount of the stock bought or sold at the market price on the date of the transaction. Since the Gaming Act, 1892, an agent employed to make bets for another is not entitled to recover any C. that may have been promised him. Such agents

may style themselves C. or turf agents, but they are not legally recognised agents.

Commission, Military, in its most general sense, is the document by virtue of which an officer is authorised to perform military duty for the service of the State. The royal authorisation to the feudal barons in Norman times presents but few features in common with the grant to-day of a C. in the army. In the Norman period the regular mode in England of assembling an army, either to resist an invading enemy or to accompany the king on a foreign expedition, was by sending a royal command to the chief barons and spiritual lords, that they should meet at a given time and place with their due proportion of men, horses, etc., properly equipped, according to the tenure by which they held their landed estates. These *tenants in capite* appear to have appointed by their own authority all their subordinate officers. But Cs. were occasionally granted by the kings authorising individuals to raise men for particular service. *Commissions of Array*, as they were called, were also issued by the king of England, probably from the time of Alfred, for the purpose of mustering and training the inhab. of the shires in military discipline; and in the reign of Edward III. the Parliament enacted that no person trained under these Cs. should be compelled to serve out of his own shire except the kingdom were invaded. Of the same nature as these Cs. of array was that which in 1572, when the country was threatened with the Sp. invasion, Queen Elizabeth issued to the justices of the peace in different countries. This privilege of granting Cs. to the officers of the national militia continued to be exercised by the lord-lieutenants of cos. until 1872, when the militia became more closely connected with the regular army. Prior to 1871 Cs. were obtained by purchase, except in the artillery and engineers, where they were always conferred without purchase. To a certain extent this was the case with Cs. granted to officers of the line—those cadets who had completed a course of military education at Sandhurst being so appointed. In other cases the price of an ensigncy or C. was regulated by authority, varying from £450 for a C. in an infantry regiment to £7250 for the C. of a lieutenant-colonel in the Life Guards. In proceeding to higher grades, an officer paid the difference between the price of the grade which he left and of that which he entered. But the system of purchase was abolished by royal warrant in 1871 in favour of the present system of entrance into the army by examination, with promotion to higher grades depending on examination in military subjects (as laid down in the Appendices to the King's Regulations) and (though to a less extent than before the First World War) on seniority. By far the greater number of Cs. are given as the result of success in open competitive examinations. First appointments as sub-lieutenants are, however, also granted to non-commissioned officers with a

special recommendation, univ. students who have passed certain qualifying examinations, and to 'king's' cadets. A number of cadetships for Sandhurst are given annually to young soldiers from the ranks who show qualities of leadership. Cs. now entail previous service in the ranks for a period of at least twelve months, followed by entry to Sandhurst. At Sandhurst the cadet is still in the ranks until he has passed out. The commissioned officers of a battalion of infantry are as follows: Field-officers—colonel, lieutenant-colonel, and major. Regimental officers—captains and lieutenants. Staff-officers—chaplain, adjutant, quartermaster, and surgeon. It may be observed that in the navy the various Cs. are a sort of warrant signed by the Lords Commissioners of the Admiralty; but the documents are called Cs., and are signed in the name of the king or queen. Under the Cardwell (see CARDWELL, EDWARD, VISCOUNT) reforms civil servants were granted Cs. in certain military depts., e.g. purveyors of the Military Store Dept., and others of a like nature. In course of time these officers passed through the stages of relative rank, honorary rank, and quasi-military ranks such as surgeon-captain. The rank of quartermaster and honorary lieutenant (captain or major) survived until 1918, when the honorary was dropped. An innovation took place in 1927 as regards Cs. by the issue of a 'C' in standardised form for all officers of all branches of the service (with a few exceptions). The forms of C. are three in number: the first gives the king's authority to the holder 'in such manner and on such occasions as may be prescribed by Us to exercise and well discipline in arms both the inferior officers and men serving' under the holder; the second refers to chaplains and exhorts the holder 'carefully and diligently to discharge his duty as an officer of the Royal Army Chaplain's Department,' and the third 'gives and grants' the holder 'full power and authority to have, hold, and enjoy' his said honorary rank. The King's Regulations prescribe when the command, given by a first C., is exercisable and over what bodies.

Commission, Parliamentary. Neither House of Parliament can proceed to business at the beginning of a session until the king has, either by himself or by a C. appointed by him (called the Lords Commissioners), declared the causes of summons. This is somewhat formal, of course, because Parliament by no means confines the subsequent meetings of the sessions to discussing the matters mentioned in the Royal Address. As an historical fact, Parliament has proceeded to business without the royal authorisation at all; for in 1788, when Parliament assembled after being prorogued, George III. was mentally incapable, not only of making the speech from the throne, but of appointing any C. to do so for him. The *impasse* was bridged by the lord chancellor (see CHANCELLOR), doubtless acting in pursuance of his character as keeper of the

royal conscience, affixing the great seal to a C. to open Parliament without the authority of the king, but avowedly 'in his Majesty's name.' At the opening of a new Parliament the commissioners also direct the Commons to elect a Speaker, and are the body for signifying the royal assent to the election when made. A message from the Lords Commissioners for the purpose of signifying the royal assent to a Bill 'makes a House,' even if forty members be not present (*see* COUNT OUT). In connection with its inherent jurisdiction in the matter of elections of members, Parliament, upon a petition, alleging corrupt practices to the House of Commons, presented within twenty-one days after the return of the member the validity of whose election is disputed, may appoint a C. under the 15 & 16 Vict. c. 57, to inquire into the facts of the election, provided the petition is followed by the presentation of an address of both Houses for inquiry. Under the Private Legislation Procedure (Scotland) Act, 1899, when an inquiry is directed to be held on a proposed order or group of orders in respect of private Bills, the chairmen of both Houses constitute a C. for the purpose of choosing four members from the panel of commissioners to conduct such inquiry. When completed, these commissioners make their report to the secretary for Scotland. *See* May, *Parliamentary Practice*.

Commission, Permanent and Special. Cs. are occasionally set up for special purposes which may ultimately necessitate permanent session; as in the cases of the Charity C., 1853, the Civil Service C., 1855, and the Railway and Canal C., 1873. The Cs. of this nature which are at present (1947) in existence include the Charity C., constituted under an Act of 1853 for the better administration of charitable trusts in England and Wales; Civil Service C.; Coal C., constituted under the Coal Act 1938 (*see* COAL MINES, NATIONALISATION OF); Development C., appointed under the Development and Road Improvement Fund Acts 1909-10, for the development of agriculture and rural industries, reclamation and drainage of land, harbours, and fisheries; Royal Fine Art C., appointed in 1921 (and extended by royal warrant of 1933) to inquire into such questions of public amenity or of artistic importance as may be referred to them by any State Dept.; Forestry C., appointed under the Forestry Acts 1919-45 and charged with the general duty of promoting the interests of forestry; Historical Manuscripts C., authorised under a C. issued in 1869 and renewed in 1919, to inquire into the location of MSS. of general public interest with a view to their publication; standing C. on Museums and Galleries appointed in 1931 to advise generally on questions relevant to the development of the national institutions as a whole; Royal C., for the exhibition of 1851, which promotes scientific and artistic education through funds derived from its Kensington estate purchased with surplus moneys of the exhibition of 1851; Railway and Canal C.;

Tithe Redemption C., constituted by an Act of 1936; Imperial War Graves C. (*see* GRAVES, SOLDIERS); War Damage C., appointed in 1941 to administer the War Damage Acts 1941-43; War Works C., appointed to adjudicate on disputes arising out of the Requisitioned Land and War Works Act of June 1945; and the Wheat C. (*see* under AGRICULTURE). All the foregoing are, in effect, Gov. depts. of a permanent or quasi-permanent character. Other Cs., again, may be set up to meet an exceptional but temporary state of affairs as, for example, the C. appointed when King George V. visited India, to perform certain of the royal duties in his absence. Judicial Cs., too, have been appointed for unusual cases where the ordinary legal procedure has been inadequate, as, for example, when two high court judges were appointed to inquire into the Sheffield Trades Union action of 1867; and again, when three judges heard evidence on the charges made against Parnell by *The Times* in 1889. Similarly under the Tribunals of Inquiry (Evidence) Act, 1921, tribunals were appointed under a high court judge to ascertain the facts in the wreck of H.M.S. *Thetis*; in the case of alleged disclosure of Budget secrets by Mr. J. H. Thomas (*q.v.*) in 1936; and in 1949 under Mr. Justice Lysney to inquire into the rumours of corrupt conduct of public servants.

Commission, Royal. A R. C. is a body constituted by royal warrant to conduct an inquiry for the purpose of gaining information either as to the operation of existing laws, or on various matters, social, educational, or otherwise. The warrant or reference, expressly defines the particular objects of inquiry, and outside such objects the C. may not go. Instances of such R. Cs. may be furnished to almost any number; *inter alia* may be mentioned various Cs. to inquire into the factory system, especially in regard to child labour (*see* FACTORY AND WORKSHOP ACTS), and the Poor Law C. at the beginning of the present century to inquire into the whole of the existing Poor Law system. Commissioners are not paid for their services, although compensation may be allowed for time and labour in cases where a high degree of professional skill is necessary. Parliament provides annually for the expenses of R. Cs. When an inquiry is completed, the C. signs and presents its report to the Crown through the home secretary. If the commissioners are not unanimous, those in the minority may record their dissent, expressing their personal views in separately signed memoranda, as, for example, in the case of the Minority Report of the R. C. on the Poor Law system. A R. C. has no power to compel disclosure of documents nor even to administer an oath or compel persons to give evidence. There is no settled practice as to whether, when counsel appear before a C., they are entitled to cross-examine such witnesses as do volunteer to give evidence. The procedure adopted before the Evicted Tenants (Ireland) C. in 1892 was to

allow questions to be put only through the commissioners themselves; and in the Featherstone Riots inquiry in 1893, Lord Justice Bowen, who presided, followed the same procedure. Much criticism has often been directed to the supposed uselessness of Cs., but although often unproductive of practical results in the shape of legislation, it must be conceded that on numerous other occasions, the greatest good has followed. as, for example, in the case of the Royal W. India C. of 1939 whose recommendations (despite the fact that pub. of its report was suspended during the war) had a direct influence on the passing of the Colonial Development and Welfare Act of 1940.

Commission, Secret. With the object of preventing the bribery of agents, employees, or servants of any kind, especially by the payment of money by way of commission, without the knowledge of the agent's or employee's principal or employer, the legislature in 1906 passed the Prevention of Corruption Act, which punishes as a misdemeanour with imprisonment for a term not exceeding two years with or without hard labour, or to a fine of £500, or to both; or, *summarily*, with four months' imprisonment or a fine of £50, or both: (1) the corrupt acceptance or obtaining by an agent either for himself or for any other person, *e.g.* his wife or child, any gift or valuable consideration of any kind as an inducement or reward for doing or forbearing to do any act in relation to his principal's affairs or business, and (2) the corrupt giving or agreeing to give anything to an agent as an inducement to act in such a way. 'Agent' includes employees of all kinds. The passing of the Act was generally regarded as a necessity in view of the ever-increasing corruptibility of persons in large business houses entrusted with the power to contract for the supply or purchase of considerable quantities of goods, and of various other persons, such as the servants of local authorities, who could not be reached by the criminal law as it stood prior to 1906. The gist of the offence is the paying or receiving *corruptly*, it being no offence in itself either to reward an agent or for an agent to accept a reward. Prosecutions under the Act may only be instituted by leave of the attorney-general.

Commissionaires, Corps of. This useful body was founded in 1859 by Capt. Sir Edward Walter, K.C.B. At its inception it was composed exclusively of a few wounded soldiers, the founder's idea being to make the association a means of obtaining some form of employment for wounded soldiers of good character. The corps soon developed into a large institution, and its membership, which comprises pensioned soldiers, sailors, and airmen, is about 5000; and there are branch institutions of the corps in Birmingham, Bristol, Leeds, Liverpool, Manchester, and Newcastle-on-Tyne; Edinburgh and Glasgow; and Belfast. The headquarters are at Exchange Court, 419A Strand, London. The men wear a

distinctive uniform, and are generally engaged in light duties of a temporary or permanent character.

Commissioners, Ecclesiastical, *see* ECCLESIASTICAL COMMISSIONERS.

Commissioners, Lords, *see* ASSENT, ROYAL.

Commissioners, Naval, *see* ADMIRALTY.

Commissioner of Police, official in whom is vested the highest administrative authority in the police force of Great Britain. This official is assisted by a deputy commissioner, three assistant commissioners, three deputy assistant commissioners, and five chief constables. The City of London has its separate police estab., under a commissioner and assistant commissioner; the force numbers about 1200 men.

Commitment, warrant or order of a court of justice of the peace directing a sheriff, bailiff, or constable to take a named person to the common jail, whether on remand or to await trial. If the arrested person is already in jail, the C. directs the governor to detain the person named for a specified period, and either to produce him or discharge him on the expiration of such period. Apprehension without a warrant is not C. in the proper sense. The Habeas Corpus Act, 1679, provided that a jailer was not justified in receiving a prisoner unless the C. was in writing. A C. must state the offence for which the prisoner is detained.

Committee of Imperial Defence, originated in 1890 as a select combination of civil and professional advisers on naval and military matters, formed with the object of securing a greater degree of efficiency of preparation for political contingencies and for joint action in time of war. At its inception it was a naval and military council whose prin. function was to consider the estimates with a view to determining the relative importance of the respective demands of the two services. During the First World War it was regularly presided over by the Prime Minister, while the members included the war secretary, the first lord of the Admiralty, the head of the Army General Staff, the First Sea Lord, and heads of the Army and Navy Intelligence Dept. The C. of I. D. was subsequently concerned primarily with questions of imperial defence and only secondarily with the estimates. The Prime Minister continued to be the chairman and the secretaries of state of the service depts., the dominions, Colonial and Foreign Offices, and other interested ministers were members. Under an arrangement made in 1936 to secure a higher degree of co-ordination between the three fighting services a minister of defence was appointed to act as deputy chairman and to devote his whole time to the duties. The overseas dominions make provision for the defence of their own areas, but the general strategical defence of the empire was undertaken by the imperial gov., through the C. of I. D. which co-ordinated the work of the sea, land, and air forces. One of the most important sub-committees was that of the chiefs of

staff of each of the fighting services, whose function was to draw up plans for defence for submission to the main committee and for the execution of the accepted policy of the committee. (This sub-committee will of course continue to exist, but will report to the minister of defence.) The duties of the C. of I. D. were ancillary to the Cabinet, being in the main advisory and informative. The plenary sittings of the committee took place some six or seven times a year. Ordinarily the committee conducted its business through permanent sub-committees. The C. of I. D. was abolished in 1946 on the creation of a minister of defence. *See further under DEFENCE, MINISTRY OF.*

Committee of Public Safety (*Comité du Salut Public*), body which was co-opted by the members of the Fr. convention in April 1793. The powers entrusted to it were at first merely those of supervising the actions of the executive, but by degrees it usurped all the powers of that body. The revolutionary gov. was conferred on the C. of P. S. by the convention on Dec. 4, 1793. Local committees were instituted in all the coms. to try the suspected persons, and law and order were thereby forth non-existent in France. Robespierre was the leader of the *comité* till his fall in 1794; in Oct. of that year a new constitution introduced a directorial gov.

Committees, Parliamentary. The Standing Orders provide for the appointment of five *standing committees* for the consideration of Bills. The procedure in these C. is the same as in select C., unless the House otherwise orders, and strangers are admitted, except when the committee orders them to withdraw. The standing orders provide that C. may sit during the sitting, and notwithstanding any adjournment of the House on any day on which the House has sat. On a div. being called in the House, the chairman of a standing committee suspends the proceedings of the committee for such time as will in his opinion enable members to vote in the div. A standing committee consists of not less than thirty nor more than fifty members, nominated by the *Committee of Selection*, who have power to discharge members for non-attendance or at their own request. The committee of selection can add not less than ten nor more than thirty-five members to a standing committee in respect of any Bill referred to it, to serve on the committee during the consideration of such Bill. One of the standing C. is appointed for the consideration of all public Bills relating exclusively to Scotland, and consists of all the members for Scottish constituencies, together with not less than ten nor more than fifteen others members nominated by the committee of selection. This last-named committee is composed of eleven members chosen by the House at the beginning of each session, and besides nominating members to standing C. it classifies all private Bills and allocates them to the different standing C. All Bills, other than money Bills, must be referred after second reading to a standing committee

unless the House orders otherwise, when they are referred to a *committee of the whole House*, or to a *select committee* or sometimes to a *joint committee* of the two Houses, consisting of two members from each House. A committee of the whole House is the House itself presided over by a chairman instead of by the Speaker. The time for amending a Bill is when it is in committee, the clauses are discussed in detail, and amendments moved in the order in which they come in the particular clause; after the consideration of new and postponed clauses and schedules the committee reports to the House. But where a Bill has been referred to a select committee it must afterwards go through a committee of the whole House. When the House goes into committee, the Speaker vacates the chair and the chairman of C. takes his place. A Bill may be at once put down for third reading, when it has gone through a committee of the whole House without amendment; but where it comes up from a standing committee it may be again amended on the report stage before being set down for third reading. Money Bills may only be introduced in the House of Commons by authorisation of a resolution in committee of the whole House moved by a minister. The *Committee of Supply* and the *Committee of Ways and Means* are C. of the whole House, formed at the beginning of a session, immediately after the debate on the address is closed. The former committee discusses the naval, civil, military, and air estimates for the ensuing year, and allocates the revenue of the country. The latter committee authorises grants out of the Consolidated Fund (*q.v.*) and votes the necessary taxes for the year. The *Railway and Canal Bills Committee*, consisting of eight or nine members chosen by the committee of selection, performs similar functions to the latter committee with regard to railway and canal Bills. The *Police and Sanitary Committee*, also nominated by the committee of selection, considers Bills dealing with sanitary and police matters. The *Committee of Privileges* deals with matters appertaining to the ancient privileges of the House. The *Committee of Public Accounts*, consisting of eleven members nominated at the commencement of each session, examines public accounts submitted to it by the comptroller and auditors-general. *See CASTING VOTE, CHAIRMAN.*

Commodore, in the royal navy, a temporary rank between that of an admiral and that of a captain. A C. is usually appointed for a squadron of three or more ships detached from the main body on special service. There are two classes of Cs., of which the first hoists his pennant, white with a red cross, at the main, and holds the temporary rank of a rear-admiral. A C. of the second class hoists his pennant at the fore, and has no captain under him in the ship. A C. may not hoist his pennant in the presence of an admiral without permission. The title is often given by courtesy to the senior captain of a squadron of sev. ships. In

the U.S. Navy the title was purely a courtesy one before 1862, applied to captains who commanded a squadron. In 1862 it was made a permanent rank equal to that of brigadier-general in the army, but was abolished in 1899. The title belongs also to the president of a yacht club and to the senior captain of a fleet of merchant vessels.

Commodus, Lucius Aelius Aurelius (180-92), known also as **Marcus Antoninus**, emperor of Rome, son of Marcus Aurelius and Faustina, was b. at Lanuvium in A.D. 161. In spite of a most careful education, he early showed a propensity for low company and debauchery. His later life fulfilled completely the promise thus given. It was spent in dissipation of all kinds, and his lavish expenditure on gladiatorial exhibitions exhausted the treasury. He himself fought as a gladiator in the shows on numerous occasions. At last Marcia, his mistress, and two other members of his household, finding their names on the list of those to be killed, gave C. poison, and he was then strangled by a wrestler named Narcissus.

Common, Right of, right of taking a profit in the land of another in common with others. It may either be such a right as is enjoyed in common with others to the exclusion of the owner of the land, or it may not exclude the owner of the land. The commoner has no interest or estate in the soil of the land on which he has a R. of C. The profits which may be the subjects of common right are the natural produce of land or water, such as grass and herbage, turf, wood, and fish. Hence the four species of 'commonable' rights are called common of *pasture*, the right to pasture one's cattle on a particular piece of land; common of *turbary*, the right to cut turves; common of *piscary*, the right to take fish from a particular piece of water; and common of *estovers*, the right to take wood for fuel, or for agric. implements. Where a person enjoys a R. of C. over land by reason of his title to other land, the common is called a common *appendant*, e.g. freeholders of a manor may have the right to pasture a certain number of beasts on the manorial waste lands. A R. of C. is said to be *appurtenant* when claimed (a) by copyholders; (b) by freeholders of a manor when they claim independently of their freehold interests; (c) by freeholders not of a manor. Copyholders may claim by special custom, while freeholders' rights may depend upon grant or prescription (i.e. title by user). There are various ways of extinguishing Rs. of C. otherwise than by buying the commoner out, e.g. the enfranchisement of copyhold to which a R. of C. is annexed extinguishes the right. The most usual mode of extinguishing Rs. of C. in modern times is by inclosure under Act of Parliament.

Common, Tenancy in, tenants in common are they who own lands or tenements, whether by a freehold or a leasehold title, in common as distinct from joint ownership. The characteristic feature of joint ownership is that each

owner has an equal aliquot share of benefit in the undivided whole; and that, assuming no proceedings for severance, the whole ultimately goes to the survivor.

In T. in C. each is the owner of an undivided share in the whole, the quantum of his proportionate part depending on the terms of the grant or devise. It is solely the fact that the tenants are all interested in the possession of the same property that constitutes them tenants in common; and each one of the tenants in common may derive title from a different instrument, whereas joint tenants derive one and the same title from one and the same instrument. There may be tenants in common of other things besides land, as, e.g., of £5000 consols, or a racehorse. The undivided shares of tenants in common no less than the quantity of their interest or estate may be equal or unequal, e.g. A may have the freehold inheritance of two-thirds of a particular park, while B. may have only a life estate in the remaining one-third. But so long as B's lesser interest exists, A and B are tenants in common. For all the purposes of sale, disposition by will, or transmission of intestacy, the undivided shares of tenants in common are like separate property. Enjoyment must be in common, if possible. If not, the tenants must come to some agreement about the mode of enjoyment, and, if they cannot agree, they must sell the thing and divide the proceeds in the proper proportions. Equity (q.v.) is said to lean against joint tenancies, and the courts endeavour to construe all instruments in such a way as to create tenancies common rather than joint tenancies. A T. in C. ceases when the ownership of the sev. shares subsists in a single individual; it can also be destroyed by means of a partition suit in equity, unless, indeed, the thing be indivisible, when a sale must be effected.

Common Council of London, The, constitutes with the lord mayor and aldermen, the corporation or governing body of the city of London. The members of the C. C. are elected by the various wards in the city, but as far back as the fourteenth century they were elected by the trades, and not by the wards. The expression C. C. was not used in the earlier times, but it is set out in the election lists of 1347 that 'the persons under written were chosen in their respective wards to come to the Guildhall of London, when they should be warned thereto to treat of business touching the city.'

Commoner, term of varying import denoting primarily any person under the rank of a peer. It also means a member of the House of Commons; one who has a title to a right in common (see **COMMON, RIGHT OF**); and, at Oxford or Cambridge, a student of the second rank, i.e. one who is neither a scholar nor an exhibitor of his college.

Common Form. In the great majority of causes of action the material circumstances are such that judgment can generally be entered in C. F., i.e. in accordance with the long-established practice of the courts. In such cases nothing more

is required than to fill in the form of the judgment the names of the parties, the dates, the amount of the damages, etc. From the simplicity of the issues in most common law actions, the C. F.s. of judgment are usually far shorter than in the case of judgments, orders, and decrees (*q.v.*) in equity (*q.v.*) suits. Nevertheless the usage of the Chancery courts has evolved an equally stereotyped set of precedents for use in every conceivable class of case. The term C. F. is not, however, restricted to a form of judgment, but may be regarded as synonymous with precedents in the sense in which that word is used to denote any legal document whatever drafted in accordance with common practice.

Common Good, in Scots law, denotes all the property of a burgh (*q.v.*) held by the corporation for the general good of the community. C. G. may be either alienable for the debts of the burgh, or inalienable. The lands, mills, and fishings of a burgh which are generally leased for periods customary in the dist., and houses, which are ordinarily let for a year, are alienable. Public lands and buildings, *e.g.* churches, tolls, market places, and common greens, and other property dedicated by grant, Act of Parliament, or otherwise to the special use of the burgh are inalienable. Inquiries have been instituted from time to time ever since 1662 into the mismanagement and maladministration of C. G., the object of the auct. grant of which was to enable the burghs to meet the Crown burdens and to discharge their local and municipal duties. These inquiries were productive of but little result, but in 1822 Sir Wm. Rae's Act was passed to regularise the administration of the affairs of burghs royal, and under the Town Councils Act, 1900, the local body must make out a yearly account of the C. G. and the revenue arising therefrom.

Common Law, a term of varying import. the different senses or rather shades of meaning of which are to be gathered by contrast with a number of opposed terms. Broadly speaking, the C. L. of England is the universal law of the realm, the fundamental principles of which, based on general customs, have existed from time immemorial, while their subsequent development to meet every new combination of circumstances has been the peculiar province of judicial interpretation acting avowedly on estab. precedent. In this broader sense C. L. as opposed to *lex scripta*, the written or statute law, is styled *lex non scripta*, or the unwritten law of the kingdom. Blackstone includes in the *lex non scripta* not only *general customs*, but also the particular customs of certain parts of the kingdom and such particular laws as are by custom observed only in certain courts and jurisdictions, and explains the description *non scripta* on the ground that the original institution and authority of such parts of our law were not set down in writing, as Acts of Parliament were, but received their binding force by long and immemorial usage and by their universal reception

throughout the kingdom. In thus adhering to the classic distinction, Blackstone points out that those parts of the C. L. which he included in the *leges non scripta* had long since lost their purely oral character, and were to be found in the records of our courts, in books of reports, and in treatises by writers of estab. repute. He accordingly identifies C. L. in its stricter significance with one class only of the 'unwritten' laws, *viz.* *general customs*, which he describes as the laws by which proceedings in the ordinary courts of justice are directed, *e.g.* that the eldest son alone is heir to his ancestor; that a deed is of no validity until delivered. *Particular customs*, as opposed to general, affect only the inhab. of particular dists., *e.g.* the right of the youngest son to inherit by custom of *borough-English* (now abolished). The third branch, *particular laws*, connote the civil or Rom. municipal law, and canon law or Rom. eccles. law compiled from the opinions of Lat. fathers, the decrees of general councils, and papal bulls, which systems have no authority in England other than that they may have received by immemorial usage in certain particular cases. In its narrower or contrasted sense, C. L. or general custom, crystallised by judicial decisions into positive law, is further and pre-eminently opposed to equity (*q.v.*) or that body of rules which savour of the *jus naturale* of Rom. law, and were originally formulated by the chancellor acting as the keeper of the king's conscience, and developed by a long line of chancery judges, for the purpose of mitigating the rigour, formalism, and technicality of the C. L. For centuries equity existed side by side with the C. L. as a body of opposed rules gradually growing as technical in its own way as the C. L., until in the year 1873 the Judicature Act abolished the distinction by enacting that the rules of equity should prevail. But though nominally equity and C. L. are fused, practically the distinction is retained by reason of the fact that certain subjects, *e.g.* trusts, the interpretation of wills, etc., were assigned to the chancery div. of the high court, and, further, from the fact that the king's bench or C. L. courts have provided no machinery for carrying out equitable judgments.

Common Measure, name applied in music to time or rhythm consisting of two or four beats in a bar. It is especially applied to 1-1 time, four crotchets in a bar, as this time is the most common of any.

Common Pleas, Court of, one of the old common law (*q.v.*) courts; before 1881 it existed as a superior court of record, having jurisdiction over England and Wales in all *common pleas*, *i.e.* civil suits between subjects. Like the present king's bench div. and the old court of exchequer, it was an emanation of the *Curia Regis*, or committee of the *Commune Concilium* or Great Council of the Realm of Norman times. The term *common pleas* was used in contradistinction to *pleas of the Crown* or criminal causes. By Magna Charta, Article 17, it was

provided that the court should be held in a fixed place instead of following the king, an enactment which led to the estab. of the C. of C. P. at Westminster Hall. By the end of the thirteenth century it had acquired, like the other common law courts, a separate staff of judges, distinct from the permanent members of the *Curia Regis*. The number of its judges varied considerably from time to time, but at the period prior to its abolition, it was composed of five judges, one of whom was chief justice and the other four puisne justices. Before the passing of

gated to the divisional court. By an Act passed in 1831 it was provided that the judgments of the C. of C. P. could only be reversed by the judges of the king's bench court and the court of exchequer sitting as a court of error in the exchequer chamber, the final appeal being by *writ of error* returnable to the House of Lords. By the Judicature Act, 1873, the C. of C. P. was merged in the C. P. div. of the high court of justice, but was finally transferred to the king's bench div. by an order in council issued in 1881.

OPEN FIELD CULTIVATION

From an old map of Laxton in Nottinghamshire, at present the only surviving unenclosed village in England.

the Real Property Limitation Act, 1833, which abolished all *real* and *mixed* actions except that of *replevin*. It had exclusive jurisdiction in all *real* actions, or actions concerning the freehold title of lands. After 1833 this jurisdiction was restricted to actions of *dower* and *quare impedit*, i.e. actions by a patron against a bishop for refusing to admit and institute to a vacant benefice the clerk nominated by the patron. In *mixed* actions, i.e. those in which a claim for damages was made along with a claim for the specific recovery of some tenement, and in *personal* actions—that is, actions on contract and tort, or civil injury—the C. of C. P. and the two other common law courts of king's bench and exchequer exercised concurrent jurisdiction. It was also constituted a court of appeal from the decisions of revising barristers on disputed franchise claims, a function now dele-

Common Prayer, Book of, see PRAYER, BOOK OF COMMON.

Common Room, apartment in a monastery, corresponding to the C. R. of univs., where dons take their wine after hall. A fire was constantly kept burning for the use of monks, and a master monk presided.

Commons and Enclosures. C. are wastes and pastures which have never been exclusively appropriated by any individual, but used in common by the inhab. of a par. or dist. The effect of maintaining all the cattle of a par. on the C. for a great part of the year was that only so much was kept in meadow as would produce hay to feed the cattle in winter weather, with the result that arable land was not well cultivated, and no one would undertake the responsibility either of draining or clearing the C. of woods or of manuring them. Hence

most of the C. and common fields in Great Britain were divided and enclosed by awards made in pursuance of a series of Inclosure Acts passed during the first forty years of the nineteenth century. Common fields differ from C. in that they are divided for the purpose of cultivation; but as soon as the crop is off the ground, the cattle of the parishioners have the right of pasture over the whole common. As the common-field system is economically unsound, common fields have likewise fallen under the operation of the Inclosure Acts. By the Commons Preservation (or Regulation) Act, 1876, it is a public nuisance to encroach upon any common; and enclosure by the Ministry of Agriculture (replacing the old commissioners) may only take place if shown to be beneficial both to the neighbourhood and to private landowners. Of more recent years there has been a very general reaction against the enclosure of common lands, and a society, the C. Open Spaces, and Footpaths Preservation Society, was formed for the preservation and protection of common land, vii. greens, or open spaces, bridle paths, waste lands, and rights of a v. See ALLOTMENTS. See F. Cannon, *History of the Theories of Production and Distribution in the Political Economy of England from 1776 to 1840*, 1893; E. C. Gomer, *Common Lands and Inclosure*, 1912; H. Bradley, *Enclosures in England, 1400-1900*, 1918.

Common School, see EDUCATION, United States.

Common Sense. Philosophy of, bases all axioms and reasoning on certain fundamental beliefs. Among these conceptions may be named the universality of causality, and the belief in the reality of the material universe apart from the mind of the person perceiving it. These conceptions are all recognised as true by the common sense of mankind. The school is chiefly represented by Thomas Reid and the Scottish school. See J. McCosh, *Scottish Philosophy from Hutcheson to Hamilton*, 1875; A. Seth, *Scottish Moral Philosophy (Philosophical Review, vii)*, 1898; See also BERKELEY, GEORGE.

Common Serjeant, judicial officer of the city of London whose functions are (1) To sit at the Central Criminal Court (q.v.) to aid the recorder in the disposal of criminal cases; (2) to act as a judge of the mayor's court of London for the trial of civil causes; (3) to act as legal adviser or law officer to the city corporation, and to act as counsel in court for the corporation if called upon; and (4) to perform certain duties at elections of the lord mayor, sheriffs, and other corporate officers. The C. S. is next in rank to the recorder. Before 1888 he was elected by the court of Common Council, since then the appointment has been vested in the Crown. The C. S., who must be a duly qualified barrister, is not disqualified from a seat in Parliament. The salary of the C. S. is at present £3000 a year.

Commons, House of, see under PARLIAMENT.

Commonwealth, term generally used as the equivalent of the Lat. *respublica*, of which it is a trans., and in this sense of a form of gov. without a monarchy it is particularly applied to that period of Eng. hist. between the death of Charles I. and the accession of Charles II., from 1649 to 1660. The period is sometimes limited to Cromwell's protectorate, which ended in 1658. C. is also the official designation in U.S.A. for the states of Massachusetts, Pennsylvania, Virginia, and Kentucky. The term C. has in recent years come to replace the term Empire in relation to the self-governing Brit. dominions, and the modern description, Brit. Empire and C. connotes the fact that the Brit. Empire is at the present stage of its evolution, partly an empire centrally controlled (i.e. the colonial dependencies proper), and partly a C. of individually sovereign states (i.e. the sev. dominions). In this context the term finds its concrete expression and authority in a report by a committee on inter-imperial relations, presided over by Lord Balfour, which was unanimously adopted by the imperial conference of 1926. This report, defining the mutual relation of Great Britain and the dominions said: 'They are autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their external or domestic affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of nations,' and this definition was subsequently given legislative sanction in the Statute of Westminster (1931). See further BRITISH EMPIRE or BRITISH COMMONWEALTH OF NATIONS; DOMINION STATUS.

Commonwealth of Australia, The, came into existence on Jan. 1, 1901, when the five Australian colonies of Great Britain united with Tasmania in a federal state under this name. See further under AUSTRALIA.

Commune, in feudal times in France, meant a body of burgesses in a tn. which had been granted a charter of incorporation by the king. Subsequently it came to denote any body of persons in a par. or dist. organised for purposes of local gov., and subordinated to the central authority of the state. The C. is now the unit of local governmental administration in France, and is composed of the citizens, a council elected by the C. itself, and a *maire* appointed by the state.

Commune of Paris, 1871, name given to the municipality proclaimed by the insurrectionist element in Paris on March 18, 1871, while the victorious Ger. Army was encamped on the heights outside the city. Some five months after the proclamation, in Sept. 1870, of the Third Republic, the National Assembly, elected after the capitulation of Paris, succeeded to the functions of the provisional Gov. of National Defence. This assembly contained a majority of Monarchists, but not being unanimous on the choice of the monarch, resorted to the temporary expedient of compromising its difficulties by leaving matters in the hands of the

republic. The Assembly hoped by this means to curry popular favour by taking no active part in the imposition of the war indemnity and then afterwards to restore the monarchy at leisure. But the knowledge that the Assembly, with its anti-Republican feelings, was about to disband the National Guard kindled the sparks of disaffection among the revolutionary spirits of the city, with the result that the latter proclaimed a C. in accordance with the traditions of that improved 'town council' formed of 'the clixir and chosen men of Sansculottic patriotism' (Carlyle, *French Revolution*, i. iii. 1.)—the C. of 1792. The consequence of this reassertion of vague democratic polity was that the National Assembly and the garrison troops repaired to Versailles, whence the latter, reinforced by the liberated Fr. soldiers of the Sedan and Metz armies, returned to conduct a second siege of Paris under the eyes of the silent Ger. Army. The Communards, having burnt the palace of the Tuileries, the Hôtel de Ville, and some other public buildings of historic interest, were themselves speedily made the victims of the fury of the Fr. regulars. Four days after the burning of the Tuileries, on May 28, 1871, Paris was taken by storm, some 20,000 to 30,000 men and women having been shot in the streets of the city, the C. was deposed, and a number of its chiefs executed or transported. After the liquidation of the war indemnity, the Third Republic reasserted itself, notwithstanding the excesses of the C., and with increased support at the ensuing by-elections established itself as the most enduring form of constitution France had known for a century. There is but little theoretical relationship between the C. of P., 1871, and that of the Fr. Revolution. The latter was the spontaneous expression of the hatred of the Parisian populace for the Fr. aristocracy. The Girondists, having fanned the flame of revolt against the tyranny of the privileged classes, were utterly unable to destroy the race of giants to which they had given birth, and Paris fell under the Reign of Terror, fomented by the triumvirate of Robespierre, Marat, and Danton. But the C. of 1871 was an insurrection motivated by a desire for local or self-gov. for Paris, and the democratic expression, loose and incoherent though it might be, of dislike for the prevalent centralisation (*q.v.*). The point of contact, however, between the two Cs. is that they were essentially the instruments of the mob; but while the earlier Communards based their pretensions on no sounder theories than the doctrine of an original social compact and the moral superiority of the state of nature promulgated by Rousseau, and ended by nothing clearer than a frenzied cry for equality, liberty, and fraternity, the intellectual chiefs of the later C. displayed strong socialistic views, which, even if theoretically vague, nevertheless contained in them a clear expression of revolt against economic oppression by the moneyed classes. The best hist. out of many is Edmond Lepelletier's *Histoire*

de la Commune, 1911. See also P. Lissagaray, *Histoire de la Commune de 1871* (Eng. trans. by E. B. Aveling), 1886; Karl Marx, *The Civil War in France, 1848-1850*, 1871; E. Belfort Bax, V. Dave, and W. Morris, *A Short Account of the Commune of Paris*, 1886.

Communications, see AIR MAIL; AIRWAYS, BRITISH; AVIATION, CIVIL; BROADCASTING; CANAL; RAILWAYS; SHIPPING ROUTES; TELEGRAPHY; TELEPHONY, etc., and under *Communications* in the general articles on countries.

Communion (Lat. *communio*, participation), the participation in the sacrament of the Lord's Supper. Since only those holding the faith of the Church were admitted to this rite, the word C. became applied to the relation of those who are united by belief in the tenets of any particular religious body or church. Hence, we speak of the Rom. C., the Anglican C., and the Lutheran C. C. in both kinds is a theological term signifying that in the celebration of the Lord's Supper communicants receive the sacrament under both the species of bread and wine. This method was undoubtedly the general practice of the primitive Church, but in the early Middle Ages the custom of withdrawing the cup from the laity gained ground. The Council of Trent in 1563 made this practice binding on the Rom. Church, which body alone retains the custom of C. in one kind.

Communism, in its limited application, means the common management of industry and the sharing of its fruits. We have the common management of parks, schools, public pleasure grounds, etc., and practical C. in water which is supplied free to the poorest inhab. of our cities. Then there is a C. in the case of commodities which are cheap. As a social theory, C. finds but few adherents either in Great Britain or in the U.S.A., but the movement has certainly gathered many adherents since the Second World War in France, Italy, and Yugoslavia, though some allowance must be made for the influence of Russia over countries of E. Europe. Again, the Communist followers of Thaelmann in pre-Nazi Germany were a numerous body and polled many votes, but were ultimately disrupted by Hitler (*see* next article). In early times, property was held in common, and individual ownership arose out of C. Many religious orders both taught and practised C. during the Middle Ages. Sir Thomas More's *Utopia* is the first exposition of C., and was intended to be a picture of ideal society. Saint-Simon and Fourier are also generally considered to be Communists, though their systems do not demand absolute equality. Perhaps the best example is Cabet's *Voyage en Icarie*, pub. in France in 1842, and his proposals led to the practical result of communistic settlements being estab. in various places in the U.S.A. New interest was aroused in C. by the estab. of the Soviet system in Russia following the revolution of 1917. Opinions differed widely on the question whether C. or Socialism was the foundation of this movement; but as Socialism

is a distinct party name in many countries indicative of parties which have undertaken the responsibilities of office, it is commonly agreed that the Russian movement required a word of rather more extreme connotation. The C. of Russia aimed at much more than the socialisation of wealth, for it seized the means of wealth-production. In the deliberate and avowed policy of the leaders of the movement some startling and paradoxical methods were upheld. It was contended that revolution must precede good order, and that a dictatorship was essential in order to procure national equality. The milder Fabian notions of gradual change were openly repudiated and the necessity of tearing down existing systems, at no matter how great an immediate cost, before new ones could be devised, was proclaimed. Russian C., successful at all events in revolution and in the estab. of a dictatorship, proceeded along the two definite lines of education and propaganda in order to estab. its future; but even the vigorous prosecution of these methods did not lessen the apparent need for ever-increasing powers of dictatorship. C. in Britain and other countries is a title frequently adopted by politicians for whom the prevailing Socialist teachings are not sufficiently forceful. During the 1919 general election in Great Britain, candidates adopting this description first stood for election in sev. constituencies. But the movement as a whole gained few adherents. Since then it has made little headway, the common opinion being that it is a movement subsidised by Moscow. 'I believe,' wrote Mr. Attlee, 'that the people of this country are as unlikely to accept Communism as Fascism. Both systems appeal to the politically immature. Both are distasteful to peoples like the British and French, who have had years of experience or personal freedom and political democracy' (*The Labour Party in Perspective*, 1927). This opinion of the present Prime Minister would seem to have been justified, for in the 1945 general election the Communist party had only twenty-one candidates, of whom only two were elected. But in the London municipal elections Communists won nine seats from Labour and three from Municipal Reformers. See J. S. Mill, *Principles of Political Economy*, 1848; K. Marx, *Das Kapital*, 1867-85; P. Lafargue, *The Evolution of Property*, 1918; E. and C. Paul, *Creative Revolution*, 1920; J. V. Stalin, *Marrism and the National and Colonial Question* (trans.), 1936; S. and B. Webb, *Soviet Communism: a New Civilisation*, 1941.

Communist Party. The C. P. of Great Britain (C.P.G.B.) was founded in 1920 to propagate the principles of Communism (q.v.), many of its founder members having belonged to Socialist bodies, particularly to the Social-Democratic Federation. At the present time no success has attended the party, and until 1945 it had but one member in the House of Commons, in which year one other was elected. The party is affiliated to the Comintern (previously the Third Inter-

national), whose seat is in Moscow. The Brit. Labour party forms part of the Labour and Socialist International, which is in line of succession of the old Second International, and is supported by most of the democratic parties in Europe, and by some in other continents. Unlike the Third International, which is the creation of the Communists of Soviet Russia, and is dominated by them, the Labour and Socialist International cannot give orders to its affiliated organisations. In Germany the C. P. in the four Reichstag elections of 1930-32 polled between five and six million votes; but, after these successes they were gradually overwhelmed by the Nazis; their leader, Thaelmann, was fung into jail, and repressive measures were taken against the party as a whole. Even the notorious Reichstag-building fire of 1933 was laid, though without evidence, at the door of the C. P.—this indeed being one of the earliest incidents of the Nazi revolution. Similarly, in Austria, the gov. decided to dissolve the C. P. on account of its subversive propaganda. The C. P. played only a minor role in the Sp. revolution, the Sp. Communists affiliated to the Third International comprising a negligible minority, the more influential left-wing party in that country being identified with the *Sindicate Union*, an independent Labour organisation. Late in the Civil war (March 1939) there was a determined Communist revolt in Madrid, but it was crushed by the Republicans in a few days, and attempted uprisings in Valencia, Almeria, and other prov. centres were similarly overcome. In Great Britain in 1933 the C. P. agreed with the Independent Labour party that a 'united front' should be presented by the two parties against Capitalism and Fascism. They approached the Labour party and the T.U.C. in the hope of securing their co-operation, but signally failed. There was a large C. P. in Czechoslovakia up to about 1938, but, with the Ger. threat to the Sudetenland, its influence rapidly waned, and with the Ger. invasion of the whole country, it was driven underground. The outbreak of the Second World War saw the rapid decline of the C. P. in most countries whose sympathies were with the cause of the W. democracies, and the policy of Stalin towards the Poles and Finns hardened world opinion against them everywhere, notably in Italy (see also ANTI-COMINTERN FACTS). With the close of Second World War in 1945, however, the C. Ps. undoubtedly made their influence felt in many countries in Europe, largely owing to the rise in the cost of living (see further under COMINTERN). Again, the revolt in the Dutch E. Indies was largely organised by Communists (see INDONESIA). But perhaps their most striking advance is in China, where during 1946-49 a successful civil war was waged between their forces and the forces of Chiang Kai-shek (see further under CHINA).

Community Foundations, or Trusts exist in the U.S.A. for the administration of charitable funds. These funds are the

accumulation of grants from private donors, and for the majority of C. F. banks act as trustees. The first C. F. was founded in 1914 under the auspices of the Cleveland Trust Company, and was called the Cleveland Foundation. There are now about sixty C. F., and each is especially concerned with the welfare of the town in which it exists. The largest C. F. are in Cleveland, Chicago, Boston, Indianapolis, and New York. The New York Community Trust was founded in 1923, and now distributes funds to the extent of \$120,000 a year from a capital of \$6,000,000.

Community Singing. Modern C. S. began in America about 1914, and has since spread to England. Sing-songs take place indoors or outdoors, and are even arranged for the lunch hour. The community may be small or large, sometimes hundreds of people, and there should be a leader to lead the songs and conduct. In C. S. on a large scale the leader's voice is often broadcast and a band may accompany the singers. Programmes consist of folk-songs, modern popular songs, negro spirituals, marching songs, and carols. Easter carolling and Christmas carolling have also been revived.

Commutator, in electrical technology, is a machine the function of which is to rectify the alternating voltage induced in the armature conductors. It is a cylindrical structure built up of segments of high-conductivity, hard-drawn copper, insulated from one another by mica.

Comnena, Anna, see ANNA COMNENA.

Comnenus, see ALEXIUS COMNENUS.

Como. 1. Prov. of N. Italy, part of Lombardy, to the S. of the Alps. It is a beautiful region, including within its bounds many of the most beautiful Italian lakes. It is no less fertile than beautiful, producing wine, corn, silk, olives, and fruit. Its manufactures of silk, cotton, iron, glass, paper are not so important. Area, 690 sq. m. Pop. 488,000. 2. City and episcopal see of Lombardy, cap. of the prov. of C. It is situated at the S.W. end of Lake Como, 30 m. N.W. of Milan by rail, and is beautifully situated in a valley enclosed by hills which are clad with luxuriant gardens and plantations of olives and oranges. The city contains some important buildings, first among which may be named the cathedral, commenced in 1396, which has been somewhat spoiled by eighteenth-century baroque additions. The greater part of the building was erected in the fifteenth century by the architect Rodari, and contains some fine sculpture by him. The public hall, known as Il Broletto, a large arcaded structure in black and white marble dates from 1215. Other important architectural monuments are the churches of S. Abbondio (Romanesque eleventh century), S. Fidele (Romanesque twelfth century), and the ruined castle of Baradello. The city museum is contained in the Palazzo Giovinio. C. is a celebrated tourist resort, and its commerce in silk, cotton, etc., is very important. Historically the city is known as the bp. of both the elder and the

younger Pliny, of Cæcilius Statius (some say Milan), the second-century comic poet, of the physicist, Volta, and of sev. popes. In 1127 it was entirely destroyed by the Milanese, but was rebuilt thirty years later by the Emperor Frederick I., as a headquarters of the Ghibelline faction. After frequent wars with Milan, it fell into the hands of the Visconti in 1335, and shared thenceforth the fortunes of that city. Pop. 52,000.

Como, Lake, It. lake 25 m. N. of Milan. Area 55½ sq. m., 43 m. from end to end. The surrounding country is very beautiful. The lake lies at the foot of the Bernese Alps. It is chiefly formed by the R. Adda, which enters it at its N.E. and issues at its S.E. extremity.

Comorin, Cape, most southerly point of India. It is low and sandy, and not visible from vessels at a distance of more than 16 m.

Comoro Islands, group of is. belonging to Franco, situated in the Indian Ocean, midway between Madagascar and the African continent. There are four chief is., viz. Great C. (or Angazlia), Anjouan (or Johanna), Mayotte, and Moheli (or Mohilla), and the whole archipelago is a colony attached to the gov. of Madagascar. The is. are of volcanic origin, and are extremely mountainous, but the soil is fertile. The largest and most westerly is the Great C., about 35 m. long and 12 m. wide. Its highest point, Mt. Kartola, is 8500 ft., and the N. part of the is. consists of a plateau some 2000 ft. above the sea. Next in size is Johanna, 30 m. long and 20 m. at its greatest breadth. Here the land rises to a central peak, 5000 ft. high. Mayotte is 21 m. long, and Moheli 15 m. long. The Fr. headquarters are at Zaudzi, a small is. off the coast of Mayotte. The fertile soil produces rice, maize, sugarcane, cotton, coffee, and all tropical fruits, while turtles are caught abundantly in the neighbourhood and form an article of export. The cultivation of vanilla has been much extended in recent years. Sugar cultivation has declined and there are now only two sugar works and two rum distilleries. The is. were first visited by Europeans in the sixteenth century, and the is. of Mayotte was ceded to France in 1841. The others became Fr. in 1886. Brit. forces occupied Mayotte on July 2, 1942. Great C., Moheli, Anjouan, and a number of smaller is. have an area of 650 sq. m. and a pop. (1936) of 111,000; the combined pop. in 1936 was nearly 129,000. The people are mostly Kaffir, Arab, and Malagasy.

Compagnie Générale Transatlantique, or French Line, most important of the Fr. shipping companies which for nearly a century has been an essential factor in the economic life of its homeland. It was incorporated in Feb. 1855 as the Compagnie Générale Maritime, but its name was changed in 1861 to the present title. Before the Second World War it ensured Franco's commerce with the countries bordering the Caribbean and the coast of N. Africa; its ships fetched and transported cargoes from the E. and W. coasts of S. America and the great ports

of the Amer. Pacific coast, and it held a leading position on the N. Atlantic, a fine fleet maintaining a frequent service between Le Havre, Southampton, and New York. Serious losses were sustained in the Second World War—two-thirds of Fr. Line tonnage was lost, and amongst these losses were many of the major ships of the line. Of the N. Atlantic liners only the *Île de France* and *De Grasse* remained. The latter returned to the run after the war and maintained the service until the *Île de France*, reconverted after a trooping career, returned early in

matters, especially as to apprenticeship, good production, etc. Their power gradually fell into the hands of the wealthiest members, and passed away from the trade altogether, and now they have little or no connection with the trade to which their name attaches, except so far as their educational funds are devoted to special or technical education. Many of the C. are possessed of great wealth, and large sums are held in trust for specific charities, etc. The twelve greater C., with their total income, in order of civic precedence are here given:

THE HALL OF THE MERCERS' COMPANY

This hall and the company's chapel were destroyed by bombing on May 10, 1940.

1949. The Fr. Line also has the former Norddeutscher Lloyd *Europa* (renamed *Liberté*) which joined the *De Grasse* and *Île de France* later in 1949.

Companies, City (i.e. of the city of London), also known as Livery Companies, name given to certain societies or corporate bodies existing in the city of London. These C. began in the Middle Ages, and are a survival of the industrial and municipal system of trade organisations known as guilds or gilds. In the reign of Henry II. (1212) the C. of the Goldsmiths and that of the Pepperers, later incorporated with the Grocers, are mentioned, and also 'Guildhall.' Edward III. was a member of the Linen Armourers and Merchant Taylors, a signal instance of royal favour. The name of 'Livery' comes from the distinctive costume or livery that the members of the C. wore. Originally they were genuine corporations of the members of the particular trade, and had important and valuable functions in regulating trade

Mercers', £111,000; Grocers', £38,000; Drapers', £78,000; Fishmongers', £50,228; Goldsmiths', £58,000; Skinners', £66,700; Merchant Taylors', £50,000; Haberdashers', £57,000; Salters', £22,000; Ironmongers', £26,000; Vintners', £18,600; Clothworkers', £84,600. These C. had halls of their own in the city; the anct. halls having for the most part suffered in the Great Fire of 1666, the existing halls were fine and comparatively modern, but of thirty-four standing at the beginning of the Second World War, only three were undamaged at its end—the Apothecaries', the Ironmongers', and the Vintners'. Many C. possess fine old plate, pictures, and other valuable artistic property. There are sixty-four other C. still in existence, their incomes varying very much. The names of some of them, such as the Loriners', the Girdlers', the Fletchers', are interesting survivals of old trades. The lord mayor, sheriffs, city chamberlain, and other corporation officers are elected by the

liverymen of the C. C., as freemen of the city, a right that has been left them, though many of their former privileges have been taken away. The C. are ruled by the court of the master and wardens, chosen from the liverymen who are recruited from the third class or freemen of the company. In 1880 a royal commission inquired into the Livery Cs. and their finances. The report (1884) contains much information. They are large supporters of charities and educational establs. — Tonbridge School, by the 'Skinners' Company; St. Paul's, by the 'Mercers'; Merchant Taylors', by that company being the chief. See W. C. Hazlitt, *The Livery Companies*, 1892; P. H. Ditchfield, *The City Companies*, 1904; G. Unwin, *The Gilds and Companies of London*, 1908; W. Kent, *An Encyclopedia of London*, 1937.

Company and Company Law. In the sense of commercial organisations, the term C. at the present day comprises two kinds of associations, differing not so much in essentials as in the manner of formation and degree of external control. These kinds are: (a) Statutory or public Cs. formed under a private or special Act of Parliament for the purpose of carrying on some undertaking of a public nature, e.g. railway, gasworks, and waterworks Cs. These Cs. are regulated by the Companies Clauses Acts, 1845-69, the provisions of which, based on those usually provisions of which, based on those usually to be found in the earlier special Acts, constitute a code of practically universal application: (b) Trading Cs. incorporated by charter or under the Companies (Consolidation) Act, 1929. Of these the latter are by far the more numerous. The former (on which see CHARTERED COMPANIES) are now but rarely launched, and exist chiefly to exploit new regions abroad. Even when the Crown did grant more charters, however, such Cs. had many drawbacks, prin. among which was that the members were not responsible for the corporate debts. Hence the introduction of the common-law C., or precursor of the modern joint-stock C. These earlier joint-stock Cs. differed from the modern in that they were unincorporated and the liability of the members was unlimited. In 1855 Parliament passed an Act legalising the principle of limited liability. This limitation of liability, coupled with the advantage of trading on a co-operative system so as to eliminate the waste involved in individual effort and small capital outlay, led to an ever-increasing number of Cs. being formed, until now the returns of the registrar of joint-stock Cs. show a registration of something over 5000 new Cs. every year. The Companies Act, 1929, which operated as from Nov. 1, 1929, repeals previous consolidating Companies Acts, 1908 and 1923, in addition to sev. other statutes. The Act applies to limited Cs., Cs. limited by guarantee, or Cs. other than limited Cs. as if they had been formed and registered under the Act. Nothing in the Act except such provisions as relate

expressly to Cs. registered or incorporated in N. Ireland.

The chief provisions of the Act are: **Incorporation of C.** Any seven or more persons or, where the C. to be formed will be a private C., any two or more persons, may by subscribing their names to a memorandum of association, and otherwise complying with the Act in respect of registration, form an incorporated C. with or without liability. Such a C. may be (1) A C. having its members' liability limited by the memorandum to the amount, if any, unpaid on the shares respectively held by the members (a C. limited by shares). (2) A C. having its members' liability limited to such amount as the members respectively guarantee to contribute to the C.'s assets in case of a winding-up (a C. limited by guarantee). (3) A C. not having any limit to the liability of its members (an unlimited C.).

Share Capital and Debentures.—A prospectus issued by or on behalf of a C. or in relation to an intended C. shall be dated, and a copy, signed by every director or proposed director named therein (or by his agent authorised in writing), shall be registered with the Registrar of Cs. on or before the date of pub., and no prospectus shall be issued until it is so registered. A C. may not, since the Act of 1929, follow the practice, widely adopted before the Act of publishing a synopsis of its prospectus with a form of application for shares; and any form of application must be accompanied by a full prospectus complying with the requirements of the Act (except in connection with a bona fide invitation to a person to enter into an underwriting agreement or in relation to shares or debentures not offered to the public.)

No allotment shall be made of shares offered to the public for subscription unless the amount stated in the prospectus as the minimum amount which in the opinion of the directors must be raised has been subscribed and the sum payable on application received by the C. The amount payable on application on each share shall not be less than 5 per cent of the nominal value of the share. If the aforesaid conditions have not been complied with on the expiration of forty days after the first issue of the prospectus, all money received from applicants for shares must be repaid forthwith to the applicants without interest. Although theoretically shares could not be issued at a discount, in fact that was constantly done, before the Act, by means of payment of commissions. The Act of 1929 makes it incumbent upon a C. to disclose any commissions agreed to be paid in the prospectus or in the particulars in lieu of prospectus and the number of shares which persons have agreed for a commission to subscribe absolutely must also be disclosed.

The Act of 1929 embodied the findings of the Greene Committee's Report of 1926. The committee were of opinion that C. legislation should be an elastic

system giving free play to honest business but hindering the activities of dishonest promoters.

Steps in the Formation.—These comprise the preparation of the memorandum of association, the articles of association, the preliminary contracts (if any), and registration. Any seven or more persons, by subscribing their names to a memorandum of association and contributing at least one share each, may on registering the memorandum with the register of joint-stock Cs. form an incorporated C. It is, of course, not obligatory on individuals associated for the purpose of trade to form a C.; but large partnerships, as distinct from Cs., are forbidden in certain cases: ten or more persons associated for the purpose of carrying on the business of banking, and twenty or more for the purpose of carrying on any other business, must register themselves as a C. The memorandum of association provided for in the Act must contain: (1) The name of the C., with limited as the last word in its name; (2) the part of the United Kingdom in which the registered office is to be situate; (3) the objects of the C.; (4) a statement that the liability of the members is limited; and (5) the amount of share capital with which the C. proposes to be registered, and the manner of div. of the capital into shares. No C. may be registered by a name which contains the words chamber of commerce unless the C. is a C. which is to be registered under a licence and without the addition of the word limited, this being allowed in the case of charitable and certain other Cs. (Section 18 of the Act). Again, except with the consent of the Board of Trade, no C. may be registered by a name which contains the words royal or imperial or is calculated to suggest royal patronage; nor one which contains the words municipal or chartered, or is calculated to suggest connection with any municipality or other local authority or with any society incorporated by royal charter; nor one which contains the word co-operative. The powers of a C. depend entirely on the memorandum of association, and there can be no ratification by the shareholders of any act done by the directors which is *ultra vires*, i.e. not within the scope of the memorandum. A memorandum can generally only be changed by leave of the court. The capital clause states the amount of the nominal capital of the C., together with the number and amount of the shares. The subscribers must pay for their shares, sign the articles of association (see below), and either appoint the first directors or act as directors themselves until such appointment. On compliance with these requisites, the memorandum of association and the articles of association, properly signed and attested, and each bearing a ten-shilling deed stamp and five-shilling registration stamp, may be taken to the registrar, together with a statutory declaration by the solicitor of the C., or by a person named in the articles as a director or secretary, that the various requirements

of the Act as to registration have been complied with. On payment of the *ad valorem* stamp duty on the amount of the capital, the registrar issues a certificate of incorporation certifying that the C. is incorporated under the Act.

Articles of Association.—These form a binding contract between all the members or shareholders and the C. The matters provided for in the articles include, among others, the mode of div. of the profits and losses, calls, transfer and transmission of shares, conversion of shares into stock, increase or reduction of capital, borrowing powers, qualification of directors, meetings, powers of directors, auditing of the accounts, and the winding up of the C. Where no articles are registered the Act provides that the model articles given in Table A in the first schedule to the Act shall apply. When registered the articles bind the C. and the members thereof to the same extent as if they had been signed and sealed by each member, and contained covenants (*q.v.*) on the part of each member to observe them. The articles may amplify the memorandum but may not contain anything contrary to its tenor. The articles may be altered without recourse to the court. Alterations in both the memorandum and the articles of association are effected by special resolution. The court will not confirm alterations in the memorandum designed to enable the C. to acquire entirely new powers except on special terms; and as a rule the court only confirms such alterations as are intended to enable the C. to carry on its business more economically, as, for example, by reducing its capital, or to enlarge the area of its operations. Changes in the articles must not go outside the powers given by the memorandum. The articles may not deprive a shareholder of his right to present a petition for winding up the C.

The Promoter.—The promoter is the person who is responsible for the C.'s existence as such. The typical promoter starts the scheme of forming the C., negotiates with the vendors (if any), gets together the board of directors, retains brokers, bankers, and solicitors for the C., has the memorandum and articles of association prepared, provides the registration fees, drafts the prospectus, pays for the expense of issuing it, etc.; in a word, undertakes to form a C. with reference to a given project and to set it going and to take the necessary steps to accomplish that purpose. A promoter stands in a fiduciary relation to shareholders and subscribers, and therefore may not make any secret profit out of the flotation, whether he is selling his own property to a syndicate or himself forming a syndicate with other promoters to purchase property for the purpose of reselling it at an enhanced figure to some other syndicate. Intending shareholders should be careful to ascertain what the vendors paid for the property or concern the exploitation of which is to be the substratum of the C., for unless the true purchase price is disclosed and the profit on resale accruing

to the vendors, the shareholders will never know what liabilities the C. is under in regard to its preliminary contracts. For this reason he should beware of the 'waiver' clause in the prospectus which is mainly designed to put him off inquiry. Section 81 of the Act is aimed at making it impossible for promoters to arrange for charges being created before the C. is registered and thereby avoid the necessity for registration of charges which affect the property of the C. no less than would have been the case if the charges had been created by the C. itself. The promoter or promoters are liable (together with directors and others) to pay compensation to all persons who subscribe for shares or debentures on the faith of the prospectus for the loss or damage such persons may have sustained by reason of any untrue statement in the prospectus. Promoter in this context does not include any person acting in a professional capacity for persons engaged in procuring the formation of the C.

Prospectus.—This is generally a circular sent round by the promoters or directors after the registration of the C., and its primary object is to induce the public to take up the shares in the C. It is a document in regard to which the legislature and the law courts have ever enjoined the necessity of the fullest and strictest disclosure. Any untrue statements, whether fraudulent or innocent, will, if material, entitle the person taking shares on the faith of such representation to rescind contract. In the case of fraud, damages may be obtained as well. A director or any person responsible for the issue of a prospectus is liable to pay damages to any person who is damaged by a false statement in the prospectus, unless he had reasonable grounds for believing in the truth of the statement, or made it upon the authority of an expert whom he had reasonable grounds for believing to be competent, or where the statement was an accurate copy of an official document. The prospectus must disclose: the contents of the memorandum; the number of founders' or deferred shares (if any); the number of shares fixed by the articles as the qualification of a director; the remuneration of the directors; the names, descriptions, and addresses of directors or proposed directors; the minimum subscription on which the directors may proceed to allotment; the number of shares or debentures issued as fully or partly paid up otherwise than in cash; the names and addresses of the vendors or any property acquired by the C., or proposed to be acquired; the amount paid or payable in cash, shares or debentures to the vendors, whether as purchase money or otherwise, specifying the amount (if any) payable for goodwill; the amount of the underwriting commission (i.e. consideration for which some person undertakes to take the whole or a portion of the offered shares as may not be subscribed for by the public); the amount of the preliminary expenses; the amount paid to any promoter and the

consideration for such payment; the dates of and parties to every material contract where not made in the ordinary course of the C.'s business; the names and addresses of the auditors (if any) of the C.; full particulars of the interest of each director in the promotion of or in the property proposed to be acquired by the C., and any sums paid to him, or agreed to be paid to him, to induce him to become a director; and the rights of voting attached to the sev. classes of shares (where divided into different classes). It is thought that the present law requires strengthening, especially in relation to the liabilities of promoters, the positive requirements of a prospectus, the compulsory publication of subsidiaries' results, consolidated balance sheets, and the disclosure of all relevant current contracts to auditors. Reforms in C. law designed to give shareholders more information and wider powers of control, to impose stronger checks on directors, prospectuses, private companies, and 'stags' were recommended by the Cohen committee in their report issued on July 18, 1945.

Directors and Members.—A C. is not bound to have directors. The individual members might undertake to carry on the business themselves. As a rule the C. appoints directors to act for it in all important matters. Their position is that of trustees and agents. Directors who make contracts for the C. are not personally liable on the contracts where they do not contract in their own names. The first directors are usually named in the articles, but if not named, the first directors are generally appointed by the subscribers to the memorandum. Being in a fiduciary position, the law requires that directors should always act in good faith and in the best interests of the C. In the absence of express agreement, directors are not entitled to remuneration. A director is not liable for unlawful acts if he can prove that he acted in ignorance of the facts which made his act unlawful. Even if negligent, a court of equity can relieve him from liability if he acted honestly and reasonably. The members of a C. include the persons who sign the memorandum and those who have agreed to become members by applying for shares or taking a transfer of shares from some other member. Any one can become a member, but an infant may repudiate his shares on attaining full age. Members must pay for their shares unless the allotment is made in return for services. Every C. must keep a register of its members, containing their names and addresses, the amount and numbers of their shares, the date of acquiring them, and the amount paid up on them. A list of the members, called the Annual Return, must be made out every year and sent to the registrar. This return must also give the name of persons who have ceased to be members since the date of the last return; and it must contain a summary distinguishing between shares issued for cash and shares issued as fully or partly paid up otherwise than in cash and specifying particulars as to the share

capital of the C., the amount called up on each share, the total amount of calls received, and of calls unpaid, the number of shares forfeited, particulars of the discount allowed on the issue of any shares, the amount of share warrants issued, the total amount of the indebtedness of the C. in respect of all mortgages and charges, and many other particulars.

Shares.—A share denotes a right to receive a certain proportion of the profits of the C. and of the capital of the C. when it is wound up. A member of a C. obtains his shares by allotment, his title being completed by the issue of a share certificate. Shares may be transferred in the manner provided by the articles of association. Transfer is usually effected by deed, completed by registration of the transfer. Every shareholder is entitled to transfer his shares, subject to any restrictions that may be imposed by the articles; thus a shareholder may assign his shares to a man of straw to avoid liability on the winding up, if not prohibited by the articles. If the C. be wound up within one year of such a transfer, the transferor remains liable to the amount unpaid on his shares. Transfers may be made subject to the approval of the directors by the articles, but, generally speaking, the rules of the Stock Exchange will not allow any such restriction on fully paid shares. Where a shareholder fails to pay calls due on his shares, the shares may be forfeited in accordance with the articles. On the liquidation of the C. the amount outstanding on the shares must be called up. On the matter of the real ownership of shares held by nominees the Cohen committee (see above) proposed that the latter should declare whether they are beneficial owners or act as nominees, but not that the name of the actual owner should be disclosed (see end of this article).

Capital is generally divided into preference shares, ordinary shares, and deferred shares. Preference shares are usually entitled to receive a fixed dividend before any dividend is paid on the ordinary shares. Preference shares are said to be cumulative where any deficiency in the dividends accruing in a bad year rests to be made good out of the profits of subsequent years. Deferred or founders' shares, which are usually taken by the promoters, are generally entitled to a proportion of the profits if the dividend on the ordinary shares amounts to more than a fixed amount. Deferred shares are sometimes allotted as fully paid up, and sometimes issued by way of bonus to ordinary shareholders. Preference shares on the winding up of the C. are paid off in full before the ordinary shares are paid anything, where they are made 'preferential as to capital.' Where the C. by special resolution elects that any portion of its capital not yet called up shall be incapable of being called up except to wind up the C., such uncalled capital is *reserve capital*, and it cannot be dealt with or charged by the directors. Capital may be increased or altered if authorized by the articles; if not, the C. may give itself power to do

so by special resolution. Alteration of capital occurs where existing shares are either consolidated, as, for example, by changing every ten £5 shares into one £50 share, or subdivided, as, for example, by changing every £5 share into five shares of £1 each. Capital may also be altered by converting fully paid shares into stock. The essential distinction between shares and stock is that the former are issued in round sums, whereas the latter may be divided into any aliquot amounts; neither are the divs. of stock numbered as are shares. The conversion of shares into stock means that the shares have been completely paid up, and that the time has come when the shares may be transferred in fragments. On the Stock Exchange stock is quoted at a certain price a £100 of stock, while shares are quoted at the price per share. Where the C. has sustained losses which it ought to provide for before paying dividends out of its profits, it may pass a resolution to reduce its capital. The leave of a chancery judge must be obtained on motion day where the rights of creditors are affected by the proposed reduction or writing off of capital.

Debentures.—A debenture is a document given to evidence the fact that money has been lent to the C.; it creates a charge on the C.'s assets, and provides for the repayment of the loan on the happening of certain events, as, for example, the making of an order for winding up the C., or an order for the appointment of a receiver. Debentures may be payable to bearer, or only to the registered holder, bearer debentures are transferable by delivery, and no notice of the transfer need be given to the C.

Meetings and Resolutions.—The Act of 1929 provides that a C. must hold a general meeting within not less than one month and not more than three months from the date of commencing business. The purpose of this, the statutory meeting, is that all the shareholders shall have an opportunity of forming an opinion of the exact position of the C. within a short time of its commencement. The directors are required to send out to the shareholders seven days before the statutory meeting a report stating the number of shares allotted and the general state of the C. The articles usually provide for the convening of an *annual general meeting*. Special business is transacted at an *extraordinary meeting*; the directors are bound to hold an extraordinary meeting if required to do so by the holders of one-tenth of the issued capital. Voting at meetings may be by show of hands, or on a poll, according to the articles (see under **CASTING VOTE**). Unless the articles make the voting dependent on the number of shares held, each shareholder has one vote. Resolutions are either ordinary, special, or extraordinary. An extraordinary resolution is one which has been passed by a majority of not less than three-fourths of the members voting at a general meeting of which notice specifying the intention to propose the resolution has been given. A special resolution is

one which has been passed by a three-fourths majority, at a meeting of which at least twenty-one days' notice has been given. It was formerly necessary for a special resolution to be confirmed at a second meeting, but this is not now necessary. An extraordinary resolution appears to be effective only in the case of the shareholders resolving that the C. cannot go on with its business and that it is advisable to wind it up.

Winding up is of three kinds: (a) by the court; (b) voluntary; (c) subject to supervision by the court. A C. may be wound up by the court if a special resolution has been passed to that effect, or if the C. does not commence business within a year of its incorporation, or if the C. is unable to pay its debts, or if the court is of opinion that it is just and equitable that the C. should be wound up. Winding up by the court is begun by petition, and any contributory or creditor may present a petition, but the court may refuse to order a winding up if the majority of the creditors oppose it. The most usual manner of winding up a C. is voluntarily. A voluntary winding up takes place when the period fixed for the duration of the C. by the articles has expired, or where the C. passes a special resolution to wind up the C. voluntarily, or resolves that as it cannot meet its liabilities it is advisable to go into liquidation. When a C. has passed a resolution to wind up voluntarily, the court may make an order that the voluntary winding up shall continue *subject to such supervision of the court and upon such terms and conditions as the court thinks just*. Whichever mode of winding up is adopted, a liquidator is appointed to call up the amount unpaid on the shares and generally to administer the property of the C. by applying the assets first in the payment of debts, and then, if there be any residue, among the shareholders according to their priority. On the winding-up order being made by the court the official receiver becomes provisional liquidator unless the creditors have chosen some other person to act as liquidator. The liquidator may bring and defend actions in the name of the C., and carry on the business of the C. so far as may be necessary for its beneficial winding up. Sometimes winding up is effected with the object of *reconstructing*, i.e. selling the undertaking of the C. to a new C. in return for shares in the new C. C. generally reconstruct when more capital is required, and when the only way to get it is to put pressure on existing shareholders, usually by inviting them to take up partly paid shares in the new or reconstructed C. in substitution for their fully paid shares in the old C. A shareholder who has not voted for the special resolution to wind up the C. may express his dissent to the liquidator, and require him to purchase his share interest in the old C., but he must dissent within a week of the resolution. The number of Cs. on the registers in Great Britain at the end of 1937 was 155,279 (excluding those in course of liquidation or removal from the registers). Of these 17,761 were public

and 137,518 were private Cs. After making various allowances at the end of that year there were 14,677 public Cs. with a paid-up capital of £4,067,035,904, and 137,492 private Cs. with a paid-up capital of £1,828,814,099. The paid-up capital in each case was higher than any previously recorded. At the end of 1938 there were 147,801 Cs. (England and Wales) on the register with paid-up capital £5,542,800,000; 9,715 (Scotland), capital £147,800,000; and 1753 (N. Ireland), capital £45,500,000; a total of 159,329 with a paid-up capital £6,036,100,000.

Private Companies.—A private C. is defined by the Companies Act as one which limits the number of its members to fifty (exclusive of employees), restricts the right to transfer shares, and prohibits any invitation to the public to subscribe for shares or debentures. Usually all the shares are held by members of a single family. A private C. may consist of no more than two members. Such a form of C. is usually resorted to when a trader desires to have the advantage of limited liability without the disadvantage of sharing his profit with other persons. A number of partnerships have been converted into private Cs. since the Act was passed, one great advantage of incorporation being that the death of a partner does not bring an end to the association, and a partner's interest may be continued in his son by giving the latter debentures in the C. See P. F. Simonson, *The Law relating to the reduction of the Share Capital of Joint Stock Companies*, 1924, and *Reconstruction and Amalgamation of Joint Stock Companies*, 1931; A. Stiebel, *Company Law and Precedents* (third ed.), 1929; F. Gore-Brown, *Handbook of Joint Stock Companies*, 1930; A. F. and A. M. R. Topham, *Principles of Company Law*, 1934; S. Borrie, *Private Companies: their Management and Statutory Obligations*, 1936.

The Companies Act, 1947 (passed as a result of the findings of the Cohen committee).—The main provisions are intended to secure what the Lord Chancellor (Lord Jowitt), on the second reading of the Bill, called financial democracy—namely to make it easier for shareholders to influence and control their managements. To that end the Act ensures that the fullest possible information is given to shareholders through the statement of accounts. It provides that 'every balance sheet of a company shall give a true and fair view of the state of affairs of a company, and every profit and loss account of a company shall give a true and fair view of the profit or loss of a company for the financial year.' Under clause 13, all holding Cs. must, subject to certain exceptions, furnish consolidated accounts for themselves and their subsidiaries so as to disclose a true and fair view of the position of the group as a whole. Hence they are brought fully within the provisions of the Act relating to publicity and the auditing of accounts by qualified auditors. Such provisions do not in fact go beyond the

practices of many Cs. before the Bill was introduced; but in one important respect the statutory requirements do go beyond the practices of many Cs. in the disclosure, so far as is practicable, of inner or secret reserves. Under the previous law, every C. had to lay a balance sheet and profit or loss account before its shareholders, and a public C. had to file its balance sheet with the registrar of Cs. It was not, however, required to file its profit and loss account, though the practice had been to do so. Under the Act of 1947 both have to be filed, as also are consolidated accounts where the case is one which calls for such accounts. Clause 16 provides that only a properly qualified person shall act as auditor of a C. and it is on the auditor, backed by public opinion, that reliance must chiefly be placed for the observance of these provisions. There are also important provisions as to private Cs., which, under previous Acts, were under no obligation to file their balance sheets with the registrar. That facility popularised the private C., and in 1946 there were on the register nearly 180,000 private Cs. as compared with only about 11,000 public Cs. The main reason for the privileged position of private Cs. was to enable family and other purely private concerns to enjoy the benefit of limited liability without having to publish their financial position to the world at large. But it was therefore possible for public Cs. to form subsidiaries as private Cs. which were in reality their own branches, and thereby to mask their real financial position. Hence the Cohen committee sought to restrict the privilege to the concern which is really private.

As to directors, the new Act provides that the accounts must show the aggregate of the directors' emoluments, the aggregate amount of directors' or past directors' pensions and compensation paid to them for loss of office. A fine of £500 may be imposed for a breach of the provisions relating to disclosure of payments to directors and officers of the C. The retiring age of directors of public Cs. is fixed at seventy; but a C. can alter its articles to provide any retiring age between sixty and eighty, and any director over seventy can continue in office by special resolution.

As to investigation the Act provides that a few hundred members of a C., even though they do not hold one-tenth of the issued shares, may apply for an investigation; and an investigation may in any case be ordered by the court, and the Board of Trade can themselves initiate an investigation if it appears to them that the matter is one of public concern—subject to there being circumstances of maladministration or of oppression of the members.

Clauses 48 to 60 on prospectuses, allotments, and offers for sale contain some salutary changes. The provision that no allotment may be made until the third day after the issue of the prospectus gives longer time for the public to digest the information. Where a prospectus states that application will be made or has been made for permission to deal on any

stock exchange, then unless such permission has been applied for before the third day after the issue of the prospectus, or if permission has been definitely refused within three weeks, the allotment is void and their money must be returned to the applicants. Clause 62 is designed to induce the experts to exercise proper care in making statements on the strength of which the public are asked to part with their money and that clause places a definite liability on the experts. The abuse of the 'stap' is also dealt with by the Act. On the debatable question of nominees, it was recognised by the Cohen committee that the practice of placing shares in the names of nominees had grown to such an extent in recent times that the register of membership had almost lost its significance as a register of the real owners of the shares. But the committee considered that it was impracticable to try to abolish the practice altogether, especially as there was no suggestion that it had led to any widespread abuse. The committee, however, recommended that every shareholder should be required to state whether he was the beneficial owner; secondly, every person who is directly or indirectly the beneficial owner of one per cent or more of the issued capital, or of the issued shares of any class, should be required to make a declaration to that effect to the C.; that a register of such beneficial ownership should be maintained; and that the Board of Trade should have power to investigate the ownership of shares where they think public interest so demands. Clause 57 embodies the second of the above recommendations, which however may prove easy of evasion.

Company, a subdivision of a battalion. The Brit. infantry battalion is divided into Cs., each of which is commanded by a captain and two lieutenants. The Army Service Corps is divided in a similar manner into Cs. Four Cs., distinguished by the letters A, B, C, and D, each of six officers and about 220 men, form a battalion. The C. is itself again divided into four platoons, and these are subdivided into sections. It itself the C. is practically self-controlled, keeping its own books and its own arm chest. The Engineers are similarly divided into Cs., but these Cs. are commanded by a major, a captain, and four lieutenants. A battery of artillery and a squadron of cavalry are the equivalents of a C. of infantry. C. of a ship includes the whole of the persons employed on board and paid for specific duties, and therefore excludes troops and passengers.

Company, John, popular nickname for the old E. India C.

Company Law, see COMPANY.

Comparative Anatomy, that portion of the science of anatomy which concerns itself with the comparison of the structures of various classes of animals. It is of great importance in the science of biology. See ANATOMY, BIOLOGY, and the articles on the various forms of life, and those on the different parts of the body.

Comparative Ethics comprises the study of the moral standards by which man has lived from the earliest times to the present day. This study does not aim at evaluation, but although conduct does not become ethical until it is guided by a consciously held principle of what is right and what is wrong, C. E. take us back to primitive times. The life of primitive man, as soon as he came to live in family and tribal groups, was hedged about by rules and taboos which were ethical in so far as they were directed towards securing the highest good for the individual or the tribe to which he belonged. Primitive morality, however, was governed by fear and the desire to placate the gods. Even among the anct. Egyptians ethics were a form of plety towards the gods, but the spirit pervading Gk. ethics was essentially different. In the words of Apuleius: 'The Egyptian deities were chiefly honoured by lamentations, and the Greek divinities by dances.' The Egyptian Book of the Dead, however, inculcates a high standard of conduct, of a restrained and prudent kind. The influence of oriental religions, with the mysticism found in Egyptian and Sinitic religions, tended to produce a system of ethics which superseded the purely Gk. spirit. The Brahmanic code of India and the Zoroastrian code of Persia both taught a moral law which was part of the divine will. While the former was ascetic and pessimistic, the latter was active and optimistic, preaching a dualism of good and evil and a conflict between them in which man must play an active part. Ethical teaching divorced from religion also had its roots in the E. In the teaching of Gautama-Buddha and of Confucius. Gautama preached a resignation to evil, but Confucius laid down common-sense rules of conduct and courtesy which have been the mainstay of the Chinese polity ever since. Lao-Tze, however, a contemporary of Confucius, had considerable influence in teaching that everything had its essential character which it was useless to try to alter. From this came a polytheism similar to that deduced from Plato's Theory of Ideas. The Neo-Platonists became mystical and polytheistic, but Plotinus, their founder, remained monotheistic, and he had considerable influence on Christian ethics, as also did the teaching of the Stoics. The ethics of Porphyry, the disciple of Plotinus, were very similar to those of his Christian contemporaries, and the antagonism between them is therefore surprising. The fathers of the Church did, indeed, borrow largely from earlier philosophies and metaphysics, but they were interested in dogma rather than ethics, and the problem of conduct did not claim precedence over science and politics until the eighteenth century. The Eng. philosophers, Locke, Berkeley, and Hume, advocated a morality founded on practical experience. Later in the century came the utilitarian hedonism of Bentham, from which were born the humanitarian ethics of the nineteenth century. In the meantime, however, Kant had estab-

morality as law, man's law unto himself. See W. E. H. Lecky, *History of European Morals from Augustus to Charlemagne*, 1869; E. A. Westermarck, *Origin and Growth of the Moral Ideas*, 1906-8; L. T. Hobhouse, *Morals in Evolution*, 1906; H. Sidgwick, *Outlines of the History of Ethics for English Readers* 1931.

Comparetti, Domenico Pletro (1835-1927), It. scholar, b. in Rome, where he later studied at the univ., and became one of the chief classical scholars of Italy, being appointed prof. of Gk. at Pisa in 1859. Of his work in classical literature the best known are an ed. of the *Euxenippus* of Hyperides, monographs on Pindar and Sappho, and trans. of some fragments of Hyperides. His researches concern the *Book of Sindbad* and *Virgil in the Middle Ages*. He also ed. a collection of It. national songs. D. at Florence.

Compartment, term used in heraldry. Each of the divs. on a shield is called a C. The intention of quartering is to show the descent of one family from heiresses or co-heiresses of other houses.

Compass, or **Mariner's Compass**, instrument for determining the magnetic meridian and for showing one's position with regard to it. It consists of a magnetised needle turning on a pivot, and is used chiefly for directing the courses of ships at sea. The ordinary C. is composed of three parts, the box or bowl, the card, and the needle. The needle consists of a fine magnetised strip of steel, or of sev. magnetised strips joined together. Fastened to the needle, and moving round with it is a circular card having its circumference divided into 360 degrees. In addition to this it is marked with the thirty-two points of the C. The four cardinal points are N., E., S., and W. and the spaces between these are divided as N.E., S.E., S.W., N.W. The spaces between these eight points are again equally divided as N.N.E., E.N.E., E.S.E., S.S.E., etc. The last sub-div. of the sixteen spaces gives us N. by E., N.E. by N., N.E. by E., E. by N., etc. The reading off of the thirty-two points in order, going round either way, is known as 'boxing the C.' The needle swings on a pivot which rises perpendicularly from the centre of a bowl, which has a glass covering to protect the needle. This bowl is generally of copper, as this metal is a particularly good conductor of electricity. The bowl is often filled with spirit, but the friction of this injures the susceptibility of the needle. The C. is generally situated in the binnacle, but other varieties of C. are known as standard, hanging, and steering C., according to their position on the ship. Until the end of the eighteenth century, Brit. naval Cs. were very carelessly constructed, but since that time much progress has been made. The C. at present in general use is that patented by Sir Wm. Thomson, elevated to the peerage as Lord Kelvin, in 1876. It is made up thus: In the centre is an aluminium boss, resting on an aluminium cup with sapphire centre poised on an iridium point. This boss

is connected with an aluminium outer ring by silk threads. From this outer ring, lower than it, and near the centre point, are suspended eight thin magnetised strips of steel, four on each side of the centre. These eight small magnets also have their corresponding ends fastened together by silk threads. To the outer rim is attached a circular paper, with the points marked on it. A special form of magnetic C. is used on aircraft, and a gyroscope C. is employed on both ships and aircraft. Two important forces combine to form the error of a ship's C. One of these is the attraction of the ship itself. The magnetic influences of the hull, machinery, and metal work

declining again. Irregular sources of variation are found in magnetic storms and similar electric disturbances. The dip of the C., induced vertically by the magnetic force of the earth, also varies. An azimuth circle is used to take bearings, and to discover the angle between the C. N. and the true N., the total error made up of variation and deviation. This circle has reflecting mirrors and sighting wires, and fits over the top of the C. bowl. Thus, from the position of the sun, when from 8° to 15° high, the amplitude, or azimuth, is made out. The early history of the C. is somewhat obscure. It was known to the Chinese at a very early date, and their own historians ascribe its

THE POINTS OF THE COMPASS

Philip Harris, Birmingham
MARINER'S COMPASS

In general all affect the needle and divert it from its proper position. The error thus caused is known as the deviation of the C., and is met in various ways. First, the C. is situated or placed some distance above the upper deck so as to be less susceptible to these influences. Secondly, the deviation is diminished by placing magnets and bars of soft iron in such a position around the C. that the attraction of the rest of the ship's metal is neutralised. Thirdly, deviation charts are made, showing carefully the deviation of the particular C. when pointing in various directions. With steering C., the errors are often considerable, so much so that a C. has been known to point steadily to one part of a ship, in whatever direction she headed. A second error is known as the variation of the C. When free from deviation, the needle points to the magnetic pole of the S. and not to the geographic pole. The two are differently situated and hence occurs the variation of the C. This variation varies considerably at different parts of the earth's surface, and at certain points becomes nil. The variation changes from year to year, gradually rising to a maximum and then

discovery to the year 2034 B.C. Certainly it was in common use in the Far E. by the end of the third century A.D. However, the Chinese were never inclined to take a high place as navigators, and their knowledge never led to the perfecting of this aid to navigation. It was once reputed that the principle of the C. was introduced into Europe by Marco Polo on his return from travels in Cathay, but it was well shown by Chappell (*Nature*, 346, June 16, 1876) that early in the twelfth century the knowledge had been arrived at by independent discovery. Some ascribe the discovery of its variation to the same century, but others ascribe it to Columbus. The terror that was caused by the variation of the magnetic needle on this explorer's voyage to America is well known, and certainly led the way to further knowledge on the subject.

Compass Berg, mt. in the Schnee Berge range, Cape Province, S. Africa, 30 m. N. of the tn. of Graaff Reinet. It rises 8500 ft. above the sea.

Compass Plant, see SILPHIUM.

Compasses, instruments for describing arcs and circles, or for measuring distances. They generally consist of two

The root is usually a tap-root, often thickened, *e.g.* in the dandelion, sometimes tuberous, *e.g.* in the dahlia. The leaves are usually exstipulate, radical, or alternate, but in some cases, *e.g.* in the sunflower, they are opposite. In many species laticiferous vessels are found containing the milky juice well seen in the dandelion and sow-thistle, and oil-ducts are very commonly present. Few of the plants are of economic importance, but many are cultivated for their beauty, *e.g.* dahlias, marigolds, coreopsis, asters, chrysanthemums. In some cases they are diuretic, as various conyzas and also the dandelion; some are tonic and stomachic, as wormwood

COMPOSITE: THE DANDELION

A, single floret, side view; B, single floret, front view; C, fruit with tuft of hairs (pappus); D, plan of floret.

and camomile; the common and Jerusalem artichokes, lettuce and endive are esculents; chicory is used as an adulterant in coffee. The C. are classified in various ways, based on the form of the flowers and on the distribution of different florets in the capitulum. The Tubuliflorae are those in which the flowers of the disk are not ligulate, and there is no latex; the Liguliflorae are those in which all the flowers of the capitulum are hermaphrodite and ligulate, and all the plants have laticiferous vessels; and a third sub-order of S. Amer. plants is sometimes added, the Labiatiflorae, in which the disk-flowers are hermaphrodite and the corolla is regular or bilabiate, while the ray-flowers have usually a bilabiate corolla. The daisy represents the first group, the dandelion the second, and the genus *Mutisia* the third.

Composition, in mechanics, refers to either velocities (see VELOCITY) or forces (see FORCES, PARALLELOGRAM OF). The converse of C., as we shall see later, is resolution, and these two problems, *i.e.*

of the C. and resolution of velocities and forces, form two of the fundamentals of the science of mechanics.

Dealing first with the C. and resolution of velocities, we treat the problem as a branch of dynamics (*q.v.*). Now a body cannot be in two places at the same time; therefore it cannot move in two different ways at the same time. But it is often convenient and even necessary to regard the motion of a body as being compounded of sev. velocities. These various velocities are termed the component velocities, and must be regarded as relative, while the actual velocity is said to be the resultant velocity, and the process of finding this resultant velocity is termed compounding the velocities. Thus, supposing one steamer passes another going in the same or the opposite direction, then the resultant velocity is the algebraic sum of the velocities of the steamers, which are the component velocities. But take the case of a ball thrown up in a railway carriage in motion. In this case the ball moves upwards under its own velocity and at the same time is carried forward with the velocity of the train. In this case, and all cases where the directions of the velocities are different but are co-planar, the theorem known as the parallelogram of velocities is used. 'If two component velocities be represented in magnitude and direction by the two adjacent sides of a parallelogram drawn from a point, then their resultant velocity will be represented by the diagonal of the parallelogram drawn from that point.' Thus in the case of the ball in the carriage, according as the speed of the ball upwards is greater or less than that of the train horizontally, so the resultant velocity will be in a direction approaching the vertical or the horizontal. All cases are not even as easy as this, for take a steamer travelling along a riv., with a man walking across the deck of the steamer, and a fly crawling up the man's hat (Briggs and Bryan): then the speed of the steamer is relative to that of the water, and the velocity of the man to that of the steamer, and that of the fly to the velocity of the man. Each of these is a component velocity of that of the fly, and affects its motion, but the actual or resultant motion is different from any of them. In this case it is possible to take two of the components, and, by finding their resultant, eliminate one; and so, by continuing this process, to arrive at last at one resultant. Other theorems, such as the triangle, polygon, and parallelepiped of velocities, aid in finding the resultant velocity in particular cases. This concerns the C. of velocities, but if we were given the resultant velocity, and asked to find the component velocities, we would have to use the process called the resolution of velocities. This is evidently the converse problem to the C. of velocities, and a moment's thought will show that just as it is possible to construct an infinite number of parallelograms around a diagonal, so there are an infinite number of possible component velocities to any given velocity. When, however,

the resolved component velocities required are to be at right angles to each other, as they usually are, then the problem is capable of solution.

Now since forces can be represented in magnitude and direction by straight lines, it is evident that all that has been stated applies to statics as well as to dynamics, and to forces as well as to velocities; so by merely altering the word velocity to force, the foregoing statements will explain the C. and resolution of forces. *See DYNAMICS; STATICS.*

Composition, in bankruptcy, the scheme of arrangement of his affairs proposed by a debtor after a receiving order has been made against him, embodying in writing the terms upon which he is desirous of satisfying or compromising the claims of his creditors. *See under BANKRUPTCY.*

Composition and Composer (of type), *see under PRINTING; TYPE; TYPE-SETTING.*

Compost, *see under GARDENING.*

Compostela, Santiago de, *see SANTIAGO.*

Compound, *see CHEMISTRY.*

Compound Dislocation, displacement of one bone from another with which it forms a joint, complicated by the bone having been forced through the skin, so allowing an access of air to the wound. It is a very serious condition, since it may involve inflammation and blood-poisoning, and in healing may induce ankylosis (q.v.). After the dislocation has been replaced antiseptic treatment and complete rest of the limb are necessary. *See DISLOCATION.*

Compound Engine, steam engine in which the expansion of the steam is divided into two phases, the first being effected in the high pressure, and the second in the low pressure, cylinder. The two phases may be divided over three cylinders, by dividing the steam from the high pressure cylinder to supply two low pressure cylinders, or by having two high pressure supplying one low pressure cylinder. This should not be confused with the triple expansion engine, in which the steam passes successively through three different cylinders.

Compound Fracture, one in which one of the bony fragments of the broken bone has pierced the skin, causing a wound which communicates with the fracture. In contradistinction to this, a complicated fracture is accompanied by some other injury not communicating with the fracture, e.g. a dislocation, a large flesh wound, or a broken blood-vessel. C. Fs. are obviously more serious than simple fractures, but the dangers have been much lessened since the introduction of antiseptic surgery.

Compound Householder, term frequently used by rating authorities to denote the occupier of a 'small tenement,' who is not separately rated for the relief of the poor, and whose rates may therefore be said to be included in his rent. This happens principally where rating authority compounds with the owner or landlords for the payment of the rates. The various Acts concerning the registration of voters require that those claiming the occupation franchise be separately rated. But the

Poor Rate Assessment and Collection Act, 1869, provides that in cases where the rateable value of a house does not exceed £20 in London, £13 in Liverpool, £10 in Birmingham or Manchester, and £8 elsewhere, the owner may agree with the rating authority to become liable for the rates himself whether his property be occupied or not, and that the rating authority may allow him a commission not exceeding 25 per cent on the rateable value. The Act also provides that the rating authority may order the owner to be rated instead of the occupier, subject to an abatement or deduction of 15 per cent. In such cases the C. H. is deemed to be separate for the purposes of the occupation franchise. The object of the Act of 1869 was to obviate the great expense and loss of time consequent on the collection of the rate from the numerous small occupiers. (Ryde on Rating, 1930.)

Compounding Offences. **Compounding felony** means forbearing to prosecute a person who has committed a felony in consideration of some reward received, as for example, agreeing not to prosecute a thief in consideration of receiving back the stolen goods. **Compounding a felony** is a misdemeanour punishable by fine and imprisonment. The publication of an advertisement in a newspaper or by any other means offering a reward for the return of stolen or lost property coupled with words indicating that no questions will be asked or inquiry made on the production of the goods, renders the advertiser, printer, and publisher each liable to a penalty of £50. **Compounding misdemeanours** without proper leave is also an offence. But where a particular misdemeanour more closely affects an individual than the public at large, the court will sometimes allow the accused, before any judgment is pronounced, to settle with the prosecutor when a nominal sentence only will be inflicted. *See also CONCEALMENT.*

Compound Interest, *see INTEREST.*

Compound Quantities, in algebra are figures consisting of more than one term; in arithmetic they are quantities expressed in terms of various denominations as cwts., qrs., lb.

Compressed-Air Baths are made of iron plates riveted together, of such a strength that they can withstand pressure. Air is pumped into the chamber until the required pressure, indicated by barometers, is reached. These baths will hold two or more persons. Another manner in which compressed air is used is that in which a mask fitted with tubes and valves is fitted tightly over the mouth and nose. The patient can then inhale compressed air and breathe out into rarefied air. The use of these in treating disease comes under the term *aerotherapeutics* (q.v.). The use of compressed air tends to lower the frequency of the chest and heart movements while increasing the oxygen absorption and the blood tension; the action of rarefied air will, of course, be opposite.

Compressed-Air Motors are machines that use air which has been raised to a

pressure much above that of the atmosphere, in a similar manner to that in which steam is used. They should not be confused with air engines (*q.v.*), which work on a different principle. Steam engines are more in vogue than C.-A. M., and it is easy to see that theoretically as well as practically the former should be regarded as being the more efficient, for whereas steam is obtained under pressure directly by the action of heat on water, some intermediate power must be used to obtain the air under pressure. This renders the use of compressed air comparatively more costly than the use of steam. Although this is so, however, there are many conditions under which C.-A. M. are advantageous. When steam has to be carried any distance, there is always some loss of power, owing to the radiation of heat from the pipes into the air. Now compressed air can be transmitted without loss of power through this cause. Again, the exhaust air, after having done its work in the engine, adds to the purity of the surrounding air, whereas exhaust steam vitiates the atmosphere.

Because of these two advantages C.-A. M. have attained considerable use in mines and tunnelling. C.-A. M. are used for driving coal-cutters (*see* COAL-MINING). Further, they are used for driving drills for boring holes in rocks and in tunnelling operations, while they are also used to manipulate hammers for riveting steel and iron plates together, and chisels in sculpturing, and small and very light sheep-shearers. All these machines require to be portable and easily handled and controlled, and C.-A. M. offer great facilities in these directions. They can be supplied with air through flexible tubes, and consequently the power generators do not add weight to the motor, nor do they make the rigid portion of the machines large and therefore cumbersome. Further, the working parts are not at a high temp., and therefore the danger attached to their use is less than in the case of steam. It can well be seen, too, that in the case of tunnelling and mining, the advantages mentioned above are very valuable. C.-A. M. have been used in many other ways. Compressed air can, of course, be stored in cylinders without loss of power. Stored in this manner at a pressure approaching 2000 lb. per square inch, in reservoirs under the vehicle, it has been used as the motive force for driving tramcars; it has, at much greater pressure even, also been used in motor cars. Again, pneumatic tubes for transmitting letters and small parcels of all kinds are worked partly by compressed air and partly by exhaustion. Further, in some of the Amer. arsenal locomotives are driven by compressed air, and their advantage over steam engines in the neighbourhood of explosives is easily understood. In addition to these uses, there are the cases of lifts or elevators, which are sometimes worked by compressed air, and the automatic brakes on passenger trains offer further illustration of its use; while one of their most important

uses is in supplying the locomotive power to torpedoes. There are sev. types of compressors for driving the motors, the type depending on the number of air cylinders and the manner of their setting in relation to the steam cylinders. An auxiliary for increasing the power is used sometimes, and consists in heating the air before it reaches the motor. This heating, of course, causes it to expand, and in proportion to the expansion so is the power increased, in some cases to as much as 30 per cent. With the growth of use of steel framework for the construction of large buildings, so much riveting has to be done that a light and easily used riveting machine is essential. The pneumatic hand-hammer (or riveter) supplies this need. The supply of compressed air is obtained from a small but very powerful unit driven by a petrol engine, the whole of which is mounted on a small truck which can be drawn anywhere, the power being conveyed by flexible armoured tubing, and easily led out of the way of other workers. Another use for C.-A. M. has been found by road engineers in the pneumatic road drill which is taking the place of the now obsolescent pick. This road drill can be used by one man, and can do work more quickly and better than the pick. In mining machinery there are two main types of C.-A. M. which are used to drive pneumatic tools: (a) turbine-type and (b) cylinder-type motors. In the former the C.-A. M. consists of three parts, a stator and two rotors. The rotors, which revolve inside the stator, consist of two V-shape tooth gear-wheels meshing together; the inflowing air is forced on to both gears, and the teeth of the gears as they revolve form valves and stop the air from escaping to the other side of the gears. In the cylinder type of machine the motive force is obtained from the motive action of two more cylinders; the valves which are driven from the crankshaft admit the air, which drives down the piston, and at the end of its motion the air escapes from ports on one side of the cylinder casing. Pneumatic tools possess many advantages over electric tools, the chief being their lightness, a C.-A. M., which can develop two or three h.p., weighing no more than 30 to 35 lb. *See* D. Bral, *Compressed Air in Engineering Production*, 1913.

Compression and Compressibility. When a body is acted on by a force in such a manner that it decreases in volume, it is said to be compressed, and the diminution in volume is its compression. The term compressibility is sometimes used to denote this property of yielding to pressure, but strictly used it represents the extent of this property as possessed by various substances. Different bodies will diminish by different amounts under the same pressure, and to represent this varying amount of yielding, compressibility is defined as being the ratio of the amount of compression per unit volume to the pressure applied. So it is found by measuring the amount of compression of a given volume under a given pressure, and dividing this by the product of the

original volume and the pressure. This gives the average compressibility per unit pressure, and the unit of pressure is usually taken as one atmosphere, or the weight of a square-inch section column of mercury, 29.905 in. in height at a temp. of 0° C., weighed at sea level. This is really equal to 14.7 lb. weight per square inch. The compressibility of gases is greater than that of liquids or solids. For gases the relation between pressure and volume being determined by Boyle's law, that the volume is inversely proportional to the pressure, it follows that the diminution in volume grows less as the pressure becomes greater, i.e., that the compressibility is inversely proportional to the pressure. Liquids are compressible, e.g. water can be compressed, although the compressibility is less at high than at low temps. and pressures. Measurements of the compressibility of liquids are made in an instrument called a piezometer. Thus it has been proved that the compressibility of water at 10° C. and a pressure of one ton per square inch is approximately $\frac{1}{20,000}$. Sea water is roughly 10 per cent. less compressible than fresh water. Mercury has the ~~smallest~~ compressibility of any fluid, its compressibility being roughly one-sixteenth that of water. The compressibility of solids is very much smaller than that of gases or liquids, and except for theoretical purposes can be neglected. In measuring the compressibility of liquids, however, corrections must be made for the compressibility of the instrument employed. This being usually of glass, careful measurements have been made of its compressibility. This varies for the different kinds of glass, but is roughly about one-twentieth that of water.

Compressors. C. are used chiefly in connection with mining machinery. There are two main types of C., namely reciprocating and rotary C. The first is the more widely used, and there are many models, all varying in design and action. The low-pressure compressor, up to 200 lb. per square inch, is a single-stage compressor, i.e. the air is compressed by the single action of one piston. In pressures of 200 lb. and over the C. are two, three, four, or multi-stage C., i.e. the air is first compressed in one cylinder, and then suffers one or more subsequent compressions before it is finally stored. The valves of a compressor are of two types; those placed in the cylinder casing and those fitted in the piston itself; the valves in both cases are automatic in action, being opened and closed by the suction and compression strokes of the piston. In recent years high-speed C. have been developed in connection with refrigerating plants, and for liquefying gases such as air, with the object of subsequently separating their constituents by evaporation. Most ammonia C. are of the single-acting enclosed type with the ammonia in the crank case; the valve ports are situated in the cylinder walls and lie between the limits of travel of the upper and lower parts of the piston.

Compromise Measures of 1850. These

were a series of measures which had for their object the settlement of five questions in dispute between the pro-slavery and anti-slavery factions in the U.S.A. As a fact the compromise of 1850 settled nothing, but was compounded by every element of the country's politics, and may be made to yield on analysis almost every ingredient of the historian's narrative. Ter. had just been acquired by conquest and purchase from Mexico; Texas had just been admitted to the Union, and the perplexing question was the extension or restriction of slavery, for it threw obstacles in the way of a plan and gov. for the new ter., and made the determination of the Texan boundary a matter of grave sectional interest. Part of the country wanted the slave trade abolished from the dist. of Columbia—the seat of the national gov.—and slavery from the new ter.; the other part urged with equal vehemence that the slavery question was a matter for decision by the framers of the State constitution (when it should come to be formed) of the new ter.

The result of this controversy was the series of measures framed and introduced by a committee of which Henry Clay was chairman, called the C. M. of 1850, which were signed by the President in September of that year. It was agreed (1) that Texas should be paid 10,000,000 dollars to relinquish her claim upon any portion of New Mexico; (2) that California should be admitted as a state under a constitution which prohibited slavery; (3) that New Mexico and Utah should be organized as ters without any regulation in respect of slavery, leaving it to the election of their own settlers whether there should be owner-ship in slaves or not; (4) that the slave trade should be excluded from Columbia, but be interfered with nowhere else by the Federal law; and (5) that the whole judicial and administrative machinery of the Federal Gov. should be put at the disposal of the S. slaveowners for the recovery of fugitive slaves found within the free states. There seems little doubt that the C. M. helped to postpone secession and civil war for some years, during which time the N.W. grew more wealthy and was brought into closer touch with the N.E. states. See *Cambridge Modern History*, vol. vii., chap. xli., and J. F. Rhodes, *History of the U.S. from the Compromise of 1850, 1893-1906*.

Comptat Venasquin (from *Venasque*, Lat. *Vindazinum*) was a parallel div. to Comptat d'Avignon, the two being cos. of the papal states, held by the popes from 1228 to 1791. C.V. was, however, larger, having an area of 450,000 ac., and now forms more than half of Vaucluse. The country is fertile, with magnificent scenery. Ventoux (1912 ft.) is the loftiest peak. The dist. is irrigated by a system of canals and by the Rhône, Durance, and Sorgue. Venasque is a tn. in Vaucluse.

Compton, Arthur Holly, Amer. physicist, b. at Wooster, Ohio, Sept. 10, 1892; son of Elias C. Graduate College of Wooster, 1913; instructor of physics in univ. of

Minnesota, 1916-17; and research physicist of the Westinghouse Light Company, Pittsburgh, 1917-19. Came to England, and pursued research at Cambridge, 1919-20; prof. of physics at Washington Univ., St. Louis, Missouri, 1920-23; prof. of physics at Univ. of Chicago since 1923. His speciality is X-rays. Made first measurement of wavelength of hard gamma rays, discovered change in wavelength of X-rays when scattered, and, with other researchers, discovered total reflection and effected polarisation of X-rays.

Compton Effect (X-rays). Discovered in 1923 by A. H. Compton, this effect is the change of wavelength of a beam of X-rays when scattered by substances. This change of 'colour' cannot be accounted for by the wave theory of light, which, however accounts for many of the properties of X-rays (*q.v.*), known to be rays of extremely short wavelength. The corpuscular theory of light, while accounting for the C. E., is unable to explain other properties of X-rays and ordinary light. Up to the present time no reconciliation between the two theories has been effected.

Compton, Henry (real name Charles Mackenzie) (1805-77), Eng. comedian, b. at Huntingdon. In 1844 he appeared as Touchstone in *As You Like It*, and at once became famous. Other roles were Blenkinsop in Tom Taylor's *Unequal Match*, Muggles in Byron's *Partners for Life* at the Globe Theatre, and Dr. Pangloss in *The Heir at Law*.

Compton, Spencer Joshua Alwyne, see NORTHAMPTON, MARQUESS OF.

Comptonia asplenifolia, or Sweet Fern, species of *Comptonia*, which genus, like *Myrica*, belongs to the order Myricaceae. It is a small bush, 3 to 4 ft. high, yielding a powerful aromatic fragrance when rubbed between the fingers. It is a native of the woods and mts. of the U.S.A., and possesses tonic and astringent properties.

Comptroller, official title for one who keeps or audits accounts, used mainly for gov. offices, or in connection with the royal household, when it refers to a kind of steward or treasurer. Thus the C.-general is the head of the National Debt Office, the C. and auditor-general the head of the Exchequer and Audit Dept., etc. The word is more correctly spelt *controller*, as it comes from the Fr. *contrerolle*, from Med. Lat. *contrarotulus*, a counter-roll or copy of a document used to check the original; in this form it is applied to the controller of the Navy and to the head of the Stationery Office in England, and in the U.S.A. to the controller of the Treasury and the controller of the currency, the latter being one who administers the law relating to national banks.

Compurgator (Lat. *compurgare*, to purge completely), name given to a witness of character who swore to the character of the accused person in a trial. The word was used only in eccles. law until the seventeenth century, when it was used by legal antiquaries in connection with the

civil law. In Glasgow, up to the middle of the eighteenth century, when the office was abolished, an official whose duty it was to clear the streets of strollers during the time of church worship on Sunday was called a C.

Comrades of the Great War, Brit. organisation of ex-service men which arose out of the Great War, or First World War. With the cessation of hostilities, public attention was naturally drawn to the consequential effects of the war, and among the numerous matters which called for prompt decision were pensions, the treatment of wounds, the supply of artificial limbs, resettlement in civil occupations, etc. The majority of ex-service men were incompetent to look to their own interests in such matters, and required the advice and assistance of those who were better qualified to act. It was from such circumstances that the Comrades of the Great War arose, and it did much good work in its own particular field. Later it was absorbed into the Brit. Legion (*q.v.*), although some individual branches or clubs still exist and retain their original identity and character.

Comrie, par. and vil., Perthshire, Scotland, on the R. Earn, 6½ m. W. of Crieff. It lies on the fault line which divides the Highlands from the Lowlands and is subject to occasional earthquake shocks. Roofing slates are worked there. Pop. 1800.

Comstock, Anna Botsford (1854-1930), Amer. naturalist and natural-hist. artist; b. at Otto, New York; wife of John Henry C. (*q.v.*). Prof. of nature study, Cornell, 1920-22; associate director, Amer. Nature Association. Works include *Ways of the Sir-footed* (1903); *How to Know the Butterflies* (with her husband) (1904); *Confessions to a Heathen Idol* (1906); *Handbook of Nature Study* (1911; sixteenth ed., 1925); *Bird, Animal, Tree, and Plant Handbooks* (1914); *Trees at Leisure* (1916). Ed., *Nature Study Review* (1917-23).

Comstock, John Henry (1849-1931), Amer. entomologist; b. at Janesville, Wisconsin. U.S. entomologist, Washington, 1879-81. Prof. of entomology and invertebrate zoology, Cornell, 1882-1914. Works include *Report on Cotton Insects* (1879); *Notes on Entomology* (1885); *Manual for the Study of Insects* (1895); *Insect Life*, (1897); *How to Know the Butterflies* (with his wife) (1904); *The Spider Book* (1912); *The Wings of Insects* (1891).

Comstock Lode, famous silver mine in Nevada, U.S.A., discovered in 1859; the richness of the mine may be said to have caused the rise of Nevada as one of the great gold- and silver-mining districts of the world. It was financed chiefly from San Francisco, and the 'bonanza' boom of the seventies led to a financial panic. The Comstock dist. is exceedingly rich in both gold and silver, but the fall in the price of the latter resulted in great depression. Virginia City, a prosperous mining centre, is built on the site of C. L.

Comte, Auguste (1798-1857), founder of Positivism. He was b. at Montpellier,

where his father, a strong Royalist and Catholic, was the receiver-general of taxes. He received his early education at the public school of his own tn., and later proceeded to the Ecole Polytechnique in Paris. About 1818 he came under the influence of Saint-Simon, a relative of the famous duc de Saint-Simon, and although he himself at a later date declared that the influence of Saint-Simon was for evil rather than for good, there is no doubt that during this period of his life he had a great admiration for his patron. Saint-Simon's teeming imagination seems at any rate to have supplied C. with the bases for some, at least, of his later philosophical ideas. In 1824, after a quarrel, C. severed his connection with Saint-Simon entirely. In the following year he married, but his marriage did not altogether turn out for good. He now found the greatest difficulty in making a living; he tried to get pupils but failed; he wrote a little for the papers, and finally proceeded to give a course of lectures which would embody the main principles of his philosophy. The lectures were at the beginning seriously interfered with, since he suffered at this time from an attack of insanity, from which, however, in the course of a few months he recovered. In 1828 the lectures were resumed, and two years later appeared the first vol. of his great work, *Cours de philosophie positive*. Financially, matters had become brighter, and he was in possession of an income which amounted to £100 a year, although he had to work excessively hard for it. Until 1842 matters went more or less smoothly for C., but in that year the temperamental differences between himself and his wife culminated in their separation; although for a long time after this separation they corresponded, and C., even in the midst of later financial difficulties, always made her an allowance. By this time he had lost half his income owing to a gratuitous attack which he had made on the directors of the Ecole Polytechnique, and for some time he lived on the subsidies of friends. In 1842 had appeared the sixth and final vol. of the *Philosophie positive*, and during the pub. of this work he had become friendly with J. S. Mill, who now helped him very considerably in his financial difficulties. In 1845 C. fell under the influence of Mme de Vaux, an influence which seems to have been entirely for good, but which, unfortunately, lasted for only a year, being terminated by the death of the lady in 1846. C. was genuinely attached to her, and seems to have felt her death very deeply. In 1851 appeared the first vol. of *Système de politique positive*, the last vol. in 1854. *Catechisme positiviste* was pub. in 1852. During the years 1849-51 C. gave lectures at the Palais Royal, where he strenuously advocated his general theories. He was attacked by cancer in the year 1859, and *d.* towards the close of that year. See also POSITIVISM; PHILOSOPHY. See G. H. Lewes, *Comte's Philosophy*, 1863; E. Littré, *Comte et la*

philosophie positive, 1863; J. S. Mills, *Comte and Positivism*, 1865; E. de Roberty, *Comte and Spencer*, 1894; F. J. Gould, *Auguste Comte*, 1920.

Comus (from Gk. *κόμος*, revel, or a company of revellers), the god of festive mirth, unknown in classical mythology; he belongs to the later Gk. mythology, and is depicted by Philostratus, who wrote in the third century A.D., as a sleeping youth with wings, crowned with flowers, and holding in either hand a hunting spear and an inverted torch. Milton in his *Comus* represents him as the offspring of Bacchus and Circe endowed with the magic power of turning human faces into those of beasts.

Comyn, Cumming, or Cumyn, Fr. family who came to England with William the Conqueror. Robert was made earl of Northumberland, his nephew William becoming chancellor of Scotland. John Comyn (*d.* c. 1300) was a Scottish baron and nephew of the earls of Buchan and Menteith, from the latter of whom he inherited the lordship of Badenoch. He took part in the negotiations between Edward I. and the Scots (1289), and was one of the claimants for the Scottish throne on the death of Margaret, the Maid of Norway. He fought, however, for John de Balliol, but in 1296 submitted to Edward I., and came to England. His son John, known as the Red C., also fought for Balliol, and was kept as a hostage in England for a time. After the battle of Falkirk he was made guardian of Scotland, and for five years carried on the feud with England. He has become famous on account of his quarrel with Robert Bruce, the origin of which is unknown, but in Jan., 1306 they met at Dumfries, and as a result C. was stabbed to death, whether by Bruce or his followers is not known.

Conacre (a corruption of corn-acre), obsolete land system once prevalent in Ireland, under which small patches of land were let out for potato growing in lieu of wages.

Conca, Sebastiano (1676-1764), It. oil- and fresco-painter, who studied under Solimena. In his work he was an imitator of Pietro da Cortona, whom he resembled in his superficiality and rapidity. Of his works the 'Sacred Pool of Siloam' in the hospital of Santa Maria della Scala at Siena, is the best.

Concan, see KONKAN.

Concan, maritime dist. of Bombay, India, stretching N. and S. from Danam to Goa, and E. and W. from the Ghats to the Indian Ocean. Its extent is about 300 m. long, and an average of 40 m. broad. It covers the Brit. dists. of Tannah and Ratnagiri. The climate is subject to violent monsoon rains.

Concarneau, seaport in the dept. of Finistère, France, 14 m. S.E. of Quimper. The old tn., which is surrounded by ramparts, is believed to date back to the fourteenth century; it lies on an is. near the bay of La Forêt, while the newer portion, St. Croix, is on the opposite shore. It is a centre of the sardine, mackerel, and tunny fisheries. Pop. 10,500.

Concave (Lat. *concavus*, hollowed), and **Convex** (Lat. *convexus*, vaulted) are two opposite terms. As their etymological derivation signifies, the former is applied to a surface falling, the latter to a surface rising in a circular form. Thus the outer surface of a saucer is convex, the inside concave. In mathematics a line is convex on the side on which the point of intersection of two tangents falls, and on the other side concave.

Concealment, in the law of contract, means any improper suppression of facts or circumstances by one of the parties to a contract so as to induce the other party to enter into it. In certain contracts, styled contracts *uberrimæ fidei* (of the utmost faith), each party must make the fullest disclosure of all material facts within his knowledge, or the contract will be voidable at the option of the party misled. The remedy for a fraudulent C. is an action to rescind the contract and for damages; for an innocent but material C. rescission only (see **CONTRACT**). In criminal law, a person knowing of any treason or felony without in any way assenting to it, is guilty of misprision if he conceals his knowledge. Misprision of felony is punishable by fine and imprisonment (see also **MISPRISION**). Various acts of C. by a bankrupt if fraudulent render the bankrupt liable to certain penalties under the Debtors Act, 1869 (see **BANKRUPTCY**). C. of treasure trove is punishable by fine and imprisonment. C. of birth is a misdemeanour punishable by imprisonment. C. of documents of title to land or any testamentary instrument is a felony punishable by imprisonment.

Concealment of Birth, see **BIRTH**, **CONCEALMENT OF**.

Concelção de Nogueira, tn. of Brazil, in the state of Minas Geraes, 85 m. N.E. of Ouro Preto. It has gold and iron mines. Pop. 10,000.

Concentration, in metallurgy, the treatment of ore to separate the precious metal from the gangue. Generally the ore, having been ground into small pieces, is separated by a process in which reliance is placed in the difference between the sp. gr. of those portions which contain the metal and the valueless gangue. The separated product containing the metal is the concentrate and the residue is called the tailings.

Concentration Camp, institution of Nazi Germany for the detention of opponents of the Nazi regime. These C. Cs. of the Third Reich would have been inconceivable in Imperial Germany. It is true that the Third Reich had something in common with the empire of the Hohenzollerns—enough to render both a menace to mankind—but there was one fundamental difference: the empire was under the rule of law, the Third Reich was not. It has been estimated that about 50,000 persons were in the C. Cs. at the outbreak of the war in 1939, and that upwards of 300,000 had passed through them in the previous seven or eight years. Prisoners in these camps included, besides Jews, Communists, Socialists, Democrats, Catholics,

opposition Protestants, Czechs, and indeed even such Nazis as had refused to conform to the party line. Detention in the camps was entirely arbitrary; no person there was ever tried nor was there any legal time-limit to their detention, and indeed, most were there for years. Among the worst of these C. Cs. were those at Belsen, Buchenwald, Dachau, Auschwitz, Oranienburg, Papenburg, Maideneck, Oswiecim, and Treblinka. The prisoners were beaten, forced to hard work far beyond their physical capacity or endurance, and exposed to frightful tortures and humiliations by their guards. Descriptions of the appalling sights which met the eyes of the liberating Brit. troops will be found under **BEISEN** and **BUCHENWALD**. There was, however, convincing Polish evidence that the camps of Maideneck, Oswiecim, and Treblinka were torture camps, where the reign of terror and sadism far exceeded all that had been reported from Belsen, Buchenwald, or Dachau. Millions of persons were killed in these camps, the majority slowly tortured to death in the execution of a deliberate policy of mass extermination (see **Brit. White Paper of Oct. 1939**). The existence of the C. Cs. was officially admitted; they were impudently represented as political reformatories, so to speak, of a rather humane character: on Aug. 23, 1934 Goebbels (*q.v.*) declared to the delegates of the International Penal and Prison Congress in Berlin that the purpose of the camps was to turn 'anti-social' members of society into 'useful members' by the most humane means. Goering (*q.v.*), at a diplomatic reception, said in an address that to characterise the camps as 'places of torture' was a malicious invention. The terror practised in these camps and in the similar Brown Houses—the notorious Hedemannstrasse and Papenstrasse, the Ulap, the Columbia Bar, and others which received thousands of men, and even women, in March 1933, and from which latter issued whimpering physical and mental wrecks with faces smashed or pulped out of recognition by the *Stahlruten*, tapering steel rods with leather-covered handles, wielded by the brown-shirted S.A.—was entrusted exclusively to the Gestapo by a special law which was promulgated on Feb. 12, 1935, though camps had been in existence for at least two years before that date. The Nuremberg tribunal of 1945-46 heard the evidence of Hoess, commandant of the Auschwitz C. C. from May 1, 1940 to Dec. 1, 1943, who estimated that in that camp alone in that time 2,500,000 persons were exterminated and that a further 500,000 d. from disease and starvation. The unique horror of the C. Cs., and the persistence of that horror for more than twelve years, the more than inhuman cruelty of the terrorists, and the connivance or at least the indifference of a huge public—all these demanded an explanation which in the nature of things was impossible to exact. But at least Goering and others, including Kaltenbrunner, organiser of the camps, and Dr. Hans Frank, head of the

administration of the so-called central gov. of Poland, were tried and condemned to death at Nuremberg as war criminals, and all, save Goering who took his own life, duly paid the penalty.

Concentric (*con* and *centre*), name which is applied in mathematics to any two or more similar figures which have a common centre. Thus the upper and lower edges of the rim of a wheel form two concentric circles.

Concepción: 1. Prov. of Chile, situated between Nuble on the N., and Biobío and Angol on the S. Its area is about 3260 sq. m., and there are large and extremely fertile plains. The cap., C., is a seaport, situated on the r. b. of the R. Biobío, 7½ m. from its mouth, and 270 m. S.S.W. from Santiago. Talcahuano, however, on the bay of C., is more used as a port. C. has a considerable trade in grain, hides, tallow, timber, salt beef, etc., and in the vicinity are large coal mines. The tn. was founded by Pedro Valdivia in 1550. In 1739 it was destroyed by a volcanic eruption, and again in 1751. The earthquake in 1835 once more reduced it to ruins, but it is now a well-built town. (prov.) 308,200; (tn.) 92,300. 2. Dept. of the oriental section of Paraguay, lying to the E. of Paraguay R. The cap. of the same name lies on the riv.'s l. b. about 135 m. N.N.E. of Asunción. It has an important trade in maté tea. Pop. (dept.) 44,300; (tn.) 16,400.

Concepción de la Vega, tn. of San Comingo, 5 m. S.E. of Santiago, on the Camá. It has a fine cathedral. Pop. 7000.

Concepción del Uruguay, tn. in the prov. of Entre Ríos, Argentina, on the r. b. of the R. Uruguay, on the Entre Ríos railway. It has a college, slaughter houses, and new port works. Pop. 20,000.

Concept and Conceptualism. *Concept*, a term in philosophy, logical, metaphysical, and psychological. It is the result obtained by the mental process popularly known as 'abstraction.' We recognise various particular objects which we call 'horses,' and form a general idea, by abstracting certain common qualities from these particulars, of a universal 'horse': the mind 'affirms' a concept 'horse' by a process of abstracting, combining, and reconstructing of 'perceptions' thus; 'conception' is contrasted with 'perception.' *Conceptualism* was the scholastic theory, mainly connected with the name of Abelard, which in attacking the rival theories of Nominalism and Realism, attempted to steer a middle course between the two. The question in debate was as to the nature of genera and species; do they exist in themselves or only in the mind? While the Nominalists held that 'universals', i.e. genera and species, are only names invented to express the term of qualities expressed, e.g. by the term 'horse,' and are *post res*, i.e. after things, subsequent; the Realists affirmed that 'universals' have real existence and are antecedent, *ante res*. The conceptualist theory held that they are concepts, existing in the mind expressing a simi-

larity: they are really existent, but not apart from particular objects to which they apply, or, as Abelard put it, a 'universal' obtains reality by being predicated of anything; e.g. there is no reality in the concept 'horse' till you affirm 'Persimmon is a horse.' The rival schools had a great influence in the development of medieval theology. Abelard's conceptualism swayed too much towards the dangerous, materialistic Nominalist school for him to escape the attack of the Church.

Concert, in music, is musical harmony. Concerted music is that written for two or more instruments, where each part is of equal importance.

Concertina, or **Melodion** (Fr. *concertina*. Ger. *harmonika*, or Argentine *bandonion*). It is a wind instrument with free reeds. It is composed of two hexagonal or rectangular keyboards which are connected by a long, expanding bellows. On the keyboard

CONCERTINA

are rows of knobs, which when pressed open valves which admit the air to the free reeds, by whose vibration the sound is formed. The reeds are narrow slips of brass riveted to the inside surface of the keyboard at one end. The outer ends are bent in alternate ways; those bent inwards are actuated by compression, those outwards by suction. The length and thickness of the reeds determine the pitch. The Eng. C. was invented and patented by Sir Charles Wheatstone in 1829; it has a double action, playing the same note on compression and expansion. The Ger. variety, on the other hand, plays two different notes when compressed and then expanded. The C. is made in sev. varieties—treble, tenor, bass, and double bass—the compass of the whole set being seven octaves. The timbre of the instrument is soft, and capable of delicate gradations. The capabilities of the C. have been recognised by many musicians, concertos having been written for it by Molique and Regondi. Tchaikovsky included four Cs. in the score of his second orchestral suite. The most prolific composer for C. was Edward Elgar.

Concerto, musical composition written with an orchestral accompaniment, calculated to display the powers of an instrument or a performer. Cs. are generally

written for a solo instrument, though Bach's Cs. for two or more pianofortes, Mozart's for two pianofortes, and Beethoven's for pianoforte, violin, and violoncello, may be cited as exceptions. A C. consists of three movements, which require a clear development and a strict adherence to the rules of form; like the sonata, on which it is founded. There is usually a *cadenza* in the first, or sometimes in the last movement; this is an embellishment or flourish, prepared or improvised, for the solo instrument. Few examples of classical Cs. for wind instruments are found, though Weber's clarinet C. is an exception. The earliest composer to write Cs. was Torelli, whose work dates from 1686. Since that time modifications have been introduced by Corelli, Geminiani, Bach, and others; Mozart gave it its modern form, although Beethoven introduced some modifications of this. Mozart wrote four concertos for horn, Spohr two for clarinet, Schumann a *Concertstück* for four horns (all with orchestra).

Concert Pitch, see PRICH.

Conch (Gk. *κόχχης*, mussel or cockle shell), name applied to various shells, but especially to the fountain shell, a species of gastropod mollusc in the wing-shell family. In art it is represented by a *Triton* shell, from the allied family Tritonidae.

Conchagua, Bay of, see FONSECA, GULF OF.

Conchifera, term which Lamarck applied to the *Acéphales testacea* of Cuvier, together with the Brachiopoda, which forms Cuvier's fifth class of molluscs. The term *Acéphala Testacea* has been replaced by modern zoologists by *Lamellibranchiata*.

Conchoid (*κόχχης*, shell; *ῥῖος*, form), plane curve invented by Nicomedes, who used it to solve the problem of the duplication of the cube, the trisection of an angle, etc. AB is a fixed straight line and P a fixed point. Equal straight lines

CONCHOID

are drawn through the point P so that they are bisected by the straight line AB, and their ends trace out the two branches of the conchoid. Thus, in the figure, $OC = OD = RN = RM = ST = SP$. When OD is greater than OP the lower branch forms a loop below P, as in the figure; when $OD = OP$ a cusp is formed at P; when OD is less than OP the lower branch does not reach P. The curve is obviously symmetrical about the straight line XY.

Conchology, branch of zoology which treats of molluscs with reference to their shells. In Victorian days the science of C. was immensely popular, but it is now recognised that the inhab. of any shell is much more important to science than the shell itself.

Conchos, riv. of Mexico, which rises in the E. of the Sierra Madre, and, flowing through the state of Chihuahua for about 350 m., joins the Rio Grande del Norte at Presidio del Norte.

Concierge, Fr. word, signifying the janitor or door-porter commonly attached to a Fr. house. He has a small office near the front door or main entrance, and his duties are to admit visitors, and receive parcels, telegrams, telephone messages, etc.

Conciliation in Industry. Machinery for the settlement of industrial disputes by C. and arbitration has been in operation in various countries for many years. The Conciliation Act of 1896, combined with the Industrial Courts Act, 1919, are the characteristic Brit. form of the system, with its emphasis on voluntary resort to investigation, C., and arbitration by competent tribunals. Such voluntary resort with or without assistance from the gov. has been long estab. in all the well-organised Brit. industries. Trade boards supply a need in those less well organised. At the opposite extreme is the principle of compulsion. Australia and New Zealand are conspicuous among the countries which have adopted this principle. In Queensland the arbitral tribunal estab. by law has legislative functions, in the sense that its awards have legal effect even as respects employers and employees who may not have been involved in the dispute which gave rise to the award. C. machinery is now being introduced in the W. Indies and in other Brit. colonies parallel with the development, under official guidance, of trade union principles. Important changes in the machinery of C. have been made by most countries in the past twenty-five or more years, but no perfect system has yet been evolved. Far more disputes are settled by the voluntary machinery set up by the trade unions and organised employers for purposes of joint consultation than by any other agency; but cases do arise from time to time which call for mediation and where collective bargaining is out of the question. The Act of 1896 did little more than empower the Board of Trade to inquire and report, and it was not until 1911, when the Industrial Council was estab., that any attempt was made to systematise the application of the principle of C. embodied in the Act of 1896. But this body had no power to require disputants to refer to it, the voluntary character of the Act being maintained. In 1919, however, the Standing Industrial Court was estab. under the Industrial Courts Act, consisting of independent persons and representatives of employers and employees, to deal with such disputes as might be referred to it with mutual consent, or to investigate the circumstances if the Ministry of Labour deemed

inquiry to be desirable. Neither an award by the court nor the findings of an inquiry were made binding. In its original form the measure contemplated compulsory arbitration and the attachment of trade union funds for strikes against the decisions of the arbitrators. This was necessarily opposed by the unions, with the result that the voluntary tradition subsists. The National Arbitration Tribunal was constituted by the Ministry of Labour and National Service under the Conditions of Employment and National Arbitration Order, 1940, for the purpose of settling trade disputes which cannot otherwise be determined. Many advocates of C. think that almost any system of C. is useful in so far as it promotes investigation. The method of arbitration, on the other hand, leads to the formulation of agreed principles of determining wage questions. In Australia and New Zealand, for example, the system which began last century as a method of averting strikes and lock-outs has developed into one of wage regulation, based on a fairly scientific attempt to ascertain what wages can and ought to be paid. On the whole experience seems to reinforce the traditional Brit. method of voluntary C. and arbitration; but it also tends to strengthen the opinion that power should lie in the background to compel inquiry and that the tribunal should be such as would ensure its permanence and the continuity of its operations. *See also* ARBITRATION; INDUSTRIAL RELATIONS.

Concini, Concino, Marshal d'Ancre, *see* ANCRE.

Conclave (room), name given to the place of assembly when the cardinals of the Rom. Catholic Church meet to elect the pope. The name is also applied to the assembly itself. The regulations for such a meeting were laid down in 1274 by Pope Gregory X., who had suffered from the dilatoriness of election then prevailing. By them it was laid down that after ten days from the pope's death the cardinals present should assemble in the palace, and should be secluded until they had elected the deceased pope's successor. These regulations are still observed in the main; since most of the popes have d. at Rome the Vatican has been the usual place of the conclave.

Concord, in music, is an agreeable combination of sounds. They are the octave, fifth, third, and sixth, and their ratios are 2 : 1, 3 : 2, 5 : 4, 5 : 3. The first two are perfect and the last two imperfect.

Concord: 1. The cap. of New Hampshire, U.S.A., and co. seat of Merrimac co., on the Merrimac R. It has some fine public buildings, including a state house, built of granite, a state library, and the Margaret Pillsbury hospital. It has some celebrated white granite quarries, and manufs. of machinery, carriages, woollen, cotton, and leather goods, shoes, and pianofortes. Benjamin Thompson (Count Rumford), the statesman and natural philosopher, was a schoolmaster here in 1770-72, and it was the home of Mrs. Eddy, the discoverer and founder of Christian Science. Pop. 27,100. 2. The

co. seat of Cabarrus co., N. Carolina, on the S. railroad, 21 m. N.E. of Charlotte. It has textile mills. Pop. 15,500. 3. Tn. in Middlesex co., Massachusetts, on the Concord R., 23 m. N.W. of Boston, on the Boston and Maine railroad. The first skirmish in the war of Independence took place here on April 19, 1775, and an obelisk marks the spot where the first Brit. soldiers fell in the war of Independence. In it have lived many notable men of letters, including Emerson, Hawthorne, and Thoreau. Pop. 7900.

EMERSON'S HOUSE AT CONCORD,
MASSACHUSETTS

Concordance (late Lat. *concordantia*, agreement), name given to a book containing a citation of parallel passages in any work, and an alphabetical arrangement of words contained therein, with reference to the passages where they are found. Originally each group of parallel passages was called a concordantia, and the plural form concordantiae used for the collection of such passages, and the Gers. still distinguish between Cs. of things and Cs. of words. The first book to which Cs. were made was the Bible; the reason for this was the belief that was formerly held that all the parts of the Bible were in harmony with each other, and formed one divine whole. Anthony of Padua (1195-1231) is said to have been the author of the earliest C. we have, an anonymous work based on the Vulgate. The first authentic C. was that of Cardinal Hugh of St. Cher, a Dominican monk of the middle of the thirteenth century; he is said to have felt the need of such a work for his studies, and to have employed 500 monks to aid him in compiling it. The Cs. of Conrad of Segovia in the fourteenth century were based on the work of Hugh. The first Hebrew C. was compiled between 1437

and 1445 by Rabbi Mordecai Nathan, and printed at Venice in 1523 by Daniel Bomberg. It was entitled *Meir Natib* (Light of the Way), and served as the basis for the C. in four vols. of Marius de Calasio, a Franciscan monk, dated 1621. The C. of Johann Buxtorf, senior, is only useful to those acquainted with the Massoretic method. Cs. of biblical proper names have been pub. by G. Brecker (1876) and Schusslovicz (1878). In 1642 Conrad Kiroher of Augsburg produced a C. to the Septuagint, and Abraham Tromm one in 1718. The best modern C. on such lines is that of the Clarendon Press, Oxford, *A Concordance to the Septuagint and the other Greek Versions of the Old Testament, including the Apocryphal Books*. This was pub. in 1897, and a C. of proper names was added in 1900. The first Gk. C. to the N.T. is that of Xystus Betuleius (1500-54); other Cs. were produced by the Stephensens, father and son, and Erasmus Schmid, a Lutheran divine, whose work forms the basis of most subsequent Cs. A C. of the Gk. text with an Eng. version to each word, and the prin. Hebrew roots corresponding to the Gk. words of the Septuagint was produced in 1767 by J. Williams. The first C. of the Eng. version of the N.T. is that of T. Gibson (1535), and the first Eng. C. of the entire Bible was produced by J. Marbeck in 1550. Alexander Cruden's C., which is the basis of all modern Cs., was produced in 1737, with the title, *A Complete Concordance to the Holy Scriptures of the Old and New Testament, to which is added a Concordance to the Works called Apocrypha*. More recent Cs. are J. Strong, *The Exhaustive Concordance*, 1890; *The Oxford Cyclopedic Concordance*, 1910; R. Young, *Analytical Concordance to the Bible*, 1912; D. M. Miller, *The Topical Bible Concordance*, 1947. Since the value of a C. was discovered, the works of many other authors have been furnished with more or less complete Cs., notably Dante, Chaucer, Shakespeare, Milton, Shelley, Browning, and Dickens.

Concordat, term which originally denoted merely a compact or an agreement. Later it came to mean an agreement between the eccles. and secular authorities on matters which concerned both. From this usage came that which is at present the one most commonly meant; a C. is a compact between the pope, as head of the Rom. Catholic Church, and a temporal sovereign, having for its object the regulation of eccles. affairs within the dominion of the sovereign. A C. may take any one of three forms. The pope may consult with the gov. with which the C. is to be drawn up, and then issue a papal bull to regulate the affairs of the Rom. Catholic Church in that country; the contents of the bull are incorporated by the gov. in the law of the land. This was the method pursued in the C. drawn up in 1516 between Leo X. and Francis I. of France. Another method is for two identical separate acts to be drawn up; the pope signs one of these, and the sovereign the other. The first true C.,

that of Worms, in 1122, was drawn up in this way. The third and most common method is for a formal treaty to be drawn up after consultation, signed by plenipotentiaries on both sides, and ratified by the high contracting parties. Such a method was adopted in the Fr. C. of 1801. A C. is naturally concerned with such matters as affect both the Church and the State, as Church property, eccles. appointments, the rights of the clergy, regulation of public worship, etc. Various views are held as to the binding force of a C. Some secular jurists have held that such a compact can be annulled at will by the State; extreme ultramontanes have declared it to have no binding power on the pope. The common-sense view is that such a contract, like any other, is binding on both the contracting parties, with the proviso that no gov. can guarantee that the stipulations of a C. will be accepted by the next gov. in office.

Concord, Book of, or the nine Symbolical Books of the Lutheran Church, of which the Apostles' Creed, the Nicene and Athanasian Creeds are borrowed from the Rom. Catholic Church. The Lutheran books proper are the Augsburg Confession, drawn up by Luther, Melancthon, Jonas, and Bugenhagen (1530); the Apology for the Confession by Melancthon (1530); the Articles of Schmalkald by Luther (1537); the Smaller and Larger Catechisms of Luther (1529); and the Formula of Concord, drawn up by six Lutheran divines (1577). The whole was united by order of Elector Augustus of Saxony and officially recognised as the B. of C. at Presden on June 25, 1580. The first trans. of the B. of C. into Eng. was made by Ambrose, Socrates Henkel, and others in 1851.

Concorde, Place de la, famous public place in Paris, formed by Louis XV. in 1748 and adorned by a statue of that monarch. During the Fr. Revolution it was known as the Place de la Revolution, and later Place Louis XVI. It was here that Louis XVI. and his consort were guillotined.

Concordia, Rom. goddess of harmony and peace, to whom many temples were raised. The earliest of these was that of Camillus, erected in the Capitol (367 B.C.), celebrating the reconciliation brought about between the patricians and the plebs by the Licinian laws. The Senate frequently met in this temple, and here Cicero delivered his famous oration against Catiline. The goddess is represented on coins as a matron, holding in one hand an olive branch and in the other a cornucopia.

Concordia: 1. Tn. of Argentina, on the Uruguay R., in the prov. of Entre Rios. It has large slaughter-houses, iron works, brick factories, and flour mills, etc. The chief exports are Paraguay tea and salt meat. Pop. 28,000. 2. Small tn. in Italy, 34 m. N.E. of Venice, which is known for its anct. cathedral.

Concrete, building material composed of a cement (q.v.) which will enter into chemical combination with water forming a solid, mixed with definite proportions of

sand and broken stone or other binding materials. Thus the cement as it hardens binds these together, forming an artificial stone. Its value lies in the fact that it can be moulded to any required shape, and that its components can be obtained almost anywhere. Its manu. is neither costly nor difficult, and though its appearance is not equal to natural stone, yet since it can be used in many cases where natural stone cannot be laid, it is of great use in the building trade generally. Furthermore, because of its property of hardening under water, it is the chief material used in the building of culverts, piers, breakwaters, and dock walls, in fact in all places where it will be exposed to the action of water.

History.—C. as known to-day is a result of the discovery by J. Aspidin in the year 1824 of the material he called Portland C. because when set it resembled Portland stone in colour. Forms of C. were known to the ancients, but the binding materials they used were clays, or mortars made with lime or pozzolana, some of which had the property of setting under water. Most of these anc. materials, including that used by the Romans, would nowadays be called lime mortars, and Rom. cement, differing but little from that used by the Romans, was used in the manu. of C. up to about the middle of the last century. What is called C. to-day is made with a variety of Portland cement or high-alumina cement, all of which set in water.

Properties.—Strength, durability, and watertightness are the properties generally required of C., and these properties depend upon the following factors: (1) the quality and properties of the materials used; (2) the proportion of cement in the finished C.; within limits, the higher this proportion is the stronger is the C.; (3) the strength of the cement paste; the wetter the mixture the weaker the C. so long as the proportion of cement is not altered; (4) the even distribution throughout the mixture of different sized particles of aggregate and of the cement paste; (5) thorough compaction to produce maximum density; the lower the density of C. the weaker it will be; and (6) drying out slowly, and protection against frost and hot and drying winds during the hardening period. The reasons for these requirements, and methods of meeting them, are discussed in the following.

Aggregates.—The main requirements of the material to be added to cement to form C. are that it must be clean and inert. C. cannot be stronger, more durable or weatherproof than the materials with which it is made. If C. is to be strong and everlasting, to keep out the weather, and to be fire-resistant, it must be made of materials that have these properties. If C. is to be light in weight, a lightweight aggregate must be used. If C. is wanted that will reduce the passage through it of heat and cold, an aggregate and mixture that will produce a C. with this special property must be used. In constructional work the requirements are strength, durability, and watertightness. These properties are present in gravel and

sand, and, because these materials are found in most parts of the country and can be cheaply obtained, they are used for most C. work. Crushed hard stone is satisfactory. C. made with these materials weighs about 140 lb. per cub. ft. The aggregate must be clean. If it is coated with clay or loam or other foreign matter the cement cannot bind the pieces together, because it will adhere to the layer of foreign matter instead of to the surface of the aggregate.

Lightweight Concrete.—If lightweight C. is the primary consideration, then breeze, pumice, or foamed slag may be used. Lightweight Cs. are not waterproof, and must be rendered if they are used for external walls. If C. is to be resistant to the passage of heat it is best to use an aggregate that is not solid (such as breeze and foamed slag) and to use this aggregate in a C. that is not solid—that is, by omitting some of the fine material. Pockets of air are highly resistant to the transmission of heat from one face to another and, generally, the greater the proportion of voids in C. the greater its insulating properties. These Cs. are weaker than gravel C. C. to which aluminium powder or other chemicals are added has a high insulating value. The chemical reacts with the cement and produces gas bubbles, so that when the C. is hard it has a high proportion of voids. This class of C., known as cell C., can be made to weigh as little as 18 lb. per cub. ft. but has very low strength. Sawdust and wood-wool are also used to make lightweight and insulating C., usually in precast slabs.

Size of Aggregate.—The maximum size of the aggregate depends on the work in which it is to be used. For foundations or heavy work it may be up to 3 in. in size. For road work $1\frac{1}{2}$ in. is commonly used. Generally, however, in reinforced C. structures, all the aggregate should pass through a sieve with $\frac{1}{2}$ -in. meshes, or meshes $\frac{1}{2}$ in. less in size than the distance between the most closely spaced bars, whichever is the smaller. In thin walls the largest particles of aggregate should not exceed one-fifth of the thickness of the C.

Grading of Aggregate.—If C. is to be strong, watertight, and durable it must be dense. A cub. ft. of solid stone weighs about 160 lb. When it is in the form of coarse aggregate it weighs about 100 lb., so that more than one-third is voids. The cheapest material with which to fill these voids is smaller stones, and there must be smaller and still smaller particles to fill the spaces between all the sizes larger than the smallest. The more carefully an aggregate is graded the stronger a C. will be if all other processes are the same. The ideal aggregate is one comprising all sizes from the largest to the smallest in the proportions that produce greatest density, and this can best be obtained by dividing the aggregate into two sizes, the coarse and the fine. Coarse aggregate is all the material retained on a sieve with $\frac{1}{2}$ -in. meshes. Fine aggregate is the material that will pass

through a $\frac{1}{4}$ -in. sieve, with any excess of dust removed. If the coarse and fine materials are both properly graded, then a suitable aggregate is produced by mixing them together in the proportions of about 2 parts of the coarse aggregate to 1 part of the fine aggregate because the fine material is more than sufficient to fill the voids in the coarse. Fine aggregate is sometimes screened out and only the coarse material, say that between $\frac{1}{4}$ in. and $\frac{1}{2}$ in., used with the object of providing a C. that will have insulating value due to the presence of voids.

Proportions of Materials.—So long as the materials, workmanship, and manufacturing processes are the same, the strength of C. depends upon the quantity and the strength of the cement paste it contains. By proportioning is meant the selection of the quantities of cement and aggregate to be used in a C. or, more frequently, the quantities of cement, fine aggregate, and coarse aggregate, to produce a C. of a required strength.

When aggregates are separated into fine and coarse, and then mixed together in the proportions that will give greatest density, the combined bulk will be little, if any, greater than the bulk of the coarse aggregate alone, because most of the fine aggregate will fit in between the pieces of coarse aggregate. Thus a mixture comprising 1 part of cement to 6 parts of all-in mixed aggregate (a 1 : 6 mixture) will contain less cement than a mixture comprising 1 part of cement, 2 parts of fine aggregate, and 4 parts of coarse aggregate (a 1 : 2 : 4 mixture); in the 1 : 2 : 4 mixture most of the fine material will fit into the spaces between the coarse aggregate, so that the mixture will, in fact, be 1 part of cement to 4 to 5 parts of combined or 'all-in' aggregate.

For ordinary work C. in the proportions of 1 part cement, 2 parts fine aggregate, and 4 parts coarse aggregate (or 1 part cement to 4 to 5 parts 'all-in' aggregate) is suitable. For work that must be watertight, or where extra strength is required, the mixture should be 1 part cement, $1\frac{1}{2}$ parts fine aggregate, and 3 parts coarse aggregate (or 1 part cement to 3 to $3\frac{1}{2}$ parts of 'all-in' aggregate). For work of minor importance a mixture of 1 part cement to 3 parts fine aggregate and 6 parts coarse aggregate (or 1 part cement to 6 to $7\frac{1}{2}$ parts 'all-in' aggregate) is sufficient.

Strength of Concrete.—In ordinary good-class C. the following strengths may be expected. The figures are crushing strengths 28 days after placing C. made with ordinary Portland cement, ballast, and sand: 1 : 1 : 2 mixture, 4500 lb. per sq. in.; 1 : $1\frac{1}{2}$: 3 mixture, 3750 lb. per sq. in.; 1 : 2 : 4 mixture, 3000 lb. per sq. in. Where special precautions are taken to control the quality of C., these strengths can be considerably exceeded and strengths of 8000 and 10,000 lb. per sq. in. are fairly easily obtained.

Water Content.—Cement will not begin its chemical action of setting and hardening until it is wetted, and $1\frac{1}{2}$ hrs. or so after water is added the setting process becomes noticeable. The water

combines with the cement and makes a paste which coats the particles of aggregate and binds them together. The amount of water determines the strength of the cement paste and therefore of the C. so long as the same amount of cement is used. If the quantity of cement remains the same, the more water that is added the weaker becomes the cement paste and the weaker the finished C. If more water must be added to make the C. workable enough for the work in hand, then more cement must be added to keep up the strength of the cement paste if the strength of the C. is to be maintained.

Too little water will also make a weak C. because it may not be sufficient to enable the chemical action of the setting of the cement to proceed properly, for setting only goes on while the cement is moist, and stops as soon as the C. dries out. A good rule to follow is to use no more water than is necessary to enable the C. to be placed and compacted. A good average C. is obtained by the use of 6 gallons of water to a bag (112 lb.) of cement. Porous aggregates, such as broken brick, pumice, and foamed slag absorb some of the mixing water, and this must be allowed for by soaking the aggregates before they are mixed.

Mixing.—If the materials are mixed by hand the aggregate should first be measured and spread out on a clean mixing platform and the cement spread on top. The coarse material should be spread out first, followed by the fine material, and then the cement on top. After the materials have been mixed dry until the colour is uniform they should be shovelled to the shape of a saucer so as to retain water, and the water poured into the middle. The materials and water are then mixed by shovelling from the side to the middle, and then turning over the heap to a different part of the platform and back again until the water is evenly distributed.

Machine mixing is more efficient and cheaper than hand mixing, such machines generally being in the form of steel drums rotated by power. In machine mixing it is not necessary first to mix the materials in the dry state. Very small machines are fed by filling the dry materials into the drum by shovel; larger machines are charged by means of a skip or from an overhead bin. The water is added when the dry materials are in the drum. All except the smallest mixers are fitted with tanks with a ball-cock or other device which enables the correct quantity of water to be added to the batch.

Continuous mixers have separate hoppers for cement and aggregates which are taken by Archimedean screws to the mixing compartment from whence the mixed C. is discharged through a spout in a continuous flow. The size and rate of rotation of the screws determine the quantity of each material carried into the mixing compartment, and thus automatically proportion the mixture.

A recent innovation in Britain is the supply of ready-mixed C. At a central depot the dry materials are filled into a mixing drum mounted on a lorry chassis

and the water is filled into a tank over the drum. As the lorry, known as a 'truck mixer,' approaches the site the driver empties the water into the drum and causes the drum to rotate and mix the C. The drum is emptied by running the C. down a chute into a hopper or on to a platform.

Placing in Position.—If the site for a floor or road slab is muddy, hardcore should be rolled on to it to make a level surface, or 3 in. of lean C. (say 1 : 10) laid over it before the structural C. is placed. The site must also be brought to an even surface, as irregularities will cause variations in the thickness of the slab.

The depth of C. placed in each layer or 'lift' in walls and columns depends upon its consistency and the strength of the shuttering. Very stiff C. should be placed in lifts of 4 in. to 6 in. Wetter mixes may be placed in lifts of 2 ft. or 3 ft. so long as they can be properly consolidated. Wet C. exerts a side pressure similar to water, and it is probably true to say that most collapses of shuttering have been due to placing wet C. at too rapid a rate, when it is placed in small lifts the lower lifts have time to harden, or partly harden, and the pressure on the shuttering is reduced before fresh lifts are placed. Each lift of C. should be the same depth throughout the work, and the C. should be spread evenly in the shutters.

Consolidation.—Each lift must be consolidated and worked well into the layer below. In the case of stiff mixes, heavy rammers should be used. A piece of wood, or a reinforcement bar with the bottom bent at right-angles, is a useful tamping tool in confined spaces. For road and floor slabs, 6 in. by 3 in. timbers with handles fitted at each end may be used by two men, one on each side of the slab. Tamping must be continued until air bubbles cease to escape and a film of moisture appears on the surface; it is then discontinued.

The C. must be well spaded against the shutters in order to produce a dense face and to prevent 'honey-combing' of the surface, but the tamping must not be carried on to such an extent as to weaken the body of the C. by bringing an excess of cement to the face. C. should not be disturbed after it has begun to set, and for that reason the mixing, placing, and tamping of each batch should be finished in less than an hour after water has been added. Excessive trowelling or tamping brings neat cement and water to the surface, and this will set as a skin which will flake off if it is on a floor subjected to traffic, or crack if it is on a surface subjected to changes of temp. Excessive trowelling of wet C. is the commonest cause of 'dusty' floors.

Consolidation can be assisted by hammering the shuttering with a mallet, the vibration thus set up helping the pieces of stone to slip into place and also helping to produce a smooth face. Vibrating machines for consolidating C. are of three types, namely: (1) vibrators for attachment to the outside of the shuttering; (2) vibrators which are pushed into

the C.; and (3) plate vibrators which are placed on the C. so that the vibrations are imparted in a downward direction; these are generally used for floor and road slabs.

Construction Joints.—When concreting is stopped for more than an hour, a stop-board must be used to keep the edge vertical and the C. well tamped up to the board. Any scum must be removed before more C. is placed, and the new C. thoroughly tamped against that already in position. If the work has to be left until the older C. is hard, then the surface must be hacked to form a key for the new C. After hacking, a wire brush should be used to remove dust and loose material, the old surface thoroughly wetted and brushed over with a very thin coating of mortar mixed in the proportions of 1 part of cement to 2 parts of sand, and the fresh C. then placed. This applies to all cases where new C. is bonded to old.

Concreting under Water.—When C. is placed under water a tremie is used. This is a pipe with a funnel at the top and a valve at the bottom, and is sufficiently long for the funnel to be above water when the bottom of the pipe is resting on the bed of the sea or riv. The C. is fed into the funnel, and the pipe is raised as the level of the C. rises. Care must be taken to keep the pipe full of C. in order to prevent water from entering. If there is much movement of the water, such as occurs in a flowing stream, it is necessary to provide a cutler-dam so that the work can be done in the dry.

Guniting.—C. may also be placed by a cement gun. In this process C. is 'shot' on to an existing structure. The materials are mixed dry and fed to a hose through which they are forced by compressed air. When the dry materials reach the nozzle, water is added by a jet. Due to the force with which it impinges against the surface to be treated, gunite is very dense and waterproof, and is mostly used for repairing or strengthening structures built of C., brick, or other material.

Hardening.—Cement sets and hardens only in the presence of moisture, and when the mixing water dries out the setting and hardening stop. Setting and hardening will also stop if freshly placed C. is exposed to freezing temp., because the water will change to ice; further, when frozen C. is thawed out the surface will flake off, because when water changes to ice it increases in volume and causes disintegration. If C. is to harden properly it should remain moist and warm until it has gained the greater part of its ultimate strength. For normal purposes this period can be taken as seven days with ordinary Portland cement, four days with rapid-hardening Portland cement, and twenty-four hours with high-alumina cement. During these periods the C. must be protected against drying winds, hot sunshine, and extreme cold. C. should not be placed when the temp. is below 40° F., unless precautions are taken to prevent the C. falling below that temp. When the temp. does not fall below 30° F., the

addition of 2 lb. of calcium chloride per cwt. of cement expedites setting.

Surface Finish.—There are two main trends in the treatment of C. surfaces. One is to produce a surface that will need no, or very little, finishing after the shuttering is stripped, and the other is painting, rendering, brushing, or bush-hammering. Shuttering for the production of smooth surfaces should be of steel or plywood. The C. must be thoroughly spaded against the shuttering in order that the face of the C. shall be as free as possible from holes due to entrapped air and water pockets. If a smoother surface is required the C. can be rubbed with carborundum bricks or power-operated carborundum disks after the face has been made good. Ordinary oil paint is not suitable for use on C., because it is affected by the free lime in the cement. Paints specially made for the purpose are available in a variety of hues. Coloured and white Cs. are made with aggregates and cement of the desired colour. Generally the aggregate is crushed natural stone, and this is used with cement of the same colour.

When C. is tamped or vibrated a skin of cement and fine material is brought to the surface and the face of the work has the appearance of neat cement. If this skin is removed the aggregate will be seen on the face. To make the aggregate visible on the face of the work is the object of 'exposed aggregate' finishes. The methods usually adopted are scrubbing and hammering. In the scrubbing process the best results are obtained if the shutters can be stripped within 48 hrs., or at any rate before the cement is too hard to be brushed off. The scrubbing is done with a wire brush, using plenty of water, until the surface skin of cement is removed. If a hammer is used the work is best done when the C. is hard. For unimportant work C. surfaces can be improved by hammering off this and projections, filling holes with mortar, and giving the whole surface a brush coat of grout mixed in the proportions of 1 part of Portland cement to 3 parts of sand.

Floor Surfaces.—Hard-wearing floor surfaces, known as granolithic, are topplings 1 in. to 2 in. thick of a dense concrete made with crushed granite or other aggregate with a high resistance to abrasion. The usual method of hardening a C. surface is to apply a solution of 1 part of silicate of soda to 4 parts of water. The solution must be copiously brushed on with a soft broom, and three applications at intervals of twenty-four hrs. are desirable. The simplest way to make a non-slip C. surface is to form grooves in it or roughen it with a brush before it hardens. Another method is to sprinkle carborundum powder on the surface before it is hard, or iron filings may be mixed with the top in. or so of C.

Precast Concrete.—C. products are made separately in moulds. Almost every part of a building that is commonly made in wood or stone can be made in C., from members weighing many tons such as sectional bridges and blocks for harbour

wharves to roofing tiles, and include C. poles and posts, paving flags and kerbs, manholes, stairs and steps, and so on. Steel and wood are generally used for the moulds, but plaster piece-moulds and gelatine moulds are used for ornamental work. Power machines are used for the mass production of wall-blocks, paving flags, kerbs, roofing tiles, and other common C. products. See A. C. Davis, *Portland Cement*, 1934; J. Singleton-Green, *Concrete Engineering*, 1933-35; F. M. Lea and C. H. Desch, *The Chemistry of Cement and Concrete*, 1935; W. H. Glanville (ed.), *Modern Concrete Construction*, 1939; H. L. Childe, *Concrete Products and Cast Stone*, 1940.

Concrete, in logic, term opposed to abstract, usually defined as a term applied to or signifying persons or things as opposed to abstract terms, signifying qualities; thus a sweet taste is C., sweetness is abstract; red as a colour is C., redness is abstract. However, some logicians place adjectives apart as attributes.

Concretion, see under GEOLOGY.

Concubinage. Cohabitation of a man with a concubine is a very ancient custom. Among the Gks. married men were allowed to have concubines; the position of the latter was not utterly despised, and their children had some status, if recognised by their father. The Rom. law, too, recognised concubines; their position was in many cases respectable, but Augustus, to encourage regular marriages, passed the Lex Julia and the Lex Papia Poppaea, which enacted that only women of low rank should be chosen as concubines. The children of concubines were not legitimate, but were called natural, and their right of inheritance was very limited, though they were rendered legitimate if their parents afterwards married. In the O.T. times C. was permitted as a relief from a barren marriage, and was extensively practised. The ancients had laws which permitted a sort of informal marriage similar to a *morganatic* union. Christianity did not permit such irregular unions, and Constantine the Great was the author of legislation intended to check the practice. The E. empire also prohibited C. Under the law of France, if a man brings a concubine to stay in the same house as his wife, the presence of the former entitles the latter to divorce.

Concussion of the Brain, form of shock where the injury received has shaken the brain and reduced the patient to a state of stupor, without producing any mechanical injury to the brain or skull. Any severe blow on the head will cause concussion; the symptoms are complete unconsciousness, with pallid cold skin, and feeble pulse. This condition continues for length of time varying with the severity of the shock received, when the pulse becomes stronger and consciousness returns. Though the recovery from concussion is usually complete, such symptoms as loss of memory may remain for some time. The patient should be put to bed as quickly as possible with hot-water bottles, and should then be left alone. No stimulants should be given

unless specially ordered by the doctor in charge; and during the period of recovery all excitement is to be avoided.

Condamine, La, Charles Marie de, see LA CONDAMINE, CHARLES MARIE DE.

Condapilly (Kondapilli), small tn. and hill-fortress of India, Madras Presidency, on R. Kistna, 50 m. from Masulipatam. No longer important as a fortress, it manufs. small figures and toys from a light wood obtained near by (*Gyrocarpus Jacquin*). Pop. about 5000.

LOUIS I. DE BOURBON, PRINCE DE CONDÉ

Condé, Henry I. de Bourbon, Duc d'Enghien, Prince de (1552-88), son of Louis I., a Fr. Huguenot leader; he fought for Henry of Navarre under Adm. Coligny. To save his life after the massacre of St. Bartholomew he embraced the Catholic faith, but on the death of Charles IX. he recanted and went to Germany, where he raised an army and joined Alençon, 1575. Eventually he was taken prisoner and d. from the effects of poison supposed to have been given him by his wife, Catherine de la Tremouille.

Condé, Henry II. de Bourbon, Duc d'Enghien, Prince de (1588-1646), son of Henry I. and father of the 'Great C.' He was a Rom. Catholic, and in 1609 Henry IV. brought about his marriage with Charlotte Marguerite de Montmorency. To save his wife from the king who had also fallen in love with her, C. fled to Spain and remained abroad until after the assassination of Henry (1610). On his return he started an intrigue against Marie de' Medici, the regent, which resulted in his imprisonment. After his release he decided to adopt a policy of loyalty, and to this end fought zealously against the Protestants, and became one of Richelieu's most faithful adherents. He was made president of the Council of Regency when Louis XIII. d., 1643, and

his second son, Armand, was founder of the house of Conti.

Condé, Louis I. de Bourbon, Prince de (1530-69), fifth son of Charles de Bourbon, duke of Vendôme, and younger brother of Antoine, king of Navarre. He was the first to bear the famous title, and had a distinguished military career under Marshal de Brissac in Piedmont, at Metz while Charles V. was besieging it, and in the battle of St. Quentin. A supporter of the Huguenots, he was one of the leaders in the conspiracy of Amboise, designed to remove Francis II. from the Guise influence and make him acknowledge the Huguenot faith, and only the death of Francis saved his life. On the accession of Charles IX., Catherine de' Medici made him governor of Picardy. In 1562 he took command of the Huguenot army against the Guises and was captured at Dreux, but released again by the treaty of Amboise, 1563. When renewed trouble broke out C. was again leader, and after a brilliant fight at the battle of Jarnac he surrendered, and was treacherously shot.

Condé, Louis II. de Bourbon, Prince de (1621-86), the 'Great C.' an eminent and talented Fr. general. B. in Paris. Acquired during his education a taste for literature, which stood him in good stead at the close of his career. He bore the title of duc d'Enghien during the lifetime of his father; he defeated the Spaniards at Rocroi in 1643, Mersey at Nördlingen in 1645, and took Dunkirk for the Fr. in 1646. In this last year he succeeded to his father's kingdom and title, and since he had wedded Richelieu's niece in 1641, this accession to his power made him one of the most important personages in the realm. He at first took the side of the Court against the Parliament and the nobles, and brought back the young Louis XIV. to Paris in 1649. He imagined himself ill treated by Mazarin, however, and put himself at the head of the faction of the Petits Maitres; he was captured and imprisoned by Mazarin in 1650. After a year the union of the old and new Frondes brought about his release, and he marched upon Paris and fought an indecisive battle in the suburb St. Antoine. Many of his adherents left him, and he joined the Spaniards, who appointed him generalissimo of the Sp. armies. He fought for the Spaniards at Arras in 1654, Valenciennes in 1656, and Cambrai in 1657. He was defeated at the battle of the Dunes by Turenne in 1658, and was only restored to his rank in France by the peace of the Pyrenees in 1659. He was charged with the task of reducing Franche-Comté, which then belonged to Spain, to submission, which he succeeded in doing in the short space of three weeks. He afterwards fought the Dutch at Senefte, 1674, defeating the Prince of Orange (afterwards William III. of England), and in the following year drove Montemar out of Alsace. Four years later he retired to Chantilly, where he enjoyed the society of Molière, Boileau, La Bruyère and others, and d. at Fontainebleau.

Condé, Louis Antoine Henri de Bourbon, see ENGHEN, DUC D'.

Condé, Louis Joseph de Bourbon, Prince de (1736-1818), son of Louis Henry, duke of Bourbon (1692-1740); he joined the army at the commencement of the Seven Years war, and distinguished himself by his victory at Johannsberg, 1762. He was for some time governor of Burgundy and, when the revolution broke out, commanded the 'army of Condé' for the king, joining the Austrians until the peace of Campo Formio in 1707. He then went to Poland and fought for the emperor of Russia, afterwards going to Bavaria in the pay of England. In 1800 he settled at Malmesbury in England, but returned to France on the restoration of Louis XVIII. He was the author of an *Essai sur la vie du grand Condé* (1798).

Condekerque Branche, vil. situated on the N. coast of France, in the dept. of Nord. It is 3 m. from Dunkirk. Pop. 600.

Condell, Henry (1757-1824), Eng. violinist and composer. He distinguished himself in the orchestras of the King's Theatre, Drury Lane, and Covent Garden, and composed overtures and incidental music for various plays and operas, including Fawcett's *Enchanted Island*, 1804; Reynolds's *Bridal Ring*, 1810; *Love Laughs at Locksmiths*, adapted by Colman, and *Aladdin*.

Condenser, apparatus for condensing steam or other vapour into the liquid form by introducing cold water into the vapour, or by passing the vapour through cold water. See STEAM ENGINE and TURBINES for the various forms of C.

Condenser, Electrical. A condenser may be defined as an arrangement by which the capacity of a conductor is artificially increased. It is shown in electrostatics that if Q is the charge of a conductor and V its potential, the ratio $\frac{Q}{V}$ is constant, and is called the capacity, C , of the conductor. Thus $C = \frac{Q}{V}$. Therefore any arrangement which decreases V while Q is kept constant increases C and is a condenser.

Explanation of the Action of Condenser.—Consider the simplest case of a condenser, namely, that of two parallel plates. Suppose A and B are two equal, parallel, metal plates, each of which is connected to an electroscope (see ELECTROSTATICS). Give A a positive electric charge Q , by connecting it to the terminal of a friction machine. When A is positively charged, it is given a certain positive potential. When B is insulated and brought up to A , its potential is lower than that of A . Thus the potential of A decreases, and its leaves close somewhat, whilst the potential of B increases and its leaves open. If B is earth connected, its potential is lowered to zero, and the potential of A is lowered still further by the presence of B , causing A 's leaves to close still further. Thus to raise the potential of A to its initial value it is necessary to give it

a further charge. The presence of B condenses the charge on A , if the potential of A is kept constant. The greatest effect is produced when B is earth connected. With this simple apparatus the important fundamental facts concerning condensers can be demonstrated.

It can be shown that as B is brought nearer to A , the leaves of A close further still, showing that its potential is decreasing and its capacity increasing. If the plates are close together, the capacity varies inversely as the distance between them. A is called the positive armature of the condenser, B negative armature, whilst the medium between A and B is called the dielectric. If a slab of a good insulator, say sulphur, is placed between A and B , the leaves of A close still further, showing that the capacity of the condenser depends on the dielectric.

Capacity of Plate Condenser.—Suppose that the plates are closer together so that the tubes of force from A all end on B as shown in the diagram, and that the dielectric is air. If the area of each plate is S , sq. cm. the capacity of the condenser (in farads) is $\frac{S}{4\pi d}$ where d cm. is their distance apart.

Capacity of Spherical Condenser.—A spherical condenser consists of two concentric spheres, of radii ' a ' and ' b ', $b > a$. Suppose that air separates the spheres, and that B , the outer sphere, is connected to earth. The capacity is $\frac{ab}{b-a}$.

Energy of a Condenser.—The energy of a condenser is $\frac{1}{2} QV$ (see ELECTROSTATICS). Since $C = Q/V$ the energy of the condenser can also be expressed in the alternative forms, $\frac{1}{2} CV^2$ or $\frac{1}{2} Q^2/C$.

Specific Inductive Capacity.—Faraday made numerous experiments with a spherical condenser to determine the effect of the dielectric on the capacity. He found that the capacity varied with the dielectric, and he called the ratio of the capacity when the substance was dielectric, to the capacity when air was dielectric, the specific inductive capacity of the substance. It is usually designated by K .

Practical Forms of Condenser.—For purposes of demonstration the Leyden jar is the most common form of condenser. The invention of the Leyden jar was the result of an accident. In 1746 a physicist, Cuneus, was electrifying water by holding a flask of water in his hand, and allowing a chain which was connected to the conductor of an electric friction machine to dip into the water. On taking the chain out of the water, he received a severe shock. It took him two days to recover from the effects. The news of this shock led to investigation which has resulted in the modern Leyden jar. The Leyden jar consists of a wide-necked bottle, coated both inside and out for about four-fifths the height with tinfoil. The mouth of the bottle is closed with an insulating cork, through which passes a metallic rod, terminating above in a knob, and connected below to the inner coating by a chain. The glass should be of a non-hygroscopic nature, and to ensure its dryness the exposed portions of the glass are covered with shellac varnish, which is less hygroscopic than glass. The two coatings of foil form the armatures of a condenser whilst the glass is the dielectric. The outer coating is usually earth connected, and a positive charge given to the inner foil by connecting the knob to the conductor of a friction machine.

Leyden Jars in Parallel.—This arrangement is obtained by connecting all the inner coatings together, and connecting the outer coatings to earth. If C_1, C_2 , etc., are the capacities of the jars and C that of the system, $C = C_1 + C_2 + \dots$

Leyden Jars in Series.—This arrangement is obtained by insulating the outer coatings by placing the jars on slabs of sulphur and connecting the inner coating of one jar to the outer coating of the next, and so on. With the same notation as above, in this case we have

$$\frac{1}{C} = \frac{1}{C_1} + \frac{1}{C_2} + \dots$$

Seat of Electric Charge.—Benjamin Franklin showed that the seat of the electric charge is the dielectric. He formed a Leyden jar which could be taken apart. The inner coating can be lifted out of the glass, and the glass out of the outer coating, by means of insulated hooks. He charged the jar in the usual way, and then took it apart and tested the parts separately. He found that the glass

was the only part charged, showing that the seat of the charge is the surface of the dielectric.

A form of condenser for accurate work was devised by Lord Kelvin. It consists of a number of sheets of tinfoil insulated from each other by sheets of mica or paraffin paper. The odd sheets of foil, i.e., the first, third, fifth, etc., sheets are connected together, and to one terminal of the condenser. The other sheets are connected together, and to the other terminal of the condenser. During recent years the electrical condenser has made great strides owing to the popularity of wireless and the growth of cheap electricity. In wireless work the condensers used are of a very small capacity, ranging from 0.001 to 2 mfd. The small fixed condensers are made of small plates of brass foil about $\frac{1}{16}$ in. thick, separated by thin mica strips; the larger condensers use waxed paper as the dielectric, and are thus more bulky relatively than the mica condenser. Variable-air condensers are also used in wireless work. They are composed of aluminium vanes about $\frac{1}{4}$ in., separated by about the thickness of the vane. The vanes are mounted alternately on a fixed and a moving spindle, so that the area of one set overlapping the other can be varied from nil to full. The vanes were originally semicircular in shape, but with this type the capacity did not vary in direct proportion to the overlap, and this was remedied by shaping the vanes so that the capacity was proportional to the square of the angle of rotation of the knob of the condenser. In the modern power-house the improvement of the power factor is a big problem for the engineer, and the condenser affords him most material assistance. The condensers are usually connected parallel with one another and parallel with the applied load, so that the leading current taken by them will balance, totally or partially, the lagging current taken by the load. In overhead transmission condensers are used to protect switchgear and transformers from lightning. When the overhead conductor is struck the resultant surge of high voltage which flows along the line is simply absorbed in the condenser at the end of the line.

Condensing Engines, see under STEAM ENGINES.

Conder, Charles (1868–1909), Eng. artist, *b.* in London, son of a civil engineer, educated in England; was in the Australian Gov. service (1884–90) but in 1890 turned to art, studying at the Société Nationale des Beaux Arts, Paris. He attracted attention with his painting 'The Hot Wind' (1890). Developed an original decorative style, especially in water colours on panels of white silk, Watteau-like designs for fans, and charming pictorial scenes. *See J. Rothenstein. The Life and Death of Conder, 1938.*

Conder, Claude Reignier (1848–1910), colonel, Royal Engineers, and explorer, *b.* at Cheltenham. He studied in Italy, and at the University College, London, and the Royal Military Academy, Woolwich. He became head of the survey party at

Nabius, Samaria (1872), and took charge of the survey of Palestine (1872-78 and 1881-82), his *Memoirs* of which were brought out in seven vols., by the Palestine Exploration Fund in 1880. This work is of great value to the student of the O.T. and N.T. hist. In 1882 he was attached to the Egyptian expedition under Garnet Wolseley, and took part in the battles of Kassassin and Tel-el-Kebir. He worked in the ordnance survey of Plymouth (1887-94) and in the W. of Ireland till 1905. C. pub. many scholarly works on archaeological and philological subjects. These include *Tent Work in Palestine* (1878); *Syrian Stone Lore* (1886); *Altaic Hieroglyphs and Hittite Inscriptions* (1887); *The Tell Amarna Tablets* (1893); *The First Bible* (1902); and *The City of Jerusalem* (1909).

Condé-Smendou, com. in the arron. of Constantine, Algiers. It is noted for its wines. Pop. 17,000.

Condé-sur-l'Esaut, tn. of France, in the dept. of Nord, situated at the confluence of the Scheldt, and Hayne, 8 m. N. of Valenciennes. The princes of Condé took their name from this place. Pop. 6400.

Condé-sur-Noireau, tn. of France, in the dept. of Calvados, at the junction of the Noireau and Drouance, 33 m. S.S.W. of Caen. Pop. 4300.

Condillac, Etienne Bonnot de (1715-1780), Fr. philosopher, b. at Grenoble. He spent practically all his life on his estate of Flux, near Heaugency, engaged in philosophical studies, and d. there. His first notable work appeared in 1746, the *Essai sur l'origine des connaissances humaines*. This work, in conjunction with his *Traité des systèmes* (1749), outlines his theory. He explained almost everything by the law of association of ideas, and whilst allied to the principles of Locke, he disagrees with those of Descartes, Spinoza, Malebranche, etc. Sensation is, according to him, the only possible source of knowledge, and all intellectual processes may be traced back to sensation. The clearness and perspicacity of his writings obtained for him the post of instructor to the infant duke of Parma, the nephew of Louis XV. He wrote for him the seven instructional works, including a grammar, elementary books on the arts of writing, reasoning, and thinking, and a hist., and these form seventeen vols. of the complete works of C., pub. in 1798. His teachings exercised great influence in the eighteenth century, and were severely criticised in the early part of the nineteenth century. It was shown by Taine, however, that the modern trend of psychological and physiological research goes to prove that the ideas of C. are well founded. He lived as a recluse, and had Diderot and Rousseau for intimate friends. His works include, besides those already mentioned, *Traité des sensations* (1754); *Traité des animaux*, (1755); *Le Commerce et le gouvernement, considérés relativement l'un à l'autre* (1776). See L. Dewaule, *Condillac et la psychologie anglaise contemporaine*, 1892.

Condiments (Lat. *condire*, to season or pickle), any substances of pronounced

flavour used as seasoning agents, to give relish to food or stimulate the appetite. Many C. are essential. Among the chief are salt, vinegar, olive oil, sugar, and aromatic or pungent C., such as spices, mustard, pickles, pepper, and ginger.

Condition. In the law of contract (q.v.) the non-fulfilment of a C. *precedent* by one of the parties disentitles him from enforcing the contract against the other party. By a C. precedent is meant some act to be performed or some contingency to be fulfilled or some time to elapse before one party can be called on to carry out his part of the contract. For example, if A. agrees in writing to sell his business to B, and they verbally agree that the transfer shall be subject to the consent of A's partner, A cannot be forced to sell until A's partner does consent. Cs. may also be *concurrent*, i.e. each party must perform his agreement at the same time. For example, A. agrees to buy a slate quarry from B, and B agrees to purchase all slate from A: A cannot sue B for not taking slate unless he can show that he was ready to buy the quarry or had bought it. Sometimes the parties to a contract introduce a provision that the occurrence of an event shall discharge them mutually from further liabilities, e.g. that the happening of an accepted risk of a charter-party shall discharge the ship-owner from liability for failure to carry a cargo. Such provision is known as a C. *subsequent*. It is entirely a matter of construction, whether representations or alleged verbal stipulations in any particular can amount to Cs. Not every representation made prior to a contract can be called a C. Whether it be a C. depends on whether the court comes to the conclusion that such statement or representation was the *condition on which the other party contracted*. Cs. must be distinguished from warranties. A warranty is part of the contract itself, whereas a C. is something collateral to it. A breach of warranty only entitles the injured party to damages; the breach of a C. entitles the injured party to repudiate altogether. But the Sale of Goods Act, 1893, expressly provides that in certain cases Cs. shall be implied in a sale, which, if unfulfilled, shall entitle the buyer to repudiate. (As to these see SALE.)

Conditional Immortality, known in the U.S.A. as Annihilationism, is the doctrine that the immortality of the soul is not inherent in the race, but depends on faith and union with Jesus Christ. Its adherents maintain that the Bible invariably speaks of immortality as something to be hoped for, and as a future gift of God. They state that this gift is given by the assumption of a spiritual body after the second coming of Christ. They are thus opposed to the doctrine of Universalism, but not less so to that of the eternal misery of the wicked. These, they say, will undergo the great judgment and then pass through a period of punishment which will end in annihilation. Everlasting destruction or death is thus considered as the antithesis of the everlasting bliss or life of the blessed. The

best exposition of these tenets is given by Edward White in *The Life of Christ* (London), 1875, a somewhat different view being contained in S. D. McConnell's *Evolution of Immortality* (New York), 1901. In 1878 the C. I. Mission was founded to carry on propaganda work in the Brit. Isles.

CONDOR

Conditioned Reflex, term introduced by the celebrated Russian physiologist I. P. Pavlov, to describe certain nervous behaviour the investigation of which has thrown much light upon the activities of the brain. Pavlov noticed that the flow of saliva, for instance, which is normally caused by the taste of food in the mouth, can equally well be caused by the mere sight of food, as indeed is common knowledge; we often say the sight of such and such a luscious object 'makes our mouth water,' and the statement is literally true. The flow of saliva at the sight of food is a *conditioned reflex*. Pavlov showed by experiment that this simple instance could be paralleled in numerous interesting ways. Thus he found that flow of saliva could be produced in a dog by the mere ringing of a bell, the ringing of which had for several previous occasions been followed shortly afterwards by the appearance of food. The importance of a study of C. Rs. is that it enables us to understand better the real nature of intelligence, many actions hitherto ascribed to intelligence proving to be the results of conditioned reflexes. As an aid to the analysis of behaviour, the artificially produced conditioned reflex is of the utmost value, and it is largely employed in experimental psychology. See I. P. Pavlov, *Conditioned Reflexes*, trans. by Auer, 1927.

Conditioning, see GRADING AND CONDITIONING.

Condom, tn. of France, in the dept. of Gers, 25 m. N.N.W. of Auch, situated on a height above the Baise. Formerly it was

the cap. of the large dist. Pays-de-Commois, and was an episcopal see, of which Bossuet was bishop. There is a good trade in brandy, wine, grain, and flour. Pop. 6300.

Condonation, in law, the conditional forgiveness by one spouse of an offence which the other spouse has committed in breach of the marriage vow. The condition is that the party if forgiven will not repeat the offence. C. may be either expressed in writing or implied by conduct. It is a complete bar to proceedings for divorce so long as the condition remains unbroken.

'Condor,' Brit. gunboat, which was commanded by Lord Charles Beresford (then captain) at the bombardment of Alexandria in 1882. Another C. of the R.N. went down with all hands near Honolulu in 1901.

Condor (from Peruvian *cuntur*), *Sarcorhamphus gryphus*, large S. Amer. vulture, found particularly in the region of the Andes, especially in the higher regions, where they make their nests at a height of from 10,000 to 15,000 ft. The general colour is black, and in both sexes there is round the lower part of the neck a white ruff of feathers. Above this the head and neck are bare. The C. feeds on flesh, to obtain which, in default of carrion, he will attack small or aged animals.

Condor Vine, see CONDURANGO.

Condorcet, Marie Jean Antoine Nicolas Caritat, Marquis de (1743-94), eminent Fr. philosophical and mathematical writer, b. at Ribemont, near St. Quentin, of a very anct. family. He was educated at the college of Navarre, and distinguished himself especially in mathematics. He wrote in 1764 his *Essai sur le calcul intégral*, and in 1767 his *Mémoire sur le problème des trois points*. These works, afterwards pub. together under the title of *Essais d'analyse*, and dedicated to the Academy of Sciences, procured for him in 1769 the distinction of a seat in that institution. The facility with which C. treated the most difficult mathematical studies was remarkable, and until 1792 his output was large, as, in addition to the works already mentioned, he contributed frequently to the transactions of the learned societies of St. Petersburg, Berlin, Bologna, Turin, and Paris. His *Éloges des académiciens morts avant 1690* (1773) was immensely popular, and gained for him in 1773 the honour of being made perpetual secretary to the Academy of Sciences. He won the prize offered by the Academy of Berlin in 1777 by his theory of comets, and owing to his acquaintance with D'Alembert he wrote many articles for the *Encyclopédie*. He was not elected a member of the Fr. Academy till 1782, owing to the aversion which was felt for him by Maurepas. When the first Fr. revolution broke out he sided with the people, and was elected deputy to the legislative assembly of Paris. He was soon appointed secretary, and in Feb. 1792 was made president. The legislative assembly was merged in the national convention in Sept. 1792,

and C. was there in sympathy as a rule with the Girondist party. He was in favour of the punishment of Louis, but not of his death, as he believed in the abolition of capital punishment. On the fall of the Girondist party he attacked the new constitution, and was denounced at the Bar on July 8, and later accused of being an accomplice of Brissot. He was protected by Mme Verney for eight months, but learning that she was in danger of death for harbouring him, he fled from Paris, but was recognised and arrested at Clamat. He was found dead in his cell, having probably taken poison, which he always carried about with him. His best-known work was written whilst he was with Mme Verney, *Esquisse d'un tableau historique des progrès de l'esprit humain* (c. 1795). This book is full of enthusiasm for liberty, and maintains the perfect equality of the sexes and the inherent possibilities of mankind. C. was a free-thinker, and had a high standard of virtue. In both his public and private life he was blameless; his application of the problems of philosophy to mundane affairs and the betterment of social conditions is the distinguishing feature of his polemical works.

Condottieri (It. leaders), name given to the captains of those bands of soldiers which overran Italy and held the military power there in the fifteenth century. They were composed of professional fighting-men who would serve under any one who held out prospects of plunder, the idle riff-raff of the country, and criminals fleeing from justice, with a proportion of men who had lost their all in the wars. Naturally with such ingredients the chief objective of the armies was always plunder; it was immaterial to the combatants which of the contending govs. gained the victory. Though most of the C. of this period were simply glorified brigands, one or two of them were faithful to one party, notably the Englishman, John Hawkwood, who was always on the side of the Guelphs. After some time the C. became heads of organised bodies of men, and sev. attained much power and position. Albéric de Barbiana was a powerful influence, and Attendolo Sforza made himself king of Milan, and handed down his sovereignty to his descendants. The decadence of the C. followed, however, and, as might have been expected from the composition of the armies, many so-called battles were fought with hardly any loss of life. At the battle of Zagonara (1423), only three lives were lost, and at those of Castracaro and Molinella none at all.

Condrieu, small tn. of France, in the dept. of Rhône, situated on the R. Rhône, 20 m. S. of Lyons. It is noted for its wine. Pop. 2200.

Conductance (in electrical engineering), conductive capacity, for which the *mho* is the unit, the reciprocal of resistance.

Conduction of Electricity. Electricity can be transmitted through matter, and the process of transfer is called C. In solids and in liquid metals C. is due to a flow of electrons, or charges of negative

electricity, from points at low potential to ones at higher potential. The electrons (*q.v.*) are furnished by the atoms of the material, and the atoms as a whole take no part in the movement. Metals contain many electrons that are free to move with relatively little hindrance from the parent atoms, and such materials are therefore good conductors. In the other solids the electrons are more tightly bound to the atoms, and C. occurs less readily. Increase of temp. frees more electrons, so the conductivities of non-metallic substances increase with rising temp., whereas those of metals fall. C. in gases and in many liquids involves not merely a flow of electrons, but of atoms or groups of atoms as well. When a quantity of the salt sodium chloride, for example, is dissolved in water the atoms are not electrically neutral, but the chlorine atoms have each gained an electron and become negatively charged, while the sodium atoms have each lost one and become positively charged. These charged atoms, or ions, can move through the liquid and transport electricity (see ELECTROLYSIS). In gases the molecules can become charged, under suitable conditions, by gaining or losing electrons, and so the gases also become conductors. As gases are ionised with some difficulty, however, they are, under normal circumstances, almost completely non-conducting. They are more readily maintained in a conducting state at high temps., as in the electric arc, or at low pressures, as in electric discharge lamps. C. can also occur in a vacuum, as a stream of electrons, if a suitable source of these is provided (see VACUUM TUBES).

Solids differ enormously among themselves in their electrical conductivities, good conductors such as the metals silver, copper, and aluminium at ordinary temps. having conductivities millions of millions of millions of times as great as those of so-called insulators such as sulphur, rubber, and paraffin wax. At very low temps. certain metals such as lead become almost perfect conductors, and if a current is set up in a ring of a metal in this superconducting state the current persists for a considerable period without any further energy being supplied to it. In all other cases the flow of a current through a conductor is accompanied by a loss of energy as heat, and a continuous supply of energy is required to maintain the current. The production of heat is sometimes useful (*e.g.* in electric radiators or incandescent filament lamps). Sometimes it represents mere waste, as in the heat generated in supply mains. To reduce these losses the mains are made of good conductors (copper or aluminium). The heat losses can also be reduced if the power is transmitted at high voltages, since for any required power the current is then smaller. For this reason the transmission of power over long distances is usually at many thousands of volts (in the Brit. Grid at 11,000, 33,000, or 132,000 volts). The chemical changes that are caused by the flow of current through solutions are of value for the

production or purification of certain materials, and for electroplating (see **ELECTROLYSIS**). A magnetic field (see **MAGNETISM**) is always present in the space around a conductor in which a current is flowing, and the generation of electric current and many of its uses depend upon this fact.

A current that flows always in the same direction in a conductor is called a direct current (D.C.), and one whose direction is periodically reversed is an alternating current (A.C.). The current in the grid is A.C. of fifty cycles; that is, it flows fifty times per second in each direction, reversing its direction 100 times per second. Because the magnetic field produced by A.C. is continually changing, and interacts with the current in the conductor, the behaviour of A.C. is more complex than that of D.C. (see **ELECTRICITY**, *Electromagnetic Induction*). A.C. possesses certain advantages, however. In particular its voltage can be changed at will by means of transformers (q.v.). It can therefore be generated at moderate voltages, stepped up to a higher voltage to reduce heat losses during transmission, and stepped down to lower and safer ones for use in motors, in factories, and for domestic purposes.

Conduction of Heat. Heat may be transferred in three ways; by radiation, by convection, and by C. Radiation is a process of transference of energy by a wave-motion in the ether, and is the same process as that by which light is transmitted. It can occur in a vacuum as well as through some kinds of matter. Convection occurs in fluids only, and in this process the material is heated at one point and then caused to flow to another where it gives up its heat again. The flow may be due to the expansion of the material, as in the convection currents up a chimney below which a fire is burning (natural convection), or may be caused by the action of a fan or pump (forced convection). C. differs from convection in that the flow of heat is unaccompanied by a flow of matter, as when a poker that is heated at one end in a fire becomes warm at the other end. It may occur in gases or in liquids, but is of more importance in solids. Metals are good conductors of heat, and owe their high thermal conductivities to the presence of free electrons, so the best conductors of electricity are also the best conductors of heat. Good conductors are essential for such articles as steam boilers, domestic cooking utensils, etc., while poor conductors are required for house walls, furniture, and clothing, where it is desirable to limit the transfer of heat. The thermal conductivities of air and other gases are low, so porous and fibrous materials such as felt, asbestos, and woollen materials, serve as relatively good insulators of heat on account of the high proportion of air contained in their interstices.

Conductor, in music, the director of a chorus or orchestra. The practice was first introduced into England by Spohr at a Philharmonic concert in London in

1820. Previously, the first violinist set the time, while the C., seated at a piano-forte or harpsichord, accompanied the performers with a few leading chords. An orchestra is now invariably led by a C., who faces the performers and beats time with a baton. A good C. must have first studied his music so as to be thoroughly familiar with the score. He must realise the possibilities of all the voices and instruments under his direction and be able to bring out the best that is in them. Above all, he must be a good musician and have interpretative talent. The C. has to rehearse his performers beforehand, separately and together, so that they become familiar with his methods and his intentions, and at public performances can carry out his instructions by watching his eyes and his movements. Many great musicians, such as Haydn, Mozart, Beethoven, Wagner, etc., have conducted their own work, but creative genius is not essential to a great C. The idea of interpretative conducting originated in the first half of the eighteenth century, probably with Stamitz (1719-61). Among famous Cs. may be named Liszt, Berlioz, von Bülow, Costa, Richter, Nikisch, Mottl, Mahler, Paur, Sucher, Hallé, Strauss, Ysaÿe, Sousa, Weingartner, Wood, Hamilton Harty, Dan Godfrey, Beecham, Toscanini, Stokowsky, Furtwängler, and Boult. See Sir A. Boult, *A Handbook on the Technique of Conducting*, 1937; D. Brook, *Conductor's Gallery*, 1945.

Condurango, or **Cundurango**, name applied to sev. species of *Asclepiadaceæ* found in S. America, but especially to the plant *Marsdenia C.* (condor vine). The bark yields a drug used as a remedy for snake-bites and chronic dyspepsia.

Condyle, rounded eminence in a bone which serves to articulate it with another bone. Such structures occur in the femur, the humerus, the jaw, and the occipital bone.

Condyloma (plural *condylomata*), wart-like growth or tumour near the genital organs or the anus. It may be pointed, or, in the case of syphilitic C., broad, flat, and moist.

Condylura macroura, species and genus of the New World moles, is an insectivorous mammal of the family Talpidae. The animal is about 7 in. long, 2½ in. being taken up by the tail, whence the name long-tailed condylure; at the end of the snout there is a curious radiating structure from which the creature is sometimes called the star-nosed mole. The fur is a deep lustrous brown above, lighter beneath; in habit the condylure is a burrowing animal, and its diet consists of worms, insects, and their larvæ.

Cone, surface generated by a straight line which passes through a fixed point and is intercepted by the circumference of a fixed curve. The moving straight line is called the generator, the fixed point the vertex, and the fixed curve the directrix. The term is also applied to the space enclosed by the curved surface and

the fixed curve, and often refers to a right circular C., which is defined by Euclid as the solid figure formed by the revolution of a right-angled triangle about one of the sides containing the right angle. The side about which the triangle revolves becomes the axis of the C., and its length becomes the altitude; the circle described by the other side containing the right angle becomes the base. An oblique C. is one in which the base is not at right angles to the axis. Some of the characteristics of a conical surface are: All planes tangential to the curved surface pass through the vertex; the curved surface is 'developable,' that is, it can be unrolled to form a plane, or conversely, a plane surface can be wrapped round a C. without rupture or wrinkling. The curved surface when unrolled becomes a sector of a circle whose radius is the slant height of the C. Its area is one-half the slant base multiplied by the perimeter of the base. The volume of a C. is one-third that of a cylinder with the same base and height; therefore it may be measured by multiplying one-third of the height by the area of the base, the area of the base being πr^2 , where $\pi = 3.14159 \dots$ and r = the radius of the base. Similar Cs. are those in which the axes and the diameters of the bases are proportionals. A truncated C. is formed when the upper part containing the vertex is cut away by a plane parallel to the base. In machinery the term C. is applied to a truncated surface tending to converge to a point.

Conegliano, tn. of N. Italy in the prov. of Treviso. 35 m. N. of Venice. It has a fine cathedral, containing an altar piece by Cima (1492), the ruins of a castle, and a loggia with sculptural monuments of Dante, Victor Emmanuel, and Garibaldi. Pop. 15,800.

Conegliano, Giambattista da, *see* CIMA.
Coney (Lat. *cuniculus*; Gk. *κονικλος*, a rabbit), name for rabbit, which is not now commonly used. The word occurs in the Bible as a translation of Hebrew *shaphen*, which is probably the *Hyrax syriacus*.

Coney Island forms part of the bor. of Brooklyn, New York city. It stands at the entrance of New York harbour, on the S. shore of Long Is. It is 5 m. long, its greatest breadth being three-quarters of a mile. It has a fine beach, and is a very popular summer resort. There is a continual service of steamboats between it and New York, which is 11 m. distant, and it is reached by many electric and steam railroads. It is divided into sev. dists.—W. Brighton, Brighton, Sea Gate, and Manhattan Beach, the cheaper amusements being at W. Brighton. There are sev. bathing pavilions, and a tubular iron pier, 1000 ft. long.

Confarreatio was one of the three Rom. forms of marriage. It was the only one which was invested with the sanctity of a religious performance; an offering was given to Jupiter, and bread made of spelt (*panis farreus*) was eaten. The priest spoke certain sacred words over the couple in the presence of ten witnesses. C. is supposed to have been confined to

the patricians, and certain offices in the state could only be held by persons whose parents had been so married.

Confectionery (Lat. *confectio*, a preparation, from *conficere*, to make up). C. is of two kinds. (1) sugar C. and (2) flour C. Sugar C. means sweets in which sugar is the main ingredient. They consist either of sugar in very fine crystal form dispersed in a sugar solution and flavoured, i.e. chocolate *crèmes*, fondants, etc., or there may be sugar maintained in a solution of a careful blend of the different types of sugar, i.e. boiled sweets, toffees, caramels, etc. Fats, milk, nuts, etc., are employed to obtain a variety of forms. Before the nineteenth century sweets and candies were the monopoly of apothecaries, who made them to hide the taste of their drugs. Sweets were at first made by hand, but by the middle of the nineteenth century machinery was introduced for many of the operations, such as mixing and rolling. Flour C. consists of pastries and fancy cakes having as their basis flour but sweetened and mixed with various dairy products such as butter, eggs, etc. These, although now being made more and more on a large scale, are usually made by bakers at local shops. *See also* COCOA and CHOCOLATE.

Confederate States, name adopted by those S. states of the N. Amer. Union which seceded and formed an independent union at the end of 1860 and beginning of 1861. The name stressed the profounder cause of the Amer. Civil war, which was to see their rise and extinction. It was for the vindication of state rights against the Federal Gov. of the N. (*see* CONFEDERATION) that the S. states seceded, though the vital issue was the question of slavery. The eleven C. S. were, in order of secession, S. Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, Texas, Virginia, Arkansas, Tennessee, N. Carolina, the first in Dec. 1860, the last in May 1861. The president was Jefferson Davis (q.v.); the vice-president, Alexander H. Stephens; and the secretary of state, Judah P. Benjamin. The seat of the gov. was at Richmond. The constitution, adopted on March 18, 1861, based on the U.S.A. constitution, varied in freer independence to the separate states, in the right of the Cabinet to seats in the two Houses of Congress, in the prohibition of protective tariffs or bounties, and in the avowed upholding of the institution of slavery and rights of property in slaves. The inherent weakness of the C. S. lay in their numbers, about half of those of the N. states, in railways, and in finance, and, moreover, they were crippled by the overwhelming naval superiority of their antagonists. The brilliant military capacity of their generals alone kept the war going as long as it did. *See* UNITED STATES, *History*.

Confederation, political term, contrasted with or opposed to federation, for a form of union of individual states or societies. It insists on the individual independence of each state or society in a common union, while federation insists on the supremacy of the common gov. Thus the Brit.

Empire, as at present constituted, is a C., as was the Ger. C. estab. at the Congress of Vienna, 1815. The distinction is well illustrated by the Ger. terms *Bundesstaat*, a bond of states or federal state, and *Staatesbund*, a states bond or confederation. The Amer. Civil war was fought, not only on the slavery question, but on the profounder question whether the union should be that of confederate or federated states. An apt example may be taken from ordinary leagues or societies which, as formed for a common purpose, may be regarded as confederate so long as they are answerable only to themselves for the methods they adopt for attaining that purpose. But although this form of association between states, in which the general gov. is dependent upon the regional govts., has often been described as a C., and the principle of its organisation 'the confederate principle,' it is an unsatisfactory description. The terms resemble 'federation' and 'federal' too closely for the distinction to be obvious; and there is no uniformity in political practice to support it. It is true that the term C. has been used in constitutions which did embody the principle of subordination of a general gov. to regional govts. Thus, as we have seen, it was used in the Articles of Confederation of 1777 (United States); in the Union of Utrecht (constitution of United Netherlands); in the constitutions of Switzerland from earliest times; of Germany from 1815 to 1867; of the N. Ger. C. of 1867 to 1871; and of the Ger. Empire from 1871 to 1918. It was adopted by the seceding states in America when they called themselves the Confederate States of America, and this use of the term seems to give it weight because these states had deliberately rejected the federal principle in its favour. But it is to be noted that immediately after styling themselves 'the people of the Confederate States' they declared that their object was to form a permanent federal gov. The terms are treated as interchangeable in the Swiss Constitution of 1874, which is headed 'Constitution fédérale de la Confédération Suisse.' The authors of *The Federalist* itself did not distinguish between the two terms, although they distinguished between the two principles involved. To increase the confusion the Canadian Constitution, which when it is not federal is unitary, describes the gov. it sets up as a C. But if the use of the term C. is linked with the principles of the Articles of Confederation of 1777 and of the Confederate States and of the Ger. Cs., its meaning may be kept distinct. See also FEDERAL STATE. See K. C. Wheare, *Federal Government*, 1946.

Confederation of the Rhine, name given to the union of the states which seceded from the Ger. empire in 1806. In that year the first Ger. elector, arch-chancellor of the empire, announced to the diet that he had appointed Cardinal Fesch, an uncle of Napoleon Bonaparte, as his helper and successor. This act was not in accordance with the constitution of the empire, and accordingly sixteen Ger. princes

signed an act of C. at Paris on July 12, 1806, by which they formally separated from the emperor and the empire. They invited the other states to join their C. Napoleon adopted the title of protector of the C. of the R., and instructed his ambas. to announce that his rules would not acknowledge a Ger. empire. Many princes and counts were subjected to the princes of the C. by meditation. In 1806 the elector of Wurzburg the elector of Saxony, and the five Saxon dukes joined the C. By the year 1808 many other princes and rulers were enrolled, including the two princes of Schwarzburg, the kingdom of Westphalia, and the dukes of Mecklenburg-Strelitz and Mecklenburg-Schwerin. The confederacy at the time of its greatest power extended over a space of 125,000 sq. m., with 14,600,000 inhab.; after Napoleon's Russian campaign (1812) the power of the C. declined, and the whole structure fell to pieces.

Conference, English parl. procedure, the meeting which is sometimes held when the two Houses of Parliament disagree over a Bill. Delegates are chosen from each House to discuss the provisions of the Bill with a view to reconciliation. The House which has possession of the Bill at the time must be the one to propose a C., and the subjects thereof must be stated; the place and time of the C. are always determined by the House of Lords. The delegates, who are called managers, usually merely present the reasons for the course of action which each House proposes to take; these reasons have been formerly prepared by a committee, and no other speeches are delivered. A free C. is one at which the managers are allowed to influence the other side by speeches of their own. Such a C. is only held after two ordinary Cs.

Confession, L'Isle de la, see FAIRBANKS. **Confession**, or more specifically **Auricular Confession**, is the disclosure of sins to a priest of the Church for the purpose of obtaining absolution. The practice was ordained by the early Catholic Church of a public C. of three mortal sins; these were murder, idolatry, and adultery. About the time of Pope Leo I. (440-61) the list of mortal sins was extended so as to include all crimes which under the Rom. law were punishable by death, exile, or severe corporal punishment. We should note however that there was a distinction between C. in itself to a priest and the public *exomologesis*, or penitential discipline for crimes. By the fourth General Lateran Council of 1215 it was laid down that it was the duty of every faithful member of the Church who had reached years of discretion to confess his or her sins to the priest at least once a year. This is still binding upon Rom. Catholics. The great difference between the ant. and the modern C. is that formerly great sins were to be confessed publicly and publicly atoned for, whereas now great emphasis is laid on the seal of secrecy. C. is practised by the Rom. Catholic, the Gk., and all oriental churches, and also by an Anglican section.

Confession, in law. If the accused at his trial volunteers an unqualified C., that is conclusive evidence against him, but in trials on a capital charge he is generally advised to withdraw such a C. and plead not guilty. A C. made elsewhere than before a judge or on summary proceedings before justices may be conclusive, but is only admissible in evidence where proved to have been made freely and voluntarily; and a C. is not free and voluntary if made as a result of some improper threat or inducement of a temporal nature held out by a person in authority, such as a committing magistrate, a police constable, or the prosecutor. The accused's master would not be a person in authority unless the offence was committed against him. A C. following on a statement by a person in authority to the accused that he need say nothing to incriminate himself, but that anything he might say would be used against him is admissible in evidence. A sacramental C. to a priest would probably be privileged from disclosure. Although a C. may be inadmissible, any facts discovered thereby, and so much of the C. as relates to those facts are admissible. In arraignment, if the accused pleads guilty, no further proof or trial is necessary and the court proceeds to judgment on his 'own confession.'

Confessional, place in the Rom. Catholic churches where the priest sits to hear the confession of penitents. As a rule Cs. are not part of the church structure, but are movable wooden boxes or stalls, entered by means of a door or curtain and having on either side gratings or openings beneath which there are steps for the penitent to kneel upon, the object being to keep the penitent in view of the public, the priest remaining hidden. The term was originally applied to the burial-places of martyrs (who had 'confessed' Christ) and later to their tombs in the churches. In the Middle Ages very strict rules were enforced with regard to the C., scandals having arisen, and in many places confessions were heard in the chancel of the church. Cs. in the Anglican Church were condemned in 1900, when the case of *Davis v. Hinde* (vicar of the Annunciation at Brighton) was tried in the consistory court of Chichester before Dr. Tristram. See C. Y. Sturge, *Points of Church Law*, 1907.

Confession and Avoidance, in the language of pleading, means an *admission* by one party of the facts alleged against him by the other party, coupled with counter-allegations of fresh facts going to show either some justification or excuse, or a discharge or release, so as to *avoid* the legal effect of the admission. A plea in C. and A. may be used either in the defence to a statement of claim or in the plaintiff's reply to a counterclaim. A party pleading in C. and A. is not thereby prevented from putting in a separate plea called a *traverse* denying the facts confessed.

Confession of Augsburg, see AUGSBURG, CONFESSION OF; CONFESSIONS OF FAITH.

Confessions of Faith, reasoned statements of the religious beliefs and doctrines of a particular church or body. The anct.

Christian C. of F. are more usually called creeds, under which heading they are treated. Modern confessions begin more or less with the Reformation, when the leading Protestant reforming bodies formulated their doctrines. The first of these is the Confession of Augsburg, 1530, drawn up by Melancthon and revised by Luther, who desired to define his position not only towards the Rom. Catholics, but also towards the followers of Zwingli. This was presented to Charles V., who had summoned the diet of Augsburg to offer a fair hearing to all the religious parties of the empire. It expounded in plain teaching the doctrine of God and of the Son of God; of original sin and of justification; it also dealt with the marriage of the clergy, invocation of saints, the celebration of the mass, etc. It was originally intended as a statement of belief for Saxony only, but was agreed to and signed by a number of other Protestant cities and princes. In its articles it attempted to show that it differed in its statements from current doctrines only so far as it intended to maintain the original purity and teaching of the early Christian Church. Among other things it rejected transubstantiation. An answer to the confession from the Rom. Church brought Melancthon's Apology, which was presented to the emperor but not received. Both the confession and apology were pub. in 1531. The Articles of Schmalkald were drawn up by Luther in 1536, the Confession of Württemberg in 1552, and the Formula of Concord in 1580; together with the Augsburg Confession they formed the body of the Lutheran C. of F. A separate confession, Zwinglian in tendency, was presented at Augsburg by Strasburg, Constance, Lindau, and Memmingen, the *Confessio Tetrapolitana*; but the Zwinglian position was more clearly defined by the Confession of Basle, 1534, and the First Helvetic Confession, 1536. Calvinism was formulated in 1559 by the Gallican Confession, presented to Francis II. and Charles IX. The Second Helvetic Confession, strongly Calvinistic, revised in 1564, was accepted widely, in Switzerland, Hungary, France, and Scotland, as an authoritative statement of the doctrines of the reformed churches. In England Henry VIII. held a convocation in 1536, at which ten articles were drawn up aiming at a compromise between the old and new theology. In 1538 a conference was held at Lambeth with envoys from the Lutherans; thirteen articles were formulated, but the Catholic reaction followed with the Statute of the Six Articles, 1539. In 1549 Crammer required all preachers to subscribe to the Articles of Religion, chiefly drawn up by himself. In 1552 they were revised, and as the Forty-two Articles held the ground till the revision as the Thirty-nine Articles of the Church of England, 1563, by Archbishop Parker and Guest, bishop of Rochester; the final revision was in 1571. In 1647 the Westminster Confession, strongly Calvinistic, with predestination as its main characteristic, was drawn up. The clergy of the Eng. Church withdrew, and the In-

dependents took little share in it. It was Presbyterian throughout. It was sanctioned by the Scottish parliament in 1640, and enforced throughout the United Kingdom. The Baptists issued a Vindication of the Truth as a formulary of their teaching, they having been excluded from the conference which drew up the Westminster Confession. The latter, with the larger and shorter catechisms, has, with modifications, remained the confession of Eng.-speaking Presbyterians (see PRESBYTERIANISM, and SCOTLAND, CHURCH OF). In 1673 Robert Barclay issued a statement or Apology embodying the faith of the Society of Friends. In 1833 the Congregational Union pub. a confession which was prepared by Dr. George Redford, not as a confession in the strict sense, but as embodying general principles. The Orthodox Gk. Church, besides the Nicene Creed (minus the 'filioque' clause), and the Athanasian Creed has a confession drawn up in 1640, and a catechism of 1839. The Rom. Catholic Church formulated its doctrines in the decrees of the Council of Trent, made in 1554 and 1563 on the dogmas of the Immaculate Conception and papal infallibility.

Confidentially, in law, or Privileged Communications. There are necessarily many occasions on which one person may freely make statements to another without being in danger that the law will compel him to disclose the nature of the communication. In law such statements enjoy a *qualified privilege*, the privilege being in most cases qualified by proof of express malice or ill will. As a rule the privilege arises either from the existence of some common interest (generally pecuniary) between the person making the statement and the person to whom it is made, or by reason of some moral, social, or legal obligation. A moral or social duty has been judicially described as one which is recognised by Eng. people of ordinary intelligence and moral principle. Confidential reports to an official superior, answers to confidential inquiries in the ordinary course of business, as by one banker to another respecting the financial credit of a customer, and statements as to the character of a servant are common examples of such duties. Communications between husband and wife are always privileged. Communications made in self-protection are equally privileged. *e.g.* a warning given by a master to his workmen not to associate with a former fellow workman dismissed for dishonesty. Communications as to affairs of state or official communications between public officers on public affairs cannot be disclosed without the consent of the head of the dept. concerned. The C. of communications with legal advisers extends to all statements or documents concerning matters made the subject of professional intercourse; but communications made in furtherance of a common unlawful design are not privileged. The compulsory disclosure or discovery of documents after action commenced is no real exception to the rule of C., such dis-

covery being based on the principle that if the party makes the documents part of his case they must come out sooner or later; and their purport ought, in ordinary fairness, to be divulged to the other party, that he may know what case he has to meet. Medical men may be compelled to disclose communications made to them even though imparted in professional confidence; and the rule of privilege probably does not extend to communications made to clergymen; but judges have evinced a disinclination to enforce disclosure. In this latter respect Eng. law differs from that of Rom. Catholic countries and the U.S.A. In Scots law confessions made by a prisoner to obtain spiritual advice and comfort are, but confidential communications to clergymen in the ordinary course of their duty are not, privileged. A broad distinction must be noted between statements made in answer to confidential inquiries and those merely volunteered. The latter would only be protected if it were the duty of the person making the statement to volunteer the information contained in it: for the law does not protect idle gossip. Generally it may be said that where a confidential relationship exists, *e.g.* as between master and servant, brother and sister, employer and employee, or perhaps intimate friends, there is a mutual duty to volunteer information on anything which each of them ought to know. But where there is no confidential relationship volunteered statements are not often privileged.

Confirmation (Lat. *confirmare*, to strengthen), ceremony for the completion of baptism, and consists in the laying-on of hands by a bishop and the invocation of the Holy Ghost as a comforter and strengthener. In the Rom. Catholic and Gk. churches it is always accompanied with the anointing with oil. There is some difference of opinion among the churches as to the age at which it is to be administered, and as to whether it constitutes a sacrament or not. In the Rom. Catholic Church it is administered, in the W., usually after the age of discretion; in the Lutheran Church from thirteen to sixteen years after baptism; and in the Eng. Church between fourteen and eighteen years of age. In the Gk. and oriental churches C. follows immediately after baptism. In these churches and among the Rom. Catholics it is considered as a sacrament, but not by the Eng. Church, except among the High Anglican. In the Gk. churches it is usually given by the priest at baptism, but among the Rom. Catholics nearly always by a bishop. The Lord's Supper is not taken by the Eng. and Lutheran churches until after C.

Confiscation (Lat. *ascus*, the treasury). In its literal signification, means forfeiture of property to the Treasury, as, for example, in Rom. law the *Lex Julia* punished violence without arms by C. of a third of the offender's property. In Eng. law C. of property, generally known as forfeiture, followed on conviction for felony (see CRIMINAL LAW); but the Forfeiture Act, 1870, abolished forfeiture for felony, although in certain cases the accused may

be condemned to pay compensation up to £100. The expropriation of neutral ships carrying contraband of war (see DECLARATION OF LONDON) is practically the only other kind of C. now known either to municipal or to international law.

Conflict of Laws, or Private International Law, i.e. the body of recognised principles for deciding cases where the private or local law of different nations is in conflict. Private International Law, or, to use Prof. Dicey's phrase, C. of L., consists of the rules acted upon by courts of justice in determining (1) the limits of their own jurisdiction in disputes relating to foreign transactions; and (2) the appropriate law, whether local or foreign, to be applied in a case which is within their jurisdiction. Most civilised countries concur, for example, in deciding cases on contract according to the law of the land where the contract was made. The question whether the courts of one country are guided by courtesy or by legal principle in applying foreign law to the decision of particular cases has given rise to much academic controversy, owing to the truism that the courts of one country cannot be legally compelled to respect alien legal principles. See COMITY.

Confoveal, having the same foci. In geometry, a conic or conic section may be regarded as the curve formed by the intersection of a cone by a plane, or as the locus of a point whose distances from a fixed point called the focus and a fixed line called the directrix form a constant ratio. If conics have the same foci, they are termed C. A characteristic proposition is that if an ellipse and a hyperbola have the same foci, they intersect at right angles.

Conformable Strata, are beds which rest upon one another in a regular manner, the bedding planes being parallel throughout. This shows that in these cases the same physical conditions have accompanied each deposit of a stratum, and the formation is conformable because continuous and uninterrupted. When, however, land is raised out of the water, denudation takes place, and should those strata become again submerged and new deposits arise, then the bedding would not, as a general rule, be conformable. See UNCONFORMITY.

Confraternities, see BROTHERHOODS.

Confucius (551-478 B.C.), the famous Chinese sage, b. in the vil. of Ch'üeh, in the prov. of Lü. His family name was Kung, his clan being an offshoot of the dynasty of the dukes of Sung. In C.'s third year his father, who had been a soldier of distinction and valour, died, leaving his second wife, who was C.'s mother, ill provided for. The title C. is a Latinised form of K'ung Fū-tszu, the Master King. In 532 C. married, a son, Li, and two daughters being the fruits of this marriage. In the following year he began to teach in his native state Ch'üehli (Chihli), having occupied the interval as a subordinate official in charge of public herds and stores. Between 531 and 517 he paid a visit to the cap. at Loh, where it is thought he

may have met the great teacher Lāo-tszu. In the latter year he took refuge in the neighbouring prov. of Chi, for Lü was the scene of civil strife in which the reigning Duke Chiao suffered defeat. On the death of this ruler in the year 510, Ting became duke in his stead, and when in 501 he appointed C. governor of the city of Chungthü he found that he had done an excellent service alike for his own house and for his subjects, for C., who was rapidly promoted to the Ministry of Works and later of Crimes, became at once the idol of the people and the practical reformer of many outstanding abuses. Gov. grew strong; men grew loyal, and women gentle. Immorality and corruption both vanished, and from far and wide men came to see a model state. But petty jealousies undermined his success, and a crafty gift to the duke of some beautiful courtesans led indirectly to a rift between the latter and his counsellor. Accordingly in the year 497 C. set out on his wanderings, which were destined to last till 483. With a little band of faithful disciples he travelled from state to state and court to court, settling always where there seemed most chance of freedom from persecution. Friends and believers in his word were not lacking, yet it was no uncommon thing for his company to be in actual want and even in peril of their lives. At length there came a message to the teacher in Wei from the ten-year-old Duke Ai, who had succeeded Ting, bidding him return to his native place, which he accordingly did. It is improbable that he made any effort to pick up the threads of his old political life. Rather he devoted his last years to literature, to the collection and exposition of the anc. writings, and especially to the piecing together of his *Ch'un Ch'ü*, which recounts the annals of Lü from 722 to 481 B.C., and to which a peculiarly high interest is attached as the only classical or really authenticated work of this greatest of Chinese sages. But to gain any insight into C.'s personality, it is necessary to turn from such a bare record of biographical facts to the many memorabilia compiled by his disciples, for the Confucian analects were collected shortly after his death, and probably give a true picture of what the Master said and did. They should, therefore, be carefully distinguished from that mass of legendary and apocryphal literature that later grew up round the name of C. as round that of every great religious teacher. And first of all it seems clear from the analects that, unlike other men of equal influence, C. was careful to disclaim any special communion with God. Indeed his conversation was rarely of the nature of divinity or heaven, and his answers to such questions as 'What becomes of man after death?' or 'What is the meaning of sacrifice to the spirits of the dead?' were always enigmatic or evasive. So deficient are his sayings in the fervour of the piety of a Francis of Assisi or in the belief in human progress and in a great social regeneration to come, that many regard Confucianism rather as a system of ethics than as a

religion. Yet in the days of his misfortunes and exile he was supported by a belief in the reality of his mission as a preacher of the truth. He said once to his followers fearful for his safety: 'After the death of King Wán, was not the cause of the right way lodged in me? Will Heaven doth not wish this cause to perish, what can the people of K'wang do for me?' Further, he is said to have remarked of himself at the age of seventy that he 'could do whatever his heart prompted, without transgressing what was right.' But he has himself told posterity how he liked best to imagine his life's work. Once a disciple was non-plussed when a certain ruler asked him to describe his Master. 'Why did you not tell him,' said C., 'that I am a man who in his eager pursuit of knowledge forgets his food, and in the joy of its attainment forgets his sorrows, and who does not perceive that old age is coming on?' Thus he would have men picture him as a philosopher eager in the search of truth, but it was always the truth of this world, that is of the just relationship between man and man, rather than the truth of the Unseen and of what all sceptics regard as the Unknowable. 'While you cannot serve men,' he once argued, 'how can you serve spirits?' But the practical nature of his teaching is best realised in his emphatic assertion of the golden rule: 'What you do not like when done to yourself do not do to others.' It seems that he stated it only thus, that is, in its negative form, and his writings make it clear that he also appreciated its worth in its positive and higher form: in one passage he regrets bitterly that he had not taken the initiative in obeying it. The formulation of this axiom of conduct illustrates his sympathetic knowledge of human nature—a knowledge that further illuminates the countless epigrams and sententious maxims upon which it is no exaggeration to say has grown the fabric of Chinese morality. Scattered up and down throughout all the Chinese classics they have upheld the standard of right conduct to which every good citizen tries to conform. Here are a few of his sayings: 'A poor man who does not flatter, and a rich man who is not proud, are passable characters; but they are not equal to the poor who yet love the rules of propriety.' 'What the superior man seeks is in himself; what the small seeks is in others.' 'A man can enlarge his principles; principles do not enlarge the man.' 'In style all that is required is that it convey the meaning.' 'Learning undigested by thought is labour lost; thought unassisted by learning is perilous.'

Much of his life was devoted to literature. His remark that 'by the "Spring and Autumn" men would know him and men would condemn him' shows the importance that he himself attached to this part of his work. Yet it is a matter of established fact that the book to which he refers (his *Ch'un Ch'ü*) is full of gross misrepresentations and suppression of essential facts, besides being at the best no more than the most meagre of histori-

cal abstracts. The attempt to harmonise his statements with reliable data has been the cause of endless and futile activities among the ablest of Chinese scholars. Yet this book has been the model of all historical summaries of later times. This can only be accounted for by the unbounded admiration accorded to C. and to all his achievements the instant almost he had passed from this life, where, like many another prophet, he had met with his full share of neglect, scorn, and adversity. To-day the law requires that there shall be a temple to C. in every prefecture, sub-prefecture, dist., and mkt. tn. in the land, and although he has never been deified, sacrifices and prayers have from the moment of his death daily been offered him by faithful worshippers in all corners of the Chinese realm (see also CHINA, *Chinese Literature*). See H. F. Johnston, *Confucianism and Modern China*, 1934; Lin Yutang (ed.), *The Wisdom of Confucius*, 1930; M. Collis, *The First Holy One*, 1948; and A. Doebelin, *Confucius*, 1948.

Conge d'Elire (in Anglo-Fr. *conge de eslire*) means leave to elect, and is applied in England to the warrant or licence from the Crown to the dean and chapter of a cathedral, authorising them to elect a bishop or archbishop, as the case may be, to a vacant see.

Conger Eel, The, muscular, voracious fish of the eel family (Anguillidae). In colour it is usually whitish below and a dark blue-grey above, whilst its length varies from 3 to even 10 ft. It has no pelvic fins nor scales, but its dorsal fin is continuous and stretches very far forward. These eels have wide mouths, sharp, closely packed teeth, and free tongues, and though their flesh is coarse are quite edible. They occur in four distinct species which are widely distributed over the temperate and tropical seas.

Congestica, localised excess of blood in the arteries, veins, or capillaries. It is to be distinguished from plethora, or general excess of blood. C., or hyperemia, may be classified as arterial or venous, active or passive, inflammatory or atonic, functional or hypostatic; or as associated with different parts, as cerebral, spinal, pulmonary, renal, hepatic, etc. Arterial or active hyperemia is caused by the increased flow of blood to a part; it may be inflammatory, when the blood is in excess for the purpose of eliminating irritating substances; or functional, when it is due to the normal action of some organ. Venous or passive hyperemia is caused by delay in the return of the blood to the heart; it may be atonic, when it is due to the enfeebled or obstructed state of the circulatory system; or hypostatic, when it is due to the action of gravitation. The last two states are necessarily often associated.

Active hyperemia may be caused by nervous disturbance due to emotion, as in blushing; by increased functional activity; or by local external stimulation, as the application of heat, poultices, etc. The symptoms are redness in the adjacent parts and a throbbing which eventually

becomes painful. If long continued, a possible effect is hypertrophy of the tissues affected, owing to the excess of nourishment; while a sudden hyperæmia may result in the rupture of blood-vessels and the exudation of blood into the neighbouring parts. The treatment, if it is advisable to reduce the hyperæmia, consists of the application of cold to the part; or the application of a counter-irritant to another part of the body.

Passive hyperæmia may be caused by loss of power in the heart due to old age, debility, or valvular disease. It may also be induced by the action of cold which constricts the veins and capillaries without affecting the deeper lying arteries; or by applying a ligature or tight bandage to a limb or other part. The most dangerous conditions are occasioned by embolism, or the blocking of a blood-vessel by a fragment of tissue carried along with the blood-stream; or thrombosis, which is the sudden clotting of the blood at some point in the course of a vessel. The surface symptoms of passive hyperæmia include a deepening of the colour to purple. The possible effects are exudation of blood into adjacent parts and fatty or fibrous degeneration of the tissues owing to failure of the nutritive functions of the blood. If the cause be cardiac weakness, the treatment aims at stimulating that organ by means of drugs such as digitalis, ammonia, etc., and at lessening the strain by a recumbent position and as much rest as possible.

C. of the lung occurs at moments of excitement; it is also a stage of heart disease and of pneumonia, and may occur by reason of the settlement of venous blood in the base of the lung when the heart is enfeebled by old age or the exhausting effects of fevers, etc., to give hypostatic pneumonia. In the first stage of pneumonia the vessels are gorged with blood and exudation takes place into the surrounding tissues, leading to the second stage, when the air-cells are occupied by blood. The third stage involves fatty degeneration, when there is considerable danger from absorption of the morbid products. C. of the kidney is active when there is irritation from drugs such as cantharides, or from microbe poisons; it is passive in heart and lung disease or when the *vena cava* is obstructed by tumours. C. of the liver and digestive tract is a normal condition during the process of digestion. It may become excessive through the use of rich or stimulating food. Passive hyperæmia occasioned by debility leads to deficient functioning, when a condition of chronic catarrh may set in. C. at the base of the digestive tract leads to the formation of hemorrhoids or piles. C. of the brain is often due to embolism or thrombosis, in which case it is known as apoplexy and is characterised by varying degrees of loss of consciousness and paralysis according to the site of the vessels involved. C. is sometimes induced for remedial purposes, as in the application of poultices, hot air, etc. See BIKER'S CONGESTION TREATMENT.

Congleton, tn. in the co. of Cheshire,

England. It stands on the R. Dane to the S. of Macclesfield. Its prin. manufs. are silk and cotton fabrics. Four m. S. of C. is Little Moreton Hall, a property of the National Trust. It is a moated building of the sixteenth century, which took its present shape between 1559 and 1589, and generally considered to be one of the most perfect specimens of the 'black and white' style in England. The hall is remarkable for its carved gables and Elizabethan wood and plaster work. Pop. 15,900.

Conglomerates (from Lat. *conglomerare*, to form into a ball) are merely consolidated gravels, and are typical shore formations or beach deposits. They consist of rounded pebbles, and vary in diameter from 20 to 1 ft., and which owe their smooth surfaces to attrition during transport by sea currents. Most of the pebbles are of a hard rock, such as granite, sandstone, quartzites, cherts, flints, and gneiss, whilst the matrix or binding material, where it exists, is sometimes a kind of feldspathic or calcareous sandstone, but usually is similar in consistency to the pebbles, only with a greater proportion of dolomite clay, weathered feldspar, mica, and other softer stones. The stratification of C. is usually very rude, their appearance being described as 'tumultuous,' but rarely they are intercalated with fine materials like shale, which serve to show the nature of their bedding.

Congo, second riv. of the continent of Africa in point of drainage area (1,425,000 sq. m.), and also in point of length (about 3000 m.), whilst its volume of water it is surpassed only by the Amazon and the Mekong. The mouth of the C. was first discovered in 1482 by Diogo Cão, the Portuguese explorer, who estab. a settlement. Nearly 400 years later a Brit. expedition under Capt. Tuckey surveyed the C. mouth, which was believed to be the outlet of the Niger R., but the expedition ended fatally. Later two expeditions under Cameron and Grandy went to the assistance of Livingstone, who d. at Lake Bangweulu. Cameron's expedition led politically to the opening-up of the country under the auspices of King Leopold, and in 1877 Stanley made his famous voyage down the C. from the Luapula to the sea. The actual source of the riv. is still disputed. Geographically the Lubudi, which flows into the Luapula above Bukama, is the headstream of the C., as from there to the mouth of the C. the riv. valley shows normal development. But if the source of the C. is to be found in the headstream of its furthest trib., the C. may be said to rise in a high table-land between Lakes Tanganyika and Nyasa at an altitude of 5000 ft. Its two head-streams, the Chozi and Chambezi, after their union, enter Lake Bangweulu, and on their exit at the S. corner are known as the Luapula, which soon hurls itself over the Mumbatuta Falls. With a breadth varying from 300 to 1150 yds., the Luapula passes through Lake Mweru (2800 ft. high), and in its journey across the Mitumba Mts. falls some 1000 ft.

Soon afterwards the main riv. is joined by the Lualaba and Lubudi, together with two other streams from the W. Up to the Stanley Falls, two rapids only—those at Nyangwe and Ukassa—make the C. unnavigable. Stretching now often over a mile from bank to bank, it receives from the E. the Lukuga, which drains Lake Tanganyika, and further N. the Lira and Urindi, coming from the forest tracts. The Middle C., which enters the alluvial plain of W. equatorial Africa at an elevation of 1300 ft., runs mainly in a westerly direction till it turns sharply southward near Bangala. Of the S. tribs. the Lomami, which pursues a course

more falls intervene. During this part of its course the C. drops 850 ft. in 146 m. Round the non-navigable sections of the riv. railways have been constructed to carry freight, etc. From Matadi to the Atlantic, which the great riv. finally reaches with a S.-westerly course, the distance is 86 m., and may be covered by ocean vessels. The C. alone of African rivs. can boast of a true estuary, the bottom being a great canyon extending 100 m. out to sea and obtaining in some places a depth of 4000 ft. below the normal sea level. At its mouth the C. is 6 m. wide. See T. A. Barnes, *The Wonderland of the Eastern Congo*, 1922.

THE HEADWATERS OF THE RIVER CONGO

E.N.A.

mostly parallel to the Upper C., is the chief, whilst the Lulonga joins the main stream many m. to the W. Other affluents on this side are the Ruki and the streams of the great Kasai system, including the Lukeni, Sankuru, Lulua, Djima, and Kwango. Joining the Middle C. on the right or N. bank are the great Aruwimi and Ituri, which rise near Lake Albert and water the equatorial forests, the Rubi, and the Ubangi or Welle, which is far the largest trib. on this side. Below the Ubangi is the Sanga, which flows into the C. with a southerly direction. There are many lacustrine expansions along the Middle C., the last being that of Stanley Pool, which is 1000 ft. above sea level. This part of the riv. is navigable for some 1020 m. Above Man-ya-nga, on the Lower C., there are about twenty rapids in a course of 90 m. From this place to Isangila, a distance of 70 m., the riv. is navigable, whilst below ten

Congo, Belgian, formerly Congo Free State and now a colony of Belgium. Its coast-line is only 25 m., but its whole area is some 909,000 sq. m. The B. C. is bounded on the N. by Fr. Equatorial Africa, on the N.E. by the Anglo-Egyptian Sudan, on the E. by Uganda and Tanganyika Ter., on the S.E. by N. Rhodesia, on the S.W. by Angola, and on the W. by the Atlantic. The central zone of the colony is a great table-land with an average altitude of 3000 ft. above sea level. It is a well-watered country, covered with wooded savannahs and forests which grow in the riv. valleys, especially towards the E. and N.E. of the state. The forest region, stretching from Lake Albert to the mouth of the Aruwimi, known variously as the Great Congo, the Stanley (from its discoverer), and the Pygmy (from the small people inhabiting it) Forest, covers an area of 25,000 sq. m. In these primeval

impenetrable forests are to be found avenues of trees like the colonnades of an Egyptian temple, opening 'into aisles and corridors musical with many a murmuring fount.' Vegetation grows rank; creeping plants entangle the footsteps of the explorer; dense interlacing foliage of giant trees obscure the sun's rays and everywhere insect and animal life of brilliant colour and every variety of form flourish in plenty. The long int. chain, known as the Mitumba Mts., which has peaks varying in height from 5000 to 10,000 ft., runs from the S.E. boundary in a N.-easterly direction to the great Lake Tanganyika, and then northward past Lake Kivu to Lake Albert. The Bambara hills, to the W. of Tanganyika, are an offshoot of this range. The W. slopes descend gently to the C. basin, but the E. face is often very abrupt. The Crystal Mts. follow the coast-line. N. of Lake Kivu, the W. shores of which are in the colony, are sev. volcanoes which belong geographically to the Nile basin. The C. R., dealt with in another article, is the most important physical feature of the state, as it is also largely responsible for its commercial development. The flora is very luxuriant. The India-rubber is obtained from the lianas of the forest. Giant baobabs grow on the savannahs, and in the forests many timber trees, such as teak, ebony, mahogany, besides bamboo palms and resin-yielding trees, and great euphorbias and orchillas are plentiful. There are abundant plantain and banana trees, and in some parts cotton and coffee plants are indigenous. Crocodiles and hippopotami are found in great numbers in the riv., whilst red buffaloes and antelopes wander in the open country, and in the forests a great variety of wild animals abounds, including the chimpanzee and other monkeys, the lion, elephant, jackal, leopard, etc. Storks, parrots, and ibises are quite common, and terns, hawks, and herons are found by the banks of the C. Ants, mosquitoes, spiders, etc., exist everywhere, whilst dragonflies and butterflies are noted for their gorgeous colourings.

The great humidity of the climate, combined with the heat, discourages European settlements. Situated in the zone of the equator, the ann. variation of temp. is slight. The coldest month is July, the hottest February, the average ann. temp. being 90° F. In the W. of the colony rain falls regularly between Oct. and May, the rest of the year being the dry season. It will therefore be seen that along the lower reaches of the C. the period of heavy rains coincides with that of the greatest heat, so that it is not surprising that fevers are much more prevalent here than in the central plateaux, where, moreover, the precipitation is dispersed fairly evenly over the whole year. The rainfall varies, rising sometimes to 38 in. Grass fires are common and extensive, and violent storms are not infrequent. Gov. stations, none of which has a pop. over 5000, correspond to European tns. Banana, near the mouth

of the C., has a fine natural harbour, and is one of the most important trading centres. Boma, an important port on the lower C. 60 m. from the mouth, was the former cap., but the seat of administration was transferred to Leopoldville by royal decree in 1921. The C. railway starts from Matadi, the most important port on the lower C., and goes as far as Dolo on the Stanley Pool, passing Tumba halfway. Tumba has supplanted Lukungu as the cap. of the Falls dist.; Leopoldville is the cap. of the Stanley Pool, Coquilhatville of the Equatorial, and New Antwerp of the Bangala dists. Besides the C. railway, there is a line from Stanley Falls to the Nile. Railways also connect Stanley Falls and Nyangwe (79 m.), Nyangwe and Lake Tanganyika, and Boma and the Mayumbe dist. The completion in 1931 of the Benguela railway joins the E. and W. coasts of the continent (see LORITO BAY). There are 3100 m. of railways and 56,000 m. of road. A motor road runs from Stanleyville to Refat on the Nile. Up to Matadi (85 m.) the C. is open to ocean-going vessels. Above Matadi, for 250 m. rapids render the riv. unnavigable as far as Stanley Pool (Leopoldville). But above the Pool are over 1000 m. of navigable water, reaching Stanley Falls, while sev. of the great tribes are navigable over a considerable extent of their total course of 6300 m. Riv. transport has been much developed, and a pipe line runs from Matadi to Leopoldville to supply steamers with oil. There is an air-mail service between Boma and Elisabethville, both of which tns. are important telegraphic centres. There are also regular air services from Leopoldville to Stanleyville, Lusambo, and Elisabethville, and Stanleyville to Usumbura and Elisabethville. Wireless stations are estab. at forty-six points. Agriculture is still very undeveloped. There are, however, cocoa, coffee, rice, rubber, and tobacco plantations, and maize, manioc, and sugar-cane are also grown. Cotton is being increasingly cultivated and exported. Oil palms are abundant and supply an ever-increasing trade in palm oil and palm kernels. Rich deposits of uranium, copper, and copper ore are found in Katanga, especially the S. dists. Diamonds are found in the Kasai dist. Petroleum has recently been discovered in the Albertine Rift. Iron, though widely distributed, is still mined in a primitive fashion. Gold mines are worked at Kilo and the Mboga dist., Lake Albert (30 m. E. of Kilo), and also at Ruwé in Katanga. Other minerals worked include manganese, zinc concentrates, and tin. Large radium deposits occur in the Elisabethville Prov., where the large copper deposits are found. Bakuma is the centre of a rich tin region. Diamond-bearing gravels are exploited in the S. The gathering of the caoutchouc from rubber vines is the staple industry. Other exports, 75 per cent of which are sent to Belgium, are ivory, palm oil, coffee, rice, cocoa, timber, and white copal,

radium, tin, wolfram, and diamonds. Food, machinery, clothing, and arms are the chief imports.

The inhab. of the colony belong to the Bantu-Negro stock, but the small Pygmy bands, distributed in the great forests, probably are the survivors of the aboriginals of Central Africa. The natives are divided into many tribes, among which may be mentioned the degenerate Ba-Kongo, the Ba-Luba, the Ba-Lunda, the Mongo, the Bo-kuba, and the warlike Azandeh, who immigrated from the N. Two kinds of culture prevail among the natives: that of the W. and central dists., where clothes are made of palm fibre and the bow is the chief weapon, and that of the E. border and Welle dist., where skins are used for clothing and the ordinary weapons are swords, spears, and throwing knives. The tribes are for the most part autonomous. They all speak different dialects of Bantu, but most of them understand Swahili. Elaborate funeral rites and the propitiation of countless malignant spirits are the chief articles of religion. The N. W. dist. is given at 10,676,000. The white pop. numbers 357,000. Chief tns.: the cap., Leopoldville, 110,000 (7200 whites); Matadi (400 whites); Elisabethville (6200 whites); Jadotville (2000 whites); Stanleyville (900 whites); Coquilhatville (350 whites); Banana; and Boma.

Cameron's expedition in 1875 led to the formation of the Association 'Internationale Africaine' under the auspices of Leopold II., king of the Belgians. The association was to suppress slavery and to civilise Africa, and a great impetus was given to the movement by the discoveries of H. M. Stanley (q.v.) in 1877. In 1885 the C. Free State was given international status by the treaty of Berlin. Before slavery could be suppressed, war took place between the Belgians and the Arab traders under Tippoo Tib. To aid the state to recover financially from the effects of the war Leopold adopted the concession system for exploiting the natural resources of the country. The system led to many abuses and the C. Free State was formally annexed by Belgium in 1908. The state became an absolute monarchy. A governor-general, with civil and military powers, represents the king in Africa. At home a colonial minister, advised by a colonial council, now supervises the government of the state, which for administrative purposes is divided into 6 provs.; the provs. are divided into 18 dists., the dists. into 123 ters. Technical and agric. colleges have been estab., chiefly to educate recruits for the armed force of the state. In 1927 some ter. in S.W. B. C., area 3500 sq. km., was ceded to Portugal in exchange for an area of 3 sq. km. in the C. estuary. The cattle country of Ruanda-Urundi, formerly in Ger. E. Africa, is included in the Belgian administration of the C. under mandate from the League of Nations. See also CONGO RIVER. See H. M. Stanley, *The Congo and the Founding of its Free State*, 1885; E. D. Morel, *Red Rubber*, 1906; C. Christy, *Big Game and*

Congo, French, see FRENCH EQUATORIAL AFRICA.

Congregation (Lat. *cum*, with *gregare*, to gather into a flock), collection of people, the term usually being applied to those gathered together for public worship. In the Rom. Catholic Church it denotes certain bodies of men—such as cardinals—who meet together with a special object connected with the affairs of that church. Thus there is the C. of the Council, which enunciates the formal interpretation of the Council of Trent; the C. of the Propaganda, which looks after missionary affairs; that of the Holy Office of the Inquisition, which judges matters of faith; the C. of the Index, forbidding the reading of certain books; and sev. others. The term is sometimes applied to a body of men who undertake to observe certain rules, but are under vows less strict than those of the monks, as the Passionists and others. It also signifies a certain number of monasteries who band together in an autonomous federation: thus in the Benedictine order there were the Cs. of Bursfold and St. Maur. The univs. are governed by bodies known as Cs. The Congregationalists obtained their name from the fact that they believe in the basis of government being laid down by each C. for itself.

Congregationalism, name given to that part of the Protestant Church which, in organisation, is based on independency, in the sense that each body of worshippers or congregation is locally governed and only answerable to itself. It is one of the most important of the Free Churches in the United Kingdom, and occupies an equally important position among the Protestant non-episcopal churches of the U.S.A. Regarded generally, it is one of the three great systems of eccles. gov. and organisation as contrasted with Episcopacy on the one hand and Presbyterianism on the other, the one with its diocesan organisation and administration, the other with its regulation by eccles. courts, while C. has its roots in independent democracy. In England, the original home of the principles of C., its rise and development were very gradual, and began in a separatist movement from the Church as under the supreme headship of the Crown. In Mary's reign small secret congregations met under Protestant clergy, and without them if such were not obtainable; in Elizabeth's reign these meetings increased and, realising that no real chance of reformation was coming, began definitely to arrange themselves in local bodies and conform only to what they held to be the real teaching of the N.T. Robert Browne (1550-1633) stands out as the most important figure and leader of the separatist Puritans; after great persecution he and as many of his congregation as were able emigrated to Zeeland in Holland. Here they were tolerated, but owing to differences among themselves this community broke up.

Persecution in England gave them extra strength, but again differences arose; Smyth, one of the Zeeland community, became a Baptist, and a Baptist community settled in England; John Robinson, whose views were identical in the main with those of modern C., differed from Robert Browne, and started large and for a time flourishing communities. During the Civil war, the Independents, as they now began to be called, grew and estab. themselves widely and firmly, and had a great influence in resisting the estab. of Presbyterianism. The real hist. of religious liberty may be regarded as beginning at that time and through them. Cromwell was a follower and supporter of them, especially in their political views, and the Protectorate saw them firmly settled. The Restoration forced them, with the Baptists and Eng. Presbyterians, into Nonconformity. The hist. of early C. is closely connected with the Puritan migration to America (see below). The Toleration Act, 1689, gave freedom of religious thought to all parties, and this was followed by a period of stagnation or apathy, not only confined to them, to be stirred to a greater spiritual enthusiasm under the inspiration of the Methodist movement of the eighteenth century, when the numbers of Congregational bodies increased enormously. The nineteenth century was marked by a tendency to combination. In 1811 the Congregation Union of Scotland was formed, and in 1831 a similar union was made between the Eng. and Welsh bodies. In 1896 the Congregationalists and the Evangelical Union combined and arranged that international councils should be held, one being held at Boston, Massachusetts, in 1899. The Congregational Union is one of the prin. members of the Free Church Federation, founded in 1893. It supports home and foreign missions, the London Missionary Society especially owing much to it. All social reform movements are supported by it. The Central Hall of the Union in Farringdon Street, London, is the official centre. There are about 4457 churches and mission stations in Great Britain, with over 1000 churches in Brit. dominions; there are also churches in many parts of the European continent. The most recent (1931) statistics give 1,020,000 adherents in England, 520,000 in Wales, and 107,000 in Scotland. The Church of the Pilgrim Fathers, New Kent Road, is the oldest (A.D. 1616) Congregational church in London. It was enlarged by Amer. subscribers in 1856. The Harcourt Congregational Church was founded in 1648 at Pancras, Soper Lane, and after various moves was removed in 1857 to Canonbury. The City Temple, the Westminster Congregational Church and the Whitefield Central Mission are the other great Congregational churches of London.

The hist. of Amer. C. begins with the arrival in 1620 of Wm. Brewster, elder of the refugee church in Leyden, whose small band founded Plymouth in the modern Massachusetts, though strictly this group were Separatists. The enthu-

siatism that marked the early years of Amer. C. waned, and it was not until 1734 that the 'revivalist' work of Jonathan Edwards (followed by that of Whitefield in 1740) roused fresh zeal. But the Edwardian standpoint was followed by nearly fifty years of apathy, during which interest centred mainly on doctrinal controversy. The 'New England Theology' of Edwards, Bellamy, and Timothy Dwight soon became predominant, and was generally in vogue at the beginning of the nineteenth century. The 'Literal' school of Chauncy and Mayhew, however, rapidly grew in importance, and as early as 1805 was recognised in Harvard College as predominant. C. has never, however, made much headway in the S. states, the influence of the above theological schools, which emerged out of the old Calvinistic theology of the early New England settlers, being more or less confined to New England states. But it has spread to the W., though it was not until about 1850 that Amer. Congregationalists began to unite and to spread their distinctive policy in the W. states and ters. There has, in the last few decades, been a spread in the community of innovations in doctrinal opinions, and a wider diversity of belief, with the result that 'Evangelical' (popular sense) rather than 'Calvinistic' is the more appropriate definition of Amer. Congregational preachers and churches. Besides some 500 foreign mission churches, there are at the present date about 5500 Congregational churches in the U.S.A. More than 600 of them are in the state of Massachusetts, which is the stronghold of C., no other state reaching the 400 mark. The members of the body number nearly one million. See W. Walker, *History of the Congregational Churches in the U.S.A.*, 1894; R. W. Dale, *History of English Congregationalism*, 1907; R. G. Usher, *The Pilgrims and their History*, 1918; A. Peel, *A Brief History of English Congregationalism*, 1931.

Congregation of the Holy Office of the Inquisition, see OFFICE, HOLY.

Congress, Library of, see LIBRARIES, U.S.A.

Congress (Lat. *congressus*, an assembly; from *cum*, together, and *gradus*, a step). In its diplomatic sense C. means a gathering together of sovereigns or their representatives to discuss questions of international interest. Famous Cs. of the past were those of Munster and Osnabrück, which resulted in the treaty of Westphalia, 1648, and at the end of the Thirty Years war; of Radstadt, at the end of the Sp. Succession war, in 1713; of Vienna, at the end of the Napoleonic wars in 1815; of Paris, in 1856, at the end of the Russian war; and of Berlin, in 1878, at the close of the Russo-Turkish war. But the name C. has come to be applied in Federal states to the legislative assembly which directs national or federal as contradistinguished from State or prov. concerns (see next article). Still more recently the name has become associated with the Indian Nationalist or Home Rule movement (see INDIAN NATIONAL CONGRESS) and the Trades Union C. to

which body are affiliated most of the Brit. trade unions (see TRADES UNION CONGRESS).

Congress of the United States is the National Legislature, consisting of two bodies, the Senate and the House of Representatives. The Senate numbers ninety-six members, each state electing two members for a period of six years, one-third retiring or seeking re-election every two years. The House of Representatives consists of members from the various states, elected on a basis of pop., at present, 1 for 281,000 or 435 representatives besides a delegate from Alaska, a delegate from Hawaii, and one resident commissioner from Puerto Rico. The C. is subject to the constitution, which it may not amend save by a two-thirds majority in each House, followed by approval by three-fourths of the States in the Union; and it is not concerned with the executive power, which is decided by popular election. Its legislative power is limited by the existence of the govts. of the individual states, which it may not overrule. The Supreme Court of the U.S.A. has the right to nullify any Act of C. which is judged to be unconstitutional. Within the constitution the powers of C. are in brief these: (1) to levy taxes, duties, imports, and excises; (2) to borrow money on the credit of the U.S.A.; (3) to regulate commerce, foreign and interstate; (4) to establish a uniform rule of nationalisation and uniform laws on bankruptcy; (5) to coin money and to fix the standard of weights and measures; (6) to provide for the punishment of counterfeiting the securities and current coin of the U.S.A. (a resulting power of C. includes the whole of the Criminal Code); (7) to establish post offices and post roads; (8) to promote the progress of science and the useful arts; (9) to constitute tribunals inferior to the Supreme Court; (10) to punish piracies and felonies on the high seas and offences against the law of nations; (11) to declare war; (12) to raise and support armies; (13) to maintain a navy; (14) to provide for the calling forth of the militia to execute the laws of the Union, suppress insurrections, and repel invasions; (15) to provide for organising, arming, and disciplining the militia; (16) to exercise exclusive legislation over the national capital; and (17) to make all laws which shall be necessary and proper for carrying into execution the foregoing powers. Within these terms C. has to deal with a vast amount of legislation. Bills are proposed by private members, and the committee system has been introduced for reporting on and sorting out those which merit immediate consideration. The President has the power of veto (see under ACR). C. meets once a year, but the President may convene one or both of the Houses in special session. The first session lasts from Dec. of the odd-numbered years until the summer; the second session lasts from Dec. of the even-numbered years until March 4. C. came into being after the adoption of the Federal constitution, and arose out of

the old continental C. held since 1789. The present C. (1847-40) is the eightieth.

See Viscount Bryce, *The American Commonwealth*, 1888, 1917; W. B. Munro, *The Government of the United States*, 1925, 1936; F. A. Ogg and P. O. Ray, *Introduction to American Government*, 1925, 1938; D. W. Brogan, *The American Political System*, 1933, and *Politics and Law in the United States*, 1941; A. C. McLaughlin, *A Constitutional History of the United States*, 1935.

Congreve, William (1670-1729), dramatist, was educated at Kilkenny school, where he was a contemporary of Swift, and at Trinity College, Dublin. His father was a lieutenant in the Irish Army

WILLIAM CONGREVE

and his father's home was Idmeston Castle, C. himself was b. not far from Leeds on the estate of his great-uncle on his mother's side, Sir John Lewis. Intending to go to the Bar, he left Ireland and came to London, where he entered himself as a student of the Middle Temple; but he soon abandoned law for literature. He made his debut as a man of letters with a novel, *Incognita, or Love and Duty Reconciled* (1692) pub. under a pseudonym, which has long since been forgotten. He next turned his attention to the stage, and his first comedy, *The Old Bachelor*, was produced, four years after it was written, at Drury Lane in Jan. 1693. This was sufficiently successful to justify the management in putting up, in Nov. of the same year, his second play, *The Double Dealer*, which proved very popular. Some time after Betterton and others of the Drury Lane company seceded, and opened a new theatre in Lincoln's Inn Fields on April 30, 1695, with C.'s *Love for Love*. This proved so much to the liking of the public, and consequently so profitable to the managers, that C. was

given a share in the theatre, he, for his part, undertaking to produce a play every year. With this condition, however, he did not comply. Indeed, he wrote only two more pieces, a tragedy, *The Mourning Bride*, played at the Lincoln's Inn Theatre in 1697, and a comedy, *The Way of the World* in 1700. *The Way of the World* was received coldly, but the author assured his sympathisers that he was indifferent. His other literary work was the composition of poems not of serious importance. He rendered some service to letters by assisting Dryden in his trans. of Juvenal (1692) and Virgil (1697), of which assistance Dryden made due acknowledgment. C. in company with Wycherley, Vanbrugh, and Dryden, was severely mauled in Jeremy Collier's *Short View of the Immorality of the English Stage* (1698). The other writers kept silent—Dryden afterwards admitted the justice of the reproach—but C. replied in the same year in a pamphlet *Amendments of Mr. Collier's False and Imperfect Citations* (from C.'s plays), which Collier answered vigorously and effectively. He had ample means, derived from sinecures, for from 1695 he was commissioner for licensing hackney-coaches, an office which ten years later he exchanged for the more lucrative commissionership of wine licences. In 1714 he exchanged this position for that of secretary for Jamaica, worth about £700 a year, which he held conjointly with a place in the pipe-office, that brought him in nearly as much. He had lived with Mrs. Bracegirdle—there were rumours that he married her—but on his death he left her a legacy of only £200, and left the duchess of Marlborough, who did not want money, the bulk of his estate, worth about £10,000. The duchess spent £7000 of the money on a diamond necklace. All this has prejudiced C.'s reputation as a man; but his legacy to the wealthy duchess is accounted for by the fact that the money was destined for her daughter who was his child. For how otherwise could he, without scandal, have transmitted it? The duchess bequeathed the legacy to the daughter, Mary. Mrs. Bracegirdle, to whom C. was faithful for ten years, and who left him for the wealthy Lord Scarsdale, had retired in easy circumstances twenty years before C. d. After 1710 C. was afflicted with bad sight and bad health. He met his death on Jan. 19, 1729, as the result of injuries received in a carriage accident. He was buried in Westminster Abbey. C.'s plays are chiefly remarkable for polished dialogue coupled with a cynical heartlessness and a fashionable licentiousness. *The Way of the World*, his masterpiece, scintillates with an arctic brilliance. In few plays is the art more adroit, the wit more polished; yet in few is there less of real human interest. It was the fault of C.'s age, perhaps, that he could not deviate from the restrictions of artificial comedy into those broader scenes of life and that wider outlook which lift Vanbrugh, despite his inferior technique, almost to the level of C. C. has not the robustness nor audacity of

Wycherley, but in his own mode and sphere he is unsurpassed. *The Way of the World* ran for over 100 nights at the Lyric, Hammersmith, in 1923, and has been put on more than once in recent years. The long run of *Love for Love*, revived during the Second World War, showed that C.'s popularity as a dramatist had actually, in 1944, reached again the pitch it once attained in his lifetime. John C. Hodges's *William Congreve: the Man* (1944) helps towards a better understanding of C.'s early success as a playwright and of his subsequent motives and character, besides confirming various facts concerning his birth and youth. Hitherto, C.'s reputation as a man has suffered from Voltaire's statement that C. referred to his own works as 'trifles', and told Voltaire that he would rather be considered 'a gentleman who led a life of pliancy and simplicity' than a dramatist. But C.'s estimate of his own work, which disgusted Voltaire, was not due to false modesty or to snobishness. Being a thorough artist and also a detached unambitious man, he considered the comedies which had made his reputation "trifles"; even *Love for Love* he thought "homely fare," though for *The Way to the World* he made no such apology. There are eds. of C.'s plays by A. C. Ewald (1887), W. Archer (1912), and J. W. Crutch (1927). C.'s *Complete Works*, including the adaptation of Molière's *Monsieur de Pourceaugnac*, *Squire Trelooby*, written in collaboration with Vanbrugh and Walsh (1704), ed. by Dr. Montague Summers, was pub. in 4 vols. in 1923. See Sir E. Gosse, *Life of William Congreve*, 1888, 1924; D. C. Taylor, *William Congreve*, 1931.

Congreve, Sir William (1772-1828), inventor of the C. rocket which was successfully employed at the siege of Copenhagen, Lord Gambier's engagement in the Basque Roads (1809) and at Leipzig (1813) where the Rocket Troop of the Royal Artillery did yeoman service. Besides publishing three treatises on his rocket, which was later superseded by Hale's, he patented many other inventions, including a process of colour printing, pyrotechnic improvements, a smoke-consuming device, and a gun-recoil mounting.

Coni, see CUNEO.

Conia, Conino, or Conline (C₂H₁₁N), alkaloid contained in the seeds of the spotted hemlock (*Conium maculatum*). It is a colourless, oily liquid with a penetrating smell, boils at 167° C., turns brown on exposure to the air, and is soluble in water and alcohol. It is strongly basic; the prin. salts are conine hydrochloride and conine hydrobromate. The alkaloid and its salts are strongly poisonous; moderate doses produce motor paralysis without loss of consciousness, and larger doses cause death by paralysis of the organs of respiration. Small doses are valuable in acute mania, delirium tremens, and tetanus.

Conibos, or Manos, tribe of S. Amer. Indians, who live along the banks of the Ucayali, Peru, and also in the Pampa del Sacramento. Franciscan missionaries

were murdered there in 1685, but since their conversion to Christianity such barbarities have become a thing of the past. As they use the language of the Panos, ethnologists regard them as a branch of that people. They wear silver rings on lips and nose, paint their cheeks with blue and red streaks, and gain their livelihood by fishing and trading with white men in sarsaparilla.

Conical Projection, system by which points, lines, and areas on the surface of a sphere or other solid are represented by corresponding markings on the surface of an enveloping cone. As the earth is a spheroid, it is impossible to represent accurately on a plane map the relative distances of points on the earth's surface. A cone, however, is a surface which can be unrolled, or spread out on a plane, to form a sector of a circle. If, therefore, the earth is imagined to be enveloped by a cone touching a certain parallel of lat., the distances on that parallel are accurately rendered on the map when spread out, while the inaccuracy increases as the regions on the earth's surface become more remote from that parallel. In such a map the meridians are represented by straight lines converging to the pole, and the parallels by circles having the vertex of the cone as centre. The method is particularly applicable to maps of the polar regions.

Conic Sections, curves which are formed by the intersection of a cone by planes in different directions. If the cone be cut parallel to the base, the section is a *circle*; if it be cut by a plane parallel to the generator, i.e. a straight line from the vertex to a point on the circumference of the base, the section is a *parabola* (q.v.); if it be cut by a plane parallel to the axis, the section is a *hyperbola* (q.v.); and if it be cut by a plane parallel to none of these, the section is an *ellipse* (q.v.). A conic section or conic may also be regarded as the locus of a point whose distance from a fixed point is equal to its distance from a fixed straight line; a hyperbola is the locus of a point whose distance from a fixed point bears a constant ratio, greater than unity, to its distance from a fixed straight line; an ellipse is the locus of a point whose distance from a fixed point bears a constant ratio, less than unity, to its distance from a fixed straight line.

Coniferae, most important natural order of gymnospermous plants, consisting of between three and four hundred species of resinous trees or shrubs, which inhabit all temperate and cold parts of the world in which arborescent plants can exist. Some of the most characteristic features of the order are the presence of resin-ducts, the regular monopodial branching of the stem, the long tap-root, and the small simple leaves. The classification of the C. is treated differently by various botanists, but the species are often grouped under the headings Pinoidae and Taxoidae. The Pinoidae contains the majority of the species, and includes the well-known genera *Abies*, *Cedrus*, *Larix*, *Picea*, *Pinus*, *Juniperus*, as well as sev-

others of less importance; the Taxoidae comprises *Phyllocladus*, *Ginkgo*, *Taxus*, and six other genera. For further details see separate articles, and W. Dallimore and A. B. Jackson, *A Handbook of Coniferae, including Ginkgoaceae*, 1923.

Conil, coastal tn., with sardine and tunny fisheries, 21 m. S.E. by S. of Cadiz, in the prov. of Cadiz, Spain. Pop. 5500.

Conine, or **Coniine**, see **CONIA**.

Coningham, Sir Arthur (1895-1948), Brit. air marshal, b. at Brisbane, Australia, and educated at Wellington College, New Zealand, and at New Zealand Univ. Enlisted in Canterbury (New Zealand) Mounted Rifles, 1914, but after service in the Middle E. was invalided out of the army, 1916. Later he joined the Royal Flying Corps, serving with great distinction in France as a fighter pilot. Granted a permanent commission in R.A.F. in 1919. Commanded a flight of aircraft in 1925 on the first flight from Cairo to Kano (Nigeria), thus opening the way to an air route across Africa. Awarded A.F.C., 1926. As a wing commander he was posted to Coastal Area in 1935, and, in 1937, was promoted senior air staff officer at Lee-on-Solent. Not long before the outbreak of war in 1939 he was given the command of a group and promoted air commodore. With his transfer in 1941 to the Middle E. his long and fruitful association with Sir Arthur (now Lord) Tedder began. Soon after reaching N. Africa he was put in command of the air forces in Libya, later known as the desert air force. Air vice-marshal, 1942. Awarded K.C.B. in 1942 for his services in the battle of Egypt. He and Sir A. Tedder were the primary designers of the air side of the plan by which the action of all three services were integrated; for though such a system had long existed in theory, it was first applied in Libya. When Sir Arthur Tedder became commander-in-chief of the allied air forces in the Mediterranean in Feb. 1943 C. was assigned the work of concerting the air operations in support of the Brit. First and Eighth Armies in Tunisia. With the acting rank of air marshal C. was then put in command of the N.W. African tactical air force and continued to command the tactical air forces in the field in Sicily and Italy. In 1944 he was appointed air officer commanding of the R.A.F. second tactical air force, which operated with the Brit. and Canadian Armies on the W. front. After the war he became air officer commanding in chief, Flying Training Command, K.B.E., 1946. In 1946 he received the freedom of Brussels, where an avenue was named after him. Resigned at his own request, 1947. Killed when travelling as a passenger in a Tudor aircraft, which was lost on a flight from the Azores to Bermuda (Jan. 1948). A most efficient air commander and a brilliant strategist.

Conington, John (1825-69), Eng. classical scholar, was educated at Rugby and Oxford. He obtained a first-class honours degree in classics (1846), and won (1847-1848) three chancellor's prizes for Lat. verse, Eng. and Lat. essay respectively.

In 1854 he renounced his legal studies in London for the chair of Lat. language and literature at Corpus Christi College in his own univ. Thus amid congenial surroundings he was able to give effectual scope to his supreme and infectious enthusiasm for classical culture, and also to work at his many trans. The most famous of these is his version of the *Æneid* (1866) in the galloping or octosyllable metre of Scott, but he also produced a trans. of the last twelve books of the *Iliad* (1868) in the Spenserian stanza, of the *Agamemnon* of Æschylus (1848), and of the *Odes* and *Carmen Sæculare* (1863) and *Salvæ. Epistles*, and *Art of Poetry of Horace* (1869), the last named being in the heroic couplet. In 1852 he began, in collaboration with Prof. Goldwin Smith, a complete ed. of Virgil, with a commentary, of which the first two vols. were pub. between 1858 and 1864, and the third, in which H. Nettleship replaced Goldwin Smith, soon after C.'s death. He also produced an ed. of Persius with commentary and prose trans., pub. posthumously in 1872.

Conisbrough, tn. in Yorkshire, 5 m. from Doncaster, celebrated for its ruined Norman castle. Rhinoceros bones have been found here. Pop. 16,000.

Coniston, vil. on the shores of C. lake in the N. Lonsdale div. of Lancashire, England. There are slate quarries in the vicinity, and copper ore is mined. John Ruskin resided at Brantwood, his property in the par., and is buried in the churchyard. Pop. 1100.

Coniston Grits and Flags belong to the Ludlow group, which is the geological name of the upper sub-div. of the Silurian rocks in Great Britain. They occur in the Silurian area of the Lake Dist., Cumberland, being named after Lake C.

Coniston Lake, one of the smaller lakes in the Eng. Lake Dist., much visited on account of its natural beauty and associations by tourists from Grasmere and Ambleside. It is situated in N. Lancashire, 14 m. W. by N. of Kendal, with which it is connected by the Furness railway, and 9 m. W. of Bowness on Lake Windermere. The breadth is only ½ m. compared with a length of 5 m., the N.W. extremity being overlooked by the round-backed landmark known as C. Old Man (2633 ft.). Perch and trout are fished from its waters. Brantwood, once the home of Ruskin, stands some way above its E. shore. The most picturesque view of the lake may be obtained from the rising known as Tarn Hawes.

Conium, see HEMLOCK.

Conjeeveram (Kanchipuram), Golden City, one of the oldest tns. of India (Madras prov.) and one of its seven sacred places. It was the cap. of the renowned Pallava kings. One of the anct. Pallava temples is a most remarkable architectural monument for the extent and beauty of its sculptures. Pop. 62,000.

Conjo, tn. in the dist. of Santiago and the prov. of Corunna, Spain. Pop. 6200.

Conjoleus, Fr. tn. in the dept. of Charente. It stands on the R. Vienne. Pop. 3500.

Conjugal Rights, see under MARRIAGE. Conjugation: 1. Term in grammar applied to a verb to denote its different forms. These forms may be obtained by inflection or by the use of particles and other words, the latter giving the periphrastic form of the verb. Verbs are conjugated to express differences of voice, mood, or tense. 2. Term used in biology for a process which leads to the rejuvenescence of cells or to the reproduction of their kind, and is common only to the lowest forms of animals and plant life. Among the animals to which this method of reproduction is common may be mentioned the *Amæba*, *Paramecium*, and *Vorticella*; among the plants, the *Spirogyra*.

Conjunctions, in grammar, are words used as connectives between one word and another, or one sentence and another.

Conjunctiva and Conjunctivitis. The C. is a mucous membrane lining the inner surface of the eyelids, and constituting a pellucid covering on the surface of the eyeball. The former is called the palpebral, and the latter the ocular part. In the ocular part a sclerotic and a corneal portion may be distinguished. The C. is very subject to inflammation of varying degrees of severity. There are many causes of conjunctivitis: general debility from whatever cause, or eye-strain due to defects or overwork of the eyes; irritation from any cause, such as smoky atmosphere or exposure to dust or too bright light. Many of the infectious diseases, such as diphtheria and measles, have eye complications like conjunctivitis. The treatment of conjunctivitis should never be neglected. The cause of the condition where known should be remedied, and rest provided for the eyes, either by a period of comparative disuse or by glasses. The eyes should be bathed by means of an eye-bath, sev. times a day, with some antiseptic lotion such as a weak solution of bicarbonate of soda or boracic acid. Yellow oxide of mercury ointment may be applied to the rims at night. Special towels and washing materials should be kept to scrupulously. See also PINK-EYE; TRACHOMA. See also HORSE (DISEASES).

Conjuring, art of producing apparently miraculous effects by tricks or illusions, so as to deceive the audience. Such may be done by sleight of hand and dexterity, combined with a momentary diversion of the attention of the spectators induced by the performer. Large numbers of tricks with cards, coins, etc., are performed solely by sleight of hand, of which the prin. basis is the concealment and rapid passing of a card, coin, or small object in or to the palm of the hand; these tricks are elaborated by means of mechanical contrivances, objects concealed in the sleeves, etc., and with specially made or marked packs, etc. They are styled tricks of legdormain or prestidigitation. Another class, and these are they which have a long antiquity, are based on natural phenomena, unknown or unappreciated by the audience, such as the effect of combining or using chemical substances, electricity, etc.

Further, many wonderful feats, especially of E. jugglers and conjurers, are attributed to hypnotism and the undoubted power of thought transference and suggestion. Elaborate code signals explain many other feats. Further we get the illusions proper, the vanishing figures, automatic figures, speaking heads, and all the devices of the modern scientific conjurer and wonder-worker. C. is often styled white magic, to distinguish it from sorcery or black magic. C., or magic, is a very anct. art; the people of the E. delighted in and feared their magicians. The Syrians and Babylonians, and especially the anct. Egyptians, were exceedingly clever conjurers. The anct. Gks. and Roms. also delighted both in C. and juggling, and from ages past till to-day the Hindus have been experts in the art. From China and Japan have come many elaborate and beautiful tricks with birds in cages, gold-fish, and the like. The mechanical figure has a long hist., and so has the production of spectral figures or phantasms, obtained by reflection on smoke or on mirrors. Considerable interest was aroused in recent times by the offer of J. N. Maskelyne of a large reward for an imitation of his famous box-trick; the result was a lengthy legal suit carried to the House of Lords. The successful imitator won his case, though his box was not the same as Maskelyne's. The wonders of the mediæval sorcerers were worked on many of the principles developed and improved to-day, when every branch of physical science, chemistry, optics, mechanics, and electricity, is called to the aid of the conjurer or illusionist. J. E. Robert-Houdin (1805-71) was one of the most famous of modern conjurers. His Temple of Magic in Paris was the scene of many marvels, in which he used electromagnetism; though a Ger., Döbler, in 1842, was the first to use electricity in his trick of lighting 200 candles at once by the firing of a pistol. Houdin, it may be recalled, was sent to Algiers by the Fr. Gov. to prove that the marabouts were not in league with heaven. The production of objects, of which the rabbit from the hat is the most familiar, has long been a favourite, and has had endless modifications and elaborations. In modern Egypt the street and bazaar conjurers abound. Many of their tricks are performed with mirrors, and in special cases hypnotism and thought-reading play a part. Disappearing figures appeared in England as early as Chaucer, and in the sixteenth century spectral illusions were exhibited in the Colosseum. In the eighteenth century a vanishing figure was produced with the aid of mirrors in France. The illusion of unsupported figures floating in the air was first produced by the Chinese. Roger Bacon was said to have a speaking head of brass, and throughout the Middle Ages we have allusions to man's feats of so-called magic and sorcery which are eclipsed by the white magicians of to-day. Few tricks have surpassed Maskelyne's 'Vanishing Lady,' or his automaton, Psycho, and

other performing figures. See L. Hoffman, *Modern Magic*, 1877; E. H. Jones, *The Road to Endor*, 1920; H. Houdini, *Paper Magic*, 1922; W. Goldston, *Great Tricks Revealed*, 1935; J. Maskelyne and A. Groom, *The Book of Magic*, 1936; J. Maskelyne, *White Magic*, 1937. W. B. Gibson, *Professional Magic for Amateurs*, 1948.

Conkling, Roscoe (1829-88), Amer. politician and lawyer, was b. in Albany, New York. From 1858 to 1862, and again from 1864 to 1867, he sat in Congress as Republican representative. His final resignation was due to his election as U.S.A. senator, a position he occupied for fourteen years (1867-81). As regards the conduct of the Civil war and the treatment of the S. states he proved an energetic supporter of the policy of Lincoln and Grant, and consequently an opposer of Johnston's schemes. In 1880 his vigorous championship of Grant and his rivalry with Blaine (q.v.) led to a split in the republican ranks. His resignation of his senatorship took place in the following year. He had a protracted dispute with Garfield on the question of the New York patronage.

Conn, Herbert William (1859-1917), Amer. biologist, b. at Fitchburg, Massachusetts. From 1905 he was bacteriologist of the Connecticut State Board of Health and director of the State laboratory. He made a special study of the bacteriology of dairy products, publishing sev. works on that subject. Other works include *Evolution of To-day* (1886); *The Study of Germ Life* (1897); *The Study of Life's Mechanism* (1899); *The Method of Evolution* (1900); *Agricultural Bacteriology* (1901); *Social Heredity and Social Evolution—the Other Side of Eugenics* (1921).

Conn, Lough, lake in the co. of Mayo, prov. of Connaught, Eire. The R. Castlebar flows into L. C., which in its turn empties itself into the R. Moy.

Connaught (Connaacht), prov. in Eire. On two sides, the N. and W., it is washed by the Atlantic, while on the N. it is bounded by Ulster, on the N.E. and E. by Leinster, and S. by Munster. Area 6610 sq. m. A large part of the prov. consists of a level plain, while the W. and N. is traversed by mts. C. is noted for the beauty of its lakes, the chief being Loughs Conn, Corrib, Mask, and Allen. The chief rive. are the Shannon, the Moy, and the Suak. The coast-line is very much indented, forming large bays, the chief being Sligo Bay, Clew Bay, and Galway Bay. C. comprises the cos. of Leitrim, Sligo, Mayo, Roscommon, and Galway. Pop. 492,800.

Connaught, Prince Arthur (Arthur Frederick Patrick Albert), of (1883-1938), only son of Arthur, duke of Connaught and Strathearn (q.v.); b. at Windsor Castle, Jan. 13, 1883; married Oct. 15, 1913, Princess Alexandra Victoria, duchess of Fife, whose mother was eldest daughter of Edward VII. Privy Counsellor, 1910. Lieutenant, 7th Hussars, 1903. Captain, Scots Greys, 1907; major, 1915; colonel, 1922. A.D.C. to Brit. Expeditionary Force, 1914-16; G.S.O.

(2nd grade), Canadian Corps, 1917-18 (dispatches, twice; C.B.). One of the four counsellors of state during the king's absence in India, 1911-12; and went to Japan as the king's emissary to the emperor. Governor-general of Union of S. Africa, 1920-24.

Connaught and Strathearn, Arthur William Patrick Albert, Duke of (1850-1942), seventh child and third son of Queen Victoria, attended the Royal Military Academy at Woolwich in 1866 and entered the Royal Engineers in 1868, being transferred to the Rifle Brigade the following year. In 1871, the year of his

The Times

THE DUKE OF CONNAUGHT

majority, he received his captaincy and also an annuity of £15,000 from Parliament, which was augmented to £25,000 when, in 1879, he married the Princess Louise Marguerite of Prussia (d. March 14, 1917), youngest daughter of Prince Frederick Charles. Appointed major to the 7th Hussars in 1875, he became lieutenant-colonel of the Rifle Brigade in 1876. During the expedition to Egypt in 1882 he led the Guards Brigade at the battle of Tel-el-Kebir, earning a threefold mention in dispatches and receiving at the same time the order of C.B. He had been created duke of Connaught and Strathearn and earl of Sussex in 1874. In 1886 he received the Bombay command, being also, by virtue of his office, a member of the governor's executive council and, in 1890, on his return, was appointed to the command of the S. dist. as a lieutenant-general, and three years later he became general. In 1900, when Lord Roberts went to S. Africa, the duke took his place as commander-in-chief of the army in Ireland, and in 1902 was promoted field marshal. From 1904 to

1907 he acted as inspector-general of the forces, and as commander-in-chief in the Mediterranean, 1907-9. In 1910 he represented the king on the occasion of the opening of the Union Parliament in S. Africa. Elected master of Trinity House the same year, he was appointed in 1911 to the governor-generalship of the dominion of Canada, which he held till 1916. One of his last official acts as governor-general was to lay the cornerstone of the new dominion Parliament buildings at Ottawa. In 1921 he went to India as the king's representative to inaugurate the new prov. legislative councils of Madras, Bengal, and Bombay. Made a freemason in 1874, he became senior grand warden in 1877, grand master of England, July 17, 1901. His home was Bagshot Park, Surrey; his London residence, Clarence House, St. James's; and his continental retreat, Les Bruyères, St. Jean, Cap Ferrat, Alpes Maritimes. A study of his life, by Sir George Aston, was pub. 1929. He had three children: Princess Margaret (1882-1920), wife of the crown prince of Sweden; Prince Arthur of Connaught (q.v.); and Victoria Patricia, b. 1886, who on her marriage to Capt. (later Adm.) the Hon. Alexander R. M. Ramsay in 1919 was authorised to renounce her title of princess.

Connaught Rangers. The old 88th Foot was raised in Connaught in 1793, to which circumstance it owed its title. In 1881 the old 94th Foot was linked to the 88th under the title of the C. R. In consequence of the inauguration of the Irish Free State some Irish regiments were disbanded in 1922, the C. R. being one. The regiment was with Abercrombie in the 1801 Egyptian campaign, and has twelve honours for the Peninsular war. It went through the Crimean campaign and helped to restore order in the Central Provs. during the Indian Mutiny. In 1877-79 it was fighting in S. Africa and again 1899-1902. During the First World War it raised six battalions which fought in France, Flanders, Macedonia, Gallipoli, Palestine, and Mesopotamia.

Conneaut, small tn., fed by three railways, on Lake Erie in Ashtabula co., Ohio, U.S.A. The first colony in the W. reserve, it owes its commercial importance to an excellent harbour. Jams and other canned goods are made. Pop. 9300.

Connecticut, one of the six of the New England States and of the original thirteen states of the U.S.A. It is bounded on the W. by New York, on the N. by Massachusetts, on the E. by Rhode Is., and on the S. by Long Is. Sound, the area, including land and sea, being 5009 sq. m. The chief rvs. all flow in a southerly direction through gently undulating lands of no great elevation at any part. There are three riv. valleys of importance in the state—the Thames, Housatonic, and the Connecticut—each of the rvs. of which has numerous small tribs. The E. of C. consists mainly of hills with narrow and deep riv. valleys. In the N. the country is mountainous, but the valley of the C. R. is broad and fertile, being mostly of Triassic formation, whereas the greater

part of the rest of the state consists of rocks of granite and gneiss. Brownstone, which is used in large quantities in the cities for building, is quarried at Portland, while good building stone is found on Long Is. Tungsten is mined also, copper, lead, and other minerals being found in places. The climate of the state is subjected to extremes of heat and cold, while the soil in the N. part is fertile and in the S. sandy. There are no great agric. facilities, as a large portion of the soil is not so fertile as that of other states. Hay is one of the most important products and tobacco is grown in the C. valley. Dairy produce and fruit farms are also a source of wealth, and some cereals are grown. C. is a very important manufacturing state, and its position, together with the facilities afforded by its rivs., has largely contributed to this end. Its manufs. are many and varied, the chief being brass, cotton, silk, and woollen goods; carpets, hosiery, leather, boots and shoes. C. ranks high in the matter of education. Yale Univ. has over 1000 teachers and 8000 students; the Wesleyan Univ. and the C. College for Women are other important colleges. It is said to have been the first community in the world to form a written constitution by a social compact. Such constitution was confirmed by Charles II. in 1662. The General Assembly consists of the Senate of thirty-six members and the House of Representatives of 272 elected for two years. Pop. 1,709,000. Prin. cities are Hartford, 166,200; New Haven, 160,600; Bridgeport, 147,100; Waterbury, 99,300; New Britain, 68,600; Stamford, 47,900; Norwalk, 39,800; and Meriden, 39,400. See O. Shepard, *Connecticut, Past and Present*, 1939.

Connecticut River, largest riv. (some 450 m. long) in New England, U.S.A. Rising in the extreme N. of New Hampshire, it forms a boundary between that state and Vermont, crosses Massachusetts, and finally C. where it enters Long Is. Sound at Saybrook, 30 m. E. of New Haven. Its general course is always southerly. For ships of light draught it is navigable as far as Hartford (50 m. up). The W. trib., known as Hall's Stream, separates Canada from the U.S.A. for some distance. The C. is noted for its shad fisheries and drains an area of 11,260 sq. m.

Connective Tissue, mass of cellular tissue and cartilage, serving to support the body and unite its different organs and main tissues. C. T. is varied, but it all arises from a similar source—a layer of embryonic cells existing all over the body. It comprises adipose tissue, in which fatty substances largely replace the cells; lymphoid or adenoid tissue, in which the cells are filled with leucocytes (q.v.); and areolar tissue, which is purely cellular. See also **TISSUE** AND **TISSUE CULTURE**.

Connellsville, bor. of Fayette co. in S.W. Pennsylvania, U.S.A., situated on Youghiogheny R. and served by sev. railways. Here most of the coking coal for iron smelting in America is produced.

There are many manufactories. Pop. 13,600.

Connemara (the Bays of the Ocean), known also as Ballynahineh, forms the westernmost div. of co. Galway, Eire, and is itself subdivided into Joyce co. in the N., C. proper in the W., and Yar-Connaught in the S. In length it reaches for 30 m., whilst its breadth varies from 15 to 20 m. It is noted for its quarries of a green variety of marble. Tourists are attracted by its wild scenery of bogs and mts., lakes, and inlets, whilst anglers are certain of good sport.

Connorsville, situated on the White-water R., 828 ft. above sea level, the cap. of Fayette co. in E. Indiana, U.S.A., and a centre for three great railway systems. Makes automobiles and furniture. Pop. 12,800.

Connétable de France, name used at different periods in Fr. hist. for different offices. Under the early kings it was applied to a dignitary at court, but in the reign of Philip Augustus the commander-in-chief of the army was known as the C. Such was the C. until Richelleu removed him in 1627. But Napoleon revived the office in 1804, giving it to his brother Louis. It was finally done away with when the line of Bourbons was restored.

Connolly, James (1870-1916), Irish Socialist and rebel, was b. near Clones, co. Monaghan; son of a labourer, who in 1880 took his family to Edinburgh. 'Devil' in *Evening News* office, worked in a bakery and a mosaic-tile factory; then, in turn, tramp, navvy, and pedlar. Returned to Edinburgh as corporation dustman. Joined Social Democratic Federation and went to Ireland in 1896 as their emissary. Estab. Irish Socialist Republican party. Lectured in Great Britain and U.S.A., returning to Ireland in 1910. With James Larkin, organised strike of transport workers, 1913. Three years later, as a 'fight against the War,' led Easter Week rising in Dublin. Captured by the Brit.; shot dead at Kilmainham jail, May 12, 1916. See R. M. Fox, *James Connolly: the Forerunner*, 1947.

Connor, par., 1 m. from Kells station, and 6½ m. N. of Antrim, in the S.W. of the co. of Antrim, N. Ireland. Pop. of par., 4500; area 17,140 ac.

Connor, Ralph (Charles W. Gordon) (1860-1937), Canadian clergyman and novelist, was educated at the univ. and at Knox College, Toronto. From 1890 to 1893 he did excellent work as missionary among the lumbermen and miners in the Rocky Mts., and it is on the experiences gleaned during these years of service and adventure that most of his works of fiction are based. Of his novels the best known are *Black Rock* (1898); *The Sky Pilot* (1899); *The Pilot at Swan Creek* (1905); *The Dawn by Galilee* (1909). His later works included *The Arm of Gold* (1933); *Glengarry Girl* (1934); *The Rebel Loyalist* (1936); *He Dwelt Among Us* (1936).

Connotation and Denotation, words used in logic with reference to terms or names. The C. of a term implies certain qualities possessed by the object of which the term

is a name. Comprehension and Intension are words used to express the same thing. The D. of a term shows how many particular objects the name can be applied to, 'extension' being used as synonymous with D. For example, when the term dog is used the C. of that term implies certain characteristics as to size, hairy coats, shape of the animal, fidelity, and other attributes, and it could not be applied to anything else which did not possess all these attributes in conjunction. That is to say, the word dog, when used, calls up certain attributes to any one hearing the term. The D. of this same term dog is the number of particular animals to which this name can be applied, which, of course excludes everything not possessing the essential characteristics necessary to place it in this class. The C. of a term determines its D. Thus, when the term dog is used it can be applied to all animals having hairy coats, a particular size, shape, and certain other characteristics. If, however, the C. is increased, the D. is decreased. So the term white dog, which adds another quality, namely white, will apply to fewer animals, as all dogs of other colours will be excluded. All terms have D., but proper names, according to most logicians, have no C. in that they do not imply any particular attributes.

Conolly, John (1794-1866), founder of the Brit. Medical Association. In 1832 C., together with Sir John Forbes and Sir Charles Hastings, instituted a medical society for the improvement of practices in the provs.—a society which proved to be the Brit. Medical Association in embryo. In his *Construction and Government of Lunatic Asylums* (1847), and *Treatment of the Insane without Mechanical Restraints* (1856), those splendid principles are enunciated which have justly shed renown over C.'s revolutionary and successful administration of the Hanwell Asylum.

Conon: 1. Gk. mathematician, fl. at Alexandria about 250 B.C. Berenice, the wife of Ptolemy Euergetes, lost her hair, which she had dedicated to the temple as an offering to secure her husband's safe return. C. declared that the Coma Berenices (Hair of Berenice) had been set among the stars. (See also COMA BERENICES.) Catullus, who imitates Callimachus, wrote a poem on this incident. 2. Athenian general, played a conspicuous part in the latter half of the Peloponnesian war, when the glory and supremacy of his native city were already waning. In 406 B.C. he was chosen as one of the ten commanders who succeeded the fallen Alcibiades. After the disastrous defeat at Egospotami in 406 B.C., C. was obliged to seek refuge with his friend Evagoras, king of Cyprus. When war broke out between Persia and Sparta, C., together with the satrap Pharnabazus, became commander of the Persian fleet, and in 394 redeemed his former reputation by overcoming the Spartans near Cnidus. But his noblest act of patriotism was the restoration of the long walls and of the fortifications of the Piræus, and the expulsion of the

Lacedæmonian harmosts from many of the seaboard garrisons of the Ægean. Some say he d. in Cyprus about 390, others that Tiribazus, the Persian, had him assassinated, when he came on an embassy from Athens, as a proof of his loyalty to Sparta.

'Conqueror,' name of many Brit. battleships. The most famous were those of Boscawen's victory in Lagos Bay (1579), of Byron's action with d'Estaing (1779), of Rodney's encounters with de Guichen (1780) and de Grasse (1782). There was also a C. at Trafalgar (1805), and at the capture of Simonoseki, Japan (1864). A Dreadnought of this name was built in 1911-12.

Conquest (Lat. *conqueri*, to obtain). In Scottish law, heritable property which came into the possession of the deceased by purchase, gift, or in any other way unconnected with his capacity of heir, from a stranger, or from a relative to whom he would not by law have succeeded, is called C. But the distinction between C. and heritage proper has been rendered devoid of practical significance since the Conveyancing Act, 1874, provided that the fees of C. should descend in all respects in the same way as fees of heritage.

Conquistadores (Sp., conquerors), collective term for the Sp. conquerors of America. The title is applied especially to the great leaders who conquered the natives of Peru, Mexico, and other parts of Sp. America, such as Cortés, Bilbao, Almagro, and Pizarro.

Conrad I. (d. 918), Ger. king, came to the throne in A.D. 911 as the direct line of the Carolingians was extinct. He belonged to a distinguished Franconian family and was related to King Arnulf. His reign was a wearisome succession of wars. Both the Magyars and Normans from without and the stem-duchies from within effectively opposed his schemes of unification, and later the Bavarians and Swabians waged continuous and equal warfare with him. C. tried in vain to get possession of Lorraine, and could make no headway against Henry the Fowler of Saxony, whom he ended by naming his successor.

Conrad II. (c. 990-1039), emperor of the Holy Rom. Empire, and founder of the Franconian line, was a descendant of Otto the Great. In 1024, on the death of Henry II., C. was crowned king by his chief supporter, Arlbo, archbishop of Mainz; but there were many who disputed his sway. The death of Boleslaus, the duke of the Poles, in 1025 removed one of his enemies. In the following year C. assumed the Lombard crown at Milan, and after defeating the inhab. of Pavia and Ravenna, was crowned emperor at Rome in 1027 by Pope John XIX. In 1032 he acquired Lusatia, having worsted Meslaus, duke of the Poles, in sev. engagements, and the next year he was duly crowned king of Burgundy at Peterlingen. After putting an end to the horrid ravages of the Bohemians and other Slavonic tribes he again crossed to Italy in 1036. Here he issued an edict by which in future

the principle of heredity was to apply also to land held by the small vassals. His son Henry, who received Burgundy during his father's lifetime, afterwards became emperor as Henry III. By his decree the law of Justinian supplanted the Lombard law in Italy.

Conrad III (1093-1152), Ger. king, and founder of the Hohenstaufen dynasty, was actually crowned king of Italy at Monza in 1128, but finding it impossible to make good his claims against those of Lothair of Saxony, he finally recognised the supremacy of the latter in 1235. However, Lothair *d.* two years later, and in 1138 the Ger. princes, fearing the growing strength of the Guelph party, offered him the crown. The refusal of Henry the Proud, duke of Bavaria and Saxony, to give C. his allegiance made the latter's position intolerable. Germany, Saxony, Burgundy, and Bavaria were in a state of continued and hopeless civil disorder. Meanwhile Italy was also a prey to the disastrous quarrels of the Guelphs and Ghibellines and other factions. Thus when war was declared between Bavaria and Hungary in 1146, C. gladly seized the opportunity to escape from the endless turmoil, which was offered when St. Bernard of Clairvaux preached a new crusade. C. joined the crusade, but disaster still followed in his track. His splendid troops fell victims in Asia Minor to the ravages of the plague and warfare and C. himself was stricken with disease. Finally, in 1148, he left Palestine broken in health and *d.* at Bamberg with no results to crown his great exertions.

Conrad IV. (1228-54), Ger. king, was the son of King Frederick II. Crowned emperor of the Romans in 1237, two years after he had been chosen duke of Swabia, he at once involved himself in the futile and long-standing quarrel between emperor and pope. Until 1250 he was warring with two anti-kings, and was constantly fighting the leaders of the papal party in Germany. After narrowly escaping assassination at Regensburg, he assumed the title of king of Jerusalem and Sicily, marched to Italy, captured Capua and Naples, and was preparing to return home with a large army when death overtook him in 1254.

Conrad V., *see* CONRADIN OF SWABIA.

Conrad, Joseph (1857-1924), novelist writing in Eng.; *b.* Dec. 3, 1857, at Berdyczow in Podolia, Ukrainian prov. of Poland then under Russian rule. He was the only child of Apollo Nalecz Korzeniowski and his wife Evelina Bobrowska, and was christened Józef Teodor Konrad Nalecz Korzeniowski. His parents were of the landowner class, and his father was involved in the secret national Polish movement. When C. was three his father was arrested and exiled to N. Russia, his wife and child being allowed to go with him under the same conditions of banishment. C.'s mother *d.* in exile in 1865; two years later his father, a sick man, was given conditional parole, and he *d.* in Cracow in 1869, leaving the orphaned C. in the care of his maternal

uncle, Tadeusz Bobrowski. Between the ages of fifteen and seventeen C. astonished his uncle by expressing a determination to go to sea, a strange calling to people belonging to an inland country and devoted to agric. pursuits, but he persisted and in the autumn of 1874 he travelled to Marseilles to become a seaman. After some experience on two sailing ships, he became one of a syndicate of four young men who bought the sixty-ton *Tremolino* and sailed her on contraband activities until she was deliberately wrecked as described in a chapter in *The Mirror of*

JOSEPH CONRAD

the Sea (the vol. of *Memories* and Impressions pub. in 1906). More of this phase of C.'s life is told in the story *The Arrow of Gold* (1919). C.'s first Eng. ship was the *Maïa*, which he joined at Marseilles in April 1878, and it was aboard that vessel that he arrived at Lowestoft two months later and saw England for the first time. After some coastal trips in another ship, he joined, as ordinary seaman, a 'wool-clipper' sailing to Australia; returning to London on a steamship in 1880 he passed examination as mate in June of that year. From then on he served as officer on sev. ships, voyaging to many parts of the world, particularly across the Indian Ocean, and in and around the Malay Archipelago and the gulf of Siam. These are, more or less, the scenes of some of his best-known stories. *Almayer's Folly* (1895), *An Outcast of the Islands* (1896), *The Nigger of the 'Narcissus'* (1897), *Lord Jim* (1900), *Youth* and *The End of the Tether* (1902), *Typhoon* and *Falk* (1903), *The Secret Sharer* and *Freyta of the Seven Isles* (pub. in *Twixt Land and Sea*, 1912), *Victory*

(1915), *The Shadow Line* (1917), *The Rescue* (1920), and others. C. became a naturalised Brit. subject on 19 Aug. 1886, and on 11 Nov. 1886 he obtained his master mariner's certificate. His account of his seamanship examinations are given in *A Personal Record* (1912), which contains, in C.'s revealing yet reticent way, reminiscences of both his life at sea and his youth and ancestry in Poland. His last ship was the *Torrens*, a renowned sailing vessel, which he left in Oct. 1893. Because many of C.'s stories have a setting of the sea and ships, based very often on his own experiences, he has frequently been regarded as a sea-story writer only; but even those stories most concerned with ships and seamen are grounded in C.'s deep insight into human character and the relation of man's innate waywardness and weakness to the simple virtues of fidelity and courage. In stories like *Lord Jim*, *Youth*, *The Secret Agent*, and *Victory*, indeed in almost all C.'s writings, the reader is brought face to face with man alone against the forces of nature or fate, against evil fellow beings, or against a flaw in his own being. The uniqueness of C. in Eng. fiction owes much to an outlook and temperament peculiar to his origins, and his glowing, convincing writing style to the fact that Eng. was not his native language. He belongs both to romanticism and realism; his descriptions of people and places, rich in colour and simile, make one literally see what is happening, and, for all the grandeur of his language, he can be detached to the point of irony. C. began writing in 1890 (*Almayer's Folly*), while in the Belgian Congo Free State through which he travelled to take command of a riv. steamer; from his experiences there he was physically weakened but psychologically awakened. Years later he gave his Congo story in one of his finest books, *Heart of Darkness* (1902), which evokes with bitter irony the tragedy of the lost souls, white or black, in that torrid, fever-ridden land in the early days of its 'development.' *Almayer's Folly*, having been read by Edward Garnett, was pub. in April 1895. Encouraged to continue writing, C. settled down to a shore life, marrying Miss Jessie George of London on 24 March 1896; they had two sons, Borys, b. Jan. 1899, and John Alexander, b. Aug. 1906. His early books were appreciated by a discriminating public and praised by eminent writers; but none of his books attracted a wide circle of readers until *Chance* (1913), which has been called the most Eng. of his books, yet is essentially a C. novel both in theme (the 'aloneness' of de Barral, the financial swindler, of his daughter Flora, and of Captain Anthony) and in construction (the shifting time sequence and the changing presentation from the points of view of different characters, including the 'narrator,' Marlow, who figures in other C. stories). Part of the action of *Chance* takes place at sea, but there are other novels in which the sea plays no part at all, or very little part, and which

show to the full his power of penetration into the minds and motives of men, and his great artistry as a constructive novelist. *Nostromo* (1904), is his longest, and in some ways his greatest novel, the tremendous tale of political intrigue and ambition set around a silver mine on the seaboard of a S. Amer. republic; and two stories of revolutionaries and agents provocateurs are among his best: *The Secret Agent* (1907), a sombre, all-comprehending story of conspiracy, attempted outrage, and family murder, set, behind a quiet interior, in the underworld of Soho; and *Under Western Eyes* (1911), mainly enacted in Geneva, wherein the Russian exiles of those days lead, in an atmosphere of ideas and ideals, a tragic life of political crime, treachery, and self-punishment. His last two novels, *The Rover* (1923), and *Suspense* (unfinished and pub. posthumously, 1925) are of the Napoleonic period; set in the Mediterranean, some of the characters have their prototypes in friends of his youthful days. C. lived most of his writing life in Kent, his last house being Oswalds, in the vill. of Bishopscourt, where his death occurred suddenly, on 3 Aug. 1924. See H. Walpole, *Joseph Conrad*, 1916; F. M. Ford, *Joseph Conrad, a Personal Remembrance*, 1924; *Life and Letters of Joseph Conrad* (ed. G. Jean Aubrey) 1927; *Letters from Conrad, 1895-1924* (ed. E. Garnett) 1928; R. Curle, *The Last Twelve Years of Joseph Conrad*, 1928; Gustav Molt, *The Polish Heritage of Joseph Conrad*, 1930; R. L. Méroz, *Joseph Conrad's Mind and Method*, 1931; E. Crankshaw, *Joseph Conrad, Some Aspects of the Art of the Novel*, 1936; *Conrad's Prefaces to his Works*, with Intro. by E. Garnett, 1937; and M. C. Bradbrook, *Joseph Conrad, England's Polish Genius*, 1941.

Conrad, Michael Georg (1846-1927), Ger. writer, b. in Franconia, Bavaria. He studied modern languages and pedagogy, and taught for three years in Geneva. Among his works are: *Parisiana* (1880); *Französische Charakterköpfe* (1881); *Flammen für freie Geister* (1882); *Die Luletia* (1883); *Lutetias Töchter*; *Pumpkinella* (1889); *Deutsche Weckrufe* (1890); *Geflügelte Masken, Allerlei Charakterköpfe* (1890); *Von Emil Zola bis Gerhart Hauptmann* (1902). His impressionist work in the naturalist manner won him the name of 'the foremost apostle of Zola.' Other writings are *Totenanz der Liebe* (1884); *Die klugen Jungfrauen* (1889); *Was die Isar rauscht* (1889-98); *Fantasio* (1889); *Die Berichte der Narren* (1893); *Majestät* (1902), dealing with the relations of Ludwig II. and R. Wagner. His dramas are *Die Eranzpierten* (1888); and, with Willfried, *Firma Goldberg* (1889) and *Salve Regina* (1899).

Conrad von Hötendorf, Franz, Baron (1852-1925), military commander under Austro-Hungarian Empire; b. in Vienna, Nov. 11, 1852, son of a colonel, served against Bosnian insurrections of 1878 and 1881. A close friend of the Archduke Franz Ferdinand. Appointed chief of general staff, 1906, reorganised artillery. In 1908-9 was for war with Serbia, in

1911, with Italy—overridden by Aehrenthal, in Nov. 1911 was dismissed. Reappointed, 1912; set pace for First World War after Sarajevo murder. Broke Russians on Gallia front, 1915, made field marshal. Displaced by Emperor Charles, commanded on It. front; was defeated S. of Asiago, June 15, 1917. Retired, a baron. Wrote memoirs, *Aus Meiner Dienstzeit*. D. at Mergentheim, Aug. 26, 1925. See von Glaise-Horsteneau, *Collapse of Austria-Hungary*, Eng. trans. 1930.

Conrad von Würzburg (Würzburg) (d. 1287), famous Ger. poet and troubadour of the late thirteenth century. Little is known of his life, but he seems to have spent some time in Strasburg, and later in Basle, where he d. He was influenced by Gottfried of Strasburg, and his work reached a far higher level than that of most of the Middle High Ger. poetry of the period. Among his works are legends of Alexius, Silvester, Pantaloon; *Der Welk Lohn*; *Die goldene Schmiede*; *Klage der Kunst*; two long epics, *Der Trojanische Krieg* and *Partenopter und Melur*. His shorter verse romances are better—*Engelhart und Engeltrut*; *Das Herzezaerre*, familiarised by Uhland's *Kastellan von Coucy*. Examples of his shorter poems may be found in Lambel's *Erzahlungen und Schwänke des Mittelalters*, 1883. See Pfeiffer, *Germania*, iii., 1867; Gölther in *Allgemeine Deutsche Biographie*, vol. xlv., 1898, under 'Würzburg'.

Conradi, Hermann (1862-90), Ger. writer; studied in Berlin, Leipzig, and Würzburg, and early started upon a literary career. He was a leader of the new 'storm-and-stress' period, and a zealous supporter of the naturalistic tendencies of his time. His sketches, *Brudertaten* and *Lieder eines Sünders*, appeared in 1886 and 1887. He also wrote the romance *Phrasen* (1887), followed by *Wilhelm II. und die junge Generation* (1888). His *Adam Mensch* (1889) caused a great sensation, and involved C., Walloth, and Albert in a lawsuit for transgressing public morality. C. d. during the judicial proceedings.

Conradin of Swabia, or Conrad V. (1252-68), b. near Landshut, Germany, was the last Ger. emperor of the Hohenstaufen dynasty, son of Conrad IV. His empire was exposed to the hereditary enmity of the pope by a long minority under Louis of Bavaria. In 1267, unopposed, and supported by the Ghibelline faction, C. entered Rome, but was defeated at Tagliacozzo in 1268 by Charles of Anjou. He was betrayed by Charles and executed at Naples in 1268.

Consaborum, see CONSUEGRA.

Consalvi, Ercole (1767-1824), celebrated It. statesman and cardinal. By 1792 he had obtained the office of auditor de Rota, a member of the highest civil court. C. was wrongfully imprisoned for a time as instigator of the murder of Duphot, 1797. In 1801 he negotiated the Concordat with Napoleon in Paris. Bonaparte had him dismissed from office, 1806, being angered at his defence of Papal supremacy and independence. He

was banished from Rome, 1810. C. was reinstated in office, 1814-23, and governed the Papal states by a most liberal and humane policy. Capital punishment for heresy and torture were abolished, and new laws enacted. The Romans named him 'the great cardinal' for all the benefits conferred upon them. C. retired on the death of Pius VII., 1823; he was recalled by Leo XII. and accepted the honorary office of prefect of the college *De propaganda fide*, but d. soon afterwards at Rome. See J. A. M. Crétineau-Joly, *Mémoires du Cardinal Consalvi*, 1864.

Consanguinity (Lat. *cum*, together, and *sanguis*, blood), or kindred, is the relationship between persons of the same blood. This relationship may be lineal or direct, that is, the relationship which subsists between ascendants and descendants who are in a direct line one with the other, or it may be collateral or indirect, that is, the relationship between two persons, sprung from a common ancestor, root, or stock, but not descended one from another. Laws of inheritance, descent, and in most countries of marriage are largely governed by the ties of C. They differ naturally according to place and country. Thus in some of the U.S.A. the C. of uncle and niece does not prohibit marriage as it does in France (according to the Code Napoléon), England, etc., and—to take an example on the opposite side—the old canon law would not allow persons to marry between whom there was only the seventh degree of C.

Conscience, Hendrik (Henri), (1812-1883), popular Flemish novelist, entered the army, 1830-36, then retired and became known as a composer of songs. In 1837 he produced the romance *In het Vonderjaer* (the Year of Miracles, 1866). The novel *De Leeuw van Vlaanderen* (Lion of Flanders) followed, 1838; and *Phantasia*, a collection of short stories. King Leopold became his patron, and helped him to find employment in his native Antwerp and elsewhere. He was especially distinguished for his writings on Flemish vil. life, and contributed largely to the revival of Flemish literature and interest in the language. C. won the national prize, 1870, with *Bavo en Liekeken*. Other works, trans. into Eng., are *Sketches from Flemish Life* (1840); *The Good Mother* (1852); *Tales of Old Flanders* (1855); *The Poor Gentleman* (1856); *The Headman's Son* (1861); *The Happiness of Being Rich* (1869); *Popular Tales* (1902-6). See E. de Bom, *Hendrik Conscience*, 1912.

Conscience, knowledge within oneself. In ordinary language C. means the inward recognition of what is right or wrong in one's own actions, a moral sense of consciousness. In ethics, however, it has had various special applications, or rather uses, in various schools of moral philosophy, been regarded from different points of view. Thus it may mean simply an ordinary judgment of one's own conduct, using the same criteria or standards, however gained, as one uses in forming judgments about other things and applying them to one's own actions.

It is in this sense a moral consciousness applied to oneself and to one's own actions. On the other hand, it has been pushed to an extreme so that it becomes an intuitive, infallible natural faculty of the mind, a law to itself. The theory that C. is an infallible faculty of the mind is one part of the intuitionist school of ethical philosophy. According to this school, C. as a special faculty at once recognises what is right or what is wrong, whether the person acts or no on its dictates. The part played by C. as a prin. factor in an ethical system has been chiefly discussed and emphasised by the Eng. schools of philosophy. Shaftesbury (1671-1731) drew a close parallel between the sense of beauty and the sense of what is right or wrong; as it is a faculty in the sphere of art, so also is it a faculty in the sphere of action; it is a moral sense which determines the value of actions; according to Shaftesbury it is mainly non-reflective. Francis Hutcheson (1694-1746) developed the moral sense; but he tends to separate the working into two parts, one acting deliberately or deductively, one instantaneously or intuitively, a feeling of satisfaction or dissatisfaction according as actions are good or bad. The moral sense, though acting both deliberately and intuitively, is not, however, the standard of judging moral actions; that is, the general well-being of society, the 'greatest happiness of the greatest number.' It is in Joseph Butler (1690-1772) that we find C. developed in an ethical system to its fullest. He analyses the nature of man into the passions or affections; self-love and benevolence and C. The last is a universal principle of reflection, and virtuous action consists in following its dictates; it judges self-love as that which has weighed the passions in the balance and decided which is to its real interest. C. therefore has an absolute power, and it is the law of our nature, and virtue consists in following it. When analysed further, Butler's C. seems to have no real basis; it does not connect with the will or practical reason. The utilitarian school of ethics dominated Eng. moral philosophy, and the intuitionists, both in the moral sense school and in Butler's C. school, ceased to have influence. Henry Sidgwick in his *Methods of Ethics*, 1874, reconciled the utilitarians and the C. or moral school; the C. or moral sense recognises the general good of the greatest number as the rule of moral conduct. See also ETHICS, and the names mentioned above.

Conscience, Courts of, which were superseded by co. courts, were at one time estab. at Westminster and other commercial centres by local acts of Parliament, for the recovery of small debts, usually under £5.

Conscience Money, is the term which is given to various sums of money received by the chancellor of the Exchequer from anonymous persons who have voluntarily evaded their obligations, more especially as regards taxes, etc. Thus the expression may be aptly described as money paid to score off an old debt and thus relieve the conscience.

Conscientious Objector. This term came into prominence during the First World War, and was applied to those who alleged that they objected on moral or religious grounds to military service in a fighting capacity. Special measures were taken to deal with them in the Military Service Act of 1916 (see CONSCRIPTION), and whilst there was no doubt about the sincerity of the views held by some, there were many who found in it a convenient excuse to avoid going to the front. Many Quakers were and are C. Os., but some were found in the fighting ranks and gained distinction therein. Under the Representation of the People Act, 1918, C. Os. were to be disqualified from voting for five years after the First World War unless they satisfied the central tribunal that they had fulfilled certain conditions, such as employment in work of national importance. This provision, however, proved a dead letter and other penalties imposed on C. Os., such as loss of seniority in the civil service, were later rescinded. Provision was made in the Military Training Act of 1939 for the exemption of C. Os. on their allocation to some suitable form of national service, but only where the objector could satisfy the court of his bona fides. C. Os. in the Second World War were released from further obligations by the National Service (Release of Conscientious Objectors) Act, 1946.

Conscription. What is termed C., or in other words, the compelling every man eligible in the country to make himself efficient for service in the ranks of the national army and take his place therein when necessary, was brought into being in modern times by Napoleon in 1798. It was adopted by Prussia in 1806 after the destruction of its army by the Fr. at Jena, and in that country the system was so perfected that in theory it had, just before the First World War, the most complete fighting machine ever seen. The *modus operandi* in most countries is that every man on reaching a certain age—nineteen, twenty, or twenty-one—has to take his place in the ranks, and undergo a certain period of military training. In some countries all those liable and found fit to serve are enlisted. This prevailed in Germany before 1914 and prevails in France to-day. The exceptions are mainly: only sons or eldest sons of widows, and clergymen, etc. This is not quite the same in all countries, as, for instance, in Spain (prior to the recent Civil war) and Portugal where C. is in force, every man is not directly called upon to serve, but each locality is obliged to furnish a certain number, and on a certain day a ballot is taken, and those who draw numbers corresponding to those required are taken if found fit; any one can find a substitute, and by this means no rich man's son need ever serve. In the Netherlands the army is mainly composed of volunteers, although C. is the law of the land. There is no standing army in Switzerland, but every able-bodied citizen serves in the militia, which is called up for ann. service for a few weeks. The best conscriptive coun-

tries have so legislated that suitable work is found for the conscript when he leaves the colours, and, furthermore, his period of service is never so long as that of men in a voluntarily enlisted army, such as the Regular Army of Great Britain. Arguments in favour and against C. will be found in Lord Roberts, *Fallacies and Facts*, etc., 1911, and Ian Hamilton's *Compulsory Service*, 1910. In the First World War, when whole nations as well as their armies soon became involved directly or indirectly in the struggle, the voluntary system of recruiting the armies of necessity broke down. Under that system in England thousands of young men at once responded to appeals and patriotically left their homes and businesses. Others in far distant corners of the earth also returned to Great Britain prompted by the same motive. But it was only a matter of time when this spontaneous supply would be exhausted and other measures had to be taken to recruit field armies at all commensurate with the vast and growing extent of the military operations. In 1915 there was agitation in Great Britain in favour of C. but Parliament hesitated to adopt an institution which had always been repugnant to Brit. tradition. Lord Derby was then appointed to direct the recruitment service according to a plan which involved an element of compulsion by the introduction of tribunals to decide the appeals in individual cases, enlistment being a condition precedent to any right of appeal. This method was successful up to a point, but the supply of unmarried men, upon which the 'Derby Group System' at first mainly relied, soon gave out and at length Parliament agreed to compulsory service and the first Military Service Act was passed early in 1916. This brought into operation a universal machinery for sifting the manhood of the nation and for hearing appeals for exemption. As the war continued other Acts were brought into force which had for their object the finer 'combing' of the nation as one source after another was drained.

In the U.S.A. those who had closely studied the effect of the war upon the man-power of Great Britain were not slow to advocate some form of compulsory service as soon as war was declared against Germany. In May 1917 the Selective Service Act was passed, under which 1,000,000 men were authorised to be enlisted for 'selective service.' As in Great Britain, the process of passing the men through the medical and physical tests disclosed many surprising facts regarding the general fitness for military service of millions of Amers. With the armistice compulsory service in U.S.A. and Great Britain ceased.

In view of the threatening situation in Europe in 1938-39 the Brit. Gov. in April 1939 decided to introduce a system of compulsory military training as necessary for the safety of the country and the fulfilment of undertakings given to certain countries in Europe (France, Poland, Greece, etc.). The fact was that no one

seriously doubted but that Germany, under the domination of the Nazis, was aiming at the hegemony of Europe and that no time was to be lost in improving the nation's military resources. At this time there was Labour and Liberal opposition to C., both parties opposing the Military Training Bill 1939 on the ground that the Prime Minister, Mr. Neville Chamberlain, had 'violated' his pledge and that C. was not necessary; but what weighed most with Labour was the fear that military compulsion might be extended into industrial compulsion, which, in effect, is precisely what did happen in 1940 when, in the face of great national danger, the Ministry of Labour and National Service was empowered in the national interest to direct persons to various employments. The third reading of the Military Training Bill 1939 was carried by 283 votes to 135. The general council of the T.U.C. co-operated with the gov., and the T.U.C., while still condemning compulsory military training, authorised trade unionists to serve on committees and tribunals to be set up under the Bill. Under Acts passed in 1939 and 1940 the gov. conscripted men between twenty and forty-one, for both military and industrial service and women between twenty and thirty for industrial service. It was at liberty, under the Emergency Powers Act of 1940, to go even beyond these limits, but it preferred not to do so without receiving express permission from Parliament. For this purpose Mr. Churchill, on Dec. 2, 1939, moved in the Commons that the obligation for national service should be extended to include the resources of woman-power and man-power still available. The reason for the crisis was that the great supply plants had now largely been built and it was urgent that they should be fully staffed. Among changes he now proposed were to raise the age limit for military service from forty-one to fifty-one and to lower the minimum limit from twenty to eighteen and a half, at the same time making recruits of nineteen liable for service abroad. Boys and girls between sixteen and eighteen were also to be registered, with a view to enrolment in various youth organisations. Regarding women, the gov. proposed to take powers to draft unmarried women between twenty and thirty not only in industry, but also, under certain limitations, into the women's auxiliary forces, viz. Women's Royal Naval Reserve, the Women's Auxiliary Air Force, and the Auxiliary Territorial Service. On Dec. 9 the minister of labour moved the second reading of the new National Service Bill which embodied the proposals outlined by Mr. Churchill. National service under this Bill included service in the armed forces, civil defence, and industry. Civil defence included the Police War Reserve, the National Fire Service, and the Civil Defence Reserve, but the minister of home security could add any organisation he deemed fit. The idea of conscribing women for military service was repugnant to some members,

and an amendment was moved to exclude them from the scope of the Bill; but this was rejected without a div. and the Bill passed its remaining stages without opposition. Under legislation enacted before Sept. 1939, power existed in Australia and in the Union of S. Africa to require all men to render military service in time of war. Similar legislative provision was made in Canada and New Zealand after Sept. 1939. Men were called up under these provisions in Canada, Australia, and New Zealand. In 1945 they were no longer being called up in Canada or New Zealand and only boys of eighteen were then being called up in Australia. Powers were also taken in many other parts of the empire to call up men for military service and were used in varying degrees.

The National Service Act, 1947, introduced a scheme of compulsory service in the armed forces for all male Brit. subjects between the ages of eighteen and twenty-six, to operate from Jan. 1, 1949, by which date the existing transitional arrangements had ended. National service men, or, in other words, conscripts, serve eighteen months whole time or with the colours, and five and a half years in the reserve, with a period of ann. training. The Act will run until Jan. 1, 1954. The numbers of men of eighteen available in the first five years of the scheme are: 1949, 204,000; 1950, 210,000; 1951, 200,000; 1952-53, 210,000.

In the U.S.A. President Roosevelt on May 30, 1940 stressed the necessity of undertaking immediately 'the training and retraining of their people, especially youth, for employment in industry and in the services of the army and navy.' A Bill for selective training and military service, sponsored by the National Emergency Committee, was introduced in the Senate by Senator Burke and by Representative Wadsworth in the other House on June 20 (1940). It proposed registration of all men from eighteen to sixty-five, numbering 40,000,000, of whom men between twenty-one and forty-five would be eligible for eight months' compulsory military training, those chosen being selected by lot. Both Gen. Marshall, chief of staff, and war secretary Stimson advocated compulsory military service as soon as possible. The Burke-Wadsworth Bill, however, made such slow progress in the Senate Military Affairs Committee that Roosevelt declared (Aug. 2) that he favoured a selective training Bill and described C. as the fairest and most effective means of obtaining man-power. He said that the thirteen months' leeway in 1917-18 during which the U.S.A. had been luckily able to build up an army of 4,000,000 men without attack from a foreign power would never happen again. The National Defence Advisory Commission supported the Military Training Bill, which was at length passed (with amendments) by the Senate Military Affairs Committee on Aug. 5. Amendments restricted the registration age from twenty-one to thirty-one years of age, in place of from eighteen

to sixty-four, which would have affected over 40,000,000 men. With the restricted age-groups a total of 12,000,000 were affected, but deducting workers in essential industries and agriculture and men with dependants, only 4,500,000 remained for immediate selection. The Bill was enacted on Oct. 19 (1940). The debate on the Bill in Congress made only slow progress owing to opposition from the isolationist block. In the House of Representatives the Military Affairs Committee adopted C. as applying to all men between twenty-one and forty-five and omitting any provision for the C. of industry. Final approval was given to the Bill in the House on Sept. 7, after it had reaffirmed an amendment to defer its operation for sixty days. But in the Conference Committee of both Houses, unanimous agreement was reached on Sept. 13 on the main controversial points, including the deferment amendment, which was dropped, thereby enabling the first 400,000 men to be called up as soon as the registration machinery was ready. The conference adopted amended provisions for the C. of industrial plant to the effect that a manufacturer must accept and execute on 'fair and just' terms orders for national defence materials when called upon to do so by the President. The conference report was finally approved by both Houses on Sept. 14. The great majority of Democrats supported the measure, whilst the Republicans opposed it by two to one. On Sept. 16 President Roosevelt signed the Bill.

Consecration. The solemn appropriation of dedication of anything to the service of God. In modern times, the C. of the clergy is called *ordination* except in the case of bishops. For members of religious orders it is named *profession*. When applied to temples and churches it is termed *dedication*. Under the Jewish theocracy not only men and beasts were consecrated to the Lord, but also houses, fields, and the walls of Jerusalem (Leviticus xxvii.; Nehemiah xii. 27). At the exodus from Egypt, the first-born males in Israel, whether of man or beast, were sanctified to God, i.e., were consecrated or devoted to Him—the beasts for sacrifice, the children for redemption (Exodus xiii.). In Christian ecclesiology C. is resolvable into (1) the dedication of persons or things to the service of God with appropriate ceremonies; (2) the formal declaration that in consequence of being devoted to God, they are now sacred. In this context, C. is understood to change, not the nature of the thing, but only the use of it. With respect to the C. of the eucharistic bread and wine, Roman Catholics maintain that a complete change is effected in the thing consecrated. The term C. is used in various special services: viz. of the consecrating of bishops, priests, and deacons; and in the Church of Rome, of the C. of altars, chalices, patens, etc., but specially of the consecrating of churches. Christianity had prevailed for some time before separate buildings were erected for divine worship; when separate

buildings were erected, simple rites of C. followed, and then, by the time of Constantine, these rites had developed into numerous and imposing ceremonies. This is still the case in the Church of Rome.

In England, the legal effect of the C. of a church by a bishop is that none but the worship of the Estab. Church can be permitted within its wall or precincts. As to burial grounds see BURIAL ACTS.

Consecutive (Lat. *consequi*, to follow), term in music applied to recurring intervals, especially to the progression of parallel fifths or octaves, which are forbidden by the strict rules of harmony in part-writing. There are certain exceptions in modern music.

Consequina, see COSEQUINA.

Consent. In criminal law proof of C. on a charge of rape would acquit the prisoner on that charge. C. is no defence to a charge under the Incest Act, 1908, nor to the abuse of a female lunatic, or to a charge of indecent assault on any young person under the age of thirteen. In the Scots law of contract, following the Rom. law of consensual contracts, some contracts may be binding by mere C. without other formalities. Such contracts include partnership agreements, sale, barter, location (hire), and mandatum (bailment). For its legal connotation as a synonym for collusion in the law of divorce, see COLLUSION.

Conservation, Soil, see EROSION; SOIL. FERTILITY OF.

Conservative Club. This was a Tory club, first founded in London in 1840, with its headquarters at 74 St. James's Street. Since 1832 associations known as Constitutional or C. multiplied throughout the country, and eight years later the first regular club was formed.

Conservative Cookery, see under COOKERY.

Conservative Party, name of one of the three chief Brit. political parties. The name implies that the essential characteristic is that its purpose or tendency is to maintain and preserve existing institutions. It was first given by J. W. Croker in the *Quarterly Review*, Jan. 1833, as a more appropriate term than Tory (*q.v.*). It was not at first welcomed by members of the party. The disruption of the Liberal party at Gladstone's first Home Rule Bill led first to the formation of the Liberal Unionist party, the name adopted by those Liberals who dissented from the policy; when these joined with the Cs. in Lord Salisbury's first gov., the name Unionist was used for both wings of the new party. In 1912 the two separate party organisations coalesced, and Unionist became the formal accepted name for the former Liberal Unionist and C. Ps. but with the grant of dominion status to Ireland (see IRISH FREE STATE) the alternative name Unionist has been dropped. The hist. of the modern C. P. begins approximately with the re-organisation of the Tory party by Disraeli late in the forties of the last century. The C. P. are the lineal descendants of the Tory party as re-

modelled by Disraeli, who may be regarded as the founder of modern Conservatism, but as modified by the inclusion of Liberals under Joseph Chamberlain and the late duke of Devonshire, who both refused to follow Gladstone on Irish Home Rule. This fusion of Liberal and C. is significant in that it tends to support the criticism that in some essentials, whether of foreign or domestic policy, there is no great difference between the two great historic parties, who seem to pass and re-pass each other in the course of legislative achievement (see further under POLITICAL PARTIES). The hist. of the Tories goes back to the time of the Civil war in the reign of Charles I., but it is only towards the end of the eighteenth century that the party system begins to assume a form like that of to-day. The Tory party of the eighteenth century was long in humiliating opposition, a consequence of the Jacobite leanings of its leader Viscount Bolingbroke. Branded for fifty years as Jacobites, the Tories were not favoured by Hanoverian sovereigns, whose first minister was always a Whig. But during the Amer. war the party was re-created, Tory and sovereign taking the common if illusory view that the Amer. colonies should remain part of the Brit. Empire. Thereafter for the next two decades, the outstanding features of Tory regime were the Six Acts, passed like the modern D.O.R.A. (*q.v.*), to meet the difficult social conditions following Waterloo; and the Catholic Emancipation Act of 1828. Then came ten years of opposition until Peel led the Tory administration of 1812, with Gladstone as his lieutenant. It was on the rock of the Corn Laws that the party finally foundered; Disraeli was opposed to the repeal of these laws, and with Derby, led the Young England party, the germ of the modern C. P. (see under BEACONSFIELD), and Peel was forced, in 1846, to embrace free trade; but eventually the Tory party turned against him over the Coercion of Ireland Bill, which was thrown out. With Gladstone, Peel then went over to Lord John Russell's group; the split was complete; and Disraeli was left to re-organise the remains of the party. To Disraeli, who consistently supported Lord Ashley in his factory reforms, is due the marked progress in social legislation and the lead in imperial policy, resulting in drawing the self-governing dominions into closer alliance with the mother country, which have been the salient features of Conservatism in recent years. Disraeli's successors as leader of the C. P. were the Marquess of Salisbury (*q.v.*), Mr. (later Earl) Balfour (*q.v.*), Mr. Bonar Law (*q.v.*) and Mr. Stanley (later Earl) Baldwin (*q.v.*), the last-named being claimed to be more consciously imbued with the Disraelian tradition than any of his predecessors. The aims of the C. P. as stated by Disraeli are 'the preservation of our institutions, the maintenance of our empire, and the amelioration of the condition of the people.' In foreign policy 'Peace with Honour' was the slogan

of the party until the time of the 'appeasement' policy towards the Nazis and the Fascists in the 1930's, and the party claimed to have done more than any other party in reducing armaments, and to have played a prominent part in the deliberations of the League of Nations. As to social conditions, the Housing Act of Mr. Neville Chamberlain, when health minister, is in the line of C. tradition, the first great Housing Act being that of Viscount Cross when home secretary. Pensions to widows and orphans, old age pensions for insured men and their wives at the age of sixty-five, and the extension of the franchise to men and women at twenty-one years of age subject only to residential qualification, are other legislative landmarks in the recent hist. of the party. In education, the Act of 1870 was a Liberal measure, but Mr. W. E. Forster, the minister responsible, declared that it could not have been passed without the support of the C. P. owing to the bitter opposition of Liberals like John Bright. The abolition of fees in primary schools, the substitution of inspection for examination, the abolition of payment by results (see under EDUCATION) were effected by C. govts., and in 1902 the so-called Balfour Act, which made so marked an advance towards a co-ordinated system of national education in all its branches, was the work of the C. P. In agriculture, the C. P. claims credit for its de-rating measure, which reform was first outlined by Mr. Churchill's budget of 1928 (see DE-RATING). Finally by its policy of safeguarding (q.v.) the party claims to have restored a measure of prosperity to the lace, the motoring, and other industries (see also PROTECTION). The party suffered a rebuff at the polls in 1924 on the issue of protection when the first Labour Gov. took office; but they were in office again eight months later, mainly through the adroit use made by their followers of the Zinovieff letter (q.v.) and the affair of the Campbell prosecution. In 1929, however, they met with a disastrous reversal of fortune at the general election of that year, the chief issue being the relief of unemployment. A contributory factor to their defeat was the lack of constructive effort implied in their much derided slogan, 'Safety First.' In 1931, however, following the disclosures, in the report of the May Commission, of the deteriorated state of the country's finances and credit—due, however, only in part to the policies of the Socialist Gov.—the C. P. secured 471 seats—being returned as C. National supporters of the first National Gov. (q.v.). They were again successful in the election of 1935—which was fought mainly on the question of sanctions against Italy in the Italo-Abyssinian war. The C. P. in the general election of 1935 won 387 seats, the number dropping to 358 at the dissolution in 1945. In the election of 1945 the party won only 189 seats, as against 393 for Labour—3,500,000 votes being cast for the Cs. as against 12,000,000 for Labour, and 2,225,000 for the Liberal party. At its ann. conference (March 1945) the

C. P. adopted for the approaching general election a programme of which the outstanding features were the abolition of controls and the restoration of private enterprise to the greatest extent possible. This proved to be an invidious programme, for the nation had vivid memories of the inflation and distress which followed the previous world war and which indeed became aggravated ten years later when the unemployed numbered about 3,000,000. The causes of the inflation and unemployment could not be traced to the acts or omissions of any single political party; but it is evident that the general drift of political opinion throughout the world was steadily left-wards in the closing years of the Second World War and after; and the apotheosis of private enterprise and unfettered enterprise was hardly likely to excite the enthusiasm of the common man, who, rightly or wrongly, saw his economic salvation in the tried and untried schemes of the Socialists. See Earl Birkenhead, *Toryism*, 1903; H. Withers, *The Case for Capitalism*, 1925; Lord H. Cecil, *Conservatism*, 1928; A. Bryant, *The Spirit of Conservatism*, 1929; Earl Baldwin, *On England and Other Addresses*, 1938; L. S. Amery, *The Framework of the Future*, 1944; Viscount Hinchinbrooke, *Full Speed Ahead: Essays in Tory Reform*, 1945.

Conservatoire, or **Conservatorio**, name originally given to schools founded on the Continent, especially for studying music and maintaining its purity (Lat. *conservare*, to preserve). The Fr. name is often used for the It. *Conservatorio*, the Ger. *Conservatorium*, and Eng. schools of music also, while the form *Conservatory* is used in U.S.A. The earliest of these institutes originated in Italy; they were primarily attached to some hospital or benevolent institution. The first for which a definite date is given was the *Conservatorio di Santa Maria di Loreto*, in Naples, founded in 1537 and among three other similar schools afterwards estab. in the same city was the *Conservatorio di Sant' Onofrio*, noted for its teachers, such as Alessandro Scarlatti and Durante. Of these four Cs. in Naples, all for boys, only two were in existence by the time of the Fr. occupation in the Napoleonic wars when Murat united the remaining two into the *Real Collegio di Musica* for pupils of both sexes. In Venice there were sev. Cs. for girls at an early date but these disappeared with the decline of the Venetian Republic and the centre of musical training for N. Italy was transferred to Milan, where a large C. was estab. in 1808 by Prince Eugène Beauharnais. The *Ecole Royale de Chant et de Déclamation* was founded in Paris (1784) for training opera singers. During the revolution the *Institut National de Musique* was erected (1793), the name changing to C. de Musique (1795). Among its most famous directors have been Sarrette (1784-1814), Cherubini (1822-42), Auber (1842-71), Ambroise Thomas (1871), Dubois (1896), and Fauré (1905-20). A still more famous con-

tinental institution is the Conservatorium at Leipzig, founded by Mendelssohn (1843), expressly for instrumental music. Other important European Cs. (including those in existence before the Second World War) are at Prague (founded 1811), Vienna (1816), Brussels (1833), Cologne (1849), Munich, Stuttgart, and Berlin (founded by Joachim (1869). Corresponding Eng. institutions are the Royal Academy of Music (founded 1822, incorporated by charter, 1830), Royal College of Music (1882), and the Guildhall (1880). The chief in U.S.A. is the National Conservatory of Music of America (New York, 1885). There are two in Boston (1867, 1870).

Conservators of the Peace, predecessors of the modern justices of the peace, but invested with powers far inferior to the latter. They were the authority to take sureties for peace and good behaviour. Certain high functionaries were general C. *ex officio*, e.g. the king, the lord chancellor (q.v.), the judges of the court of king's bench, and the master of the rolls. Other officers were C. only in special places, e.g. the common pleas judges, and barons of the exchequer.

Consett, tn. and eccles. par. (Consett Christchurch) of Durham, England, 12 m. from Durham. It has iron works and coal mines. Pop. 12,250.

Conshohocken, bor. of Montgomery co., Pennsylvania, U.S.A., on the Schuylkill R., 13 m. from Philadelphia. Founded in 1830, it was incorporated as a bor., 1852. It has large cotton, woollen, and rolling mills, foundries, furnaces, surgical instrument works, stone quarries, steel mills, and boiler shops. Pop. 10,700.

Considérant, Victor Prosper (1808-93). Fr. Socialist, and the chief apostle of Fourierism. He ed. the *Phalange* and *Phalanstère*, journals, setting forth their views. Having obtained financial assistance from an Englishman, Young, he estab. a Socialist colony in the dept. Eure-et-Loire, 1832, but the experiment failed. He then founded the *Démocratie Pacifique* in 1845 for the purpose of promoting his views. In 1848 he was a member of the Constituent Assembly, and acted with the 'Mountain' party. Accused of treason, C. fled to Belgium, 1849. He went thence to Texas, and founded a Socialist community, La Réunion, near San Antonio, but the insurrection of the South ruined this enterprise. He returned to France, 1869. Among his works are *La Destinée sociale* (1834-38), dedicated to Louis Philippe; *Débacle de la politique* (1836); *Principes du socialisme* (1847).

Consideration. All contracts not under seal require valuable C. to make them enforceable. The generally accepted legal definition of valuable C. is 'some right, interest, profit, or benefit accruing to one party, or some forbearance, detriment, loss, or responsibility given, suffered, or undertaken by the other.' A specialty contract (i.e. one under seal) is said to require no C., because of the legal dogma that a deed imports C., a fiction which probably owes its origin to the peculiar

sanctity that has attached to deeds (or charters as they were once called) from the earliest days of the Eng. legal system. No simple contract can be enforced unless supported by valuable C. For example, A promises verbally or in writing not under seal to give B £100 for no C.; B cannot enforce the promise against A. Again A owes B £100, and pays him £75 which B accepts 'in full satisfaction.' B can, none the less, sue A for the remaining £25, though it would be otherwise if A had paid £75 and given in addition some article, however trifling, by way of C. Cs. are sometimes divided into valuable and good Cs. A good C. is that of natural affection between blood-relations, but it is not sufficient to maintain the validity of a conveyance of property against the claim of a subsequent purchaser for value. C. need not be adequate to the promise offered by the other party to a contract, but must be of some value; it must be legal; e.g. lending money to gamble in differences on the Stock Exchange could not be recovered (see under DIFFERENCES); and it must not be past, but must be either present or future (see also under EXECUTORY). As a corollary of the above rules it is to be noted that neither motive nor moral obligation amounts to C., therefore, if A saves B's life and B afterwards promises A £100 out of gratitude, A cannot recover the money from B or out of B's estate. Lastly C. must move from the promisee, which may be differently expressed by saying that no stranger to the C. can take advantage of a contract though made for his benefit (see under CONTRACT). See Sir W. R. Anson, *Principles of the English Law of Contract*, 1834.

Consignment, commercial term used of the dispatching of goods for delivery to a purchaser; it is particularly used in the shipping of goods; the person dispatching goods is the consignor, and the person to whom they are dispatched is the consignee. See BILL OF LADING.

Consistory Courts, which were founded by William I., now exist in every diocese of England. They are eccles. courts controlled by chancellors appointed by a bishop or archbishop. Their business is now almost restricted to the dispensing of faculties for which application is still made according to forensic procedure. Until the Act of 1857 they assisted in exercising jurisdiction over testamentary and matrimonial disputes. By an Act of 1892 a clergyman accused of immorality may be tried in a consistory court.

Consolato del Mare, see CONSULATE OF THE SEA.

Consolidated Fund. The fund of the national exchequer comprising the produce of the extraordinary revenues of the Crown. The fund was so named from the fact that it was consolidated out of what previously had constituted distinct funds—the aggregate, the general, and the S. Sea funds. It was first formed in 1788, and afterwards by the 56 George III. c. 98, the Irish exchequer was amalgamated with it, and it then became the C. F. of the United Kingdom, the whole

fund being pledged in the first place for the payment of the interest of the national debt, and then in reduction of the capital. But before any part of the revenue can be so appropriated, Parliament raises out of it an ann. sum for the maintenance of the royal household and the civil list. The extraordinary revenue which goes to make up the C. F. is either permanent or annual. The ann. revenue is supplied by taxes annually, and in theory at least, temporarily imposed, e.g. income tax; and it may vary from year to year. The revenue paid into the C. F. may be said to comprise the following: Customs (*q.v.*), excise (*q.v.*), death duties (*q.v.*), stamp duties, land tax, inhabited house duty, income tax, income from Crown lands (*q.v.*), Suez Canal shares, post office receipts, and miscellaneous heads of taxation. These various taxes are all paid to the gov.'s credit at the Bank of England, and may not be paid out except by statutory authority. See Sir W. R. Anson, *Law and Custom of the Constitution*, 1886-92.

Consolidated Goldfields of South Africa. This company was formed in 1892 by the amalgamation of other similar undertakings, of which Cecil Rhodes (*q.v.*) was the leading spirit. It originated as the Goldfields of S. Africa Company, formed by Cecil Rhodes and Charles Rudd to exploit concessions given by Lobengula, the famous Matabele king.

Consolidation Acts, or Consolidation of Statutes, species of codification, or digest. The avowed object of a Consolidating Act is to incorporate in one repealing Act all the existing law on any one topic, together with necessary amendments, but otherwise without making any change in the pre-existing law whether statute or common law. Many C. A., however, either from faults inherent in draughtsmanship, or from the difficulty of giving adequate expression to ill-considered amendments, fall short of accomplishing this ideal; and, further, many sections being really based upon the *rationes decidendi* (principles of decision) of reported cases either do not give effect to the spirit of the decision, or fail of universal application, either because the decision was appropriate only to the facts of the particular case or because the necessary elimination of those facts in the section render the statutory language ambiguous. Examples of C. A. are the Criminal Law Consolidation Acts, 1861, Bills of Exchange Act, 1882; The Sale of Goods Act, 1893; Companies (Consolidation) Act, 1929; Children Acts, 1908-33.

Consols, term commonly used to denote a considerable portion of the national debt of Great Britain, but more correctly known as the 3 per cent consolidated annuities (see under CONSOLIDATED FUND). An Act passed in 1731 consolidated certain perpetual and lottery annuities bearing interest at 3 per cent, and these consolidated annuities formed the basis of the C. The interest on C. was reduced by an Act of 1888 to 2½ per cent, and in 1905 it was further reduced to 2¼ per cent. The value of these C. when first issued

against existing securities was £9,127,812, but this amount was increased later to over £100,000,000. By 1888 this figure had been reduced by purchase in the market and by conversions into terminable annuities to £322,681,000. In 1889 Mr. Goschen, the chancellor of the Exchequer, redeemed this large amount of stock, and the old 3 per cent C. which for so long had been looked upon as the standard security of the London market are fading into the limbo of things forgotten. Since the First World War C. have formed but a small part of the total national debt of Great Britain. The term C. has in late years been applied to certain other securities, such as New Zealand 5 per cent C. These are so named by dealers on the exchange because the word is less cumbersome than consolidated stock.

Consonance, in music, is applied to a combination of notes which when sounded together produce an agreeable effect, as for example, the octave.

Consort (Lat. *consors*, partner, sharing in), literally one who throws in his lot (*sors*) with another. In Eng. constitutional law the term is applied to the husband or wife of the reigning sovereign, viewed in a public capacity, as sharing to a certain extent in the royal prerogative. The title has been familiar in England since it was conferred on Prince Albert in 1857 by letters patent. A consort is a subject of the sovereign, and may be guilty of treason against the latter. A queen consort is entirely independent of her husband's control, and is regarded in legal proceedings as a *feme-sole*. She has her particular revenue, and certain exemptions and privileges.

Conspicuous Gallantry Medal. Instituted for award to men of the Royal Navy and Royal Marines who performed exceptional acts of bravery in action during the Crimean war. In 1874 it was re-instituted for award for similar purposes and made applicable to any campaign. It is virtually the naval counterpart of the military Distinguished Conduct Medal.

Conspicuous Service Cross, Brit. decoration, instituted in 1901, to be conferred on warrant and subordinate officers for gallantry and devotion before the enemy. The first recipients of the cross were gazetted on July 2, 1901.

Conspiracy may be categorically defined in law as an agreement between two or more persons to do an unlawful act or to do a lawful act by unlawful means. Much obscurity has always characterised what seems now to be definitely regarded as a substantive offence. The difficulty in principle lay in the confusion arising from the fact that, generally speaking, nothing can be unlawful, civilly or criminally, in two or more persons which would not be unlawful if done by one person, or if done without such previous agreement. The substantive wrong of C. was really developed as an action on the case (*q.v.*) or, in other words, was inducted from the consequential damage generally following on a conspiratorial agreement. Something more was required, however, than

the mere fact of damage, for damage *sine injuria* (q.v.) is necessarily no wrong, and the injurious element was deduced generally from the fact that such agreements as were held to be Cs. were characterised by some ultimate malicious object or wrongful means of execution. While, therefore, defining C. in the above manner, it must always be remembered that to agree to persuade a man, *without unlawful means*, to do something he has a right to do, or to abstain from doing what he has a right to abstain from doing, can never be actionable, although done to the prejudice of a third person, and although done with a malicious motive. C. as a criminal offence is classed by text writers under three heads: (1) where the end is in itself a crime; (2) where the means are unlawful but the end is lawful; (3) where the end is to injure a third person or a class though, if the wrong were inflicted by a single individual, a civil wrong only and not a crime would be committed. The whole gist of C. is the *combination*, so that a single person could only be convicted if his fellow conspirators were either dead, unknown, or not in custody for some reason or other. It is now settled law that an agreement by two or more persons to do certain acts may be criminal, although those acts if done by one person might not render him liable to any proceedings whatever. It is clear, e.g., that numbers may coerce and intimidate where a single individual could effect nothing. In regard to (1) above, a C. to commit murder is dealt with by a statute which makes it punishable with penal servitude up to ten years. Unlawful interference with trade by combinations and especially by combinations of workmen against employers form the most striking example of Cs. under (2). Workmen may lawfully combine to protect their interest, but may not, theoretically at all events, interfere with the right of such of their class as do not wish to join the combination. The Conspiracy and Protection of Property Act, 1875, expressly makes punishable as crimes by imprisonment not exceeding three months, or a penalty not exceeding £20: (a) coercion of a person by violence or intimidation manifested either towards himself, his wife, or children, or his property; (b) persistently following a person about from place to place; (c) hiding his tools or other property; (d) picketing, i.e. watching or besetting a person at his house or place of business, or for two or more persons following a person about in the streets in a disorderly manner. This has been altered by the Trades Disputes Act, 1906, which allows peaceful picketing for the purpose of communicating information, by persons acting in furtherance of a trade dispute; (e) for an employee of a gas or water company wilfully and maliciously to break his contract of service with the knowledge that such breach will cause a failure of gas or water; (f) wilful or malicious breach of contract endangering human life, or tending to cause serious bodily injury or expose valuable property to destruction. By the combined opera-

tion of section 3 of the Act of 1875 and section 1 of the Act of 1906, trade disputes stand above the ordinary law in some of their probable consequences; for if, in connection with such a dispute, two or more persons combine to do an act which if done by a single individual would not be punishable criminally, they will not, merely because of their number, be liable either to criminal proceedings or to a civil action. See also COMBINATION, LAWS OF. See F. Pollock, *The Law of Torts*, 1929; Sir W. O. Russell, *On Crimes: a treatise on felonies and misdemeanours* (9th ed. by Lt. E. Ross), 2 vols., 1936.

Constable, Archibald (1774-1827), famous Scottish publisher, founder of the *Edinburgh Review* (1802), which he managed for twenty-four years. He pub. Scott's first original work in 1805, and gave him £1000 for *Marmion* (1807). Constable & Co. also pub. most of Scott's prose works from 1813 to 1820. In 1825 C. failed for about £250,000. This failure, together with that of the printers, Ballantyne & Co., involved Scott in the heavy loss of £120,000. C. wrote a *Memoir of George Heriot*, and ed. a *Chronicle of Frise, being the Diary of John Lamont of Newton from 1649-72* (1810). He purchased the copyright of the *Scots Magazine* in 1801, and the copyright and stock of the *Encyclopædia Britannica* in 1812. *Constable's Miscellany* was started in 1827. See J. G. Lockhart, *Memoirs of the Life of Sir Walter Scott, Bart.*, 1837-38; T. Constable (his son), *Archibald Constable and his Literary Correspondents*, 1873.

Constable, Henry (1562-1613), Eng. poet, graduated from Cambridge 1580. He early turned Rom. Catholic, and spent much of his time abroad in Paris. In 1598 he was trying to form a new Eng. Catholic college in Paris. C. came to London, 1603, and was confined in the Tower for about a year for certain anti-Brit. activities in France. He was a friend of Sidney, Harrington, and Bolton. His *Diana: the Praises of his Mistress in certaine sweete sonnets by H. C.*, was pub., 1592, and is a series of twenty-three sonnets, praised by Jonson and others. C. also wrote sixteen *Spiritual Sonnettes to the Honour of God and his Sayntes*, by H.C. (these were first printed by T. Park from MS. in 1815), and *The Shepherds Song of Venus and Adonis, in England's Helicon* (1600). W. C. Hazlitt collected his works in 1859. See T. Warton (the younger), *The History of English Poetry*, 1774-78.

Constable, John (1776-1837), Eng. landscape painter, was the son of a mill-owner of E. Bergholt, Suffolk. Even in the days when he attended Dedham Grammar School all his spare hours were devoted to painting. Thus, although he was at first sent to work in the windmill, his father soon yielded to his passion for art, which had been fostered by his friendship with Sir George Beaumont, and by his study of Claude's 'Hagar and Ishmael,' and in 1795 allowed him to go to London to consult Joseph Farington, R.A., whose modern fame has been established by

the discovery of his MS. diary in 1921. The final result of this visit, during which he was taught etching by J. T. Smith (*q.v.*), was that in 1799 he entered the Royal Academy schools, and definitely embraced the career of painting. Three years later he exhibited for the first time at the academy. In 1816 he married Mary Bicknell, after a weary period of waiting due to the opposition of her relatives. The year 1819 is important not only as the date of his election as an associate of the Royal Academy, but also as that in which he received £3000 in

N. P. G.

JOHN CONSTABLE
From his self-portrait.

legacies—a timely gift which considerably relieved his monetary anxieties. Two years later he gained a gold medal at the Paris Salon for his splendid picture 'The Hay Wain,' and in 1825 he won another at the Lille exhibition for his 'White Horse.' His financial position was finally established in 1828 by an inheritance of £20,000 from Mr. Bicknell, but any gratification he might derive from this gift was at once swallowed up in the inconsolable grief which he felt at the loss of his wife in the same year. He never recovered from the shock of her death, and his own death in 1837 was due as much to nervous depression as to any physical weakness. The great part of his life had been spent in London, latterly at Hampstead. His work may be studied in the national collections at Trafalgar Square, St. Kensington, and Millbank. Like most young painters, he began, by observing truth at second hand, copying Claude and

Ruysdael and imitating the technique of Girtin, Gainsborough, and the old Dutch masters. This period of apprenticeship lasted till 1806, the year of his visit to the Eng. lakes. The altar-piece which he executed in 1804 for Brantham church is in the manner of Benjamin West, at that time president of the Royal Academy, and a kind patron to C. From 1806 to 1809 he was for the most part engaged in copying portraits by Hoppner and Reynolds, and seriously studied the science of oil-painting. The turning-point in his career was his exhibition of 'Dedham Vale' in 1811, in which he first gave his talent free scope and began to develop his striking originality. C. was thus a long while reaching his artistic maturity. His range of subjects was limited, being mostly restricted to the scenery of Suffolk, Salisbury, Hampstead, and Brighton, but he really knew the old mills and rustic bridges, the great trees and the torrents, the corn-fields, and above all the skies that he depicted. His experience as a miller must have taught him to study the clouds: at least he is unequalled in his presentation of the sky in April before a heavy shower, or of the lowering clouds that presage the storm's approach. Truthfulness is the salient feature in his detail, his broad composition and his atmospheric effects. His pictures seem to breathe the life of the farmyard and the fields. Their fresh, natural colours are not the least of their merits. In his vivid tones C. was following the example of Rubens and Claude, so that it is untrue to regard him, as was not infrequently done, in the light of an opponent of the old masters. It seems that the Impressionist school learnt from C. the fine effects of splashes of warm colour. But C.'s reputation rests not on the peculiarities of his technique, but on his faithful portrayal of the beauties of Eng. landscape and rustic life, and especially of the light-and-shade effects of rain clouds through which the sun's rays are doing their best to penetrate. It is a pity that Ruskin in his admiration of Turner and the Pre-Raphaelites should have been blinded to the true greatness of C. High prices are given for his pictures. Thus 'Dedham Mill' was sold in 1848 for £550; and a free study in pencil by C. for his picture 'The Leaping Horse' was sold in the same year for £40. The mezzotints of David Lucas (1835) are among the finest engravings after C. Among his many pictures are 'The Leaping Horse' (1825), perhaps his masterpiece; 'The Cornfield' (1827); 'Dedham Vale' (1828); 'Hadleigh Castle' (1829); 'Salisbury Cathedral' (1831); and 'The Valley Farm' (1835). See C. R. Leslie, *Memoirs of the Life of John Constable*, 1843; C. J. Holmes, *Constable and his Influence on Landscape Painting*, 1902; A. B. Chamberlain, *John Constable*, 1903; H. W. Tompkins, *In Constable's Country*, 1906; E. V. Lucas, *John Constable, the Painter*, 1924; S. Key, *John Constable, his Life and Work*, 1948.

Constable (O.F. *unstable*, from Late Lat. *comes stabuli*, count of the stable,

marshal), word of widely different meanings in different countries and at different periods in the same country: (1) In France in the Middle Ages the C. of France had the chief command of the army and jurisdiction in military offences; he also had the control of all matters relating to chivalry. One of the most celebrated holders of the office was Bertrand du Guesclin. The office was finally abolished in 1814. (2) In England the lord high C., appointed after the Conquest as an officer of the Crown, had duties not dissimilar to those of the C. of France. For centuries the office was hereditary in the families of the earls of Hereford and Essex, and afterwards of the dukes of Buckingham. The office has been extinct since the attainder (*q.v.*) of the duke of Buckingham in the reign of Henry VIII., although it has been revived *ad hoc* on such special occasions as a coronation, when the earl marshal assumes the functions. (3) High Cs. were appointed in England from the reign of Henry VII. They were chosen at the court-leets of the hundred over which they presided. They were appointed to keep the peace in their sev. dists., but are now virtually *ad libitum* being only appointed when the co. justices deem it advisable. (4) Petty or par. Cs. were appointed to maintain the peace in manors, vills., and tithings when increasing pop. made the duty too onerous for high Cs. alone. Par. Cs. are practically abolished by 35 & 36 Vict. c. 92, which estab. the co. constabulary, and provided that par. Cs. should only be appointed by the magistrates of general or quarter sessions when deemed necessary. (5) Special Cs. were often sworn in by justices when disturbances existed or were apprehended. The necessity for both high and petty Cs. has been obviated to a great extent by the institution of (6) the modern police force, which dates from the Metropolitan Police Acts of 1831 and 1840, and, so far as bors. are concerned, the Municipal Reform Act, 1835 (see POLICE). The police force of each co. is under the control of a chief C., who may appoint Cs. and superintendents, subject to the approval of the justices in petty sessions. The appointment of bor. Cs. is now regulated by the Municipal Corporations Act, 1882.

Constance (Ger. Konstanz), Ger. tn. in Baden, stands on the S. side of the lake of the same name, where the R. Rhine flows out of it about 30 m. E. of Schaffhausen. The tn. is a picturesque one, the cathedral, which was built about the eleventh century, being famous. Here some of the sittings of the council of C., 1414-18, took place, and others were held in the Kaufhaus—Jerome of Prague and John Huss being condemned at this council were burnt at the stake in 1416, and a boulder 10 min. W. of the tn. marks the spot. The Dominican convent, now a hotel, and the tn. hall are also noteworthy. The market-place contains the house where Frederick Barbarossa signed the peace of C. in 1183. There are iron and textile industries and a very considerable trade principally with Switzerland. It is connected with one of

its suburbs by a bridge crossing the Rhine. C. was in very early times an important tn., being the see of a bishop; it belonged to Austria until 1805. Pop. 36,200.

Constance, Council of. This council was called together for the purpose of reforming the church. The Emperor Sigismund and Pope John XXIII. with many church dignitaries and men holding high office in the state sat on this council, which lasted from 1414 to 1418. There were at the time three popes, Gregory XII. and Benedict XIII. sharing their power with John, and as the object of the council was to secure unity in the church the only course open was to do away with this div. of rule, which was effected by the deposition of all three and by the election of Martin V. The general reform, however, which had been hoped for, was not brought about, although it was decreed that councils were to be called periodically and that in the case of schism the final decision should lie with them.

Constance, Lake of (Ger. Bodensee), lies between Switzerland, Germany, and Austria. It is about 45 m. long, 8 m. broad, and 1305 ft. above sea level. At its N.W. extremity it divides into two, the N. branch being called the Überlingen Lake and the S. the Untersee. This lake has sev. tribes, the largest one being the Rhine which flows right through it, while among its smaller ones are the Argen, the Schussen, and the Aach. L. of C. sometimes rises considerably above its usual height owing to the melting snow, but it is hardly ever frozen over. There are two is. in the lake, Reichenau and Mainau, and sev. tns. on its banks, the chief being Bregenz, Lindau, Friedrichshafen, Überlingen, and C. There is also a regular steamboat service on the lake.

Constans I., Flavius Julius (A.D. 337-350), Rom. emperor, youngest son of Constantine the Great and Fausta (c. A.D. 320-50). Made Caesar in 337, he became joint emperor with his brothers, Constantine II. and Constantius II., in 337. Italy, Africa, and W. Illyricum falling to his share. In 340 he defeated Constantine, who fell in battle near Aquileia, thus becoming master of the whole W. He favoured Athanasius, who was proscribed by the Arians, but was weak and depraved in character. He was killed while hunting in Gaul by an emissary of the usurper Magnentius.

Constans II., Flavius Heraclius, elder son of Constantine III. (A.D. 630-68), emperor of the E., 641-68. He lost Syria, Cyprus, Rhodes, and Africa to the Saracens and Arabs, being defeated by the latter at sea, off Lydia, 655. He also fought unsuccessfully against the Slavs around the R. Danube, and lost N. Italy to the Lombards, 641. His attempts to reconquer Italy (662), and make Rome the empire's cap., were futile. He favoured the Monothelites, and to end controversy between them and the orthodox issued an edict forbidding all religious discussion. C. was generally hated, as cruel and avaricious, and was

probably assassinated. His son Constantine IV. (Pogonatus) succeeded him. See Abulfeda, *Annales*.

Constant, Jean Joseph Benjamin (1845-1902), Fr. painter and writer on art. He studied under Cabanel. Quite early he exhibited in the Salon; his 'Hamlet' was bought (1869) by the Fr. Gov. He began to paint Oriental subjects during travels in Spain and Morocco; his best E. pictures, the 'Prisoners of Morocco' (1878), now in the Bordeaux museum, and 'The Last Rebels,' now in the Luxembourg, Paris, are sensuous in feeling and colour. He decorated later the ceiling in the Opéra Comique and the ceiling of the Hôtel de Ville, Paris; and dramatic panels in the New Sorbonne. There is a fine series of his portraits, for which he was highly esteemed, in the Toulouse museum. He painted a portrait of Queen Victoria which was exhibited at the Royal Academy in the year of her death (1901). Among his works are 'Samson et Dalila' (1872); 'Mohammed II.' (1876); 'Le Jour des Funérailles' (1889); and portraits of M. Hanotaux (1898), Pope Leo XIII., M. de Blowitz (1902), and Queen Alexandra (1901).

Constant de Rebecque, Henri Benjamin (1767-1830), Fr. statesman and philosopher, was b. at Lausanne of Huguenot

HENRI BENJAMIN CONSTANT

parents and settled in Paris at the commencement of the Revolution. The influence of Mme de Staël and Talleyrand may be traced in his *Mélanges de littérature et de politique* (1829). C. was expelled from France in 1802 along with Mme de Staël for denouncing the military ascendancy of Napoleon, and lived for a time at Weimar in the society of Goethe and Schiller; but he modified his views,

and in 1814 returned to support the Bourbons and constitutional liberty. His chief work is *De la religion* (1824-1830), in five vols. (he was a rationalist in religion); he wrote also *Cours de politique constitutionnelle* (1817-20), in four vols. His celebrated novel *Adolphe* was first pub. in 1816. See G. Ripley, *Specimens of Foreign Standard Literature*, 1838-42; biography in Fr. by Ricard, 1888; *Journal intime de B. Constant* (covering the period 1804 to 1816), 1894; and *Le Cahier rouge* (autobiography from 1767 to 1787), 1907.

Constant, in mathematics, a quantity that never changes its value throughout an investigation or process (in contradistinction to variable quantities), often used, as in the differential calculus, to determine a series of changeable values. An absolute C. is one whose value is exactly the same under all circumstances (e.g., any cardinal number); an arbitrary C. is an undetermined C. in a differential equation, keeping the desired value assigned to it unchanged during all changes in the value of the variables. Examples: circular C., C. of aberration, gravitation, tidal Cs.

Constanta, Constantza, or Kustenji, seaport on the Black Sea, at E. end of Trojan's Wall, is the prin. port of Rumania, and exports large quantities of grain, petroleum, and livestock. It has a fine harbour, opened in Oct. 1910. There are nearly three m. of quays, and a pipe-line runs to the Rumanian oil fields. The commerce of the port amounted to 2,000,000 tons in 1927. Tomi, famous as the place of Ovid's exile, was its anct. name. A battle was fought between Russians and Turks at C. in 1854, and it was severely damaged in the First World War, being occupied by a Germano-Bulgar army in Oct. 1916. In the Second World War the Russians launched an offensive in Rumania against the Ger. and Rumanian forces on Aug. 22, 1914, and captured C. on Aug. 29. Pop. 79,700.

Constantia, tn. in Cape Prov. lying under Table Mt. Originally an old Dutch wine farm and founded by Simon van der Stel about 1690. A famous Cape wine derives its name from this place. Pop. 4000.

Constantina, tn. in the prov. of Seville in Spain. It has lead mines, and the trade is chiefly in timber and cork. Pop. 10,000.

Constantine II., see CONSTANS I.

Constantine III., son of the Emperor Heraclius. He succeeded in 641 and d. in the same year. His short reign was full of disorder and constant internal strife. His death is supposed to have been due to the hatred of his stepmother, who is alleged to have poisoned him.

Constantine IV., Pagonatus (668-685), son of Constant II. The earlier part of his reign was occupied in a campaign in Sicily, where a usurper had been declared emperor. Immediately after he had successfully put an end to this trouble, he was occupied in a struggle with the Arabs, who were finally forced to sue for terms. Nevertheless, although successful

in these two ventures, he was unable to prevent the settlement of the Bulgars and the setting up of a Bulgar kingdom (679).

Constantine V., Copronymus (740-775), son of Leo III. the Iconoclast. A far-seeing and capable emperor, who did much to encourage trade, restore prosperity, and strengthen the empire. Nevertheless, owing to his religious convictions and his ceaseless persecution of the monks, he is generally described by contemporaries as an iniquitous and harsh king. He caused the iconoclastic doctrines to be upheld throughout the empire, and so caused the defection of the papacy, which from this time ceases to be dependent upon the emperors, and looks for help rather to the W. and the Franks. He engaged in campaigns against the Arabs, Avars, Slavs, and Bulgars. Whilst pursuing the latter campaign he was taken ill and d.

Constantine VI. (780-97), last of the Isaurian emperors. He succeeded at the age of ten, and the empire for the next few years was ruled by Irene, the empress-mother. His mother continued to rule after C. had come of age, and although he seized and imprisoned her, nevertheless she again became powerful, and caused C. to be seized and blinded. His reign was disastrous, and during it the Arabs and Bulgars won many successes. See A. Lombard, *Études d'histoire byzantine*, 1902.

Constantine VII., Flavius Porphyrogenitus (905-59), emperor of the E., was the son of Leo VI. by his concubine Ioc. His father had great difficulty in obtaining recognition of his legitimacy. During the early part of his reign the empire was administered by the Adm. Lecapenus, with the influence of Ioc to support him. Finally Lecapenus was driven into a monastery, and C. obtained real power. He was not unpopular, and his reign on the whole was a good one. He wrote a number of books, and from these we obtain much of our information on this period. His *De Administrando Imperio* was written to aid his son Romanus in the government of the empire. By this same son he was poisoned.

Constantine VIII., the bestowee sometimes on one of the colleagues of C. VII., but generally on the emperor who ruled from 1025 to 1028. He was the colleague of Basil II., and devoted himself to a life of pleasure, giving very little heed to the affairs of state.

Constantine IX. (1042-54), old warrior of the E. Empire who owed his elevation to the purple to Zoe, the widow of Romanus III., whom he married. He neglected the defence of the empire, and spent huge sums in erecting magnificent buildings. During his reign the hold of the E. in Italy was practically lost, owing to the conquest of Lombardy by the Normans.

Constantine X. (1059-67), incompetent emperor who failed to justify the hopes that had been placed in him when he succeeded. During his period of rule the empire was fiercely attacked by the Turks under Alp Arslan and by many of the hill tribes. C. spent the greater part of his time in devotion to philosophic

trifles, and to the utter neglect of the empire. The last hold of the empire on Italy was lost in this reign by the capture of Bari.

Constantine XIII., Palaeologus, sometimes called **Constantine XI.** (1394-1453), last of the Gk. emperors; head to defend Constantinople against a besieging force of 300,000 under Mohammed II., and, though he defended it with great bravery, the city was carried by storm. C. was killed, and the E. Empire ended in 1453.

Constantine I. (1868-1923), king of the Hellenes, b. at Athens, eldest son of King George I. and of Olga, daughter of the Russian Grand Duke C. As duke of Sparta, he was trained in Ger. regiments, studying at Leipzig and at the Prussian Staff College. In 1889 he married Sophia Dorothea, sister of the Emperor William II. of Germany. For the disastrous result of the Gk. campaign in Thessaly, 1897, C. as generalissimo was held responsible; nevertheless he became commander-in-chief, and so remained till 1909; when the Military League compelled his retirement, and he went to Paris. Upon the rise of Venizelos, 1910, C. recalled, was made inspector-general and in 1912-13 he successfully commanded the forces in Macedonia. The assassination of his father, March 18, 1913, raised C. to the throne. He was successful against Turks and Bulgarians in Macedonia and Thrace; and before the year ended, his dominions were double those of his father in area. He remained neutral in the First World War, but with such benevolence toward the central powers that Venizelos resigned, March 1915, coming back, however, with a large part. majority. When, in May 1916, Fort Rupel, commanding Struma Pass, was surrendered to Bulgaria, the Allies began action which ended in June 1917 in C.'s expulsion. After three years in Switzerland, he was recalled by plebiscite, and returned, Dec. 1920. He prosecuted in Asia Minor a campaign that ended disastrously, Sept. 1922. A year later there was an insurrection in the army, and C. abdicated in favour of his son George, retiring to Palermo, where he d. suddenly of cerebral hemorrhage, Jan. 11, 1923.

Constantine (Konstantin Nikolaevitch) (1827-92), grand duke of Russia, was the second son of Tsar Nicholas I. He commanded the Russian fleet in the Baltic during the Crimean war (1854), and as a leader of the National party opposed the concessions granted to the allied forces of the Eng., Fr., Sardinians, and Turks. In 1862, when the Polish insurrection occurred, he was appointed viceroy of Poland; and in 1865 and 1878 was made president of the council of the empire, but was deprived of his offices in 1881 because of his supposed intrigues with the revolutionists.

Constantine, Pope (708-715), was elected to the papal chair in 708. He journeyed to Constantinople to confirm the decrees of the Quinisextine Council at the invitation of Justinian II.

Constantine the Great, *see* **CONSTANTINUS I.**

Constantine, cap. of the dept. of C. in the E. of Algeria. The tn. is picturesquely situated at an altitude of 2150 ft. above sea level, on an entirely isolated chalk rock, which is washed on three sides by a stream flowing through a deep ravine. C. consists of the European quarter and the old Arab quarter, which has preserved an intense local colour. The work of the native saddlers and shoemakers is famous, as also the woollen stuffs made here. It has railway communication with Bona, Philippeville, Algiers, Biskra, Tebessa, and Tunis. C.—in Rom. times called *Cirta*—was a city of the Massyli in Numidia, and the cap. of Syphax and of Massinissa and his successors. In the Jugurthine war Adherbal was besieged here by Jugurtha and slain in 112 B.C., and the tn. compelled to surrender. It was destroyed in A.D. 311, but was rebuilt by C. the Great in 312; was taken by the Arabs in 710, and by the Fr. in 1837. The pop. of the tn. is 121,200, of whom 45,000 are Europeans; of the dept. 2,727,700, of whom 70,000 are Europeans.

Constantinople, *see* **ISTANBUL.**

Constantinople, Councils of. Of the eight œcumenical councils convoked previous to the great schism, the first was held at Nicæa, and the second, fifth, sixth, and eighth were held at Constantinople. The first council of C. (A.D. 381), of 150 bishops under Pope Damasus and Emperor Theodosius I., confirmed the Nicene Creed and condemned Apollinarianism—a heresy directed against the divinity of Christ. The second council of C. (553), of 165 bishops under Pope Vigilius and Emperor Justinian I., condemned the Nestorian heresy. The fifteen anathematizations on Origen, sometimes ascribed to the fifth œcumenical, belong to a council held at Constantinople in 543. The third council of C. (680–81), under Pope Agatho and Emperor Constantine Pogonatus, defined a human and a divine will in Christ, thus terminating Monothelism. The fourth council of C. (869), of 102 bishops under Pope Adrian II. and Emperor Basil, is only recognised as œcumenical by the Church of Rome. It condemned Photius, who had seized the see of Constantinople, but the Photian schism was successful, and no other general œcumenical council was held at Constantinople. The chief work of the C. of C. was in matters of the theology of the Incarnation, but their decisions show a wide scope. *See also* **COUNCIL.**

Constantinus, Rom. serving as a common soldier in Britain at the time of Honorius (A.D. 395–423). His troops proclaimed him emperor instead of Honorius, A.D. 407 and crossing to Gaul they captured it almost entirely. Honorius acknowledged him as emperor in 408, to win his support against the Goths. C. then advanced into Italy itself, hoping to depose Honorius. The rebellion of his general, Gerontius, compelled him to return to Gaul, where Honorius's general and son-in-law Constantius defeated both at Arles. C. was executed by Honorius,

and the latter gave up Britain as part of his empire. *See* Jornandes, *De Rebus Geticis*; S. le Nain de Tillemont, *Histoire des empereurs*.

Constantinus I., Flavius Valerius Aurelius (Constantine the Great) (c. A.D. 288–337), b. in Moesia, son of Constantius Chlorus and Helena, first Christian emperor of Rome (c. 306–37). He served under Diocletian in the famous Egyptian expedition (296), and under Galerius in the Persian war, early becoming a favourite with the army as an able, brave, and good soldier, and an object of envy to Galerius. C. joined his father on the expedition against the Persians, and was proclaimed emperor in York by the legions on his father's death there. Galerius only granted him the title *Cæsar*, reserving Augustus for his own son, Severus. In 307 C. married Maximian's daughter Fausta, but in 309 he put his father-in-law to death for plotting against him. Galerius d. 311; 312, C. marched against Maxentius, an aspirant to the Rom. Empire, who was thrice defeated in Italy and finally drowned in the Tiber while trying to escape. According to legend, C. was converted about this time by the apparition of a cross in the sky with the legend *En toutis victa* (By this conquer). This story is told by Eusebius, who professes to have had it from the lips of C. himself, and also with much variation in details, by Lactantius and Nazarius. Being now supreme in the W., he promoted order and prosperity among his subjects, and encouraged Christianity. In 323 he defeated Licinius, another aspirant to the Rom. Empire, once near Adrianople, and again opposite Byzantium, becoming sole emperor of both E. and W. In 325 he assembled the first general council at Nicæa, at which Arianism was condemned and a famous Catholic creed adopted (Nicene). C. transferred his cap. from Rome by Byzantium about 328, naming the tn. after himself Constantinople. Is said to have had himself baptised in 337 as a Christian—having three years before proclaimed Christianity the State religion. There is, however, much discussion as to his Christianity or Paganism. *See* Eusebius, *De Vita Constantini* (trans. 1845); E. Gibbon, *The Decline and Fall of the Roman Empire*, 1776–88; J. B. Bury, *History of the Later Roman Empire*, 1889; J. B. Firth, *Constantine the Great*, 1905; C. B. Coleman, *Constantine and Christianity*, 1914.

Constantius I. (Chlorus, the pale), Flavius Valerius (A.D. 250–306), son of Eutropius, father of Constantine the Great who succeeded him. In 292 Diocletian and Maximian chose Galerius and C. to help them with the administration of the empire, each receiving the title *Cæsar*. Gaul, Spain, and Britain were assigned to C. He was forced to repudiate his wife, Helena, and marry Maximian's daughter, Theodora. On the abdication of Diocletian and Maximian in May 305 C. became emperor of the W., Galerius of the E. He was a brave soldier, and an able, humane, and just

ruler. He d. at Eboracum (York) during an expedition against the Picts in Britain.

Constantius II., Flavius Julius (A.D. 317-61), third son of Constantine the Great, who by will left his empire to his sons Constantine II., C. II., and Constans I. as Augusti, with his nephews Dalmatius and Hannibalianus as Caesar and Nobilissimus respectively. On their accession, 337, C. is said to have allowed the murder of Dalmatius and Hannibalianus. Thrace, Macedonia, Greece, the Asiatic provs., and Egypt were allotted to him. He had been Caesar under Constantine I. as early as 333. Throughout his reign he was at war with the Persians, and often defeated by them, notably in 348. When in 350 the revolt of Magnentius resulted in the death of Constans I., C. defeated the former at Mursa on R. Drave, 351, and in Gaul, 353, becoming master of the whole empire. Magnentius probably committed suicide after his defeat. In 355 C. II. made his cousin, the apostate Julian, Caesar and commander in Gaul. In 357 he visited Rome for the first time. He favoured the Arians, and banished the orthodox bishops. Julian's soldiers became devoted to him and proclaimed him emperor, forcing him to oppose C. The latter d. near Tarsus on his way to meet Julian, who became his successor.

Constantius III., Rom. soldier, native of Illyria. He captured Constantinus the tyrant in A.D. 408, and held the rank of general by 411. He put down the rising of Attila, 416. C. married the daughter of Honorius, who made him partner of his empire, 421. For seven months C. was emperor of the W., but Theodosius II., emperor of the E., refused to acknowledge him. While preparing to make war on Theodosius C. d. at Ravenna. His son became Valentinian III.

Constanz, or Constance, Lake of, see **CONSTANCE.**

Constantza, see **CONSTANTA.**

Constellation, group of fixed stars conceived generally as representing some mythological figure. The stars may be regarded as forming the framework of these imaginary figures; thus in the well-known N. C., *Ursa Major* (The Great Bear), called also the Dipper, the Plough, or Charles's Wain, the rough parallelogram formed by four bright stars form the body of the imaginary bear, whilst the three other bright stars starting in a curve from the top of the parallelogram constitute the tail. The origin of the Cs. is lost in the mists of the past, but it would seem that the Chaldeans were the first to give names to groups of stars. From them this star-lore was passed on to the Gks., and mention is made of sev. Cs. by Homer and Hesiod. About 366 B.C. a Gk. astronomer, Eudoxus of Cnidus, described a list of Cs. which is substantially the same as that in use at the present day, and his work was versified by Aratus, who in his *Phenomena* mentions forty-five Cs. Ptolemy mentioned forty-eight star-figures: twenty-one N. of the ecliptic; the twelve signs of the Zodiac (q.v.); and fifteen S. of the ecliptic. Of course the ancients, not knowing of the

S. terrestrial hemisphere, were equally ignorant of the S. celestial hemisphere. The S. Cs. were gradually added during the sixteenth, seventeenth, and eighteenth centuries, the chief workers in this field being Petrus Theodori (d. 1596), Bartschius (1624), Jlevelius (1690), and Lacaille (1752). The total number of Cs. is now eight-fifty, and their boundaries have been definitely fixed. This very necessary work was done by a committee of the Brit. Association appointed in 1840, and presided over by Sir J. Herschel. See under specific names; **STARS**; **ZODIAC**; also **ASTRONOMY.**

THREE CONSTELLATIONS OF THE NORTH

Constipation, stoppage or incomplete action of the bowel. This condition is so common in modern times that many people habitually take measures to stimulate the bowel. The chief causes are the character of the modern food, its mode of preparation, and the sedentary nature of many occupations. Much of our food consists of soft starchy material, and improved methods of milling have eliminated the harder particles of grain which formerly served to stimulate the bowels. In addition, the absence of exercise results in a weakened and anemic state of the bowels in sedentary workers. In order to counteract what is practically a normal tendency to C., therefore, it is necessary to revert to some of the practices of our forefathers; to eat brown or wholemeal bread, oatmeal porridge and the like, and to take regular and fairly vigorous exercise. C. also occurs as a symptom of many diseases, particularly those which have a decidedly weakening effect on the system. When the processes of digestion have extracted the nourishing constituents of food, the residue is projected along the intestinal passage by a series of muscular movements, and is eventually compressed towards the base of the bowel ready to be ejected to the exterior. If therefore the muscles and nerves of the intestine lack tone and are enfeebled by an insufficient supply of healthy blood, the passage of the food residue becomes imperfect, and if the supply of fluid is also insufficient to promote movement, a stoppage occurs which tends to become worse on account of the compression and hardening of the unexpelled residue. The effects of C. become intensified as the condition continues. The retained substances act as irritants and poisons, and a condition of auto-intoxication results.

The toxic substances are carried by the blood-stream into all parts of the body; the patient is languid, complains of headache and general malaise, becomes depressed, and shows the effect of disordered health in the unwholesome colour of the skin, in his coated tongue and unpleasant breath. The treatment of C. aims first at discovering the cause; whether it be a diseased condition of the digestive organs, or general ill-health induced by improper food or general unhygienic conditions. In general, it may be said that attention to diet and hygiene is more useful than the employment of drugs. It should be recognised that starchy foods and tea are favourable to C., and a change should be made to green vegetables, fruit, and fruit products. Prunes and figs are particularly useful in causing renewed action of the bowel. Attention should be paid to digestion, all food should be masticated well, so that there may be no unmanageable lumps to defy digestion, and it is advisable to take very little liquid with meals. A good supply of fluid, however, is essential; but this is best effected by drinking a tumblerful of water night and morning, or even oftener if necessary. Regular exercise of a kind calculated to move the lower part of the trunk should be taken, and should be supplemented by massage practised by the patient himself at fixed times each day. It is important to recognise that the action of the bowel tends to recur at intervals dictated by the habits of the patient, and it is strongly advised that the utmost regularity in this respect should be observed, even when no immediate result is promised. Care and persistence often conquer the most obstinate C. without the aid of drugs. The objection to drugs is that though an immediate effect is obtained, the bowel is not strengthened, but may become even more debilitated after the abnormal stimulation. Where the patient shows no tendency to chronic C., such drugs as liquorice, aloes, rhubarb and magnesia, Epsom salts, and cascara sagrada are valuable. An enema of lukewarm water is usually effective, as also is glycerine administered as a suppository. It is above all things important to guard against the condition where the use of drugs results in their ultimate failure to produce any effect.

Constitución, tn. on the coast of Chile, situated at the mouth of the Maipo, and is 115 m. N.E. of Concepción, and a favourite seaside resort. Some ship-building is done there, and the chief exports are flour and grain. A dangerous bar exists in the roadstead caused by the riv. washing down large quantities of sand. A railway runs from this tn. to Talca. Pop. 7500.

Constituciones, see ELECTORATES.

Constitution, in politics, signifies a system of law estab. by the sovereign power of a state for its own guidance. Its main objects are to fix the limits and define the relations of the legislative, judicial, and executive powers of the state, both among themselves and with

reference to the citizens of the state, regarded as a governed body. In the countries of continental Europe, since the foundation of the U.S.A., or at least since the first Fr. Revolution, the idea of a C. has been generally that of a written public law, promulgated by the sovereign power. In Great Britain it is the whole body of the public law, constitutional as well as statutory, which has grown up in the process of time, and is continually being modified by the action of the general will as interpreted and expressed by the parliamentary representatives of the nation. A constitutional monarchy is one in which the sovereign is restricted in his powers by chambers of the nation's representatives; the granting of a C. accordingly means the transforming of a monarchy more or less absolute into a constitutional state. It has to be acknowledged that, in a general manner, the Cs. of modern Europe are political systems of establishing the government of a nation by the nation itself, or at least by its participation in the gov. As a rule these are based on the principle of national sovereignty. The first historical type of a C. as expressed in Magna Charta, is a direct emanation of the feudal system. Later, it was slowly amended, enlarged, and assured by successive agreements between the nation and its sovereign, and despite the rather strange fact that it has never been written, the Brit. C. stands in our days a great deal firmer and less vulnerable than all the European Cs. for which it has been a pattern. The Eng. C. rests on a pact; it is the normal and uninterrupted development of the principle of respect for the rights of corporations representing the nation. Other Cs., notably that of the third Fr. Republic, are based on the right of the whole body of the citizens to govern themselves, or, to express it in a precise formula, on the principle of national sovereignty. These two principles differ greatly. The necessity of a C. is accentuated not only in all federated republics (most of the existing republics are federated or quasi-federated), but also in all other federated states, such as was formerly the case with the federated monarchies of Germany. In those federated states the C. has, in some way, the character of a treaty concluded between the different states combined in one federation, and thus it is quite different from any ordinary law. The pattern of the C. of a federal republic is that of the U.S.A., adopted before the outbreak of the Fr. Revolution. The other Amer. republics are wavering between the Fr. system and that of the U.S.A., but favour strongly the former. But there have been some still more complicated constitutional systems, such, for example, as that of Austria-Hungary, a state based on a personal union, which was that of a dual monarchy composed of two different countries practically independent of one another, but ruled by the same monarch. There may also be a confederation of sev. monarchies, as was in bygone times the old Ger. confedera-

tion, broken up through the issue of the Austro-Prussian war of 1866. Absolute monarchies have no Cs., but are in certain ways ruled by traditions, such as the succession to the throne, to which every absolute ruler has to submit; should he attempt to alter the existing custom, his arbitrary dispositions would not be respected after his demise. These traditions, to which a Louis XIV. and the most powerful of the Russian autocrats had to submit, are for absolute monarchies exactly what the C. is in constitutional states. In the present century, until the advent of totalitarianism or the era of neo-dictatorships, all modern states enjoyed more or less liberal Cs., which, however, differed very much in character from one another, but might be generally classified as (i) constitutional monarchies; (ii) unitarian republic (France); and (iii) federal or quasi-federal republics (U.S.A., Germany, U.S.S.R., Switzerland, Australian Commonwealth, Brazil, Mexico, etc.—though, as is shown below, many apparent federal republics are really unitary states. Modern constitutional monarchies in Europe, before the Second World War, were Great Britain, Belgium, Holland, Denmark, Norway, Sweden, Italy, Spain, Rumania, and Bulgaria. Most of these remained unchanged after the war, but Italy rejected the king and elected to become a republic. Spain had ceased to be a monarchy since 1931. In Rumania the C. of 1866 (as modified in 1923), which proclaimed the state of Rumania as a constitutional monarchy, was restored by royal decree of Aug. 31, 1944; but the king was forced to abdicate in 1947 and a People's Republic was proclaimed. Before the First World War Germany, Austria-Hungary (the dual monarchy), Serbia, and Greece were also constitutional monarchies, as were also, conditionally, Russia and what remained of Turkey in Europe. In Greece a plebiscite estab. a republic from 1924 to 1935, in which latter year the monarchy was restored. The Ger. invasion of Greece in 1941 forced the king into exile and after the war he set up a regency pending a plebiscite on the issue of monarchy or republic, the people in 1946 choosing to retain the monarchy. France is the one avowedly unitarian republic in existence, but many other federal states are in effect unitary. In France the new C. of the Fr. Union was adopted after the war. It provides for three organs of government. At the head there is a president of the union, who presides over the Supreme Council of the union, composed of the members of the gov. and of representatives of the member states; the third organ of government, being an assembly of the Fr. Union consisting of representatives of metropolitan France and of the member states.

Developments since the First World War.—Through the world-wide upheaval of the First World War the structure of many national Cs. considerably changed. The three or four prin. causes effecting these changes may be briefly enumerated: Firstly, the further development of political

democracy, a growth that had been going on before the war, but which the war intensified. The fact that the U.S.A. came last but with great effect into the war, and was to so great an extent the arbiter of its conclusion, led to Amer. ideas of political democracy having a wide influence among European statesmen, when they came to overhaul their constitutional machinery in the months and years immediately following the war. The influence of the ideals of President Woodrow Wilson was immense in the two or three years of reconstruction immediately after the cessation of hostilities, and Amer. distrust of 'this king business' gave added impetus to the republican movement throughout Europe. The Ger. (Weimar) C. owed much to these ideals. Secondly, there was the impact of the feminist movement on Cs. Here again the war did not intensify a pro-war movement, but the aid that women rendered their countries in the time of emergency was sufficient at its close to ensure in most European countries that women's franchise should be estab. as part of the constitutional machinery. France was the sole great European country that had made no concession to this movement. Next should be noted the effect on modern Cs. of the economic repercussions of the war and the post-war depression. This received its strongest expression in the great Russian revolution of 1917. In all the countries of the combatants victors and vanquished alike, the question who should pay for the war was the paramount issue of politics, and the unrest that ensued on the attempted solutions of this problem strengthened the influence of Russia and fostered the growth of socialist parties throughout the world (a development which was much intensified after the Second World War). This, in its turn, brought about in countries like Hungary and Bavaria short-lived attempts to imitate the Russian revolution. The counter-revolutionary forces awakened by these premature attempts—forces like Fascism in Italy, the Magyar movement in Hungary (see HUNGARIAN REVOLUTION), the National Socialist and Heimwehr movements in Germany and Austria respectively—were in their nature anti-democratic and anti-feminist. Where these movements triumphed in Europe the general disposition was to abolish, or at least to suspend, the former Cs. The Fascists (see Fascism) in Italy, under the leadership of Mussolini (q.v.), entirely re-formed the It. C., the new corporate state there no more resembling the former C. of Italy than the C. of the U.S.S.R. resembles the former C. of Tsarist Russia. In Spain the directory of Primo de Rivera (q.v.) was content to suspend the C., which his successor undertook to restore, but after his death the country became republic, only to revert after the Civil war to a dictatorship. For Amer. C. see C. E. Stevens, *Sources of the Constitution of the United States*, 1894; C. K. Burdick, *The Law of the American Constitution*, 1922; H. C. Hockett, *A Constitutional History of the*

United States, 1939. For the C. of various countries, consult Dodd's *Modern Constitutions* (2 vols.), 1909, and *Select Constitutions of the World* (Irish Stationery Office, Dublin, 1922). See also *The Constitutions of all Countries* (H.M.S.O.), 1938; E. Jenks, *The Ship of State*, 1939; W. Friedmann, *The Crisis of the National State*, 1943; D. Lindsay, *The Modern Democratic State*, 1943; K. C. Wheare, *Federal Government*, 1946; E. C. S. Wade and G. G. Phillips, *Constitutional Law*, 1948.

Modern Federal and Quasi-Federal Constitutions.—Recent years have seen the emergence of a strong movement for the federal form of C. as offering some hope of avoiding the anarchy of extreme nationalism (*q.v.*). This movement seemed to reach its climax at the time of Clarence Streit's *Union Now* (1939), a well-reasoned plea for the association of some fifteen democratic national states in a world federation. But many of these states, such as Czechoslovakia and Austria, subsequently lost their sovereign status, and in any case this and other schemes inspired by W. ideas arbitrarily excluded partly or wholly non-European nations of great actual or potential strength such as Russia and China; while critics were not slow to point out that in the experience of hist. federal gov., while successful where conditions were favourable, was no better guarantee of peace than any other form of gov. For where there already existed strong common interests, common social and religious ideals and geographical contiguity, a closer constitutional association naturally followed as, for example, in the case of the sev. Amer. and Australian states. In these cases federation merely effectuated a common desire for such closer constitutional bonds as would confer such obvious benefits as a common defence and common economic interests, while leaving the constituent states as large a residuary measure of autonomy as was consistent with the special overriding powers of the federal or central gov. It has been well said that the chief weakness of federal idealism is that its advocates too often assumed that 'a constitutional and legal device which gives shape to a movement for closer interpretation, based on forces making for social and political cohesion, might itself institute such integration. Or they have too lightly assumed that one link, like that of the democratic C. in Streit's fifteen states, might make up for the lack of community in matters of geographical situation, defence needs, economic ties, etc.' (W. Friedmann, *The Crisis of the National State*). Yet if the enthusiasm for federal union waned with the advance of totalitarianism it is by no means dead. Its original impetus may be said to have sprung from the institution of the League of Nations with its covenant (*q.v.*) designed to check aggression through the machinery of consultation and sanctions and the complementary proposals for an organised international military force; but with the failure of the League

to check aggression federal idealism of the kind envisaged by Briand (*q.v.*) in his dream of a super-European state seemed to be altogether too visionary. With the defeat, however, of the totalitarian powers of the Axis (*q.v.*) in 1945 it may be that national Cs. will have to abate some element of their sovereign implications if the United Nations' (organisation) is to prove a practicable institution.

A modern federal C. sometimes, though not always, represents a stage in a development from a loose association to a unitary state. An example is offered by the development of the Ger. Confederation, through the federal Reich of 1870 to the more firmly knit federation of 1919 and eventually the unitary state of Nazi Germany. Indeed, it may also be said that the Canadian C., like that of S. Africa, is essentially unitary and that the only true federal Cs. existing to-day are those of the U.S.A., the commonwealth of Australia, and Switzerland. The Weimar C. of 1919-33 embodied the federal principle to some extent. There was a div. of subjects between general and state legislatures with the residuary powers passing to the states. Some subjects, like foreign affairs, defence, and customs, were assigned to the general legislature exclusively; others were given to general and regional legislatures concurrently, but with the proviso that general prevailed over regional legislation in case of conflict. There was, too, a supreme court to settle constitutional disputes between general and state legislatures. But there were modifications, particularly in regard to the financial relations of the general and state gov., which were inconsistent with the whole federal principle. Of the Weimar C. it is hard to say that it is quasi-federal like that of Canada, or not federal at all but highly decentralised like the S. African C. But if the C. of the Ger. republic of those years was quasi-federal it is clear that the practice of the general gov. was progressively unitary. The C. of the U.S.S.R. of 1936 seems to merit a similar description. It contains a div. of powers between the All Union gov. and the gov. of the constituent republics. But the power of amending the C. is vested in the general legislature, the supreme Soviet of the whole Union, both houses of which are elected by the people, though the upper house is organised to represent constituent republics and the lower according to population; and this modification is perhaps by itself conclusive in justifying us in classifying the C. as quasi-federal. Article 19 seems decisive on this point, for it declares that the powers of the All Union authorities include the 'confirmation of the unified state budget of the U.S.S.R., as well as of the taxes and revenues which go to form the All Union, the republic, and the local budgets.' This is evidently an assertion in law that, in respect of finance, the regional gov. are subordinate to the general gov. and not co-ordinate with it. Moreover Article 14 of the C. gives to the All Union legislature such comprehensive

powers over almost all spheres of life that it leaves little to the constituent socialist soviet republics, if the All Union sees fit to exercise them fully; while, again, the amendments made in 1941 by which the constituent republics were given powers in respect of military affairs and foreign relations made no substantial change in the legal position; for it was enacted that the Supreme Soviet of the Union had exclusive jurisdiction over the 'establishment of the directing principles of military formations in the union republics.' But in any case the C. of 1936 has so far had but little chance to operate under normal conditions. The demands of war have made the predominance of the All Union gov. inevitable (*see further under RUSSIA*).

The C. contemplated for India by the Government of India Act, 1935, was also quasi-federal. This Act provided for what is called a federation of India, composed of Indian states under their princes, and the provs. of Brit. India, the latter ruled by Indian ministers operating a system of responsible cabinet gov., not dissimilar to that of the Canadian provs. But, as in Canada, the federal principle was modified by unitary elements in the form of control by the general executive over the prov. executive and legislature, so also in the Indian C. the governor-general of India was vested with powers of intervention in the affairs of the prov. govts., which modified the application of the purely federal principle; but at the same time that principle was introduced into the Act of 1935 to such an extent that it may be said to be the distinguishing characteristic of the C. contemplated by that Act (*see K. C. Wheare, Federal Government, 1946*). Part II. of the Government of India Act, 1935, relating to federation, did not come into force on the attainment of Indian independence in 1947, and the Central Gov. carried on under the provisions relating to the transitional period. *See further under INDIA*.

Totalitarian Constitutions.—The distinguishing mark of the totalitarian Cs., and equally indeed in the Communist C. of the U.S.S.R., is the single-party dictatorial system of gov. based on the 'totality of the state' as opposed to the liberal conception of the state which restricts the authority of the state to certain spheres of life, while leaving as many others as possible to the free decision of the individual. The 'total state,' whether Fascist or Communist, extends the sphere of state influence over the whole life, private as well as public, and demands full submission of the individual to the requirements of the state. The National Socialist Germany of Hitler's day, and the Fascist Italy of Mussolini's, are the archetypes of totalitarian states. The Reichstag, elected in March 1933, virtually, though not *de jure*, set aside the Weimar C. by yielding absolute power to Hitler and his ministers. An Enabling Act of 1933 provided that the Cabinet might make laws by ordinance, including even such laws as were not in accord

with the Weimar C., which was not formally abrogated. In 1933 a decree was issued prolonging the life of the then existing Reichstag till 1947, but this body was in no sense a representative institution, nor had it any power of legislation or even debate. It met solely to effect the will of the chancellor Hitler, in whose personal dictatorship all the activities of the country, political, economic, industrial, etc., were *gleichgeschaltet* (totalitarianised). This, the working C. of Germany, provided for a leader and Reichskanzler, who was the supreme commander of the army and was also the leader in all political activities, both in the Reich and in the states. Under this quasi-C. freedom of speech and of thought and of the press was abolished, and equality before the law limited by the so-called Aryan paragraph, which arbitrarily granted full civic rights only to 'Aryans' (*q.v.*), while personal freedom of arrest, so familiar to Eng. political science from the passing of the Habeas Corpus Act, was curtailed by the activities of an officially recognised secret police. The constituent states of Nazi Germany were also deprived of their constitutional rights, for by the Unification Act of April 7, 1933, the federal states were all brought under the rule of Reichstatthalter, or governors directly responsible to Hitler; and by an Act of Feb. 1934 the sovereign rights formerly possessed by the federal states passed under the jurisdiction of the Minister of the Interior, and the Reich Cabinet arrogated to itself the promulgation of new constitutional laws for the federal states.

The Fascist C. introduced in Italy, which prevailed until Italy's military collapse in the Second World War, represented a radical transformation of the fundamental statute of the kingdom granted on March 4, 1848, by King Charles Albert to his Sardinian subjects. By that statute or charter the executive power of the state belongs exclusively to the sovereign and was exercised by him through responsible ministers; while the legislative authority was vested conjointly in king and Parliament, the latter being bi-cameral and consisting of a Senate and deputies. But under Mussolini's Fascist regime the Chamber of Deputies was replaced by a Chamber of Fasci and Corporations (*see also CORPORATIVE STATE*) composed of the 150 members of the National Council of the Fascist party and of the 500 effective members of the National Council of Corporations. The duties of the Chamber were performed by the full assembly, by the budget general commission, and by the legislative commissions. There was also a Grand Fascist Council, which was composed of the *quadriviri* of the march to Rome as life members and various ministers and other dignitaries appointed for as long as they held their respective offices. This Grand Council existed to co-ordinate all the activity of the regime resulting from the Fascist revolution and to give its opinion on three lines of conduct of the Fascist party. Its approval had to

be obtained on all questions of a constitutional nature, including those connected with the succession to the throne and the prerogatives of the Crown. By a decree of April 28, 1938, a new statute was promulgated by which the position of the Duce or leader was incorporated in the C. of Italy. The Chamber, with the Senate, co-operated with the gov. in framing legislation. The drafts of constitutional bills and the legislative commitments of a general character and certain other matters were debated and voted by the Chamber and the Senate in their respective assemblies; drafts of other bills were generally put under exclusive approval of the legislative commissions and submitted by the Duce for the king's sanction and promulgation. The executive power was exercised nominally by the king through the gov., but in fact by the Duce, who was only theoretically responsible to the king for the general political direction of the gov. The ministers were responsible both to the king and to the chief of the gov., i.e. to the Duce, for the actions of their respective offices. Thus, while It. Fascism served as a model to a number of similar movements in other countries, and in particular to Ger. National Socialism (q.v.), there was a somewhat higher degree of liberality in the Fascist C. of Italy than in that of Nazi Germany, where eventually Hitler placed himself above the law altogether and so made no pretence to rule constitutionally at all. For where in a Fascist or any other authoritarian state there is no real legislative body there is in effect no constitutional law; for, in the hist. of political science, absolutism has long given place to constitutional gov., and constitutional law has become supreme because only in virtue of its acceptance can the legislative body be constituted. See W. Stubbs, *Constitutional History of England*, 1878; A. V. Dicey, *The Law of the Constitution*, 1885, 1939; Sir W. R. Anson, *The Law and Custom of the Constitution*, 1886-92, 1922-35; Adams and Stephens, *Select Documents of English Constitutional History*, 1901; W. H. P. Clement, *The Law of the Canadian Constitution*, 1916; G. B. Adams, *A Constitutional History of England*, 1921, 1935; D. Kerr, *The Law of the Australian Constitution*, 1925; J. H. Morgan, *The Law and Constitution of the Empire*, 1928; G. Anschütz, *Die Verfassung des Deutschen Reiches*, 1921; G. V. Portus, *Studies in the Australian Constitution*, 1933; W. P. M. Kennedy and H. J. Schlosberg, *Law and Custom of the South African Constitution*, 1935; W. P. M. Kennedy, *The Constitution of Canada: an Introduction to its Development*, 1938; H. R. G. Greaves, *The British Constitution*, 1938, 2nd ed. 1948; S. G. Chrimes, *English Constitutional History*, 1948.

'Constitution of Athens,' one section of a lost work of Aristotle's on the constitutional hist. of 158 states. It was only known by quoted fragments until in 1891 a papyrus was found having a MS. copy of the C. of A., made about A.D. 100. Aristotle's authorship is not disputed and

the date is put between 328 and 325 B.C. The C. of A. is divided into two sections. The first gives the hist. of the constitution up to the expulsion of the Thirty Tyrants. The second describes the state offices in the writer's own day. The beginning of the MS. is missing and part of the second section is mutilated. The C. of A. has been ed. and trans. by F. G. Kenyon, 1891. See also J. E. Sandys, *Aristotle's Constitution of Athens*.

Constitutional Club, one of the leading Conservative political clubs. It is situated in Northumberland Avenue, London, W.C., and was estab. in 1833. It has 5000 members.

Constitutions and Canons, see APOSTOLIC.

Consubstantial (Gk. *ὁμοούσιος*, Lat. *consubstantialis*), of one and the same essence or substance. The word is applied in theology to the Three Persons in the Godhead. The general council of Nicea (A.D. 325) pronounced in favour of the Athanasian view that the Second Person of the Trinity is *ὁμοούσιος* with the Father. This view is still held by the Gk. and Rom. Catholic Churches, those of England and Scotland, and the leading continental Protestant churches.

Consubstantiation, identity or union of substance. In theology the doctrine of the real, substantial Presence of the Body and Blood of Christ, together with the bread and wine in the Eucharist. The term is opposed to the Catholic 'transubstantiation,' and means strictly the transition or union of two substances originally distinct into one common substance; substantial conjunction, or one substance out of two. The name is often erroneously applied to the Lutheran doctrine of the Real Presence. The doctrine should rightly be ascribed to John of Paris and Rupert, meaning substantial conjunction of the two, sometimes called Impanation.

Consuegra (Consaburum), tn. of central Spain in the prov. of, and 35 m. from, the city of Toledo. Has an ant. castle and rom. remains. It was partly destroyed by flood, Sept. 1891. Manufs. coarse cloth. Pop. over 8966.

Consuetudinary, or customary, law, as opposed to written or statute law, is that law which is derived from the customs of remote antiquity. Such is the common law of Scotland, and many of the principles of the Eng. common law (q.v.) are based upon immemorial usage, e.g. the custom of borough-Eng. (q.v.). See also CUSTOMS.

Consul (mercantile), public officer maintained by the state in foreign countries for the purpose of supervising the commercial business of the state. Early in the twelfth century the custom grew up among the merchant city states of Italy of sending such representatives to other lands, and especially to the E. The custom extended to France, but then almost died out, to be revived in the sixteenth century. Even then it did not spread very quickly, and not till the nineteenth century did it become universal. A C. is primarily concerned with

commercial and mercantile matters, and does not rank as a diplomatic agent. He cannot therefore enter on his duties without the sanction of the gov. of the country to which he is sent. His first duty is to exhibit his commission to these authorities, and to receive their permission to enter on his duties. This permission is given in an *exequatur*, which may be revoked at any time. Cs. are divided into consular agents, Cs. general, Cs., and vice-Cs., and are immune from taxation unless they are themselves directly engaged in trade. The consulate is considered as a part of the Brit. Empire, and so all acts officially performed by the C. are valid in our courts of law. He can perform all the acts of a notary general. It is his duty to protect the rights of his countrymen in that part; to protect them from aggression, and to secure the redress of grievances sustained by them. If he is unable to perform these duties he must report the matter to the Brit. ambas. at the cap. In addition he has to send home annually a report to the secretary of state for foreign affairs containing the returns of the trade for the different ports within his consulate, and other matters of a similar nature. Of late years it has also been his duty to send home a report of anything of importance to trade which may occur at any time, and these reports, pub. by the Board of Trade, provide valuable information to those interested in foreign trade. He holds, also, a general supervision duty over Brit. ships and sailors. He inquires into offences committed on the high seas, and sends home any shipwrecked or distressed sailors that may be cast on the coasts.

Consul, title of the two highest ordinary magistrates in the Rom. state. After the expulsion of the kings in 510 B.C. this office was instituted, and the first to hold it were Lucius Junius Brutus and Lucius Tarquinius Collatinus. Probably the title was at first that of praetor. The Cs. were elected by the *Comitia Centuriata*, and until 367 B.C. only patricians were eligible. The inauguration of fresh Cs. was accompanied with elaborate ceremonies, including a procession to the Capitol and a great sacrifice to Jupiter. The power of the Cs. was very great, but it must be remembered that all their power was held in common. They gave their name to the year, and assumed a semi-regal state. Their insignia were the *toga praetexta*, the *sella curulis*, and the twelve lictors, each carrying a bundle of rods (*fusces*) with an axe in the centre. To the Cs. belonged the supreme command of the army, the regulation of war and peace, the judicial headship, the disposal of the treasury, and the assembling of the Senate. They could only be challenged when they again became private men at the end of their term of office. In cases of great danger, complete authority was given to a dictator, or else absolute power was temporarily voted to the Cs. by the Senate. The consular power was gradually restricted. In 494 B.C., when the office was still confined to the patricians, the *tribuni plebis* were appointed, with

right of appeal to them from the Cs. Then in 367 B.C., by the famous *Lex Licinia*, it was enacted that one C. must be a plebeian. Previous to this the appointment of censors, in 443, had removed the business from their hands, and in the same year (367) the appointment of praetors freed them from many of their judicial functions. During the civil wars the consular office lost its original character, and it survived as the mere shadow of its old self in the W. until A.D. 534 and in the E. till 541.

A CONSUL OF THE SIXTH CENTURY

Consulate of the Sea (*Consolato del Mare*), famous code of maritime law, supposed to be a compilation of the laws and trading customs of various It. cities (Venice, Pisa, Amalfi, Genoa) and the cities with which they traded (Marseilles, Barcelona, and others). The exact original date is not known, but the laws are thought to have been collected during the eleventh, twelfth, and thirteenth centuries. The earliest known ed. was pub. at Barcelona, 1494. This was trans. into Eng. by Sir Travers Twiss, 'The Customs of the Sea,' forming an appendix to *The Black Book of the Admiralty*, 1874.

Consumption, in economics, is opposed to production, with which it is closely related, for they may be respectively regarded as destroying and producing utilities. Thus the common div. of C. falls into productive, that which satisfies a want which will lead to further efficiency of the consumer, and unproductive, that is, of luxuries. The div. of the constituent members of a community into

consumers and producers, for purposes of discussing economic questions, is confusing, if not misleading; for all, in a modern state, with very limited exceptions, are both. State regulation of C. has, in the past, taken the form of sumptuary laws, regulating the kind of goods, especially luxuries, such as clothes, etc., which classes of the community are allowed to adopt and use. To-day, in the post-world war period of shortages, it takes the form of a purchase tax, the main object of which is to limit the production and C. of 'luxury' as opposed to 'utility' goods.

Consumption, see **PHTHISIS**.

Contagion (Lat. *contingere*, to touch) strictly the communication or transmission of disease from a sick to a healthy individual, caused by direct contact or by a third person who carries the contagion (poisonous principle) but escapes himself (mediate contact), or by touching articles bearing the germs of the disease. Contagious diseases are distinguished from infectious by reason that the latter can be transmitted by far more indirect contact, through the medium of excretions or exhalations of the suffering body, by spreading through the air or in water. Among contagious diseases are measles, small-pox, erysipelas, diphtheria, tuberculosis, rabies, venereal diseases. Scarlet fever is infectious, but probably not strictly contagious. See also **BACTERIA** and **INFECTION**.

Contagious Diseases (Animals) Acts. Under these Acts considerable powers have been vested in the Ministry of Agriculture and Fisheries and upon local authorities for the administration of their provisions. The animals dealt with by the Acts are bulls, cows, oxen, heifers, and calves, sheep and goats, and all other ruminating animals, and swine; but the Ministry may by order extend the Acts to any four-footed beasts; and orders have long been issued relating to horses, asses, mules, and dogs, e.g. the Rabies Order of 1897 for muzzling dogs. The diseases to which the orders of the Ministry pay particular attention include cattle plague or rinderpest, contagious pleuropneumonia of cattle, foot-and-mouth disease, sheep scab, sheep-pox, and swine fever; but the Ministry may include others, and orders have been issued including rabies, anthrax, glanders, and farcy.

Contango, see under **STOCK EXCHANGE**.

Contarini, name of one of the twelve families who elected the first doge of Venice, A.D. 697. This noble Venetian family was one of great importance, among its noted members being sev. doges (from Domenico, 1043-71, who rebuilt St. Mark's, to Alvise, 1676-84), men of letters, painters, statesmen, and soldiers (seven C. fought at Lepanto):

Andrea Contarini, doge from 1367 to 1382; ended the war between Venice and Genoa by reconquering Chioggia.

Ambrogio Contarini, Venetian ambas. to Persia (1473-77), pub. an account of his travels, 1487.

Gasparo Contarini (1483-1542), bishop of Bologna and diplomatist, was made

a cardinal by Pope Paul III., 1535. He was Venetian ambas. to the Diet of Worms, 1521, accompanying Charles V. on his travels, and concluding the emperor's alliance with Venice, 1523. As papal legate at the Diet of Ratisbon, 1541, he tried to effect a reconciliation between Protestants and Catholics. He pub. *Consilium de Emendenda Ecclesia* (1537); *De Magistratibus et Republica Venetorum* (1543).

Giorgio Contarini (1549-1605), was a Venetian painter of portraits and historical pictures. Among his works are 'The Doge Marino Grimani adoring the Virgin'; 'Conquest of Verona by the Venetians'; and 'Baptism of Christ.' See J. Fontana, 'Sulla patrizia famiglia Contarini' in *Il Gondoliere*, 1843.

Conte, literally a 'story,' from Fr. *conte*, to narrate. Though not yet Anglicised this word is often used in Eng. literary criticisms. C. is strictly a generic term, covering both long and short stories, but is more generally used for a short tale dealing entirely with one set of ideas. The word occurs in France as early as the thirteenth century to mean an anecdote artistically told. It is especially applied to tales of wonderful adventure and to fairy-tales. Various collections made these Cs. popular in the Middle Ages, such as the *Gesta Romanorum* and *Historie Latine*. It is also the title of one of the divs. of the works of La Fontaine, whose tales are identical in general character with those which diverted Europe from the days of the *fabliau* writers, through the period of the It. *novellieri* to that of the second great group of Fr. story-tellers ranging from Antoine de la Salle to Béroalde de Verville. Like the *Contes Drôlatiques* of Balzac their subjects are light love, the cunning of wives, the deception of husbands, and the breach of vows by ecclesiastics. In his *Contes Drôlatiques* Balzac, in the fresh and wonderful language of the Merry Vicar of Meudon, has given us a marvellous picture of Fr. life and manners in the sixteenth century. The gallant knights and merry dunces of that eventful period of Fr. hist. stand out in bold relief upon his canvas. Written in the nineteenth century in imitation of the style of the sixteenth, his work is a triumph of literary archaeology and a model of that which it professes to imitate -- a faithful picture of the last days of the *moyen âge*, when kings and princesses, brave gentlemen and haughty ladies, laughed openly at stories and jokes which are considered disgraceful by their more fastidious descendants.

Contemporaneity, term, used in geology to signify the similarity of conditions under which strata have been deposited. Thus, in widely sundered regions of the earth's surface a similar succession of geological layers has been observed. This does not mean that similar layers were laid down at the same time, but that they occur in an order of succession which is fairly general. The term C. is therefore not applicable in its literal significance, and Huxley proposed to substitute the term *homotaxis*, expressing similarity of suc-

cession. The evidence for homotaxis is obtained from the study of fossils, which gives more reliable indications than an examination of the rocks themselves. Although homotaxial rocks are not necessarily literally contemporaneous, they are probably not far sundered as regards chronology.

'Contemporary Review.' This monthly pub. was founded in 1866. In 1870 J. Knowles became ed., gaining as contributors, among others, Gladstone, Tennyson, Manning, Huxley, Ruskin, Froude, Bagehot, and Morley. The *Review* deals with political, theological, literary, and social questions. In 1913 it incorporated the *International Review*.

Contempt of Court, term of wide import. Blackstone shortly defines it as consisting in a disobedience to the rules, orders, or process of a court, or against the king's prerogative. In this definition, however, the primary and secondary meanings are liable to be confounded. To disobey the order of a court is to flout the prerogative of the Crown as the fountain of justice (*see* CROWN). Hence it is that so many and diverse acts may constitute C. of C., e.g. refusing without justification to answer questions properly put by counsel, abusing the judge, assaulting an officer of the court, insulting a litigant or his counsel whether in court or in a master's office, sending libellous or scandalous letters, or offering bribes to a judge or any other officer of the court, tampering with a receiver appointed by the court to administer property, to publishing reports of cases *sub judice* (i.e. undecided), or where the hearing was *in camera*, and disregarding injunctions, decrees, orders, judgments, and so forth, where at all events it is in the power of the person so disregarding to carry out the order. C. of C. has always been regarded as a quasi-criminal matter. Hence the court has power to commit the offender to prison or impose a fine. Different courts have different degrees of power to commit. The king's bench (*q.v.*) has the widest power. It can attach for contempts offered to inferior courts. But every superior court of record, e.g. any div. of the high court and the assize courts, has power to commit for every kind of contempt committed against its own authority. Other and inferior courts, like co. and quarter sessions courts, are restricted to punishing contempts committed, as it is said, *in facie curiæ*, i.e. in open court. Punishment is not often severe for C. of C. In many cases, especially where the contempt is one of the court itself, an apology and payment of costs incurred by the contempt will be deemed sufficient extenuation, provided the offender makes reparation by doing that the omission of which constituted the C. of C.

'Contemptible Little Army.' During Sept. 1914 a Brit. Expeditionary Force Routine Order was issued in which was pub. a copy of an order, reputed to have been issued by the Ger. emperor, referring to the Brit. Army as 'Gen. French's contemptible little army.' This descrip-

tion was naturally seized upon by all who were directly interested in securing recruits and it proved to be a most effective piece of propaganda. No 'title' among veterans is more honoured than that of an 'Old Contemptible,' and an association of ex-soldiers now bears that name. During the war no steps seem to have been taken to verify the authenticity of the ex-Kaiser's statement, but in 1925 some Brit. and Ger. generals made exhaustive searches in official archives and newspaper files in an endeavour to establish the true source. All efforts, however, proved fruitless, and as a last resort the matter was referred to the ex-Kaiser at Doorn, who denied ever having used such an expression with reference to an army, the high value of which he had always appreciated. At the time, however, counter-propaganda was pub. to the effect that the expression 'verächtliches kleines Heer' alluded solely to the small numbers of the Brit. Army in 1914.

Content: 1. Term used in logic indicating the aggregation of attributes which constitute the meaning and are expressed in the definition of a given concept. 2. Paper signed by a ship's captain stating the ship's destination, stores shipped, etc. It has to be given to the customs house officer before the ship can clear upwards.

Conti, House of, cadet branch of the house of Bourbon-Condé. Éléonore de Roye married (1551) Louis de Bourbon, the first prince of Condé, uncle of Henry IV., and brought him C. The title was renewed in favour of Armand de Bourbon (1629-66), second son of Henry II., prince of Condé, younger brother of the great Condé. His son, François Louis de Bourbon (1664-1709), a gallant soldier, was elected king of Poland after Sobieski d. (1697), but did not ascend the throne. The elder brother of François, Louis Armand (1661-85), fought in Hungary with Turenne and Prince Eugène. François Louis left an only son (1717-76), who was the last of the line. He d. in exile before the Restoration.

Conti, Nicolo de, It. traveller of the fifteenth century. He acquired a knowledge of Arabic in Syria, and then started on his travels, first going to Babylonia and Bassora, then to the Malabar coast, Ceylon, Sumatra, Java, and S. China. For an account of his travels, *see India in the Fifteenth Century*, 1857, which contains an Eng. trans. made by J. W. Jones for the Hakluyt Society; and also Ramusio's *Navigazioni e Viaggi* (pub. 1550, 1556, 1559).

Continent (Lat. *continere*, to hold together), a word in physical geography, originally applied to a large tract of land which holds together or contains. The word is now used in contrast to the great oceans, and does not, strictly speaking, include is. and semi-submerged tracks. Geographers recognise six Cs. in the world. These are Europe, Asia, Africa, N. America, S. America, and Australia. It is a curious fact that, with the exception of Europe and Asia, the Cs. are triangular and wedge-shaped, tapering from the N.

in a south-south-easterly direction whereas the great oceans are polygonal in shape. Chamberlin and Salisbury offer this explanation in their *Geology*, 1906: 'The true conception is perhaps that the ocean basins and continental platforms are but the surface forms of great segments of the lithosphere, all of which crowd towards the centre, the stronger and heavier—the ocean basins—taking precedence and squeezing the weaker and lighter ones—the continents—between them.' Each C. stands on a submerged platform called the continental shelf. This shelf is in the form of a terrace and apparently has been formed by the continuous beating of the waves. It is of variable width, the surface of the land sloping gently to soundings of 100 fathoms (600 ft.), until there is a sudden drop, called the continental slope, to 1000 fathoms. The continental area rising above the sea level is estimated at $\frac{1}{5}$ of the earth's surface, and the continental slope is estimated at nearly half the remainder of the earth's surface. It is difficult to determine the exact elevation of a C. above the mean sea level on account of the distortion of the sea surface. Around the Chilean Andes it has been calculated that the sea is heaped up 2000 ft., whereas in other parts only a few hundred feet can be accounted for. It is now thought by geologists that the continental area has always formed permanent features of the earth's surface. The foundation structure of the Cs. is similar, and the continental rocks, granite, etc., are different from those of oceanic is., so that an is., which, by the action of the sea, has been removed from its C., may be recognised by its rocks and soils. The rocks and soils are due to movements in the past which took place periodically, but after long spaces of time. Each C. has a high mt. range, which forms a backbone to it, and from which rivers fall and drain the plains on either side. See GEOGRAPHY; ISLAND; SEA; DESERTS; and names of the separate Cs.

Continental Congress. The C. C. of the U.S.A. was inspired by the advice and activities of the celebrated Samuel Adams in the initial stages of the resistance of the colonies to Grenville's Stamp Act of 1765. The historical importance of the meetings of the C. C. of America lies in the fact that their proceedings made manifest to the world the solidarity of the different states or provs. in their attitude towards England. The first C. C., which met at Philadelphia in 1774, was formed of delegates from all the colonies except Georgia. It was intended to be a federal body composed of states' representatives, which should meet annually and whose functions were primarily to concert the best means for forcing 'the British Parliament to come to proper terms.' It had no executive powers, and indeed, like all unconstitutional or provisional assemblies (*cf.* CONVENTION), it had no certain *locus standi* or functions whatever. Its first act was to address a petition to George III. promising loyalty

in consideration of the redress of the grievances, and in the Declaration of Right it set forth in characteristically democratic terms the collective opinion of the colonists in regard to their rights and liberties. No adequate response was met with from the Brit. Ministry, and the second Congress, which met in 1775, proceeded with greater vigour, and gave reality to the *united* or *confederated* resolutions of the delegates by raising a continental army and appointing Washington as the commander-in-chief. The third Congress met at Philadelphia in May 1776, and by passing the celebrated Declaration of Independence on July 4 severed the last tie of allegiance with Great Britain. Its position being by now more certain, it passed laws for the colonies, and assumed all the executive functions of a provisional gov. The C. C. continued to act as the federal legislative body until 1783, when the Articles of Confederation and Perpetual Union between the States having been ratified by most of the states, provided, though in a vague manner, for a div. of powers between the sev. states and a congress of delegates from the states. See *Cambridge Modern History*, vol. vii, *passim*.

Continental System, method adopted by both France and England, and provoked by the Berlin Decree of 1806, is usually given this name by the Berlin Decree. Great Britain was declared to be in a state of blockade, and all commerce or intercourse with her was forbidden to France and to her allies. This decree, naturally, only declared a paper blockade, since the naval position of France and her allies forbade the adoption of any more stringent method. The Order in Council of 1807, issued by the Brit., naturally attempted to make reprisals. No vessel belonging to any neutral nation was to enter, or have commercial dealings with, any Fr. port or any port belonging to the allies of the Fr. In 1807 Napoleon issued the Milan Decree, which stated that any ship of any nation which had been searched by, or had paid duty to the Brit., lost thereby its nationality and could be seized by the Fr. or the allies of the Fr. The Russian war of 1812 was a direct outcome of the refusal of the Russians to comply with the decrees of Napoleon any longer. Napoleon himself found that he was continually forced to give permission for the breaking of his own decrees, since, without Brit. goods, he himself could not get on. The scheme finally broke down, however, owing to the supremacy of Britain at sea, and her control of the markets of the world. The Eng. system, however, was an essential cause of the Amer. war of 1812.

Contingent Liability. In contra-distinction to a debt or liquidated demand, a C. L. is one that only arises at the happening of a certain event, *e.g.* a covenant (*q.r.*) by a debtor to assign after-acquired chattels to secure a debt creates a liability on the debtor to assign the chattels as soon as he acquires them. Any C. L. to which a debtor is subject at the date of a receiving order against him or to

which he may become subject before his discharge, is a provable debt, e.g. a surety has a right of proof in respect of his C. L. as surety for the debtor.

Contingent Remainder, in law, a term used for an estate in remainder upon a prior estate, limited to take effect, either to an uncertain or unascertained person or upon an uncertain event. If land is granted to A for life, and to B and his heirs at A's death, B's interest is called the remainder. A remainder given to an unborn or unascertained person, or upon some further contingency (when C shall return from abroad) is a 'contingent' as opposed to a 'vested' remainder (given to an ascertained person, and ready to go into effect upon determination of the precedent estate). Though such a remainder is an estate in expectancy (future), it is considered a present interest, and may be transferred to another party by modern legislation. See *Contingent Remainders Acts, 1845 and 1877*.

Continuation Schools are to be found, governed by diverse conditions, in Great Britain, Canada, Australia, America, Central Europe and Italy. At first organised in England as a system of not secondary but continued elementary education for voluntary students, they were made compulsory on all wage-earners from fourteen to eighteen, unless they had remained at school until sixteen, by the Fisher Education Act of 1918. This measure was an attempt to help to solve part of the problem of the half-tutored child entering the arena of the world, and instruction was to be not only educational, but also social, moral, and physical. Young employees were to devote a minimum of 320 hrs. in each year to their classes. The system is perpetuated in the Education Act passed on Aug. 3, 1944 (the Bill presented to Parliament by Mr. R. A. Butler); for a special feature of the Act is the institution of C. S., at first named in the Bill 'Young People's Colleges,' but afterwards changed to 'County Colleges,' where education will be continued up to the age of eighteen. In America the majority of C. S. came into existence after 1919, and wage-earners between fourteen and seventeen or eighteen who have not taken a high school course must put in an attendance at a continuation school for four to eight hours per week. In New York every employer must notify the proper school authority before engaging or dismissing an employee of school age, while the unemployed adolescent worker must report daily until fresh work is found and vouched for by the new employer. See Sir M. E. Sadler, *Continuation Schools in England and Elsewhere*, 1908; Edith A. Waterfall, *The Day Continuation School in England*, 1923; E. W. Knight, *Education in the United States*, 1929; R. W. Ferguson and A. Abbott, *Day Continuation Schools*, 1935; P. L. Kitchin, *From Learning to Earning: Birth and Growth of a Young People's College*, 1944.

Continuity, principle by which it is assumed that appreciable changes in progressive phenomena correspond to

inappreciable changes taking place in inappreciable intervals. In psychology the principle involves the idea of a stream of consciousness; that no state of consciousness is fixed, but is arriving out of a previous state and already developing into a subsequent state. In graphical mathematics, a function is said to be continuous at a point if it is defined in an interval containing that point and has a limit at the point which is equal to the function of the point. The function is said to be continuous throughout an interval when it is continuous at every point of the interval. In hydrodynamics the principle of C. assumes that a fluid is absolutely homogeneous and devoid of viscosity; this leads to relationships which are only approximately true in the more practical science of hydraulics.

Contorted Strata. When geological folds are gentle, they are said to be undulations; when the strata are highly folded and twisted, they are said to be contorted. It is in mt. regions such as the Highlands, the Alps, the Andes, and the Himalayas that these folds are so close. Changes have as a rule taken part with regard to their structure, and their contained fossils have been badly crushed. Some mighty force has been at work, and it must have been parallel to the earth's surface. The cause of this force is unknown, but it may be that it was caused by the slowly cooling and therefore decreasing interior of the earth having caused the surface to wrinkle and contract.

Contour, term used in physical geography, and means an outline. C. lines are lines drawn on maps at fixed intervals, and indicate the form of the surface of the ground, each line passing through points at the same altitude above sea level. These lines are drawn near to each other if the slope of earth is a steep one, and are further apart where the slope is less acute. The term C. is also used for other lines drawn on the same principle, such as those in which the figures employed are the same for all points on the same line, as for instance in isotherms, isobars, isoclines, etc. (See illustration, p. 202.)

Contraband (Fr. *contrebande*, from Lat. *contra*, against, and Low Lat. *bannum*, a proclamation), term applied to illegal traffic in general, and hence to goods smuggled into a country. More generally the term is reserved for contraband of war, the name applied to certain commodities, which, during time of war, it is forbidden for neutral nations to supply to either of the belligerents. C. of war includes, without any doubt, all directly military implements, such as guns, ammunition, tents, and military stores of all kinds. But unless there are special treaties between nations, which give an accurate definition of the term, much doubt is apt to arise as to the further use of the term. It is clear that articles which could only be used for peace purposes must be excluded, but there are a great number of things which, while normally so used, might give one army a distinct

advantage over the other. In 1904, during the Russo-Jap. war, Russia contended that coal, flour, grain, rails, and wood and iron beams were all C. if directed to a belligerent, whether they were to be used for warlike purposes or not. Russia further claimed the right to seize any coal ship cruising in waters near the scene of war, whether it was destined to one of the belligerents or not. Great Britain and America protested against almost all of these claims, and secured from Russia the admission that food-stuffs were only conditional, and not absolute, C.; that is to say that the destination in this case is more important than the nature of the goods. During the Napoleonic wars the Brit. Gov. insisted

to order, or if the ship's papers did not indicate the consignee of the goods, or if the goods were consigned to persons in enemy ter. or in ter. occupied by the enemy. Similar tests were applied to absolute contraband by an Order in Council of March 30, 1916. These, and other modifications adopted by the allied powers, altered the Declaration of London beyond all recognition, and it was eventually abandoned in July 1916 by another Order in Council which declared that the principle of continuous voyage or ultimate destination should be applicable in both contraband and blockade. The justification for this departure lay in the fact that the relief of the civil pop. by such goods as foodstuffs might cause

CONTOUR AND SECTION

on the right of either belligerent to stop and examine neutral ships which were suspected of carrying C. goods. Unless it acts in contravention of the generally received customs of nations, the Admiralty court (sitting as a prize court) of each belligerent has the right of deciding what is C. of war and what is not. Various agreements exist between the U.S.A. and European countries as to the various articles to be included, and the variations between these can only be seen by reference to the actual terms of the treaties. So far as ordinary trade is concerned neutral powers may carry this on with either belligerent, except in cases of blockade. The Second Hague Conference came to no decision on the subject of C., but the matter was extensively dealt with in the conference of London (1908-9).

On the outbreak of the First World War Great Britain adopted the Declaration of London (q.v.) with certain modifications which were again varied in Oct. 1914. Under these modifications conditional contraband was made liable to capture on board vessels, even though bound for neutral ports, if the goods were consigned

an increase to the military or naval forces of some other foodstuffs which the civil pop. would normally have consumed. This view, which regards modern warfare as effecting the whole of the pop. of a combatant, was held by eminent Amor. jurists early in 1914. During the First World War the distinction between absolute and conditional C. was shaken to its foundations, despite the fact that in theory the distinction was correct. But like other theories in international law it dates from a time when armies were small and comprised only a negligible fraction of the total pop. of a country. In the First World War, however, 'when every fit male in each belligerent state became a member of the military forces, when the whole country with all its resources was gradually mobilised, and the means of communication were nationalised and developed to an unforeseen degree, it was widely contended that the distinction between absolute and conditional C. was out of date, seeing that a belligerent gov. could at any moment, and would if necessary, lay its hand on and requisition all articles in the country

which were, or might be, of use for carrying on the war, (Oppenheim.)

At the beginning of 1939 conditional C. was declared generally to comprise all kinds of foodstuffs, feed, forage, and clothing, and articles and materials used in their production (but the foreign ministers of the Amer. republics at Panama on Oct. 3, 1939, registered opposition to the placing on lists of C. of foodstuffs and clothing intended for civilian pops. and not destined directly or indirectly for the use of a belligerent country or its armed forces). There are two groups of articles which must always be recognised as free. Those which serve exclusively to aid the sick and wounded may never be treated as C., even if their destination is hostile. They may, however, in case of urgent military necessity, and subject to the payment of compensation, be requisitioned if they are destined to tor. belonging to or occupied by the enemy, or to his armed forces. The unratified Declaration of London laid down this rule and it was adopted in the First World War. Similarly, articles intended for the use of the vessel in which they are found or for the use of her crew and passengers during the voyage are free.

Contraband Control in the Second World War.—As soon as war between the Allies and Germany broke out C. control bases were estab. by the Brit. Gov. at Kirkwall, Weymouth, The Downs (N. Foreland), Gibraltar, and Haifa. The Ger. Gov., by way of countering the effective Brit. blockade, announced that, since the Brit. C. list included goods that were not war materials, Germany would also include such goods. With regard to conditional C., Germany would follow Britain's example and take into consideration the possible destination of goods beyond the neutral port to which they were consigned. By mid Oct. 1939 the Brit. C. control had intercepted and detained nearly 350,000 tons, but the detection of C. was then becoming more difficult because the consignments were no longer openly sent to Germany, but to neutral agents. With the object of expediting the passage of neutral cargoes the Brit. Gov. decided to reintroduce the system of navicerts, as in the First World War. Under this system the navicert ensured the consignment for which it was granted an undisturbed passage to its destination. In effect, the navicert was a commercial passport for goods, which was issued by Brit. Gov. representatives before they left the neutral port of shipment. Naval officers and customs officials were instructed that, subject to any delay caused by other cargo carried, such consignments as were covered by navicerts or letters of assurance should suffer as little detention as possible, unless reasons for suspicion as to their ultimate destination should arise after the goods had been shipped. By the end of Nov. 1939 the allied C. control had detained approximately 735,000 tons of goods destined for the enemy, of which 476,000 tons had been captured by Britain and

260,000 by France. In the subsequent years of the war Ger. oversea trade was virtually swept from the seas. See J. B. Moore, *A Digest of International Law*, 1906; F. E. Bray, *British Rights at Sea under the Declaration of London*, 1911; Earl Birkenhead, *International Law*, 6th ed., 1927; L. Oppenheim, *International Law*, 1928; D. T. Jack, *Studies in Economic Warfare*, 1940.

Contraception, see BIRTH CONTROL.

Contract Bridge, a development of auction bridge which originated in the U.S.A., and was introduced into England about 1912. International rules were not made until 1933. There are sev. expert systems, but those most in favour are the Culbertson or approach forcing system and the Lenz or official system. The chief differences between contract and auction bridge are in the bidding and scoring. Tricks scored in excess of the number contracted for do not count towards game—100. A bonus of 50 for an overtrick beyond the contract is scored above the line, balanced by a loss of 50 for each undertrick. After having won a game, the winning side is vulnerable for the rest of the rubber. Vulnerability means that its points, both for winning and losing, are greater than those of its opponents. Points are given to players for fulfilling their contract, while those who fail to do so lose points. Under the code of 1935 dummy is now named dealer's partner. Undertrick penalties have been reduced and graduated penalties abolished; while the grand-slam bonus has been reduced to 1000 not vulnerable and 1500 vulnerable.

New International laws of C. B. were agreed upon in 1948 and came into force on Nov. 1. The revision of the laws was overdue, for they were difficult to interpret. A revised code was under consideration in 1939 but postponed by the outbreak of war, though America pub. new laws in 1943 and some of these have been incorporated in the new code. The general view of the law-makers appears to be that a number of the accustomed penalties were too severe. These are lessened in the case of exposing a card during the auction, attempting to change a call, making an insufficient bid, naming the wrong bid in doubling or redoubling, leading out of turn, and correcting a revoke. The laws have also been changed notably on the right to enforce a penalty, the penalty for a call out of turn, and the rights of dummy. The rights of dummy are greatly extended: he can question any player about a revoke, draw attention to an irregularity, or try to prevent one about to be committed; but he forfeits his rights if he has seen a card in another player's hand. The most severe penalty is that if having seen a card in another hand dummy questions the declarer about a revoke and the revoke card is withdrawn either defender may require the declarer to play his highest or lowest correct card. The revoke clauses in the 1935 laws led to more arguments than any others. Redrafted and simplified, they are now clear.

The penalty for the first revoke remains unchanged—the transfer to the non-offending side of two tricks made in play after the revoke—but the penalty for a subsequent revoke in the same suit is abolished, as has also the right to call for the play of the highest or lowest card in the correction of a revoke. A feature of the new laws is the attempt to find a satisfactory method of dealing with cases in which the declarer exposes his hand and claims or concedes one or more of the remaining tricks. The fact that his claim is challenged may warn him of a danger he had overlooked. It is now provided that he must place his cards face up on the table and forthwith make an adequate statement of his intended line of play. A defender may then face his hand and suggest a play to his partner. If either defender requires that play shall continue the declarer's cards shall be left face up on the table and he may make no play inconsistent with any statement he may have made. Unless he has stated his intention to do so he may not lead a trump while either defender has a trump, and he may not finesse either in the suit led or in trumping the suit led. See S. S. Lenz, *Lenz on Bridge*, 1930; E. Culbertson, *The Contract Bridge Blue Book*, 1931; *Contract Bridge for Auction Players*, 1932, and *Contract Bridge at a Glance*, 1932; Josephine Culbertson, *Culbertson's Contract Bridge in Five Minutes*, 1937; F. P. Barton, *Contract Bridge for Beginners only*, 1937; H. Phillips, *Brush Up Your Bridge*, 1939, and *Complete Contract Bridge*, 1949.

Contraction, in physiology, a phenomenon which is peculiarly characteristic of the cells constituting muscular fibre. Under certain conditions, a chemical change takes place in the cell which alters its shape, diminishing its length and increasing its diameter. The result is a state of tension on the points of attachment of the cell to the adjacent tissue. In yielding to this strain the tissues give rise to movement in that part of the body. Thus the C. of the cells of the biceps flexes the forearm, while the C. of the extensor muscles tends to straighten it. C. may be tonic, when it is prolonged and equable; or rhythmic, when the C. occurs in periods alternating with periods of relaxation. Tonic C. is often caused by changes in the muscle as a part of its life without any reference to nervous stimuli. Rhythmic C. is usually in response to stimuli conveyed by the nerves from the central nervous system. It appears probable, however, that some muscles have the power of alternately contracting and relaxing by virtue of their own constitution. Thus, warm strips of heart muscle, taken from the animal immediately after death, continue to show a rhythmic pulsation if kept warm and supplied with oxygen. If a muscle is too frequently stimulated, the accumulation of waste products causes a lessened sensibility, which constitutes muscular fatigue. See MUSCLE.

Contractions, see ABBREVIATIONS; PALÆOGRAPHY.

Contract Note, document which is sent by a stockbroker to his client specifying that a named amount of stock, shares, bonds, etc., have been bought at a stated price, together with the amount of brokerage charged and the stamp necessary. It also includes the name of the broker and of the buyer, and the registration fee for entering the buyer's name in the company's books as a holder of shares. The Brit. stamp duties on C. Ns. are on a graduated scale, from 6d. for stock or security valued at £5 and not exceeding £100, 1s. above £100 to £500, and so on to a maximum of £5 for over £20,000.

Contracts. A contract is an agreement enforceable at law. There must be at least two parties to a contract, and they must be *ad idem* on the terms, i.e. there must be mutual assent; further, to constitute a contract there must be both the offer of a promise or a proposal, and the acceptance of that offer or proposal. C. are divisible into (a) specialties or C. under seal, and (b) simple or parol. Specialty C. must be written, sealed, and delivered. In practice they are always signed, though originally the seal stood for a signature. If delivery is made subject to a condition and to a person not a party to the deed, the document is known as an *escrow*, and only takes effect on fulfilment of the condition. A deed requires no consideration (*q.v.*), because it is said to import a consideration. Very often a deed merely gives more formal effect to a simple contract, in which case the simple contract is said to be merged in it. Parties to a deed are *estopped* from denying the truth of statements contained in it, unless fraud, duress, or mistake be proved. C. made by corporations, with certain exceptions such as in matters of daily occurrence or the hire of servant-promises made without consideration, and leases for three years on which less than two-thirds of a rack-rent is reserved, or for any term over three years, are only enforceable if entered into by deed. Simple C. comprise every contract written, verbal, or implied from conduct which is not a specialty. A simple contract requires a consideration (*q.v.*) to support it. With certain exceptions where writing is required, no particular form is essential to a simple contract. Certain simple C. must be in writing: these comprise (1) bills of exchange (including cheques) and promissory notes; (2) C. of marine insurance; (3) assignments of copyright. As a rule transfers of shares in registered companies (*q.v.*) should be in writing: they are also very often made under seal. Certain other simple C. are not enforceable unless evidenced by writing; although they may be good as a defence to an action, either by way of set-off or counter-claim. These include: (a) Under the Statute of Frauds, 29 Car. 2. c. 3, five classes of C. which must be evidenced by some memorandum or note in writing, signed by the party to be charged, or by his authorised agent: (1) A promise by an executor or administrator to answer damages out of his own

estate; (2) a promise to answer for the debt, default, or miscarriage of another, i.e. a promise of guarantee or suretyship; (3) an agreement in consideration of marriage (but not a promise to marry); (4) a contract or sale of lands or hereditaments or any interest in or concerning them; (5) an agreement not to be performed within the space of a year from the making of it. A contract to fall under (5) must be one that cannot by any possibility be performed within a year by either party. (b) Under section 4 of the Sale of Goods Act, C. for the sale of any goods of the value of £10 or upwards cannot be enforced unless the buyer has either accepted part of the goods sold and actually received the same, or given something in earnest to bind the contract, or in part payment, or unless some note or memorandum in writing of the contract has been made and signed by the party to be charged or his agent.

It is to be noted that there are certain C. which the law will not enforce at all, and these include C. which are absolutely void, or only voidable at the option of one of the parties. C. tainted by fraud are voidable at the instance of the defrauded party, but, of course, may be enforced against the fraudulent party, because no one may take advantage of his own fraud. A void contract is one which has no legal validity at all, and in fact may be said to be only the semblance of a contract; for example, where A contracts to sell a thing to B under the impression that B is C. Some C. are said to be void for illegality as being either contrary to public policy or forbidden by statute, but not all void C. are illegal. The distinction between void and illegal C. is important, because unless the cause of avoidance is pleaded the court will not set the contract aside, but in the case of illegality the court will refuse to enforce the contract of its own motion. Illegal C. include, *inter alia*, those of an immoral nature, agreements for the sale of public offices, agreements to defraud the revenue, agreements contrary to the course of justice, e.g. champertous (see under CHAMPERTY) agreements, agreements to commit a crime. A betting contract is not illegal; it is merely unenforceable (see under GAMING). A contract in general restraint of trade is void, i.e. a man cannot validly undertake not to carry on any business at all. These C. frequently arise where one person has learnt his profession or trade from another and is about to set up in competition. Such a person may validly restrain himself from carrying on a particular business for ever or anywhere, but a court of equity requires that the contract be reasonable in all the circumstances. Not every person has capacity (q.v.) to contract C. for the loan of money, or for goods supplied, other than necessities, and all accounts stated, are absolutely void if made with an infant.

At common law, speaking generally, all C. with an infant other than for necessities, or in certain cases, C. deemed to be for the infant's benefit, were voidable at his option. In the case of voidable C.,

those which involved some continual obligation on the infant like partnership agreements, or C. to pay calls as a shareholder, were, and indeed are, valid against an infant on his reaching twenty-one, unless he expressly repudiates them; but those C. which did not involve any continual obligation were only binding on the infant on his attaining twenty-one if he ratified them. The question as to what constitutes necessities is one of fact, depending on the circumstances of each particular case. A married woman can contract in all respects as if she were a single woman, and may sue and be sued on her C. This is the effect of an Act passed in 1935 which did away with the limitation of a married woman's contractual capacity to the extent to which she owned separate estate, and also abolishes the immunity from her debts of property subject to a restraint on anticipation. A contract with a lunatic is voidable only if the other party knowingly took advantage of the lunatic's state of mind. But in any case a lunatic may ratify a contract on regaining his sanity of mind, so as to bind himself on it. A contract with a corporation, in order to bind the corporation, must generally be under the corporate seal. The exceptions are (1) in C. relating to matters of trifling importance or daily occurrence or urgency, where they fall within the scope of the business of the corporation; (2) simple C. made by the agents of trading corporations and relating to the objects for which the corporation was created; (3) companies registered under the Companies (Consolidation) Act, 1929, may validly enter into C. in writing, or by parole in cases where such C. would be valid if entered into by private persons. C. by an urb. dist. council of a value exceeding £50 must be under seal. In any case a corporation can enforce its C., whether under seal or not. As to the assignment of rights under a contract, see under CHOSE IN ACTION. The assignment of duties or liabilities under a contract is only allowable with the consent of the creditor or party to whom the duties or liabilities are owed. A breach of contract necessarily gives a right of action for damages. Where the breach goes to the root of the contract the injured party may treat the breach as a discharge of his own liability under the contract and resist any action on the contract; he may also sue or counterclaim for damages, and claim payment for any work done by him in pursuance of the contract, provided the contract be severable. In some cases, generally agreements for the sale or purchase of an interest in lands, he may bring an action for specific performance (q.v.). But where the breach is partial only, there is no right to rescind, unless the parties have expressly agreed that breach of a single term shall give a right to rescind, and in any case if one party shows clearly during the subsistence of a contract his intention no longer to be bound by it, that of itself gives a right to the other to consider himself exonerated from further performance. Damages for breach of

contract are assessed so as to place the injured party as far as possible in his original position. The general rule is that damages should be such as may fairly and reasonably be considered as either arising naturally from such breach of contract, or such as may reasonably be supposed to have been in the contemplation of both parties at the time they made the contract as the probably result of the breach of it. Damages may be given for prospective or anticipated as well as for loss already sustained. A contract is terminated either by agreement, or by performance, or by breach tantamount to discharge of the other party, or by lapse of time. A substituted agreement so as to terminate the original contract must be supported by consideration (*q.v.*). Lapse of time bars the right to sue on a contract, though the contract remains valid and subsisting for all other purposes (see LIMITATIONS, STATUTES OF). C. to do impossible things are void, *ab initio*, where, too, the performance of a contract depends upon the continued existence of a given person or thing. There is always implied in the contract a condition that impossibility of performance arising from the death or loss of the thing excuses performance where it is clear that the parties must have known, *ab initio*, that its existence was essential to the contract. Fraudulent misrepresentations, *i.e.*, false representations of fact made with knowledge of their falsity, discharge the injured party from the contract, and give a right to sue for damages (see FRAUD).

An innocent misrepresentation as to a material fact gives a right to rescind; but not a right to damages, except (a) as to misstatements in a company prospectus in reliance on which the injured party has taken shares; (b) an agent who induces another to contract with him by representing himself as vested with an authority he does not in fact possess, may render himself liable to an action at the suit of such other person. Unilateral error will not, as a rule, excuse the party making the mistake from his liability under a contract. A person must take the consequences of his failure to express himself according to his own intentions, if what he did say would have led any reasonable man to form the conclusions arrived at by the other party as to his meaning. But where the error was induced by the other party, the mistaken party will be entitled to rescind. A mutual mistake as to the identity of the thing about which a contract is made would render the contract null and void (see MISTAKE); and generally, where a mistake is mutual, a court of equity can amend the contract, and rectify it in accordance with the true intentions of the parties. C. induced by undue influence and duress are voidable at the option of the injured party. See S. M. Leake, *Elements of the Law of Contracts*, 1887; Sir W. R. Anson, *Principles of the English Law of Contract*, 19th ed. by J. L. Brierley, 1945.

Contralto, *It.* term in music to denote the lowest or deepest kind of female voice, the compass extending from F or

G below the middle C to F or G above the treble staff. In tone it is serious, tender, and rich, and has peculiar powers of expression, the low C. being specially marked by its fullness of tone. Fr. and Ger. musicians did not utilise this voice, but Rossini and other It. recognising its beauties adopted it, and it is now used by almost all nations in their choral music.

'Contrat Social' (Social Contract), title of Rousseau's chief work pub. in 1762. It describes the theory held by certain reformers that a contract should exist between the sovereign and the subjects, and that gov. should be carried on with the consent of the subjects. The work is divided into four parts dealing with societies, the sovereign and his rights, gov., and social institutions respectively. It did a great deal to bring about the Fr. Revolution.

Contravallation, see COUNTERVALLOCATION.

Contributory Pensions, name applied to those pensions to which the aspirant contributes from salary or wages a certain agreed percentage during working lifetime. There are many instances of contributory pension schemes in the Brit. Empire and U.S.A., and there is a marked tendency towards an increase of them. The Brit. civil service pensions are not, however, fixed on a contributory basis, although it is generally, but not officially, recognised that the scales of emolument in the various grades have been fixed with the knowledge that in ordinary circumstances a pension follows at sixty years of age. In the teaching profession, the Univs. and education authorities have, as a rule, based their pension schemes on contributory lines. Old-established business houses, banks, public utility companies, and insurance companies have done the same. The contribution is made by the simple process of deducting the required amount from the monthly salary payment. By far the greatest undertaking which has yet been attempted in respect of C. P. is that of the Brit. Gov. with the Widows', Orphans', and Old Age Contributory Pensions Act, 1925. By that Act all contributors to the insurance scheme, male and female, who were between sixty-five and seventy years of age on Jan. 2, 1928, or who had attained the age of sixty-five after that date, were entitled to an old age pension of 10s. per week, irrespective of means (provided that they had been continuously insured for not less than five years). A similar pension was payable to the wife of a contributor entitled to such a pension as from the date of her husband receiving his pension, or, if she had not then attained the age of sixty-five, as from the date on which she attained that age. That Act and later amending Acts provided pensions for widows of 10s. a week, with allowances for children under fourteen years and sixteen years if at school at the rate of 5s. a week for the eldest child and 3s. a week for each other child. The Acts also provided for a pension of 7s. 6d. a week for the orphan children (*i.e.* if

both parents were dead) of insured married men and widowers and of insured widows while under the ages mentioned above. The Act of 1925 and most of the subsequent Acts down to 1935 were repealed and re-enacted by the consolidating Act of 1936 on C. P. for widows, orphans and persons between sixty-five and seventy. The rate under this Act was still 10s. a week. The Pensions (Voluntary Contributors Act (popularly called the 'Black-coated Workers' Act), 1937, extended pension rights to some 2,000,000 independent workers—shopkeepers, professional, and other persons of small means, i.e. whose total income did not exceed £400 (man) and £250 (woman), not more than half unearned. 'Initial' entrants were eligible if under fifty-five on April 5, 1937, at weekly contributions of 1s. 3d. for a man (or 10d. for widows' and orphans' pensions only), and 6d. for a woman. But after the beginning of 1939 only entrants under forty were able to join the scheme on a weekly contribution scale, increasing with 'entry age,' viz. up to maxima of 2s. 11d. (man) and 1'1. (woman) for age thirty-nine.

In general, all males between the ages of sixteen and sixty-five and, following the Old Age and Widows' Pensions Act, 1940, all females aged sixteen up to sixty (instead of sixty-five as theretofore) who were employed within the meaning of the National Health Insurance Acts and did not hold certificates of exemption from health insurance, were required to insure for both health insurance and C. P., but certain classes of person could insure as voluntary contributors—such entrants after 1937 having the option to insure for either health or pensions or both, thus breaking the 'interlocked' system theretofore applicable alike to compulsory and voluntary contributors. Under the National Insurance Act, 1946, a retirement pension is payable for life to an insured person who is over pensionable age, has retired from regular employment, and has paid the prescribed number of contributions. See further under NATIONAL INSURANCE ACT.

Contreras, small vil. about 8 m. from Mexico City. In the early part of Aug. 1847 Maj.-Gen. Winfield Scott, of the Amer. Army, pitted his forces against the defending Mexicans, and after a stirring battle, put his enemy to rout. The victories of Churubusco (q.v.) and Molino del Rey quickly followed, and the fortified hill of Chapultepec succumbed. On Sept. 17, the city of Mexico flew a white flag, and the Amer. soldiers occupied the tn.

Contrexéville, vil. in the dept of Vosges in France, on the R. Vair, which is a trib. of the Moselle. It is noted for its mineral springs whose temp. is 52.7° F. Situated at an altitude of 1480 ft. Pop. 1000.

Control, Allied, was the term applied during (and for some time after) the First World War to that single control which was exerted in certain services, apart from naval and military, for the common good of the allied peoples. The

influence of the war was felt in the most remote corners of the five continents, and there were moments when the actual feeding of millions of people caused the utmost anxiety to the govts. concerned. At the beginning of hostilities tentative efforts, at once timid and limited, were made towards some sort of common organisation. In Aug. 1914, the Commission Internationale de Ravitaillement (C.I.R.) was estab. in London. Representatives of the buying depts. of the Allies were members of this commission, which proved its usefulness from the start. It placed orders with Brit. manufacturers who turned out all kinds of war equipment—uniforms, guns, munitions, etc. It provided a certain check on exploitation and kept down prices by the elimination of unnecessary competition. In placing orders the C.I.R. had due regard to the separate needs of the different Allies. In short, this commission was a Brit. organisation set up to assist and watch over allied purchases in the Brit. market. Much of its effectiveness was due to the fact that it was backed by Brit. credit. But the Allies' great effort in control is perhaps best represented by shipping, and the control which was eventually estab. in this service will go down to hist. as the classic example of A. C. Up to the end of 1917 each country was its own purveyor of transport. This was effected in two ways: (1) by requisitioning or commandeering of national tonnage (Great Britain took over Brit. railways from the beginning of the war); (2) by chartering neutral tonnage in the open market. This system was, however, modified in certain respects, as Great Britain, having more national tonnage at her disposal than the other Allies, was able to allot certain tonnage to France and Italy for the conveyance of war material. By the end of 1917, the Brit. Ministry of Shipping (a war-time organisation) had performed its work so efficiently that every Brit. ship was under its control both as to its cargo and its destination. The ruthless campaign which Germany was waging by submarine on allied shipping caused the efforts of the Allies to be still further extended in watchfulness and effectiveness, and following a conference in Paris in Nov. 1917 the Allied Maritime Transport Council was estab. This became the supreme instrument of A. C. in shipping. For some time after the formation of the A.M.T.C. the actual shipping arrangements proceeded on the old lines, but the agreement mentioned above had already tended towards single control. The Wheat Executive was already buying and distributing on an allied basis. The A.M.T.C. gradually assumed supreme command and performed its functions admirably to the end of the war. (See Sir J. A. Salter, *Allied Shipping Control: an Experiment in International Administration*, 1921.) In the Second World War much the same objects were accomplished by setting up a Ministry of Economic Warfare as soon as the war

broke out, and by the agreement made between the Brit. and Fr. Govs. to pool their resources (*see also* LEND LEASE). A Ministry of Shipping was set up a few weeks after the opening of the war, plans for such body to co-ordinate the activities of the merchant fleet having been made by the Board of Trade before the outbreak of the war.

The term A. C. was also applied to certain services performed by the Allies' Commission of Control in Germany and other ex-enemy countries in the way of supervising the carrying out of those clauses of the treaty of Versailles which provided for the reduction of ex-enemy forces to a definite total of effectives, and for the limitation of their munitions output.

Controlled Establishments were those industries which came under State control during the First World War. At the outbreak railways and shipping were taken over by the State, but the term C. E. was brought into use by the Munitions of War Act of 1915. Under this Act all the firms producing munitions became directly controlled by the gov. 'If the minister of munitions considers it expedient for the purpose of the successful prosecution of the war that any estab. in which munition work is carried on should be subject to the special provisions as to limitation of employers' profits and control of persons employed and other matters contained in this section, he may make an order declaring that establishment to be a controlled establishment' (Munitions of War Act, 1915, Part II., section iv.). By the end of 1916 State control had extended beyond the munition factories into becoming a systematic supervision of all branches of national production, exercised under the D.O.R.A. (q.v.). By Feb. 1917, all the coal mines were under State control, and a Wool Control Board and a Cotton Control Board were estab. The purpose of these was to check prices and control the raw material. By 1918 the State control of industry was complete. After the armistice, however, as many C. E. as was practicable were decontrolled, and eventually State control disappeared altogether. Much the same machinery of control was set up in 1939 on the outbreak of the Second World War, but instead of a Ministry of Munitions a Ministry of Supply was estab. with purchasing powers extending to all manner of commodities, and later a Ministry of Production was instituted. The position in 1941 was that each of the fighting services to an overwhelming extent commanded its own factories and labour, and such disputes as arose between them were smoothed over by the production executive. Mr. Churchill in that year resisted the suggestion that the appointment of a minister of production would improve matters; and that to interpose such an official between himself as minister for defence and the heads of the supply depts. would only be an additional complication and cause of delay. But such ministry was, in fact, estab. the next year. The White Paper of Feb. 10 (1942)

stated that the minister of production would carry out all the duties theretofore exercised by the production executive set up at the beginning of 1941, except those relating to man-power and labour, which would be transferred to the minister of labour. His main duties were to allocate available resources of productive capacity and raw materials (including arrangements for their import) and the settlement of priorities, and he also exercised supervision and guidance of the various depts. concerned with production, though that was not to affect the responsibility of the ministers in charge of those depts. In 1943 the Ministry of Production issued an Order in Council conferring on it powers to appoint three directors to the board of any firm working for the gov. with gov. capital, the object of the order being to deal more effectively with a large firm of aircraft manufacturers which was not giving satisfaction.

Controller of the Navy Board was once an important official of the Navy Board, whose duties related to the supply of material required by the fleet. He was chairman of the Navy Board till its abolition in 1832, when his title and duties were transferred to one of the sea lords of the Admiralty. Before the First World War the Third Sea Lord was C. of the N.; but in 1912 the C.'s dept. was reorganised, its work distributed amongst other depts., and the title dropped. The C.'s dept. has never been revived, and its work is still distributed in accordance with the reorganisation of 1912. But when, with increase of Admiralty business during the war, Sir Eric Geddes joined the Board of Admiralty (1917), he was given the title of C. Sir Alan Anderson succeeded him as C. when Sir Eric Geddes became First Lord; but in 1918 Sir Robert Horne joined the Board of Admiralty in succession to Sir Alan Anderson and took the title of Third Civil Lord; whereupon the title of C. was once more assumed by him. The Third Sea Lord and is still borne by him. *See also* ADMIRALTY.

Controller of Stamps is the short title given to the officer in charge of that branch of the Board of Inland Revenue which deals with stamps (other than postage stamps) and joint stock companies. His full title is Controller of Stamps and Registrar of Joint Stock Companies, Business Names, Newspapers, and Bank Returns, including the Stamp Offices, London Stock Exchange, and Lloyd's. The office of the C. is in Somerset House, Strand, London. *See also* REGISTRAR.

Convalescence, *see under* NURSING.

Convalescent Hospitals. These are institutions carried on in connection with ordinary general hospitals; they differ from convalescent homes in that medical treatment is an essential feature of a convalescent hospital. When patients are discharged from hospitals it is expedient that they should live, for a time at least, in clean healthy homes in a fine neighbourhood, therefore they are sent for a time to such an institution in order to recuperate.

Convenæ, *see* COMMINGES.

Convent, assembly of persons gathered together in retirement from the world, and also the house in which such community dwells. In this wider sense it denotes either a monastery or a nunnery, or the fraternity or sisterhood of an abbey or priory; but the word as used to-day means a Christian nunnery where devout women spend their lives in prayer and works of charity and education. Most of the Eng. nunneries before the dissolution of the sixteenth century belonged to the Benedictine order. The most important of these were Shaftesbury (Dorsetshire), which, traditionally, was

wife of Edmund of Lancaster, at the close of the thirteenth century. *See also* MONASTERY; ABBEY; ; PRIORY. *Consult* Low and Pulling, *Dictionary of English History*.

Conventicle, term originally applied to a meeting of the monks in a monastery, but acquiring a special use at and after the Reformation as applied in a disparaging sense to meetings of Eng. and Scottish Nonconformists, such as the Wycliffites and Covenanters.

Convention, term applied by Eng. constitutional lawyers to an extraordinary meeting of the Houses of Parliament at a time of national crisis in contradistinction

SYON HOUSE, MIDDLESEX, FROM KIW GARDENS

John H. Stone

founded by Alfred, and became extremely wealthy; Barking (Essex), founded by Erkenwald, bishop of London, in the seventh century, Ethelburga being its first abbess; Amesbury (Wiltshire), founded in Saxon times, and refounded by John in 1199; St. Mary, Winchester; Malling (Kent); Markyate (Bedfordshire); Catesby (Northamptonshire); Clerkenwell, founded in the twelfth century; St. Helen's (London), founded in the thirteenth century; Stratford-at-Bow; Chatteris (Cambridgeshire); Polesworth (Warwickshire). The Cistercian nunneries were smaller. The chief of these were Tarrant (Dorsetshire) and Swine (Yorkshire). The Augustinians and Dominicans disputed the ownership of the large nunnery at Dartford, founded in 1355. Syon (Middlesex), founded in 1414, was among the wealthiest religious houses in England; it was held by the Briggittine (*see* BRIGIT, St.) branch of the Augustinians. The Poor Clares (*see* CLARE, St.) or female Franciscans, held sev. houses, the largest being in London, near Aldgate, founded by Blanche of Navarre,

to a meeting in session initiated by the writ of the sovereign. Instances of such Cs. in Eng. hist. are the Parliament summoned by Gen. Monk to restore Charles II. to the throne in 1660, and that summoned by the prince of Orange in 1689 before he was actually made king of England. In Fr. hist., the body which took the place of the national legislative assembly in 1792, proclaimed a republic, and in the course of its three years' duration passed a number of characteristically revolutionary measures, was called the National C. In military matters, C. denotes a treaty made between the commanders of two opposing armies concerning the terms on which a temporary cessation of hostilities shall take place between them. The last C. of this nature, in which Great Britain has been concerned was the much-abused C. of Cintra made in 1808. In U.S.A. hist. the most celebrated C. was that presided over by Washington, which met at Philadelphia on May 14, 1787, at a time of crisis in the fortunes of the new confederation of states and the failure of

Congress to meet the situation. Twelve of the states (Rhode Is. alone excepted) sent delegates, among whom were such men as Madison, Sherman, Randolph, the Pinckneys, James Wilson, and Morris. The great work was the making of the U.S.A. constitution. In U.S.A. politics the term also applies to those huge meetings of party supporters which gather together in the summer preceding the year of a presidential election for the purpose of nominating electors. There are at the present day, besides the Democratic and Republican National Cs., the Prohibition party, Socialist party, Socialist-Labour party, and National Cs. See *under* ELECTIONS.

Convention Treaties, i.e. treaties entered into between different states under which they each bind themselves to observe certain stipulations contained in the treaties. In 1843 two Acts were passed giving effect to conventions between Queen Victoria and the king of the Fr. and the U.S.A. for the apprehension of certain offenders. The Act relating to France legalised a convention providing for the surrender of persons accused of murder, forgery, or fraudulent bankruptcy who may escape to France. The Act relating to the U.S.A. is similar in its nature, but the specified crimes include in addition piracy, arson, and robbery, but not fraudulent bankruptcy. See *EXTRA-DITION*.

Convergency, in mathematics, a term implying that an infinite series continually approaches a definite finite limit as the number of terms increases. Thus the series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$ has a sum which is always less than 2, but may become greater than any assignable quantity less than 2 by sufficiently increasing the number of terms. The series is therefore said to be convergent, and to converge to the limit 2; this is otherwise expressed by saying that the sum of the series to infinity is 2. Such a series as $1 + \frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \dots$ is said to be *divergent*, for the sum of the terms increases as the number of terms increases without limit.

Converse, in logic, the proposition which is obtained by turning the subject of another proposition into the predicate, and the predicate into the subject. Only universal negative and particular affirmative propositions can be so treated. For instance, if we assert that no birds are quadrupeds, it must be equally true that no quadrupeds are birds; again, if it be asserted that some Englishmen are scientists, it must, at least, be true that some scientists are Englishmen. On the other hand, universal affirmative and particular negative propositions cannot be simply converted. If we assert that all men are mortals, it by no means follows that all mortals are men; and from the assertion some men are not Englishmen, it cannot be concluded that some Englishmen are not men. The general rule is that nothing can be concluded about the individuals of a class unless the first assertion includes all the individuals. Valid conversion is therefore simply stating the same fact in a different order

of words. In Euclid's geometry the propositions are of the universal affirmative type, so that a C. obtained by interchanging subject and predicate is not necessarily valid, and therefore requires a separate demonstration.

Conversion: 1. In law: (a) A wrongful act depriving another of his property permanently or for an indefinite time. The restriction to the literal or natural meaning of converting property to one's own use has long been discarded in favour of the wider notion of any unauthorised assumption of the powers of the true owner. (b) In equity, conformably to the maxim that equity considers as done that which ought to be done, the effect of words in a deed or will directing money to be expended in the purchase of land, or land to be sold and turned into money, is that the money and land are considered for all legal purposes to be actually converted into land and money respectively. 2. In logic, a proposition is said to be converted when the subject and predicate are transposed while still retaining the quality of the proposition, e.g. 'some bilateral acts are contracts' is the converse of 'all contracts are bilateral acts.' This is called *C. by limitation*. When the converse is a proposition of exactly the same form as the proposition converted, the process is called *simple C.*, e.g. 'some voluntary associations are churches' is the simple converse of 'some churches are voluntary associations.' The process of first changing the convertend (proposition to be converted) into an affirmative proposition and then converting it simply—e.g. the inference that 'some invalid documents are sealed instruments' from the proposition 'some sealed instruments are not valid documents' through the affirmative proposition 'some sealed instruments are invalid documents'—is called *C. by negation*. 3. In theology: (a) Divinely produced spiritual change of heart or disposition, as a result of which the enmity in the heart towards God and divine law, and the obstinacy of the will, give place to a supreme love for God and His moral government, and to a general reformation of conduct. (b) Proselytism, or the act of making converts to a religious faith.

Converter, iron retort used in the Bessemer process of making steel. It consists of blowing air through molten iron. An air-blast of 15 lb. per sq. in. is introduced through one of the hollow trunnions on which it is mounted, the C. being first brought to red heat by being filled with burning coke.

Converter, Rotary, electrical apparatus with a single armature connected both to a commutator and slip rings. It is normally used for converting alternating current to direct current. See *under* ELECTRIC SUPPLY.

Conveyance, in law, denotes the deed by which are transferred various kinds of property as defined by the Conveyancing Act, 1881. Property for the purposes of a C. includes real and personal property, any interest in such property, any debt,

chose in action (*q.v.*), or any other right or interest. The term C. also includes an appointment (*i.e.* the exercise of the right or power given by an earlier instrument to appoint any person as owner of property), a covenant (*q.v.*) to surrender copyholds, and a vesting declaration made on the appointment of a new trustee by virtue of which the ownership of property is transferred to the new trustee for the purposes of the trust. Cs. which simply transfer personal property are called assignments. Cs. by matter of record include private Acts of Parliament and grants by the Crown. The formal parts of an ordinary deed of C. of lands, which in these days have been, fortunately, shorn of much of their former remarkable verbiage, are: (1) The date and names of the parties; (2) the recitals of relevant facts, such as the preliminary agreement and the vendor's title; (3) the *testatum* containing the *operative words*, or words which direct attention to the object intended to be effected by the C.; (4) the recital of the consideration (*q.v.*), and receipt thereof; (5) the *habendum* showing the extent of the interest taken by the grantee; (6) reciprocal covenants (*q.v.*); (7) the signatures and seals of the parties.

Conveyancing, art of preparing conveyances (*q.v.*) of real and personal property, of investigating the title of the vendors of property, of making wills and testaments, settlements (*see also* ENTAIL) of property, and of framing the various instruments which are necessary in passing property from one person to another, so as to effectuate the intentions of the parties. By the old common law freehold lands were conveyed by *feoffment* (or gift of a *fief*) completed by delivery of possession. A number of statutes, notably the Conveyancing Act of 1881 and the Land Transfer Act of 1875, materially simplified the extraordinary intricacy of the forms or precedents once used in C. Under the Land Transfer Act, 1875, real property may be conveyed by a short form presented by Rules, the transfer being entered in an official register, and a land certificate being delivered to the transferee after the title has been officially examined. By the combined operation of the Land Transfer Acts, 1875 and 1897, and the Order in Council made under those Acts, registration of title to lands in the co. and city of London was made compulsory on sale, though the conveyance, as distinct from the registration, might, if the parties elected, still be effected by themselves or their legal agents.

The tendency of land law reform in Great Britain for many years past has been to approximate the law of realty to the law of personality. The Law of Property Act, 1922, together with some six consolidating statutes, were designed to rid Eng. land laws of the remnants of formalism and feudalism, and to introduce a revised and simplified system of deducing title. The scheme of these Acts was experimental or tentative, the object being to make a trial of the revised system

of C. without registration over a period of ten years from Jan. 1, 1926, and, at the same time, if it proved successful, to provide machinery whereby registration might be made compulsory without the necessity of obtaining the consent of the co. council of the area to which compulsory registration was to be applied. (Land Registration Act, 1925.) It is open to any co. council or council of a co. bor. to apply to the Privy Council for an order making registration of title compulsory in its area. There have been many Land Transfer Acts, beginning with that of 1862, many of them nugatory; and their purport was to make an interest in land transferable by conveyance by mere entry on a public register as shares are by entry on the books of a company. The Act of 1897 ordained that transfer in this way would be imperative; but this compulsory transfer by registration was suspended from immediate operation except to a limited extent. The Land Registration Act, 1925, repealed the Land Transfer Act, 1875, and the whole of the Land Transfer Act, 1897, except Part I., which was in turn repealed by the Administration of Estates Act, 1925. Under the Land Registration Act, 1925, an Order in Council may be made extending the area of compulsory registration without any resolution of any co. council and in the face of any resolution of any co. council to the contrary, but subject to compliance with certain conditions (*see further under* REGISTRATION OF TITLE). Since the Act of 1925 estates capable of subsisting as legal estates (*i.e.* as opposed to equitable estates) are the only interest in land in respect of which a proprietor can be registered, and all other interests except overriding interests (incumbrances, easements, etc.) and interests entered on the register before 1926 take effect as minor interests; but all interests (except undivided shares of land as to which there can now be no legal estate) entered on the register before 1926 which are not legal estates are capable of being dealt with under the Act. *See also* VENDORS AND PURCHASERS. *See Strahan, Concise Introduction to Conveyancing, 1927.*

Conveyors and Elevators. C. are mechanical appliances, the chief function of which is to transport material in bulk horizontally. E. are adapted more particularly to lifting materials, but either may perform the double office in some degree. Such machinery may be used for the loading or unloading of ships, for the transfer or lifting of material in mills, in gas-works, etc., and has generally the manifold object of reducing labour, time, and space. The magnitude of the quantities of material which lend themselves to mechanical handling will be appreciated when it is stated that the docks of the London Port Authority receive about 2,000,000 tons of grain per annum, with plant capable of dealing with 2260 tons per hour if working at full capacity. Manchester has a grain elevator able alone to lift 350 tons per hour, with mechanical facilities for dealing with large quantities of cotton, while Swansea

has plant at its docks capable of shipping 12,600 tons of coal per hour. It is evident that such large volumes warrant the installation of costly appliances for economical reasons and to ensure the prompt delivery of shipping from the condition in which nothing is earned.

C. are chiefly used for the transfer of material to bins or hoppers, to breakers if it is desired to reduce the material, or from breakers to furnaces or retorts, as in

for the band, which is liable to suffer severely if receiving harsh and heavy material when travelling at a high velocity. The devices used in connection with band C. are ingenious. If it is desired to take off at any point along the band, say for the purpose of filling bins in turn, the arrangement shown by the diagram is frequently used. This consists of a carriage supporting drums so placed as to cause the material to throw

iron or gas works, and for the transport of refuse, as coke or clinker. They are occasionally applied for the purpose of carrying bales, sacks, or other individually heavy items. *Band C.* are, as the name implies, formed of bands of a suitable substance, as leather, or canvas and rubber, upon which the material to be transported lies, and travels with the band which, supported at intervals of about 6 ft. upon rollers, is actuated at one end by a driving drum. This type of conveyor is singularly well adapted to the conveyance of grain over moderate distances, and was first used for this purpose in 1868 at Liverpool. The linear velocity of the band may be from 150 to 200 ft. per min. for large coal and heavy material, up to 700 ft. for grain, the chief consideration affecting speed being regard

into the shoot at *a*, and by travelling the carriage along, the point of discharge may be varied at will. The drums, being mounted to swivel round the point *b*, may be thrown out of use if required, the slack of the band being taken up by a suitable device. A band conveyor may, however, discharge at a terminal drum into a stationary shoot. In either case there are points of design to be observed to ensure proper delivery. At a low speed the material carried may lie upon the band as it passes round the throw-off drum for a considerable angle beyond the topmost point of the drum, while on the other hand at a sufficiently high speed the material may leave the band at once on reaching the curvature of the drum. Obviously, this depends upon the joint effect of gravity and the centrifugal effect

due to the radius of the drum and its peripheral velocity; the point on the drum at which these are equal will be the point beyond which the material will no longer follow the circular path, and will be free to go forward under the influence simply of its linear velocity and of gravity. Whether the material be light or heavy, it will be subject to the same laws, with the reservation only that light and

weighted pulley, steadied by guides, to take up any stretch of the band, which ought not to exceed one twenty-fifth part of its length. It is not desirable that this tension should be greater than is necessary to ensure grip. Band conveyors, though commonly horizontal, may be inclined to as much as 1 in 2½.

Tray C. are formed of a series of trays connected to form a continuous chain.

BAND CONVEYOR

Efficient material may be checked by air resistance in some small degree. In the case of a band approaching the drum horizontally, the velocity, in ft. per sec., at which the material will leave the band rather than follow the drum's curvature will be equal to $\sqrt{R \times 32.2}$, in which R = radius of drum in ft. For velocities less than this the point beyond which the material will no longer rest upon the band, and will be free to follow its own parabolic path, is defined as a height above the centre of rotation by $V^2/32.2$, V being velocity in ft. per sec. The point of departure at which the material goes forward in a tangential direction being thus determined, and its velocity being known, the curve it will make in falling may be set out on ordinary principles, the shoot or other receiver being suitably placed to catch it. The diagram given shows results for velocities of 10 and 5 ft. per sec., with a drum of 2 ft. diameter. It should be observed that for very low speeds or materials of low friction coefficient, the material may slip on the band before reaching the point defined above, and, acquiring a greater velocity, throw off somewhat earlier, and throw farther, than if it does not slip. The travelling band is commonly fed from a hopper, and as rough and hard material is liable to cause injury, it is essential that the material should be fed on in the direction of motion, and preferably at the band's velocity, to avoid rolling about till the proper speed is attained. The band is commonly kept at a suitable tension to grip the driving drum by a loose

The material is carried forward upon the trays, which discharge either at the end or at any point desired, by an ingenious tipping device. *Push C.* consist of a trough within which the material lies, and is pushed along by a series of push-plates attached to a chain running at about 120 ft. per min., the weight of which, with its plates, is carried by wheels running on suitable rails, or without wheels, sliding upon rests. Discharge at any point but the end is effected by slides in the bottom

PUSH-PLATE CONVEYOR

of the trough, any one of which being drawn allows all or a part of the material to fall through. *Push C.*, when used to transport hot coke, are of the simplest construction, without rollers, the trough being formed with stoppers, or rising ends, to retain water used for quenching purposes. *Cake C.* are of extremely simple arrangement, consisting of disks strung upon a running cable, working in a continuous trough, and are generally used for loose and light materials, being run at low speed, not much exceeding 100 ft. per min. *Bucket C.*, in which

hanging buckets are spaced along a driving chain, being suitably supported by guides, are chiefly used where it is desired to arrange for horizontal movement for some distance, with vertical movement at a desired point, and are useful for lifting material above hoppers and finally distributing it to the receptacles by tipping the buckets automatically. They run at about 10 ft. per min.

E., commonly used in conjunction with *C.*, are generally of the bucket type, in which buckets of suitable form are spaced upon chains passing over drums at the top, and at the bottom. The whole is usually mounted in a box or cage, having guides for the support and control of the moving parts. The elevator buckets commonly dip into and scoop up the material to be raised at the bottom, and

BUCKET ELEVATOR

discharge at the top into shoots. For velocities of 250-350 ft. per min., and clean material, the elevator may be vertical, in which case there will be an effective throw-off into the shoot, but for such material as coal, ore, or coke, for which, having regard to economy in power and life of the buckets, more moderate speeds of from 50 to 160 ft. per min. are desirable, the elevator should be sloped at 45-75° with the horizon. Similar principles to those governing the proper throw-off from band *C.* have to be observed with respect to the discharge from elevator buckets, with the additional precaution that the material discharged must clear the buckets in advance and pass unobstructed into the shoot. If the material is at all damp or cohesive there may be difficulty in assuring this, for which reason *E.* with a pronounced slope have an advantage. *Pneumatic E.*, in which air under pressure or with suction is used, are applied for the raising and transfer of grain, considerable installations of this type have been estab. at seaports. London has elevators of this description able to deal with 1000 tons per hour, in addition to bucket *E.* Though convenient and readily adaptable to picking up at various parts of a ship's hold, the pneumatic method is not economical of power. An old form of elevator, known as the *Archimedeian screw*, now but little used, raises material by the rotation of a

worm, or of a helically-formed surface, working in a cylindrical tube. By the screw's rotation the material is carried up the sloping case and discharged at the top. The pitch of the screw influences the inclination at which the casing may slope. The angle which this makes with the vertical should be somewhat greater than the angle of pitch, plus the angle of repose of the material. The same device working horizontally is sometimes used as a conveyor. The power required to work *C.* and *E.*, generally provided by electromotors, can hardly be estimated satisfactorily by the direct application of simple principles. The work to be done is chiefly that of overcoming frictional resistances of very uncertain but considerable amounts, varying greatly with the condition of the mechanical arrangements, and the state of lubrication. In inclined coal *E.*, for instance, the power absorbed may be as much as four times that corresponding to the work of lifting the material, and in grain *E.* about two and a half times. Power may be economised in fixed *E.* by arranging that the buckets shall be filled by the material being run direct into them, instead of dropping to a lower level, from which it is picked up by the bucket dipping into it, against a considerable resistance in the case of ores and coke. For *C.* dealing with 50 tons per hour, the h.p. absorbed may be taken approximately as for:

Band <i>C.</i> , grain . . .	2 + $\frac{L}{35}$
„ „ minerals . . .	2 + $\frac{L}{30}$
Push plate <i>C.</i> (with rollers)	2.5 + $\frac{L}{25}$
„ „ „ (without rollers)	2.5 + $\frac{L}{15}$
Tipping tray <i>C.</i> . . .	2.5 + $\frac{L}{20}$
Screw <i>C.</i> . . .	3.0 + $\frac{L}{8}$

L being the length of conveyor in ft. A variety of elevator for loading ships, known as *coal hoists*, receives the wagons from rails (which may be above the quay level), and, either raising or lowering them to a desired height, discharges the wagons by bodily tipping the contents down a shoot into the vessel's hold. They are commonly worked hydraulically, the act of tipping being effected by an oscillating ram. Hoists of this description are capable of dealing with wagons of 30 tons gross weight, and are made to work up to 700 tons per hour. They are also arranged to receive wagons at the quay level, and after lifting and discharge, to deliver them at a high-level railway viaduct along which they gravitate to siding's level, an arrangement favourable to speedy working. Steel belt *C.*, as their name implies, employ a steel band instead of the usual canvas or rubber belt. They are far superior to the other type, and much heavier loads can be

supported upon them. The belt consists of finely tempered steel sheets about 300 ft. long, 1-2 ft. wide, and 1 mm. thick, riveted together to form a continuous band. The belt is not so flexible as the canvas or rubber conveyor, thus the sag due to its own weight is less, and consequently, fewer rollers are required to support it underneath. If boards are placed alongside it, the amount carried on it can be increased enormously. Another great advantage is that it can convey materials at higher temps. than can the rubber conveyor, substances heated up to 200° F. not affecting the belt unduly.

Another type of elevator is that which is applicable to the transport of passengers from one level to another on the underground railway systems. Each step of this moving stairway or escalator consists of a separate platform, shaped like an inverted L, on the under side of which are fitted two sets of small wheels which run on a continuous track that follows the contour of the stairway. At the bottom and top of the elevator the steps form a flat moving band, and thus facilitate the stepping on to and off them. The speed of the elevator varies from about 1 ft. per sec. up to about three or four times that amount. During recent years the use of continuous-belt C. in factories has been generally adopted, the articles which are assembled being passed down a long line of workers seated on either side; when the conveyor reaches the end, the finished article is taken off. This has enabled the rate of production to be increased enormously.

Convocation (Lat. *convocatio*, a calling together), term usually restricted to assemblies of the graduates of certain univs. or of the clergy. In England the name is particularly given to the assembly of the spirituality of the realm, which is called together by the archbishops of Canterbury and York, each within his own ecclcs. prov., pursuant to a royal writ. C. is summoned whenever Parliament is about to sit, and is continued as long as Parliament continues. The assemblies consist of two houses, the Upper and the Lower. The Upper House consists of the bishops and their archbishop; the Lower consists of the deans and archdeacons of every cathedral, the provost of Eton (in the case of Canterbury), proctors sent by the cathedral chapters, and proctors elected by the clergy of the diocese. The origin of C. is unknown, but by the time of Edward I. it had reached its fully developed form, the writ issued by the monarch to the metropolitans then being identical in form with that now issued. From this time till 1664 the clergy reserved the right of taxing themselves, and one of the chief duties of C. was the voting of subsidies to the Crown. The independence of C. was marked until the reign of Henry VIII., when that monarch secured the doubtful admission from C. that it 'is, always has been, and ought to be summoned by authority of royal writ.' Owing to a lack of submission shown by the Lower House

in 1717, C. was prorogued, and, except on unimportant occasions, its powers remained in abeyance until 1852. It then resumed its sitting, and its activity is steadily increasing. The addition of houses of laymen in each prov. has given the assembly a more representative character.

Convolvulus, typical genus of the order Convolvulaceæ, consists of about 170 herbaceous and shrubby plants growing in temperate and sub-tropical climates. Many of these are twining plants with large, white, trumpet-shaped flowers, and contain a milky latex. *C. arvensis* is the common bindweed found in Britain; it grows in a sandy soil, and the flowers have a sweet fragrance. *C. Scammonia*, a native of the Levant, has a rhizome which yields a resinous juice, from which the purgative drug known as scammony is obtained. In the U.S.A. the plants are known as morning-glory, and in Britain the great C., which brightens our hedges, is technically termed *C. septium*.

Convoy (Late Lat. *conviare*, to accompany), in the navy, the name given to one or more ships of war sent to protect a merchant fleet from the attacks of a national enemy or from pirates. In military service the C. is strictly a train of wagons stocked with provisions or supplies for war. The term is also used for a detachment of troops or escort appointed to protect such a train or sometimes people. See also DECLARATION OF LONDON. See Hall, *International Law*.

There are no settled rules on C. applicable to most countries. Practice, rather than law, has been the guide in the past. Each country has its own view, e.g. Great Britain and U.S.A. hold that neutral vessels sailing under C. of a commissioned vessel of their own country are liable to search by a belligerent vessel. Most continental countries take the view that such neutral vessels should not be liable to search, and that the convoying officer's declaration shall be accepted. The weakness of this view is that it presupposes that the commanding officer of a C. has personal knowledge of the cargo of the vessels convoyed, which by no means follows; the Brit. and Amer. opinion being that, however complete his good faith, an officer can hardly be expected to affirm of his personal knowledge that none of the vessels convoyed has contraband goods or enemy dispatches on board. When a vessel proposes to exercise the right of search, it is usual to fly the colours and fire a gun as a signal to the merchant vessel. Towards the end of the First World War, owing to Germany's unrestricted submarine campaign, practically all ocean-going vessels voyaged to or from Great Britain in C., and such Cs. included neutral vessels (Birkenhead, *International Law*). Very soon after the outbreak of war in 1939 the C. system was in full operation, and by the beginning of Dec. 1939 Mr. Churchill, first lord of the Admiralty, was able to announce that less than 1 ship in 750 had been sunk in C. Of course, the consequence of this effectiveness, and the Ger.

U-boats found it easier to attack neutral shipping rather than the vessels of Britain and France. This, in its turn, resulted in neutrals often chartering their ships to Great Britain for the duration of the war, which enabled them to be sure of making larger profits than had ever been made in peace, while giving them a complete guarantee against loss.

Himalayas, the Alps, Spitzbergen, and also the Bolivian Andes, when he ascended Sorata, Illimani, and Aconcagua, and explored the glaciers of Tierra del Fuego. M.P. (Unionist) for Combined Eng. Univs, 1918-31. His works include *Climbing and Exploration in the Karakoram-Himalayas* (1894); *The Alps from End to End* (1895); *The First Crossing of*

Convulsionaries, see under JANSENISM. **Convulsions**, involuntary contractions of muscles usually under conscious control. In the adult they are generally the result of brain affections. In epilepsy there is total lack of consciousness during the C.; in hysteria consciousness is not lost, though the subject may simulate insensibility. C. may be caused by the introduction of some toxic agent into the blood; a special class of cases is where poisonous matter is retained in the blood through defective action of the kidneys. C. in infants are usually caused by digestive disturbances, and are apt to be dangerous if not promptly treated. The child should be at once immersed in a warm bath up to the neck with its head kept cool by wet cloths. This has the effect of restoring consciousness. A good dose of castor oil should be administered to aid in eliminating the disturbing substances from the digestive tract.

Conway, William Augustus (1789-1828), Eng. actor, b. in London. His most famous parts were Shakespearian, including Othello, Henry V., and Mark Antony, and he created the part of Prince Zerbino in *The Noble Outlaw*, 1815. He had a romantic friendship with Mrs. Piozzi, ending his picturesque career by committing suicide by drowning off Charleston, U.S.A.

Conway of Allington, Sir William Martin Conway, first Baron (1856-1937), Eng. traveller, mountaineer, and writer, from 1901 to 1904 Slade prof. of fine arts at Cambridge. Travelled in the E., the

Spitzbergen (1807); *The Bolivian Andes* (1901); *Aconcagua and Tierra del Fuego* (1902); *The Alps* (1904); *No Man's Land* (1906); *The Sport of Collecting* (1914); *The Crowd in Peace and War* (1915); *The Abbey of St. Denis* (1916); *Mountain Memories* (1920); *The Fan Eycks and their Followers* (1921); *Palestine and Morocco* (1923); *Art Treasures of Soviet Russia* (1925); *Giorgione as a Landscape Painter* (1929); *Episodes in a Varied Life* (1932); *A Pilgrim's Quest for the Divine* (1936).

Conway, Conwy, or **Aberconwy**, seaport, mkt. tn., and municipal bor. of Carnarvonshire, N. Wales, on a steep slope at the estuary of the R. Conway, 12½ m. from Bangor, 22 m. from Carnarvon. It is one of the most striking old tns. in Britain. It is surrounded by strong walls with battlements and towers. C. castle, one of the grandest feudal fortresses of Britain, was built by Edward I. (1284) to check the Welsh. It has very thick walls and eight vast towers. The Cistercian abbey (1185) was removed by Edward I. to Maenan, near Llanwrst. Its ruins are still to be seen, and the anct. church at C. is said to be substantially the abbey church; it has a magnificent fifteenth-century rood screen. Plas Mawr, an old Elizabethan mansion, is now the home of the Royal Cambrian Academy. The castle was held for Charles I. during the Civil war. The remains of the Rom. fort of Conovium is 4½ m. from C. The site was excavated in 1926-27, showing that it was probably built about A.D. 112. Pop. 9000.

Conway, city in Arkansas and co. seat of Faulkner co. It is on the Missouri Pacific railway, and is situated in the heart of a rich cotton-growing and agric. dist. Pop. 5700.

Conybeare, John Josias (1779-1824), Eng. scholar and divine. In 1807 he was made prof. of Anglo-Saxon at Oxford, in 1812 prof. of poetry there. He was interested in geology and chem., but his chief study was A.-S. His *Illustrations of Anglo-Saxon Poetry* appeared posthumously in 1826.

Conybeare, William Daniel (1787-1857), Eng. geologist and divine, b. in London, grandson of John C. (1692-1755), dean of Christ Church, Oxford, and bishop of Bristol. Educated at Westminster School and Christ Church, Oxford. Became a fellow of the Geological Society, of which he was one of the first members, contributing many papers to the *Transactions* of the society. In 1821 researched led to his discovery and description of a skeleton of the plesiosaurus, his conjectures being closely confirmed by subsequent discoveries. He is, however, chiefly remembered for his *Outlines of the Geology of England and Wales*, written in collaboration with W. Phillips (1822). Appointed Bampton Lecturer in 1839 and instituted dean of Llandaff in 1845.

Conyza, genus of Compositæ; a strong-smelling plant, fleabane, called by Linnaeus *Conyza squamosa*. The Linnaean genus has been superseded, and the common fleabane is now *Fula* or *Pulicaria dysenterica*; the small fleabane is *Publicaria* or *P. vulgaris*; the ploughman's spikenard is *I. Conyza* or *squamosa*, its volatile oil being used in driving away insects. The genus contains some fifty herbaceous and shrubby plants found in all the continents.

Cooch Behar, or **Kuch Behar**, state of N.E. India. The cap. is Cooch Behar, on the R. Tura. The natives are called Koch or Rajbansi. Rice, tobacco, silk, and jute are produced. Area, 1318 sq. m.; pop., 639,800.

Cook, Eliza (1818-89), Eng. poetess, b. in Southwark, who spent most of her life in London. She contributed to numerous periodicals, notably the *Weekly Dispatch*, and ed. *Eliza Cook's Journal* from 1849 to 1854. In 1863, her health having given way, she received a civil list pension of £100. Sev. of her domestic lyrics, such as *God Speed the Plough*, *The Old Armchair*, *The Star of Glengarry*, and *Home in the Heart*, were very popular. Her works included four vols. of verse (1835-45); *Jottings from my Journal* (1860); and *New Echoes and other Poems* (1864).

Cook, Frederick Augustus (1865-1940), Amer. explorer, b. at Callicoon Depot, New York, son of a Ger. immigrant who changed his name. Drove a milk wagon to pay his college expenses; graduated in medicine at New York Univ. Surgeon to Peary Arctic Expedition, 1891-92; led two expeditions along the W. coast of Greenland, which were failures; ship's doctor on Belgian Antarctic expedition, 1897-99. In 1903-6 led expedition to ascend Mt. McKinley, Alaska, and

claimed to have reached the summit, but other explorers openly doubted his claim. In 1909 he startled the world by his announcement that he had reached the N. Pole, assisted by two Eskimos, one of whom he called Etukisook. A few days later, Lt. (afterwards Adm.) Robert Peary, U.S.A. Navy, returned after his discovery of the Pole, and denounced C.'s claim. Sworn statements by companions and accomplices discredited his pretensions; and, after his alleged proofs were rejected by Copenhagen Univ., he sank into obscurity. In 1922 he was sentenced to fourteen years' imprisonment for fraud in connection with a concern called the Petroleum Producers' Association, and served five years of his sentence, which was commuted by President Hoover.

Cook, Captain James (1728-79), celebrated Eng. navigator, b. at the vil. of Marton, in Yorkshire, where his father was first an agric. labourer and then a farm bailiff. He was apprenticed, when only a little over twelve, to a haberdasher at Straiths, a vil. near Whitby, but left him owing to a dispute and boarded a ship as collier's apprentice and was very soon made mate. In 1753 C. joined the navy and from now onwards his success in life was assured. On the recommendation of Sir Hugh Palliser he was appointed successively master of three sloops, in the last of which he served in the St. Lawrence, being present at the capture of Quebec. He was employed in sounding the St. Lawrence and pub. a chart of the riv. from Quebec to the sea. In 1763 he surveyed the coast of Newfoundland and the next year was appointed marine surveyor of Newfoundland and Labrador. In this capacity he pub. in the *Philosophical Transactions* an observation of a solar eclipse near Cape Ray. The charts and observations which he drew up on this Newfoundland expedition attracted the attention of the Royal Society, who invited him to take part in an expedition for the purpose of making an observation of the transit of Venus. For this purpose he received a lieutenant's commission and set sail in the *Endeavour*, a vessel of 370 tons, accompanied by sev. scientific men, including Sir Joseph Banks (q.v.). On April 13, 1769, he reached Otaheite (or Tahiti), where he erected a makeshift observatory and succeeded in making the necessary astronomical observations. From Otaheite he sailed in quest of the great continent which for centuries had been supposed to exist in the S. ocean (see TERRA AUSTRALIS INCOGNITA) and reached the is. of New Zealand, which had remained unexplored since their first discovery by Tasman in 1642. His efforts to reach the interior were baffled by the hostility of the natives, but during the ensuing 6 months he circumnavigated the is. and established the existence of the channel dividing New Zealand into two large is. From New Zealand he sailed to New Holland (Australia) and came in sight of Botany Bay, after narrowly escaping disaster on the Great Barrier Reef. Here again the natives were hostile, but, nothing

daunted, C. explored the coast and took possession of it in the name of Great Britain, naming it New S. Wales. Thence he sailed to New Guinea and to Batavia, where his much-battered ship was repaired. He arrived in England on June 11, 1771, and was at once promoted to captain's rank and put in charge of a second expedition. He now started out in command of the *Resolution*, a ship of 462 tons, and a smaller ship, the *Adventure*, of which the combined crews numbered 193 men, the object of the voyage being to pursue the quest of the great S. continent. Setting sail from Plymouth on July 13, 1772, he touched at Madeira and the Cape

CAPTAIN COOK

Engraving from a painting by Dance.

of Good Hope and explored the specified lat. Convinced that no land existed within the limits of his search he gave up the investigation on Jan. 17, 1773. After wintering at the Society Is., so naming them in honour of the Royal Society, he made further explorations eastward and, turning northwards, navigated the S. tropic from Easter Is. to the New Hebrides and discovered the Is. which he named New Caledonia. C. always showed a kindly interest in the natives and his kindness mostly won their confidence, as for example in Tahiti. As a good example of his interest to the natives of the Pacific there may here be mentioned the case of 'Omali,' as he was known to his Eng. friends. Omali was a young native of Huahine, in the Society Is., whose intelligence and engaging manners had brought him in 1773 to the notice of Capt. Furneaux, commanding the *Adventure* and C.'s second in command. With C.'s concurrence, Omali was taken in the *Adventure* to England, where he was received by George III., his portrait painted by Sir Joshua Reynolds and Nathaniel Dance, and for two years was

honoured by London society as an attractive specimen of the 'noble savage,' recently popularised by Rousseau; and finally, in 1776, brought back to Huahine by C., who took good care that the chiefs should make an appropriate grant of land to a fellow islander who had received the gift of a sword of honour from the king of England. In 1774 C. sailed as far as the Fiji Is., anchoring off Vatoa or Turtle Is. in S. Lau. After yet another attempt he gave up hope of finding land and sailed for home. Arrived back in England once more, he was promoted to the rank of post-captain, made a member of the Royal Society, and awarded the Copley Medal. He had cruised for more than three years in the Pacific and S. oceans and during the whole voyage he lost only one man through scurvy, an unparalleled triumph of discipline coupled with a scientific realisation of the causes of that disease. Above all, he had dealt the death-blow to the age-long myth of the unknown S. continent, a negative result of his explorations the political implications of which were as important as the geographical (see on this *Cook and the Opening of the Pacific*, by James A. Williamson, 1946). The attention of the gov. was now directed to the discovery of a N.-W. passage and C. volunteered to lead the expedition. His last and fatal voyage was begun on June 25, 1776. C. sailing in the *Resolution*, and his second in command, Capt. Clerke, in the *Discovery*. In the course of his voyage he discovered the Sandwich Is. (or Hawaiian Is.) which he named after the earl of Sandwich; he then proceeded to America, penetrating into what was afterwards called C.'s Inlet. Prevented from proceeding any further by a wall of ice, he returned to the Sandwich Is., where he met a premature end in 1779 in Kealahou Bay in the Is. of Hawaii in a dispute with the natives about one of the boats of the *Discovery* which had been stolen. To recover the boat C. had seized the person of the king until repatriation was made. He landed the next day, when a scuffle ensued which compelled the party of marines who had accompanied him to retreat to the boats. C. being the last to withdraw, and when he was nearing the shore he was struck from behind, the marines being unable to render any assistance. It is one of the ironies of hist. that the man who of all Pacific explorers was the most humane and considerate towards natives should have lost his valuable life in an unimportant encounter with a few pilfering natives. C., in addition to his achievements as a navigator, performed great services for his country in his geographical and scientific investigations. In 1934 his cottage in Great Ayton was purchased by the Gov. of Victoria, and transported to Melbourne for re-erection in the Fitzroy Gardens. The original deeds transferring the land to him and bearing his signature are also in the possession of the Victorian Gov. His works are *An Account of a Voyage round the World* (first printed in John Hawkesworth's *Voyages*, 1773, ed. by W. J. L. Wharton, 1893); *A Voyage*

towards the South Pole and round the World (1777); *A Voyage to the Pacific Ocean* (1781). See A. Kitson, *Captain James Cook, the Circumnavigator*, 1907; G. Campbell, *Captain James Cook, R.N., F.R.S., Circumnavigator of the Globe*, 1936; H. Carrington, *The Life of Captain Cook*, 1939; J. B. Muir, *The Life and Achievements of Captain Cook*, 1939; J. A. Williamson, *Cook and the Opening of the Pacific*, 1916.

Cook, Sir Joseph (1860-1947), Australian free trade statesman, was b. at Silverdale, Staffordshire, England, and at the age of nine worked in a coal mine. Went to Australia in 1885, and in 1891 was elected for Hartley in the New S. Wales Legislature. He was postmaster-general 1894-98; and minister of mines and agriculture, 1898-99. Became member for Parramatta in Commonwealth Parliament, 1901; and so remained for twenty years. He was minister for defence in Deakin's (q.v.) Gov., 1909-10. On the defeat of Fisher's (q.v.) Labour Gov. in 1913, C. became Prime Minister, but with a minority in the Senate, so that he soon had to resign. He held office under W. M. Hughes as minister of marine, 1917-20; and as Commonwealth treasurer, 1920-21. He was a representative of Australia at the Versailles Peace Conference, 1919. From 1921 to 1927 he was high commissioner in London for the Commonwealth; and in 1922 senior Australian delegate to the third assembly of the League of Nations.

Cook and Son, Thomas, great Eng. firm of tourist agents. The founder, Thomas C. (1808-92), was born at Melbourne in Derbyshire, and was successively a gardener's help, a wood-turner, a printer, and a Bible-reader and local missionary. In 1836 he became a total abstainer and took a great interest in the temperance movement, founding the *Children's Temperance Magazine* in 1840. It was in connection with this subject that he first conceived the idea of organising parties for travelling. He persuaded the Midland Counties Railway Company to take 570 passengers from Leicester at a return fare of one shilling, this being probably the first publicly advertised excursion. This experiment was so successful that Thomas C. continued to organise such parties, and gradually enlarged his operations. In 1865 the business was removed from Leicester to London. In 1866 the first tours to the U.S.A. were arranged, and in 1869 to Palestine. In 1882 the services of the firm were commissioned in the suppression of Arabi Pasha's rebellion to convey Sir Garnet Wolseley and his suite to Egypt and transport the sick and wounded. In 1884 it conveyed Gen. Gordon to the Sudan, and later in that year the Gordon relief expedition, which included 18,000 troops. Shortly afterwards the firm organised the Moslem pilgrimage from India to Mecca and Medina. On the death of J. M. Cook in 1899, the control of the business passed to his sons, one of whom, Frank C., was chairman until his retirement in 1929. A fusion of interests

was arranged in 1928, between Thomas C. & Son Ltd., and its associated companies—including that of Thomas C. & Son (Bankers) Ltd. and the Compagnie Internationale des Wagons-Lits et des Grands Express Européens, and the business was then organised on a greater scale than ever. The headquarters of the firm are in Berkeley Street, W. 1.

Cooke, Benjamin (c. 1734-93), Eng. musical composer and musician, son of a London music-seller. He composed anthems and other sacred music, and also popular glees, *How Sleep the Brave*, *In the Merry Month of May*.

Cooke, Sir William Fothergill (1806-1879), Eng. electrician, served in Indian Army (1826-31), studied medicine at Paris and Heidelberg, and then took up telegraphy, going into partnership with Prof. Wheatstone in 1837. They made a special study of railway signals, and in 1845 patented the single-needle apparatus. C. formed a company in 1846, and he and Wheatstone received the Albert gold medal in 1867.

Cookery, art of dressing and preparing food for human consumption by the application of heat. The names given to different kinds of C., which are considered below, arise from the various degrees and kinds of heat to which the raw materials employed are exposed during this process. Cooking increases the value of certain foods in numerous ways, but destroys some vitamins, particularly vitamin C. (antiscorbutic), therefore fresh vegetables and fruit should be taken daily to make up for this loss in cooked food. Performed while the material is fresh, cooking considerably postpones the beginning of putrefaction, and it kills harmful germs which may have infested the substance. The process brings out the flavour of the raw material in such a way as to make it more pleasing to the palate, thus increasing appetite, and, by stimulating the flow of the gastric juices, materially aiding digestion. Lastly, and most important, the main aim of C. is, by recognition of and attention to the laws of chem. involved, to render food more digestible than in its uncooked state. Research and experience have evolved various general principles which may be applied to the various classes of food. One of the chief of these, for instance, applies to the coagulation of albumen, a substance present to a large degree in animal foods. Coagulation of albumen, as seen in the white of a soft-boiled egg, is desirable, and is always attained by exposure to a gentle heat, but continued exposure to a temp. at or above the boiling-point results in the hardening of the albumen into a leathery substance extremely difficult of digestion. Thus in cooking meats, the aim of the cook should be to obtain a thin outer covering of this hardened albumen, which will prevent the escape of the meat juices by first applying considerable heat, but to prevent the toughening of the interior which would be consequent upon hardening of the albumen throughout, by removal to a lower temp. as soon as this

protective shell has been formed. The science of C., to which considerable attention is now paid in schools, institutes, polytechnics, etc., under the general title of Domestic Science courses, is of comparatively recent origin, being practically a product of the nineteenth century. The same may be said of the development of C. as a fine art, since the methods employed in the preparation of food for even the famous feasts of auct. and medieval

Grilling, which is another name for broiling, is not so well done before a fire as over it, as one side of the meat is in that case exposed to a current of cold air. The average time required for broiling is 5 min. for a steak 1 in. thick, 10 min. for a steak 1½ in. thick, and 20 min. for a steak 2 in. thick; but many foods such as steak, cutlets, bacon, fish, etc., can be cooked in a few minutes under a gas or electric grill.

PANEL FROM THE BAYEUX TAPESTRY
(Illustrating the preparation of meat for a feast)

days were few and more or less crude, depending for success on the hearty appetites and unrefined palates of the people, while the lower classes cooked their food in the most primitive fashion. Early and medieval Eng. feasts seem to have been distinguished by the immense quantities consumed, both of food and drink, rather than by the quality of the dishes served, while such recipes as have reached us are remarkable for the number and apparent incongruity of the ingredients employed. The art of C. may be said to have begun in Italy at the time of the Renaissance, and from there spread to France, which soon became its headquarters. The lt. cultured simplicity of C. seems to have been introduced into France by Catherine de' Medici, and was developed by famous chefs whose names are immortalised in the titles of their inventions, under the patronage of Louis XIV. and Louis XV. Fr. C. still remains the ideal of high-class culinary operations.

Broiling, probably the earliest known process of cooking meat, consisted in exposing the surface to direct heat, so that the outside of the meat was well browned, and the inside rendered tender and juicy. The primitive method of broiling meat was by burying it in hot ashes; but the process, when now used, is performed over a clear fire on a gridiron or similar appliance. The meat is turned during broiling by a pair of tongs, as a fork would cause the juices to escape. Small birds, such as quails, may be excellently broiled in about 10 min.; white meat as a rule requires longer cooking than red.

Roasting is really the application of the principles of broiling to larger joints of meat, for which it is an economical process and one producing excellent results. As in broiling, exposure to the greatest heat should come at the beginning of the cooking, so that the meat juices are sealed up, and the joint, when cut, exudes a rich, reddish gravy. The interior of the joint should then be allowed to cook in a rather gentler heat, by means of which the fibres are loosened, the connective tissue is changed into gelatin, the fibrin and albumen are oxidised, and the fat cells broken. The fat and tissues on the surface of the meat become caramelised and browned, and acquire a distinctive odour and flavour. The joint should be frequently basted with melted fat in order to prevent evaporation of the watery portion of the meat juice. Meat roasted before an open fire is much more wholesome than when baked in an oven, as the volatile empyreumatic oils produced on the surface are allowed to escape. Roasting is, however, possible only before an open range. The time required for roasting is from 15 to 20 min. for each pound of meat, white meat taking longer than red. Meat can be roasted in a thick saucepan, by melting sufficient fat to cover the bottom, and when hot putting in the meat, browning it on all sides, covering with a lid, and continuing to cook over a low heat.

Baking is now the usual substitute for roasting meat in an oven. It is placed in an open tin and heat applied all round at once, instead of to one side at a time; but baked meat, owing to the reabsorption

of the volatile products which cannot escape in the closed oven (this does not apply to ventilated ovens, such as gas and the latest electric stoves) is neither so digestible nor so delicate in flavour as roasted meat. Baking is also applied to other kinds of food besides meat, e.g. fish is more appetising when baked. It can either be wrapped entirely in greased paper, so retaining all the flavour, or laid in a greased casserole, with dabs of fat placed on top. Pies containing either meat or fruit are usually baked, and a meat pie possesses many advantages over plain baked meat, since the surface is protected from charring by the crust, and the meat practically stewes in its own juices. It is often difficult to cook sufficiently the contents of a pie without burning the covering paste, but this trouble may be overcome either by partly cooking the meat or fruit previous to putting on the crust, or by protecting the latter during cooking by means of a sheet of thin paper. All forms of pastry, such as pasties and open tarts, are baked, and require a hot oven, as do also cakes. The latter should be placed at the top of the oven to begin with, but after the material has risen sufficiently, removal to a cooler lower shelf is usually advisable to ensure thorough cooking of the interior. This has been attained when a clean knife, thrust into the cake, is clear on withdrawal. Especial care should be taken to close the oven door gently during the early stages of cake baking, or the risen dough may collapse. The baking of bread is governed by the same principles. Milk puddings are baked in a slow oven, and also apples with their skins on, but the cores removed. Modern electric or gas stoves are fitted with heat regulators which automatically maintain the oven at any desired temp., and in consequence less attention is necessary during the actual cooking of the food. All starchy foods are rendered more digestible by the application of dry heat, which converts the insoluble starch into soluble dextrin and sugar.

Stewing is the slow cooking of food in a little liquid in a closed vessel. It is the method recommended for tough fibrous meat, and various other ingredients, such as root vegetables and herbs, may be added to the meat and cooked together with it. Since none of the constituents of the materials used can escape, stewing is a most economical method of cooking, and is rendered doubly so by the fact that coarse and tough meat may be rendered palatable, tender, and digestible by its means. In many ways it is the ideal method of cooking meat, but success depends on keeping the temp. below about 180° F. Lean meat is best for stewing; it should be cut into convenient pieces and slightly browned by frying in fat previous to being placed in the stewpan. It should then be covered with water or stock, and set to cook for 3 to 5 hrs., particular care being taken to prevent boiling, so that the albumen does not harden, and the meat cooks in its own gradually extracted juices. Vegetables, flavourings, and

thickening matter may be added as desired. Stewing is best performed in a double vessel (if cooking is done over an open flame) as this ensures constant and gentle heat. The principle of stewing is also employed in the making of broth, and of soup or beef tea. Meat and bones for the making of soup should be placed in cold water and gradually raised to boiling-point, so that the escape of meat juices into the liquid is not hindered by hardening of the albumen. Since, however, it is not desired to eat the solid constituents, bone stock is boiled slowly for sev. hours in order to extract the gelatinous matter. It is this gelatine which causes soup to form a jelly when cold, but contrary to belief it has no great food value. By the addition, however, of vegetables, and starches such as corn-flour, barley, oats, etc., or nitrogenous matter such as cheese, macaroni, beans, or lentils, thick or cream soups are nourishing, as well as stimulating. Vegetable water, or vegetable stock also makes a good basis for soups. Stewing is also a common method of cooking fruit, by making a syrup of sugar dissolved in warm water, and adding the fruit, which is cooked gently, but not boiled.

Braising is a combination of stewing and baking, or pot roasting. It is an excellent method of cooking meat, because the cheaper cuts or tougher joints become tender after being treated this way. The meat is fried, after removing the surplus fat in a small quantity of hot fat for a few minutes until the outer covering is sealed and browned all over, and then it is removed from the pan. A liberal quantity of sliced root vegetables is lightly fried in the fat, and then placed in a saucepan or casserole, with water or stock half covering them; seasoning and a *bouquet garni* being added. The meat is then placed on top of the vegetables, and the saucepan or casserole covered with a lid; the contents being cooked over a low heat or in a slow oven for 2 to 3 hrs. Poultry, game, and root vegetables may also be cooked this way.

Boiling, or cooking by immersion in boiling water. This method is used for fresh or salted meat, game, and poultry. The temp. of the water should, however, be reduced 5 min. after the immersion of the meat (i.e. sufficient time to seal the outer covering), otherwise there is a serious risk of toughening of the connective tissue if boiling is continued. Coagulation of proteins, as in the case of the egg, takes place in a temp. of about 180° F., and an egg cooked in this temp. for 10 to 15 min. is more easily digested than one kept at boiling-point. The usual method of cooking eggs by boiling for 3 min. is far from ideal, as it allows the albuminous white to become overcooked while leaving the yolk underdone. A much better plan is to place the eggs in boiling water (half a pint to each egg) and leave them in the gradually cooling water for about 20 min. The same can also be said of meat, and it is desirable to see that the temp. of the water does not rise much above that required for the coagulation

of egg protein. This method can also be applied to fish, but to retain the flavour, steaming or baking is preferable. Puddings which contain starch and fatty elements should be kept in rapidly boiling water to ensure the bursting of the starch granules. All such puddings are spoilt, becoming sodden and heavy, if allowed to go off the boil at all.

Certain semi-liquid foods, such as milk puddings, jams, and jellies, are cooked by boiling the substance itself, constant stirring being necessary in such cases to prevent burning. Allied to boiling is *steaming*, for which the food is placed in a covered vessel having a perforated bottom which fits tightly over a saucepan of boiling water. Steaming takes rather longer than boiling, but is preferable in many ways, giving a finer flavour, and preventing the surface of puddings from becoming sodden through contact with water.

Vegetables should not be cooked too long, or at too high a temp., otherwise valuable vitamins and salts are lost. They can be steamed; cooked conservatively, i.e. in a little water; or braised. Most vegetables when grated can be eaten raw with salad or in sandwiches, and they are very nutritious taken this way. Green vegetables should be fresh; washed thoroughly, care being taken not to bruise the leaves; and they should not be left in water for more than a few minutes. Root vegetables should be scrubbed, and if necessary peeled very thinly.

Conservative cookery is the method recommended for vegetables, as only a little water is used and the flavour, valuable salts, and vitamins retained, or conserved. Green vegetables should be shredded coarsely and put into very little boiling water (about $\frac{1}{2}$ pint to 1½ lb. of vegetables), covered with a lid, and tossed occasionally to prevent burning. Attention is needed during this method of cooking, which does not take more than 10 to 15 min. The vegetables should be removed from the heat immediately they are cooked; and eaten at once. When cooking spinach it is unnecessary to add any water. A teaspoonful of fat may be added during, or after, cooking the vegetables. Carrots are delicious sliced and sautéed (i.e. cooked in a little hot fat) for a few minutes, a tablespoonful of water added, and then cooked for about 10 min. in a covered pan. Vegetables are more appetising and nutritious when cooked conservatively, than by the old method of boiling them in plenty of water. Potatoes are more nutritious when cooked in their skins, after being well scrubbed. They can be boiled gently or baked in the oven. The reason for cooking potatoes in their jackets is that the layer nearest the skin is considerably richer in mineral matter and protein than the outer flesh and central core; and the flavour is enhanced when potatoes are cooked this way. If it is impossible to retain the skins, then potatoes should be peeled very thinly, and conservatively cooked. The water in which vegetables are cooked can be salted, iodised salt

being recommended; but soda must not be added as it destroys vitamins. Vegetable water should not be thrown away, but used for soup or gravy.

Vegetables can be cooked in a waterless steamer, but boiling is preferable as there is less loss of vitamin C. Steam pressure cooking has the advantage of economy of fuel, food, and time, but it is considered by some dieticians and doctors to destroy valuable substances in the food owing to the high temps. used (212°-280°).

Frying, or cooking by hot fat, is of two kinds, wet and dry. The former, which is much the preferable, is done in a deep frying kettle containing lard, butter, dripping, or cotton-seed or olive oil. The fat should be gradually heated up to almost 400° F., when it is perfectly still and gives off a faint bluish vapour; the articles to be fried are then immersed, being usually enclosed in a wire basket for ease in handling. Fried food should be crisp, golden-brown in colour, and non-greasy, any superfluous fat on the surfaces being removed by placing the articles on absorbent paper. Fish, cutlets, croquettes, fritters, potatoes, chops, etc., are delicious when well cooked in this way, and are usually first rolled in beaten egg and breadcrumbs. Dry frying is performed in a shallow frying-pan the bottom of which is covered with hot fat. It has many disadvantages; the food is apt to be unequally cooked, greasy, and charred, and has to be constantly turned. Bacon, sausages, chops, etc., are cooked thus in their own escaping fat, while eggs, cold potatoes, and pancakes may be dry fried in a little dripping or lard. This method of frying is also known as *sauting*. All fried food should be served immediately it is cooked.

Other forms of C. include *blanching*, i.e. putting food into boiling water for a few minutes, and then plunging into cold. This helps to remove easily the peel of tomatoes, peaches, almonds, etc. Another way of blanching is by putting the food into cold water, bringing it to the boil, and plunging again into cold water: this method is used in the preparation of certain kinds of offal. To *caramelize* is to heat sugar gently until it turns brown, when it can be used for caramel custard or caramel rice; *parboiling* is partly or half boiling, the cooking being continued in another way. For instance, potatoes are more easily digested if parboiled before roasting, also a bullock's heart is rendered more tender when cooked in this manner. *Pasteurising* is the quick raising of the temp. of milk to 145° F., and keeping it there for about half an hour, then cooling it rapidly; *scalding* is heating a liquid just below boiling-point; milk, for instance, is treated this way to prevent it becoming sour quickly in hot weather; *searing* is forming a coating over the surface of meat; *souping* is cooking food slowly in vinegar and spices; herrings and mackerel can be cooked this way; and *sterilising* is boiling. Milk is often treated this way to prevent souring, and to kill harmful germs, but at the same time vitamin C. is destroyed. 'Steam

under pressure is a much more effective method of sterilising material containing bacterial spores, and a temp. of 115–20° C. for 15 min. is always to be relied on for sterilisation' (C. E. Dukas).

Beverages.—Tea, coffee, and cocoa are the beverages generally taken in Britain. Tea is the most popular and has the most varieties, dependent upon its place of growth, and according to the different leaves from which it is produced. Chinese teas have the most delicate flavour, Indian teas have the greatest degree of astringency, particularly Assam tea, which is usually used for blending with milder varieties, Ceylon teas have a rich flavour. In judging a tea one should look for a reddish-golden coloured liquid, the infused leaves should be of a bright coppery tint and evenly extracted, and there should not be much stalk with the leaves, which should not be completely unrolled after 5 min. infusion. The proper method for making tea is important; fresh water should first be brought to the boil, and the teapot thoroughly warmed so as to maintain the temp. in order to extract the finest flavour from the tea. Infusion should not be more than about 5 min., and after this the liquid, without the leaves, should be poured off into another hot pot; otherwise too much tannic acid is extracted, along with other bitter substances. *Coffee* is consumed on the Continent and in America more than in Britain. There are sev. varieties of bean, such as Mocha, Mysore, Jamaica, Kenya, Ceylon plantation, Costa Rica, Java, and Brazil. Fr. coffee usually contains chicory, which is the root of the wild endive. It is not detrimental to health, but is considerably cheaper than coffee beans. Coffee should be made strong and hot, and the beans should be freshly roasted and ground. For *café au lait* three parts of milk to one of coffee is about the proper proportion. Coffee is sometimes served iced. *Cocoa* has a certain proportion of fat and starch, and because of the latter it should be boiled for 1 or 2 min. before serving.

Fruit drinks can be made from fresh fruits, or canned fruits, and are very refreshing when served iced. Barley water may be added to make a demulcent drink suitable for the sick room, or as a beneficial drink in hot weather.

There is no food value in tea or coffee, and excessive indulgence, especially in the former, may affect the nervous system or the digestion. Tea and coffee are stimulants, and it is therefore better not to take them at night. Cocoa has very little food value, except when made with milk and sugar. Certain proprietary preparations which contain malt extract, eggs, milk, and cocoa, are sometimes used as substitutes for the above beverages.

Utensils.—Various kinds of utensils for special forms of C. have been devised and perfected. Nowadays, however, gas and electrical equipment is used increasingly, owing to its cleanliness, and saving of time. Refrigerators are used for storing and keeping food fresh; and various types of thermometer are available for testing

the temp. of ovens, milk, sugar, and fruit during preserving. The following are some of the small electrical appliances which are available, either in Britain or America, for the preparation and cooking of food and beverages: bean cutters; boiling rings; boiling plates; breakfast cookers; chafing dishes; casseroles; coffee mills, percolators, and brewers; double saucepans; drink mixers; egg poachers, or steamers; food mixers; freezers; hot cupboards; hot-water urns; ice-cream freezers; domestic, tourist, and whistling kettles; mincing machines; mixers; potato peelers; roasters; steamers; automatic toasters; warming plates; and waffle irons.

Cookers.—There are a variety of cooking stoves: *oil cookers* with or without wicks; *solid fuel cookers*, which burn coal, coke, wood, peat, or a smokeless fuel such as anthracite, coke, or charcoal; *gas cookers*, working from a mains supply, or using *Calor gas*, which is a portable fuel, delivered in small steel cylinders, the gas being stored in liquid form; and *electric cookers*. *Solid fuel cookers* include the cottage and kitchen ranges, made of cast-iron, and sometimes coated with enamel; *combined cookers* can be fitted in a living-room, in appearance are like an ordinary fireplace, and are available in various colours. The one fire heats the room, an oven, a hot chamber for plates, boils and grills, and provides hot water for baths, etc. *Back-to-back* grates have an open fire in a sitting-room (which can be shut off) with the oven and hot plate in the kitchen, and this stove also supplies hot water. *Stored-heat* cooking stoves are usually made of cast iron with heavy iron or steel blocks above the fire. The stoves are covered with a highly glossed vitreous enamel, and contain hot plates which can be covered with insulating lids when not in use, there are separate ovens for roasting, stewing, warming plates, etc. The stoves are insulated with asbestos, and consequently the kitchen never becomes over-heated. The first cost of the stored-heat cooking stoves is high, but there is considerable saving in fuel and labour. Unfortunately they are not usually designed to heat water, but water heaters may be provided. *Gas* cookers are usually the open type of cooker, or the enclosed streamlined cabinet type, which is easier to clean and has a better appearance. They are made of cast iron, or steel, with a vitreous-enamel finish. The majority of those in Great Britain are of the vertical design, i.e., with the grill and oven under the hot plate. The horizontal, table-top design, which raises the oven to an easier working level, is not so popular as it occupies more floor space. Many cookers are fitted with a thermostatic control, i.e., by the turning of a dial a desired temp. can be maintained. A simmering burner is a useful addition. *Electric* cookers are made also in vertical or horizontal designs, and most are thermostatically controlled. In order to obtain the utmost efficiency and economy it is essential to use the ground base utensils. They may have

glass inner doors to the oven, or drop-down doors, and in the U.S.A. some models are fitted with time switches and control clocks. The fireless cooker, in which food previously heated to boiling-point is kept at a high temp. for hours by surrounding it with a thick layer of non-conducting material, such as felt or hay, deserves to be better known than it is.

The kitchen should be well equipped and planned. Anything from 12 to 18 hrs. per week are spent on the preparation and cooking of meals in the ordinary household, and an additional 7 to 10 hrs. on washing up. It is, however, possible to reduce this to a minimum by the rearrangement of big equipment and utensils. The ideal kitchen need not be a large room, 8 ft. by 10 ft. or 8 ft. by 13 ft. being quite large enough for easy and efficient working. In fact, in some Amer. flats a space 6 ft. 4 in. by 4 ft. 2 in. has been successfully converted into a completely equipped kitchen by careful planning and utilisation of every piece of wall space. Recommendations for the ideal kitchen are light-coloured, washable walls, tiled, or enamel painted; doors covered with linoleum, or composition flooring, with something warm for the worker to stand on; good ventilation and light; all doors flush, i.e. no ledges for collection of dust; the cooker, cabinet, and refrigerator adjacent to the sink, which can be double or single, with double-draining boards; and built-in cupboards reaching to the ceiling to avoid dust traps.

The foods and drinks we are accustomed to consume may not, in fact, be the best for us. Varying costs of different foods often govern their general use; but habit can also be an important factor (e.g. tea drinking, and tobacco smoking). At the beginning of the last century tea was consumed at an average of about 1½ lb. per head of the pop. per annum, but now it is about six times that amount; and in Britain more tea is consumed than in all the European countries together. It is well, sometimes, to consider our general diet, together with the effects of cooking, in relation to health. Good C. is now recognised, as has been said, as a science and an art, and the study of kindred subjects, such as diet, food, and nutrition, will give the student, cook, or housewife, useful facts as a basis to work on, so enabling a proper selection to be made from the foods that are available at the time, and preparing them to the best possible advantage. See DIET; FOOD AND FEEDING; PRESERVING; PRESSURE COOKERY; SALAD; VITAMINS. See books on C. by Sir J. Elliott, 1539, and Abraham Veal, 1575. See also R. May, *The Accomplished Cook*, 1665; Dr. Pegge, *Forme of Curry*, 1780; A. Brillat-Savarin, *Physiologie du goût*, Paris, 1825; Mrs. Beeton's C. books; A. Howard, *The Art of Dining*, 1883; A. G. Cookham, par. and vil. in Berkshire on the Thames, 27 m. from London. A great fishing resort. Pop. 6000.

Cook Islands, or Hervey Islands, archipelago of small is. in the Pacific, lying between the Society and Navigator groups, between lat. 18° and 22° S., and long. 157° and 163° W., about 1700 m. N.E. of Auckland, New Zealand. The group consists of Rarotonga, Mangaia, Atiu, Mauke (Perry Is.), Atutaki, Mitiaro, Manuae, Te Au-o-tu, and Takuteta (uninhabited) in the S. group of the C. I. proper; and Tongareva, Pukapuka, Manihiki, Rakahanga, Avarau, Suvarrow, and Nassau (uninhabited) in the N. is. group. The total area is about 100 sq. m. In formation the is. include both volcanic and coralline examples, and the soil is generally fertile, copra, coffee, oranges, limes, cotton, pineapples, coco-nuts, bread-fruit, and plantains being grown. Water is scarce. The chief is., Rarotonga, with an area of 28 sq. m., forms, with its port, Avatiu, the commercial centre of the group, and trades with New Zealand. Its pop. is 5500. The natives who are now christianised and thoroughly civilised in their habits, are brown Polynesians, with a strain of Melanesian blood, and speak a dialect closely resembling the Samoan. The is. were discovered by Capt. Cook in 1777; annexed

by Great Britain in 1888, and by New Zealand in 1901. Pop. 10,000.

Cook, Mount. In the centre of the Alps in the S. Is. of New Zealand, is the highest mt. peak in Australasia, its altitude being 12,319 ft. It is covered with perpetual snow, and rises in the shape of a pyramid above the other neighbouring peaks. The Rev. W. S. Green nearly reached its summit in 1882. Fyfe ascended it in 1895, and Turner in 1906. See Freda du Faur, *The Conquest of Mount Cook*, 1936.

Cookstown, mkt. tn. in co. Tyrone, N. Ireland, 35 m. from Belfast. It has linen factories, bleach-fields, and chemical works, and a considerable trade is done in agric. produce. Pop. 4000.

Cook Strait, strait between N. and S. Island, in New Zealand. It was discovered by Capt. Cook in 1770.

Cooktown, coast tn. in Queensland, Australia, situated at the mouth of Endeavour R., 1050 m. from Brisbane. Has newspaper, two banks, pearl fisheries, and gold and tin are also worked in the dist. and the crops consist of coffee and rice. Pop. 2000.

Coolbrith, Ina Donna (1847-1928), Amer. poet, b. Illinois. Her parents early in her life migrated to California, where she spent most of her life. For twenty years she was librarian at the Oakland (California) public library, and subsequently librarian at Mercantile Library, San Francisco. Much of her poetry is coloured by her experiences of life in the mining dists. of California, and recalls the work of Bret Harte, with whom she was associated in editorial work on the *Oregonian Monthly*. She has been called the Sappho of the West, and the esteem in which her poetry was held earned for her the title of poet laureate of California, which was conferred on her by the governor and legislature in 1895. Chief pubs.: *A Perfect Day and other Poems* (1884); *Songs from the Golden Gate* (1895); *The Singer of the Sea* (1895).

Cooley, Thomas (1740-84), Irish architect, b. in England; during his early years he was apprenticed to a carpenter. In 1769 he was successful in the competition for building the Royal Exchange at Dublin, which work he finished in 1779. He erected many other buildings in Dublin and other parts of the country, including the prison called Newgate at Dublin (1773), and the pile of the Four Courts (Dublin), commenced in 1776, but unfinished at the time of his death in 1784.

Coolgardie, tn. of W. Australia, situated 360 m. from Perth. It was an extremely busy mining centre following the sensational gold finds in 1892-93. Its output of gold, however, has greatly declined and its pop. is to-day only 4000. It is, however, an important railway junction on the transcontinental line, and its aqueduct is part of the pipe-line 350 m. long that supplies water to the W. Australian goldfields.

Coolidge, (John) Calvin (1872-1933), thirtieth president of the U.S.A., was b. at Plymouth, Vermont, of old farming stock, son of John Calvin C. He was

admitted to the Bar in 1897. He was a member of the Massachusetts House of Representatives 1907-8, mayor of Northampton 1910-11; member of Massachusetts Senate 1912-15 (president thereof 1914-15); lieutenant-governor of Massachusetts 1916-17-18; governor of Massachusetts (two terms) 1919-20. In this capacity he dealt firmly with the Boston police strikers of Sept. 1919. In 1920 he received the Republican nomination for vice-presidency of the U.S.A., and he assumed office on March 4, 1921. On the death of President Harding, he was sworn in as president (Aug. 2, 1923), by his father (a notary *inter alia*), at the

CALVIN COOLIDGE

Richards

old home in Plymouth vil. He was re-elected for the term beginning March 4, 1925, and ending March 3, 1929. As president C. inherited two scandals from his predecessor—the maladministration of a bureau for war veterans and an attempt to hand over public oil lands to private companies. C. allowed these things to go to the courts and the guilty ones to be punished. During his term a considerable portion of the national debt was paid off, the income taxes were reduced, and the country enjoyed unexampled prosperity. There were those who strongly favoured his standing again, but he put a stop to all this by his sudden and cryptic announcement that he did not choose to run again.

Coolidge Tube, improved form of X-ray bulb, invented by the Amer. physicist, W. D. Coolidge. It is now in general use.

Coolies (from Tamil *kuli*, hire, or from *Koli*, the name of an aboriginal tribe of India), name applied to the unskilled labourers of India and E. Asia, and

especially to labourers of this class who have emigrated to other countries, usually under contract. Much difficulty was found in the Brit. sugar-producing colonies after the abolition of slavery in finding labourers for the plantations. The white man was physically unable to undertake the duty, and the emancipated black was unwilling to do so. In these circumstances it was suggested that the overstocked Asiatic countries might supply the need, and agents were sent to India and China to negotiate for the importation of labourers. This

E.N.A.

CHINESE COOLIE

traffic started after 1834, and was officially recognised by the Brit. Gov., under whose jurisdiction it mostly fell, ten years later. There were, however, an enormous number of abuses in the system, and those who knew it well stigmatised it as slavery. Many of the C. were attracted by elaborate promises, and some were kidnapped. They were taken over closely packed in ships and under conditions vividly recalling the slave ships. When arrived, they were practically sold by auction. The only points in which they differed from slaves were in having a regular wage paid to them and in being engaged for only seven years. The cruel oppression which characterised the whole coolie system soon brought a series of reforms. In 1854 the Brit. governor at Hong Kong forbade Brit. subjects and Brit. vessels to engage or be engaged in the exportation of Chinese C., and his action was confirmed in the following

year by the Chinese Passengers Act, which made most stringent regulations for the trade, particularly with regard to the actual sea voyage. After this the business of importing C. into S. America and the W. Indies was transferred to Portuguese traders, and was carried on from Macao. From this port the old methods were resumed, and became, if possible, still more of a slave trade. The extension of the trade to Canton led to a fresh outburst of indignation, and further legislation was carried out, this time by the Portuguese authorities. These were practically inoperative, however, and things continued with periods of reform and deterioration until 1866. In that year a conference was held by representatives of the Eng., Fr., and Chinese Govs. China insisted that the contract should include the payment of the C.'s return fare at the expiration of five years, and this put an immediate stop to the trade with the W. Indies, where permanent labourers were required. From this period the C. for Brit. colonies were drawn largely from India. Immigration of C. from India was prohibited in 1838, but the ban was removed in 1845, when the introduction of E. Indians into Brit. Guiana and Trinidad under indenture started. It continued annually—except in 1849-50—under the supervision of the Colonial and Indian Govs., being regulated by the Indian Emigration Act of 1883. This Act allowed emigration only to certain colonies where good treatment was assured. These were Brit. Guiana, Natal (then a colony), Jamaica, and most of the other Brit. W. Indian is.; the Fr. colonies of Guadeloupe and Martinique, Dutch Guiana (or Surinam), and the then Danish (now Amer.) W. Indian is. of Saint Croix. The immigration of Indian C. into the W. Indies was, however, terminated by the Gov. of India in 1917. Until recently coolie labour was employed in Singapore on work in aerodromes, but has now ended (see Labour Annual Report of Singapore for 1947). After 1904 a large number of C. were imported from China by the Transvaal authorities for work on the Rand, much against the wish of the Boers. This led to many difficulties and complications, largely on account of the compound housing plan being made use of. See CHINESE LABOUR QUESTION.

Coomaraswamy, Ananda (1877-1947), writer on Indian and Sinhalese art; b. in Ceylon. Educated at London Univ. Worked for three years in the mineralogical survey dept. of Ceylon, but, conscious of the threat to the survival of the medieval arts of India and Ceylon, he returned to England to join a movement of protest at the destructive effects of industrialism and the impact of European art on Indian culture, and for forty-five years he was engaged in reconciling the W. with Indian art and thought. Followed for research in Indian, Persian, and Mohammedan art at the Museum of Fine Arts at Boston, where he built up collections of oriental art and produced elaborate and scholarly catalogues of them. The list of his pubs. shows him as

the pioneer in a largely uncharted field: the *History of Indian and Indonesian Art*, pub. by the Royal India Society, of which he was one of the founders (1910), and by the Boston Museum; *Rajput Painting* (2 vols.), pub. by the Oxford Press in 1916, which marked an epoch in the appreciation of Kangra painting in the W.; *The Arts and Crafts of India and Ceylon*; and *The Transformation of Nature in Art* (1934). Though not himself primarily a literary scholar his trans. of vernacular poems and technical passages from the Sanskrit are essential for professed literary scholars.

Coomassi, see KUMASI.

Coon, see RACCOON.

Cooper, Abraham (1787-1868), Eng. painter whose work, consisting of over 400 pictures, is mostly battle scenes and race-horses. The best-known are those of 'Waterloo,' 'Bosworth Field,' and 'Marston Moor.'

Cooper, Alfred Duff (b. 1890), Eng. statesman and author, son of Sir Alfred C. and Lady Agnes Duff, sister of the duke of Fife; educated at Oxford Univ. Served with the Grenadier Guards in the First World War. From 1921 to 1929 he was Unionist M.P. for Oldham. Financial secretary, War Office, 1928-29. In 1931 he was elected M.P. for St. George's, Hanover Square, and returned to his former position at the War Office, 1931-34. In the same position at the Treasury, 1934-35; secretary of state for war, 1935-37; first lord of the admiralty, 1937-38, resigning after the Munich pact; minister of information, 1940-41; chancellor of duchy of Lancaster, 1941-43. Representative of Brit. Gov. with Fr. Committee of National Liberation, 1943-1944; ambass. to France, 1944-47. Author of *Talleyrand* (1932); *Haig* (1935-1936); *The Second World War* (1939); *David* (1943). Married (1919) Lady Diana Manners, youngest daughter of the eighth duke of Rutland, who was on the stage, appearing as the Madonna in *The Miracle*.

Cooper, Anthony Ashley, see SHAFTESBURY, FIRST, THIRD, AND SEVENTH EARLS OF.

Cooper, Sir Astley Paston (1768-1841), Brit. surgeon, b. in Norfolk, son of a clergyman. Early devoted himself to the study of anatomy at St. Thomas's Hospital, attending the lectures of John Hunter, and, in 1787, was appointed demonstrator of anatomy there. In 1792 he was appointed prof. of anatomy to Surgeon's Hall, a post which he occupied also in 1794-95, and in 1800 he became surgeon to Guy's Hospital. In 1802 he was awarded the Copley medal for papers read before the Royal Society on the destruction of the membrana tympani. Became a fellow of the society in 1805. In 1804-7 he pub. his great work *On Hernia*—the radical operation for which was then frequently unsuccessful owing to defective knowledge of the local anatomy. He was then appointed prof. of comparative anatomy to the Royal College of Surgeons. In 1820 he removed a tumour from the head of King George IV. Presi-

dent of the Royal College of Surgeons in 1827 and, in 1830, vice-president of the Royal Society. His other works include *Dislocations and Fractures* (1822); *Treatise on the Anatomy and Diseases of the Breast* (1829-30); and *Anatomy of the Thyroid Gland* (1832). Life by B. Cooper.

Cooper, Charles Henry (1806-66), Eng. antiquary and author. He became a solicitor in 1840, and held the position of tn. clerk of Cambridge, 1849-66. His chief works are *Guide to Cambridge* (1831); *Annals of Cambridge* (1842-53); *Athenæ Cantabrigienses* (1858, 1861); *Memorials of Cambridge* (1858-66); and *Memoir of Margaret, Countess of Richmond and Derby*, which was not pub. until 1874.

Cooper, Gladys (Lady Pearson), Eng. actress, b. Dec. 18, 1889, at Lewisham; daughter of Charles Wm. Frederick C. Married, first, H. J. Buckmaster (marriage dissolved); secondly, 1928, Sir Neville Arthur Pearson (marriage dissolved); thirdly, 1937, P. Merivale. Her first London appearance was at the Vaudeville, 1906, as Lady Swan in *The Belle of Mayfair*. Has appeared in the following (inter alia): *The Dollar Princess*, 1911; *The Importance of Being Earnest* (Cecily Cardew); *Man and Superman* (Violet), 1912; *Milestones* (Muriel Pym); *Broadway Jones*, 1914; *Half an Hour*; *The Admirable Crichton* (Lady Agatha), 1917; *Treasure of the Wells* (Clara); *The Man from Blankley's*, all-star (Marjory), 1918; *The Second Mrs. Tanqueray* (Paula), 1923; *Maqod*; *Peter Pan* (Peter), 1924; *The Last of Mr. Chenevix*, 1927; *The Indifferent Shepherd*, 1948.

Cooper, James Fenimore (1789-1851), Amer. novelist whose works were mostly of the adventure type. He came of a Quaker family, and was b. at Burlington in New Jersey. He served for some years in the navy, but he gave that up in 1811, and devoted all his attention to literature. His first book which found its mark with the public was *The Spy* in 1821; this he followed with *The Pioneers* in 1823. He also wrote *The Pilot* in 1823, and it was this work which earned for him undying fame, although *The Last of the Mohicans*, brought out in 1826, is generally considered to be his masterpiece. At this time C. went to live in France, where he wrote for the *National* on Amer. questions. Whilst he was in Paris he wrote *The Prairie* in 1827 and *The Red Rover* in 1828. In the year 1833 C. went back to America and wrote in rapid succession *The Mohicans* (1826); *Leathers in Europe* (1837-1838); *Homebound Bound* (1838); *The Pathfinder* (1840); *Mercedes of Castile* (1840); and *The Deerslayer* (1841). In 1839 he wrote *The History of the Navy of the United States*. Among his later novels were those of a trilogy known as the Littlepage MS.: *Satanstoe* and *The Chain-bearer* (1845); and *The Redskins* (1846). The last years of C.'s life were spent in heated warfare with his critics, and lawsuits followed, from which he nearly always emerged victorious. See T. R. Lounsbury, *Life of James Fenimore Cooper*, 1882; Margaret M. Gibb, *Le Roman de Bus-de-Cuir*, 1927; H. E. Spiller, *Le*

Fenimore Cooper: Critic of his Time, 1931.

Cooper, Peter (1791–1883). Amor, educationist, manufacturer, and philanthropist, *b.* in New York. He worked with his father in various trades, and in 1828 estab. iron works in Baltimore, and in 1830 constructed the first locomotive in America. He then estab. a factory in New York, and a furnace in Pennsylvania, and did much work in the laying of the first Atlantic cable. As a philanthropist he founded the Cooper Union, an institute in New York to provide for the education of the poorer people. In 1876 he was an unsuccessful candidate for the presidency.

Cooper, Samuel (1609–72), Eng. miniature painter, *b.* in London, and studied under his uncle, John Hoskins. He painted the portraits of Oliver Cromwell, Charles II., and of most of the celebrated men of the time.

Cooper, Thomas (1805–92), Chartist and poet, *b.* at Leicester. In 1810 he headed the Chartists in Leicester, ed. the *Midland Counties Illuminator*, and lectured in the pottery dists. during the riots of 1842, for which reason he was arrested on a charge of conspiracy and sedition, and imprisoned in Stafford jail for two years. While in prison he wrote *The Purgatory of Suicides*, his longest poem, and *Wise Saws and Modern Instances*, both pub. in 1845. In the following year he pub. *The Baron's Yule Feast*, and a political epic entitled *Condition of the People of England*, in ten books and the Spenserian-tanza. *The Triumphs of Perseverance* appeared in 1847, and his two novels, *Alderman Ralph* and *The Family Feud*, in 1853 and 1855 respectively. After his release from prison he lectured on politics in London, and on Christianity, and wrote *The Paradise of Martyrs* (1873); *Thoughts at Fourscore*, and *Earlier* (1885); and an account of his own life in 1872. See R. J. Conklin, *Thomas Cooper, the Chartist*, 1936.

Cooper, Thomas Sidney (1803–1902), Eng. painter, *b.* at Canterbury. He early began to earn his living as a coach-painter and as a scene painter, and afterwards became a drawing master in Canterbury. In 1831 he settled in London and showed his first pictures at the Royal Academy in 1833, enjoying an unprecedented prolonged career as an exhibitor. His name is mostly remembered for his hundreds of pictures of cattle or sheep. Some of his works are in the Tate Gallery, the National Gallery, and the Victoria and Albert Museum. A.R.A. 1845, R.A. 1867.

Cooperage: 1. The term applied to the system carried on by Dutch and other foreign vessels called coopers about the middle of the nineteenth century, of illicitly selling drink and tobacco to the fishermen of the North Sea. The six fishing powers at the international conference at The Hague, 1887, prohibited the sale of spirits in the North Sea, and in 1888 the North Sea Fisheries Bill was passed by the Brit. Gov., prohibiting the sale of spirits to fishermen. 2. An anct. craft, being known to and practised by the Romans. It is the name given to the

art of making barrels and vessels of a similar shape, which are constructed by means of curved staves fastened together by means of hoops, each stave being widest in the centre and tapering towards each end. There are sev. branches of the industry, and for each branch special coopers are employed. The wet cooper makes casks and barrels for holding liquids, and he is the most skilled of all the coopers; the dry cooper makes vessels for holding dry goods; and the white cooper makes such utensils as churns, pails, and washing-tubs, where the sides are usually straight and not curved as in the cases of casks and barrels. Machinery is now largely employed for making barrels.

Co-operation. The term, which means literally working together (Lat. *co-*, *cum*, with, and *opus*, work), is used first in a general way for any combination in production or sharing in work; it is thus, in economics, almost a synonym for 'div. of labour,' but this, the narrower sense, is mainly secondary. When we speak of C., or of the co-operative movement, we mean the system of a combination of producers and consumers for selling and buying in common, and reaping the profits from so doing, as opposed to the ordinary competitive system. It should be pointed out that the term co-operative society means rather different things in the minds of different persons using the term, each associating it with the particular kind of society with which he happens to be familiar. To the inhab. of the United Kingdom it means the Co-operative Wholesale Society, and a large number of distributive stores all over the country; to the Dane it means probably a dairy or a society for the sale of what he describes as breakfast table goods; to the Canadian a wheat pool; to the Amer. a gigantic organisation for the marketing of fruit; and to the inhab. of any part of the Brit. colonial dependencies it probably means a rural credit society on a modest scale. The various economic objects with which co-operative societies have been concerned are manifold. Three, however, of the most important types of co-operative societies have been co-operative credit societies, co-operative marketing societies, and consumers' co-operative societies. The co-operative ideal is succinctly laid down in the motto 'Each for all, and all for each,' and claims to take a middle ground between the state regulation of Socialism on the one hand and the competitive, individualistic system of society as it exists on the other. Apart from its ideals and its force as a solution of social and economic difficulties, the system and movement may be best understood from a brief sketch of its hist. In 1799 Robert Owen estab. his co-operative communistic cotton-mills in New Lanark, Scotland, and till 1828 their success was undoubted. Owen's theory of establishing self-supporting communities, based on an ideal co-operative system, was tried practically in sev. places, but each in turn collapsed, and New Lanark itself

broke down, mainly through religious and other dissensions. In 1844-45 was opened in Rochdale, Lancashire, the first of the modern co-operative stores, the Rochdale Equitable Pioneers. In a small shop started by a handful of poor weavers; the society still exists with a membership of over 15,000, and a large turnover. It is this type of C., the distributing or consumers' society, which has progressed most, at any rate in Great Britain. The main lines on which such a co-operative society is run are as follows: Any one may become a member by taking up one or more £1 shares, payable out of the dividend, with a nominal 1s. entrance payment. No member may hold more than £200 in shares. All goods are sold at the current retail prices, having been bought at wholesale prices or produced from the co-operative factories. The profit, after paying 4 to 5 per cent on capital and the expenses of the stores, is divided quarterly or half-yearly at so much per pound of money spent in purchases, which is paid on the purchasers' tokens or vouchers. This is the co-operative rebate, or, as it is familiarly called in the N. of England, the 'div'. The Eng. societies confine the profits to the consumers. The Scottish reserve a proportion for the employees. Many societies, especially some of the large ones of the N. of England, spend a proportion of their profit in educational and other institutions. Linked with these are many co-operative producing societies, some independent, others forming part of the distributive societies. A federation of co-operative societies was founded in 1863, and called the Eng. Wholesale Society. It is a federation of co-operative societies, none other being allowed to become shareholders or purchasers. Each society takes up one £5 share for every five members. The society produces practically all the staple commodities. It owns steamships, tea plantations, and has a wide system of international purchasing. Its insurance branch is an approved society under the Insurance Act.

The central propagandist body of C. is the Co-operative Union, founded in 1869, which holds an ann. congress and issues yearly the fullest statistics (address: Holyoake House, Manchester). Here, too, is the co-operative college, a residential college for adult education. The Scottish Wholesale Society was started in 1869 on similar lines to the Eng. society, but it admits its employees to collective membership on certain terms. C. in other countries has taken various forms, and on the European continent is very largely agric., and based on the rendering of credit easily available, by means of credit banks, etc. In the U.S.A. the co-operative movement is chiefly centred in building societies, which in Great Britain are considered outside the co-operative movement. There is an International Co-operative Alliance for the promotion of C. throughout the world. It is a federation of co-operative organizations in Great Britain, together with nearly all the continental nations, Canada,

and the U.S.A. It holds international congresses in various cities. As has been said, credit banks and credit societies are a prin. feature of continental co-operation, especially in pre-1939 Germany. Of these there are two main types, the Raiffeisen and the Schultze-Delitzsch banks. The first type was started in Rhemish Prussia by F. W. Raiffeisen in 1849. This was a loan bank at Flammersfeld, which was a combination of peasants borrowing money on their joint responsibility, and lending it to individual members at an increased rate of interest. The Schultze-Delitzsch banks were started in 1850 by F. H. Schultze of Delitzsch, Prussia, and were for townspeople, artisans, and craftsmen. They were not confined to localities as the Raiffeisen banks, and tended very much to ordinary banking business, especially after the co-operative bank was amalgamated with the Dresdner bank in 1903. As a political and social and economic movement, C. has not played the part hoped for by its supporters. It has tended, especially in Great Britain, to be a consumers' movement, but its direct benefits to its individual members have been great. In the past forty years, consumers' C. in Great Britain has made consistently good progress, but that of producers has been a comparative failure. Efforts to co-ordinate the interests of consumer and producer by so developing C. as to make one kind of society serve the interests of both have up to now been unsuccessful. C. of consumer has been particularly successful in the form of co-operative trading societies. The characteristic feature of these societies is that the interest on the share capital is limited to a fixed rate, and the control of members is not enhanced in proportion to their share capital. After payment of interest on capital, trading proceeds go back to the purchaser in proportion to the value of what he has purchased. Alternatively, members may elect not to take their interest and dividends, but to allow them to accumulate, and thus yield more working capital for the society. Large reserves are accumulated, with the result that consumers' C. makes marked progress even against strong outside competition.

In Great Britain there are over 1100 retail societies and three wholesale societies, and also more than a hundred productive associations controlled by consumers. The retail societies in 1939 had a total membership of 8,000,000, with a share capital of £148,500,000. Their sales in 1937 were over £240,000,000, and the surplus on the year for distribution was £29,685,000, of which £5,000,000 was disbursed as share interest and £22,953,000 as dividends on sales. Sales by the wholesale societies amounted to £143,505,000 in the same period; and those of the productive societies to £8,021,000. The co-operative movement employs nearly 300,000 persons, with an ann. salaries and wages bill (1938) of £40,000,000. Of these totals about two-thirds are in respect of distribution and

one-third production. The outstanding productive operations in the retail societies are baking and slaughtering; and in the wholesale societies, milling. The net value of productions created within the co-operative movement (i.e. after deducting cost of materials) in recent years, is the equivalent of one-sixth of the computed wholesale value of goods sold by the retail societies (statistical returns of registrar of friendly societies). A development of Brit. C. is the banking dept. of the co-operative society, which was opened as the deposit and loan dept. in 1872. It now keeps current accounts for over 1000 co-operative societies, more than 5000 trades unions, trade union branches, and friendly societies, and over 2000 working-men's clubs and other mutual organisations. The Soviet co-operative movement does not aim, as elsewhere, at the elimination of the middlemen's profits by joint purchase from producers; but it has many sides, for there is C. in agriculture, in handicrafts, in banking, and in foreign trade. The Soviet type of C. is very different from C. in Britain in its relation to the consumers; whence it would be fallacious to draw inferences from the fact that of the world co-operative membership of 150,000,000 some 60,000,000 are to be found in Russia. It is curious to note that from 1930 a system of State trading was gradually founded on the basis of single-commodity shops (e.g. textiles, hardware), and while the retail trade done by the State was progressively increased, that of the co-operatives has diminished; and, again, the abolition of urb. co-operative trade in 1935 drove the co-operative movement from the tax, without, however, solving the problem of organising urb. distribution. (See H. Baron, *Co-operation in the Soviet Union*, 1946.)

There are some successful types of co-operative societies in some of the Brit. colonial dependencies, but for various reasons (mainly rural indebtedness) co-operative credit societies are the type which has hitherto played the most important role in the co-operative movement in the colonies. In most colonial dependencies consumers' societies have played little if any part at all. The Brit. Gov. has now introduced an ordinance to provide for the formation of co-operative societies in the colonies, and to regulate their operations. The home gov. is of the opinion that the movement can be encouraged and assisted by the local govts., the two essentials being the appointment of an officer of the colonial gov., usually called the registrar of co-operative societies, charged with the duty of guiding and assisting the development of the movement, and, secondly, there should be the appropriate legal framework for the movement in the form of a co-operative societies' ordinance. For agric. co-operation see AGRICULTURAL CO-OPERATION. See also CO-PARTNERSHIP, SALESOUT. See P. Redfern, *The Story of the C.W.S.*, 1913, 193; E. G. Mears the M. O. Tobriner, *Principles and*

Practices of Co-operative Marketing, 1926; F. Hall and W. P. Watkins, *Co-operation*, 1934; G. D. H. Cole, *The Life of Robert Owen*, 1930; N. M. Kallen, *The Decline and Rise of the Consumer*, 1936; A. Orne, *Co-operative Ideals and Problems*, 1937; K. H. Campbell (Joint Registrar, co-operative credit societies, Ceylon), *Memorandum on Co-operation in the Colonies* (Colonial Office), 1944; N. Baron, *Co-operation in the Soviet Union*, 1946; *The Co-operative Movement in the Colonies* (Colonial No. 199, H.M.S.O.), 1946; and Hebe Spaul and D. H. Kay, *The Co-operative Movement at Home and Abroad*, 1947.

Cooper's Creek, or Barcoo River, rises in Queensland, Australia, and flows S. for some distance, then takes a westerly turn and flows by means of a delta into Lake Eyre. In the dry season it usually dries up, but in the rainy season there is a series of detached pools and lagoons.

Cooper's Hill, ridge on the borders of Surrey and Berkshire, England. C. H. College was estab. there in 1871 as the Royal Indian Engineering College, and in 1885 a school of forestry was attached. The whole estab. was, however, closed in 1906. C. H. is the scene of Sir John Denham's best-known poem pub. in 1642.

Cooperstown, vil. in New York State, co. seat of Otsego co., made famous by Fenimore Cooper (see his *Correspondence*, ed. by his grandson).

Co-ordinates of a point are the length of two adjacent sides of a parallelogram formed by drawing straight lines from the point parallel to two fixed intersecting straight lines called the axes. The use of C. forms a branch of mathematics called *Analytical Geometry*, which consists of the application of the principles of algebra to geometry. Arithmetic and algebra are concerned with counting, and to this end certain symbols are used which are looked on as representing certain quantities. The symbol 4, for instance, represents the quantity obtained by the process $3+1$. We may think of a number in three different aspects: first, as the symbol, which is simply a mark on a piece of paper; second, as the concrete number, when we imagine such objects as three cows, three shillings, etc.; third, as the abstract number, when we look on the mathematical quality which is common to such different collections of objects as three cows, three horses, three shillings, etc. In arithmetic we perform operations with abstract quantities which are quite capable of a concrete interpretation; the use of the abstractions simply conduces to economy of time. Similarly, in algebra, where x and y represent certain numbers, it is quite allowable to suggest that they may mean x times and y times a given unit. Descartes extended this notion to geometry, suggesting that numbers may be represented by distances; if a unit of length is fixed on, it is obvious that any whole number can be represented by a line containing the unit the requisite number of times, while fractions may be obtained by dividing the unit into the number of parts indicated by the denomi-

nator, and taking as many of those parts as are shown by the numerator.

The first necessity of this form of algebraical geometry is to provide a means of indicating the position of a point. If we wished to indicate the position of a nail in a wall, we could do so by measuring its shortest or perpendicular distance from the floor, and its perpendicular distance from one end of the wall. Armed with these two distances, it would always be possible to re-establish the position of the nail. Descartes, therefore, chose two straight lines intersecting at right angles, to which the position of all points must be referred. The straight lines are called axes; the distance of the point to

the right of the vertical axis and its distance above the horizontal axis are called its *co-ordinates*, the former distance being called the *abscissa* and the latter the *ordinate* of the point. The settlement of the direction in which the distance is to be measured at once gives a meaning to negative numbers. The symbols -2 , -3 are equivalent to the commands subtract two and subtract three, and are therefore not capable of concrete demonstration in arithmetic unless there are given certain greater quantities from which two and three have to be subtracted. In geometry, however, a distance measured in the opposite direction to that settled as constituting the distance of the point from the axis is looked upon as negative. Thus a point three units to the left of the vertical axis has an abscissa of -3 , and a point three units below the horizontal axis has an ordinate of -3 . The point of intersection of the axes is called the origin, and is denoted by the letter O; the symbols x and y are used to represent the abscissa and ordinate respectively, the abscissa always being named first. Thus the C. of P are known if the distances MP and NP are known. Suppose $MP=a$ and $NP=b$ then the C. of P are (b, a) , those of P_2 are $(-b, a)$, those of P_3 are $(b, -a)$, those of P_4 are $(-b, -a)$; the C. of M are $(b, 0)$, of M_1 are $(-b, 0)$, of N $(0, a)$, and of N_1 $(0, -a)$. The C. of the origin are $(0, 0)$.

When the C. of two points are known, the length of the straight line joining the points can be calculated. If the straight line is oblique with respect to the axes, it may be made the hypotenuse of a right-angled triangle with a horizontal side $=x_1-x_2$, and a vertical side $=y_1-y_2$. From the property of right-angled triangles, which states that the square on the hypotenuse is equal to the sum of the squares on the sides containing the right angle, we get the length of the hypotenuse equal to the square root of $(x_1-x_2)^2 + (y_1-y_2)^2$. The square on the hypotenuse may be an irrational quantity; that is to say, its square root cannot be expressed by multiplying the unit by a definite number or fraction. It is to be observed that such symbols as x^2 , y^2 , etc., although they appear to represent areas, may actually represent length of lines.

As the distance between two points in a system of C. can be computed, so can the area of any figure bounded by straight lines. Such a figure can be cut up into right-angled triangles and trapeziums whose areas are readily found.

In analytical geometry rectangular axes are most commonly used, but oblique axes are also employed. There is yet another method by which the position of a point can be indicated by two measures. In the system of *polar C.* a fixed straight line called the initial line is taken, containing a fixed point called the pole. The position of any point can be defined by the measurement of its distance from the pole, and of the angle which the direction of the line joining it to the pole makes with the initial line. The first C. is called the *radius vector*, and the second the *rectorial angle*. Polar C. may be changed into Cartesian C. by making use of the trigonometrical ratios of the vectorial angle.

So far we have dealt with the positions of fixed points with reference to C. If a point is made to move under certain conditions, e.g. that its distance from a fixed point remains constant, it describes a path which is known as its *locus*. In the example given the locus is the circumference of a circle having the fixed point as its centre; again, the locus of a point moving at a constant distance from a fixed straight line is a straight line parallel to the fixed line. When a point moves, one or both of its C. will vary in a manner determined by the given conditions. Such C. are known as *current C.* If a point moves in such a manner that its abscissa is equal to its ordinate, its locus will be a straight line passing through the origin and bisecting the angle between the axes. The relation between the C. is expressed by saying $x=y$, or $x-y=0$. Conversely we say that the algebraical equation $x-y=0$ is graphically expressed by the straight line bisecting the angle between the axes. Now take any equation of the general form $ax+by=c=0$, or, say, the particular instance $x^2+2y-2=0$. For any value of x that may be taken there is one value for y ; e.g. when $x=1$, $y=1$, and when $x=4$, y must equal -1 to satisfy the equation. If points are marked out

with their abscissæ measured by x and their ordinates measured by the corresponding values of y , it will be found that they all lie upon the same straight line. Therefore $ax+by+c=0$ is said to be the general form of the equation of the straight line.

Equations showing relations between two quantities x and y which involve the second degree of those quantities give two values of y for each value of x , and if the points thus determined are joined, the line thus indicated is a curve. Therefore, equations of the general form $ax^2+bx+cy^2+dx+ey+f=0$ determine curves which are found to be similar to those obtained by cutting a cone by a plane in different directions. The types of these conic sections are the *parabola*, the *ellipse* (of which the circle is a particular instance), and the *hyperbola*, and the nature of the curve is determined by the nature of the co-efficients, a, b, c, d, e, f .

We have dealt so far with points on a plane, and the determination of their position with reference to axes in that plane. Any point in space may be determined by three C. Instead of axes of reference we now have planes of reference, and these are generally disposed at right angles, two and two. There are, therefore, three lines of intersection passing through a common point, the origin. In rectangular C. the distances are measured to the right of one plane above another, and in front of the third. Distances in the opposite direction to these represent negative quantities in each instance. Polar C. may also be used to denote the position of a point in space. These have special applications in astronomy, a simple instance being the determination of the position of a point on the surface of the earth. The point of origin is the centre of the earth, and the quantities required to fix the position of a point are its distance from the origin, the angle formed by this radius vector with the equatorial plane, and the angle formed by the radius vector with a given plane at right angles to the equatorial plane and passing through the origin. The distance of the point from the origin is the radius of the earth, and is therefore the same in all cases; it is sufficient, therefore, to give the angular distance from the equatorial plane, or *latitude*, and the angular distance E. or W. of the plane of the meridian at Greenwich, or *longitude*. See D. M. Y. Somerville, *Analytical Geometry of Three Dimensions*, 1934; A. Robson, *An Introduction to Analytical Geometry*, 1940.

Coorg, prov. on the E. slopes of the W. Ghats and to the S.W. of Mysore in India. It is traversed by spurs from the W. Ghats and watered by the R. Cauvery. Much of the surface is covered with forests, and in the valleys the people are engaged in agriculture, and coffee (40,000 ac.), rice, cardamoms, and cinchona are grown. The natives, a branch of the Dravidians, are sturdy intelligent people and speak a language akin to Kanaroso. The administration of justice is vested in judicial commissioners. The cap. is Merikara. C. came under Brit. control in

1834, when, at the wish of the inhab., the reigning rajah, a cruel tyrant, was deposed. In 1881 the resident in Mysore became the chief commissioner for C. but with effect from July 1, 1940, a separate chief commissioner was appointed with headquarters at Merikara. A legislative council of twenty was created in 1924. The area is 1590 sq. m., and the pop. (1941) 168,700 (of whom 135,000 are Hindus, Muslims numbering 16,000).

Coornhert, Dirck Volckertszoou (1522-1590), Dutch scholar and copper engraver, b. at Amsterdam. In 1564 he became tn. clerk of Haarlem, where he had settled as a copper engraver. Taking part in the struggle against Sp. rule in 1566, he drew up the manifesto of William of Orange and was imprisoned at The Hague by the Spaniards in 1568, but escaped to Cleves, where he found a living as an engraver. Recalled in 1572 he became secretary of Holland in the service of William of Orange for a short time, but his dislike of war drove him back to Cleves, where William continued to employ his services. His chief prose work is *Ethica*, that is the *Art of Well Living* (1586). Author of trans. into Dutch from Cicero, Seneca, Boethius, the *Odyssey*, and Boccaccio; but his Dutch version of the N. T. from the Lat. of Erasmus was never completed. Credited with great influence in establishing the literary language of Holland.

Coorong, The, arm of salt shallow water near the mouth of the R. Murray, S. Australia; it is about 100 m. long, and 2 m. broad, and is separated from Encounter Bay (36° S., 139° E.) by a narrow isthmus.

Coot, water-fowl, slate-grey below, sooty black above, with a white bill joining a white patch on the forehead. It has four toes, not fully webbed. In coloration the sexes are alike, but the male is slightly the larger. They are widely distributed on inland waters in the Brit. Isles. Their nest is built on water-plants and is made of dry rushes. The eggs are stone colour with brown specks, and are about 2 in. long.

Cootamundra, tn. in Harden co., New S. Wales. Wheat of an excellent quality is grown in the neighbourhood. Pop. 4000.

Coote, Sir Eyre (1726-83), soldier, b. in the co. of Limerick. He entered the army at an early age, and went to India in 1754. While there he urged Clive to fight the battle of Plassey, defeated the Fr. at Wandiwash, and by his capture of Pondicherry in 1761, completely overthrew the Fr. in India. On his return to England he was knighted. In 1779 he returned to India as commander-in-chief and defeated Hyder Ali at Porto Novo in 1781, and so saved Madras for the second time.

Copaiba, or Copaiwa, oleo-resin; its two chief constituents being resin and volatile oil. This substance is a secretion of trees which are natives of the W. Indies and Amazon valley. Each tree yields a large quantity of the oleo-resin, so much

sometimes that it bursts the trunk with a loud noise. It is characterised by an aromatic odour, which is not at all unpleasant, and by a bitter taste. Its chief property is its power of acting on the mucous membrane and it is used very largely in cases of chronic catarrh. It has also diuretic and laxative properties. C. is often adulterated, generally with castor oil, sometimes with other oils.

Copais, or **Topolias**, marshy lake of Boeotia in Greece. This former marsh, which was enclosed by mts. on all sides, has been drained by a series of tunnels cut in the mts., thus conveying the waters of the K. Kephisso into two adjoining lakes and into the channel of Atalante.

Copal, resinous substance obtained from trees and used in making varnishes. It is usually of a light yellowish colour, generally transparent, is found in pieces which are round in shape, and is brittle. It is partially soluble in oil of turpentine, but to be entirely so it has first to be heated, which process it undergoes before being dissolved in this oil or linseed oil for producing varnishes and lacquers. It is found in the E. Indies, S. America, and Africa. Copal *arabum* is made from various kinds of C., heated and mixed with oil of turpentine or linseed oil, both of which dissolve it.

Copalchi Bark, obtained from a shrub of Mexico and Central America, the *Croton pseudo-China* or *niveus* (Euphorbiaceae), allied to the cinchona. It is used as a febrifuge, as a substitute for quinine.

Copán, vii. in the state of Honduras on the C. R. in Central America. Its ruins, consisting of a temple, truncated pyramids, monoliths with carving and hieroglyphics, testify to its former magnificence. Even at the time of its conquest it was a large city, but it is now only a vil. situated in a very mountainous dist.

Co-parceners (Co-partitioners): (1) At common law female co-owners claiming title by descent to an estate, of inheritance in land, or co-owners of either sex claiming title *through females*: less frequently (2) by custom tenants in gavelkind (see GAVELKIND). As to (1), if a man dies intestate, leaving females as his next heirs, those take his freeholds of inheritance equally, for the rule of primogeniture does not, generally speaking, apply to females. If A dies leaving three daughters, B, C, and D, his heritable lands go to B, C, and D equally as C; if B be dead leaving two sons E (the elder), F, and a daughter G, and if D be also dead leaving a daughter H, then E, H, and their aunt C will now be C. In all cases where sev. females take one inheritance by descent they are called **parceners**, or C. If there be a title or dignity descendable to heirs of the body, the lands belonging to it may descend to C., but the dignity falls into abeyance. The descent of the crown is an exception to this rule; for if there are sev. daughters, sisters, etc., and no male heir, the crown with all its co-parcenary, or the common ownership by C., could be severed by (1.)

a partition suit in the chancery div., (II.) by the whole estate becoming vested in the sole ownership of one of the C., (III.) by one co-parcener alienating her share to a third person. Partition could always be compelled by a co-parcener. This form of tenure has now been abolished, though a knowledge of its incidents and implications is required by lawyers in tracing title.

Co-partnership, Labour, is commonly defined as consisting chiefly in the practice of profit-sharing and ownership-sharing. Profit-sharing, however, is not synonymous with co-partnership. The reality of L. C. will not necessarily be found wherever the practice of profit-sharing may prevail. The difference is clear from the objects of the L. C. Association, which was founded in 1884 'to bring about an organisation of industry based on the principle of Labour Co-partnership, that is to say, a system in which all those engaged shall share in the profit, capital, and responsibility.' The first essential to the right application of co-partnership methods is a new orientation of ideas, but while the protagonists of capital and labour continue to live in an atmosphere of class war, and trade union leaders make no genuine attempt to secure co-operation between capital and labour, L. C. can never achieve any progress. In 1910 there were 121 firms with co-partnership schemes, employing 57,000 participants; the present total is but little over 300, with 200,000 participants, and the tendency is for these figures to decrease. The chief industries with co-partnership schemes include about sixty gas, water, and electricity supply firms, with over 40,000 participants; about forty metal, engineering, and shipbuilding, with 20,000; fifteen glass, chemical, and soap firms, with 30,000; and a few financial firms, with 30,000 participants. But less than half of the total employees participate in the schemes. These statistics, however, take no account of the co-operative societies which have their own profit-sharing arrangements (see under CO-OPERATION).

Cope, Sir Arthur Stockdale (1857-1940), painter, chiefly of portraits, but also of landscapes; son of Charles West C., R.A. Educated at Norwich and Wiesbaden. Studied art at Carey and Royal Academy schools. From 1876 he contributed in the Royal Academy, and painted the portraits of King Edward VII., the last Ger. emperor, the archbishop of Canterbury, Lord Kitchener, the duke of Cambridge, King George V., the Prince of Wales, the lord chief justice, Lady Hickman, Viscount Knutsford, and many other celebrated people. His 'Some Sea Officers of the Great War' is in the National Portrait Gallery. Two honourable mentions at the Paris Salon, gold medal, and Prix Rosa Bonheur. He became R.A. in 1910, and was made K.C.V.O., 1927.

Cope, Charles West (1811-90), Eng. artist. Many of the frescoes in the House of Lords, both water-glass and otherwise, are his handiwork. His other works consist of paintings and frescoes of an historic and romantic nature.

Cope, Sir John (d. 1760), Brit. general. The date of his birth is uncertain, but he was apparently knighted before 1742, the year in which he was sent with an army to aid the queen of Hungary. He is chiefly memorable for his defeat at Prestonpans (Sept. 21, 1745) by Prince Charles, the young pretender.

Cope (Lat. *cappa*), vestment worn by priests in the Lat. Church at processions and vespers, but not at mass; in the Gk. Church by bishops and archimandrites only; and in the Armenian Church by the celebrant at mass. In the Church of England the C. forbidden in 1552, was by the twenty-fourth canon of 1603 directed to be worn by the celebrant at Holy Communion in cathedrals and collegiate churches. It is now usually worn by the priest at coronations. It is in the form of a cloak with a hood, but without sleeves, reaching to the ground, and fastened at the neck with a clasp or morse, often embroidered.

Copeck, see **КОПЕК**.

Copenhagen (Dan. *København*), cap. of Denmark, and a flourishing city and seaport, which contains one-fourth of the whole pop. of the country. Its name signifies 'Merchants' Haven'. This city is situated in the Sound and covers part of two is. The greater part of C. is situated in the is. of Zealand and occupies the E., whilst the smaller and more modern part

is situated on the is. of Amager, and occupies the N. The two is. are connected by the bridges Langebro and Knippelsbro. The portion of C. in the is. of Amager is called Christianshavn. There are many outlying suburbs of C. in the is. of Zealand, principally Østerbro, Nørrebro, Vesterbro and Frederiksberg. The outlying suburbs in the is. of Amager is Amagerbro. The prin. public square of C. is Kongens Nytorv, commanding a central position and facing the entrances to twelve streets. There is a colossal statue of Christian V. in the centre of the square. Two important buildings, the palace of Charlottenborg and the Royal Theatre (viz. the national theatre), face the square. Two statues of the great national writers, Holberg and Øhlenschläger, stand in front of the theatre, whilst inside among other sculptures is the relief figure of 'Ophelia' sculptured by Mme Sarah Bernhardt. Østergade is the centre of the most fashionable shops, and Bredgade the main street of the court, nobility, and legations. A portion of the old tn. of C. is cut off by artificial waterways and is called Slotsholm or Castle Is. Here are many important buildings to be seen, such as Christiansborg Palace, which is the seat of the gov. and the Rigsdag (Parliament), the royal library (containing 950,000 vols. and 35,000 MSS.) and the Thorvaldsen Museum—here, in an open court, lies the tomb of the famous sculptor, and here are some of the finest examples of his statuary to be seen. The cathedral church, the Vor Frue Kirke (Church of Our Lady), lies in the heart of C., N.W. of Slotsholm, and is adorned with works of sculpture by Thorvaldsen, including the celebrated 'Twelve Apostles.' Not far from the church lies the univ., founded in 1479. It is a State institution, frequented by 6500 students, and possessing a valuable library with free admission to the reading room for everybody. It contains 800,000 vols. Other useful and important institutions and buildings are Denmark's Technical College, the Veterinary and Agric. College, Serum Institute, Seed-controlling Institute, Institute of Technology, College of Commerce, College of Dentistry, State Training College for Teachers, Pinsen Medical Light Institute, Insuline Laboratory, botanical garden, National Museum, Ny Carlsberg Glyptothek or gallery of sculpture, sev. art galleries, the Exchange, National Bank, the Amalienborg Palace, which is the royal residence, the Rosenborg Palace, Frederiksberg Palace, and other palaces. The zoological gardens give free admission to 100,000 school-children and students a year. C. is the one naval station of Denmark and is also the seat of the military command. The free port became the centre of the transit trade of the Baltic and connected by steamship lines with every port on the globe. It is the centre of the air traffic of N. Europe. The broadcasting system is operated by the state. Shipbuilding is carried on, and there are extensive porcelain works. The hist. of C. dates back to about the middle of the twelfth

century, when Bishop Axel built a castle as a defence against the pirates. It was only a small fishing vil. then; in 1254 it obtained the privileges of a tn. and in 1443 it was made the cap. of Denmark. In 1940 the Gers. invaded Denmark, troops being landed at C. and other places from warships and transports on April 9. C. was liberated from the Gers. in May 1945, the first allied troops into freed Denmark being a company of a S. Lancashire parachute battalion, who flew up from Hamburg to form an escort for the allied military mission to Denmark, led by Brit. forces. Pop. (with suburbs), 927,400.

principally to the study of astronomy under Brudzewski. He soon abandoned his early idea of taking holy orders, and went as Polish student to the univ. of Bologna, where he studied canon law. In 1500 he himself lectured on mathematics at Rome with great success. After a short visit to his native land he went in the next year to Padua, where he studied medicine. In 1505 he finally left Italy, and went to spend six years at his uncle's physician at the castle of Heilsberg. On the death of Lucas in 1512, C. went to Frauenburg, where he had been nominated canon of the cathedral in 1497. Though he never took orders, his activities in this capacity

Danish Tourist Bureau
COPENHAGEN—KONGENS NYTORV

Copenhagen Fields, N. London dist. which in old days was often the scene of huge public demonstrations. Thus on Oct. 26, 1796, and again on April 21, 1834, great meetings were held there in favour of trade unionism. The Caledonian Market (q.v.) is built on the fields.

Copenick, see KÖPENICK.

Copepoda (Gk. *κοπή*, oar; *πόδι*, podos, foot), order of Crustaceans which receive their name from the fact that typically they bear five pairs of swimming feet. They are to be found in both fresh and salt water. The free-swimming forms have always a large head, and the body ends in a caudal fork. Some of the species are phosphorescent. *Cyclops* is a well-known fresh-water genus, and *Lonchidium* is parasitic on the gills of sharks.

Copernicus, Nicolaus (1473-1543), founder of modern astronomy, b. at Thorn, in E. Prussia, then a part of Poland. After the death of his father in 1483, Nicolaus was practically adopted by his uncle, Lucas Watzelrode, afterwards bishop of Ermland. In 1491 he matriculated at the univ. of Cracow, and gave himself up

were multiform, and all his knowledge was freely laid at the disposal of the diocese. However, till the end of his life astronomy was his favourite study; and in spite of his busy life, he found time to perfect at Frauenburg the system of which he had already laid the foundation at Heilsberg. His great theory was broached in 1543 in the *De Revolutionibus Orbium Coelestium Libri VI.*, pub. at Nuremberg, and dedicated to Pope Paul III. This work demonstrates the theory, already hinted at by the Pythagorean philosophers, that the sun is the centre of the planetary system, and that the earth and the planets revolve round it. Kepler, Galileo, and others developed the system, until it was completed by Newton. According to Prof. Herbert Dingle the course of C.'s thought has been traced out by the Polish scholar, Wronkumajer, from marginal notes and amendments on the MS. of *De Revolutionibus* itself, and where observational facts failed C. supplied them himself, with an instrument of his own making, though he was essentially a thinker rather than an observer. C.

had been at work for more than thirty years before at last agreeing to the publication of his work. This was not, as is often supposed, because he feared that his work would be condemned as heretical, it was rather that the idea on which his system depended, appeared at that time so incredible that only those with an intimate knowledge of astronomy could be expected to entertain it for one moment. He was at last persuaded to publish by the earnest solicitations of many friends, including Schonberg, cardinal bishop of Capua, and Tiedemann Giese, bishop of Culm, as well as his young pupil Rheticus, who obtained permission to issue an account of the new system under the title, *Narratio Prima de Libris*

NICOLAUS COPERNICUS

Engraving after a picture in the possession of the Royal Society, presented 1776.

Revolutionum. This was the first printed work on the Copernican theory and, the resulting ridicule being less than C. had feared, he consented to the pub. of his own *magnum opus*. The pope, Paul III., accepted the dedication of the work to himself. *De Revolutionibus* represents a complete reformation of astronomy; the discovery of the true form of the planetary orbits by Kepler, and the conception of universal gravitation by Newton, would have been impossible without the preliminary heliostatic viewpoint which C. estab. The immediate effects, however, in the sphere of philosophy and theology were not conspicuous. Generally speaking, the reaction was favourable in Rom. Catholic circles but contemptuously antagonistic among the Lutheran reformers. There was no question of persecution or suppression, and it was only when new philosophies arose that the trouble began. When the notion of an infinite universe was advanced by Bruno it was realised that the work of C. had

removed the previously fatal objection to it; and when the removal of Bruno was followed by the discoveries and irrefutable polemics of Galileo, the time had come to deal with the evil at its source. *De Revolutionibus* was denounced by Luther and Melancthon as contrary to the truth—an opinion held by the popes from 1616 to 1757 with the result that it was placed on the Index and not removed from it until 1835. In the almost complete destruction of national monuments in Warsaw during the Second World War, the statue of C. by Thorwaldsen was spared. The inscription 'Nicolaus Copernicus: his Fellow Countryman,' had been changed to 'Nicolaus Copernicus: the German Nation,' on the assumption that C. could be regarded as being of Ger. descent. But this disfigurement was removed with the restoration of the memorial to the Polish people. (Prof. Herbert Dingle, 'Copernicus, 1473-1543,' *Spectator*, May 21, 1913). See L. Prowe, *Nicolaus Copernicus: Leben und Urkunden*, 1833-84; A. Armitage, *Sun, Stand Thou Still, the Life of Copernicus*, 1948.

Copertino, com in the prov. of Lecce, 25 m. W.N.W. of Otranto in Apulia, Italy. Pop. 10,000.

Copiapó: 1. Riv. in Chile, S. America. It has a length of 155 m. and a drainage area of 1170 sq. m., and reaches the Pacific 35 m. beyond the tn. The irrigation of the surrounding country and the water supply of the tn. depend wholly on this riv. 2. Tn., cap. of the prov. of Atacama, Chile, 1300 ft. above the sea. A desert oasis on the riv., it was formerly a prin. centre of Chilean mining, especially silver and copper, but has greatly declined of late. Pop. about 10,000.

Coping, term applied to the cap or top course of a wall sloping to shed water. There are three kinds of C.: feather-edged C., when the wall has edges of unequal thickness; parallel C., when the wall has a flat C.; and saddle-backed C., when the C. of the wall is thicker in the middle than at the edges.

Copland, James (1791-1870), Scottish physician, visited W. Africa and lived in London from 1820. He is chiefly remembered for his stupendous *Dictionary of Practical Medicine* (1832). For some time he ed. the *London Medical Repository*.

Copley, John Singleton (1735-1815), Amer. historical painter. b. at Boston, Massachusetts. Studied at Rome, 1774, and came to England; made Academician in 1783. He was the father of Baron Lyndhurst (q.v.). His best-known paintings are: 'Death of Chatham' and 'Death of Major Pierson.'

Coplin, William Michael Late (1864-1928), Amer. physician, b. at Clarksburg, W. Virginia. Prof. of Pathology, Jefferson Medical College, for nearly thirty years from 1896. Director of the Dept. of Public Health and Charities, Philadelphia, 1905-7. Medical director, Jefferson Hospital, 1907-12. Author of *Text-Book of Practical Hygiene*, and of a *Manual of Pathology, including Bacteriology, the Technique of Post-mortems*, and

Methods of Pathologic Research, fifth ed. rewritten and enlarged, 1912.

Copparo, tn. in the prov. of Ferrara, Italy. It has silk industries. Pop. (com.) 23,000.

Coppée, François Édouard (1842-1908), Fr. man of letters, began his literary career by writing poetry, but in later years chose to use the play and the short story as the vehicle for the expression of his ideas. At first a clerk in the Ministry of War and for some time dramatic critic to *La Patrie*, he acted from 1878 to 1881 as archivist of the Comédie Française, giving up this position on his election to the Academy. Although he had no opinion of the machinery of democracy, he allied himself with the violent Nationalists, actively opposed Dreyfus, and helped to found the notorious Ligue de la Patrie Française. In his numerous collections of poetry, including *Intimités*, *poèmes modernes* (1867-69), *Olivier* (1875), his only long poem, and *Poèmes et récits* (1886), may be found many delightful illustrations of his lyrical gifts, and especially of his skill in writing Parisian elegies and idylls. Of his plays, *Le Passant* (1869) and *Les Bijoux de la veuve*, the latter of which was inspired by the disastrous war of 1870, met with a hearty reception; but *Madame de Mautenon* (1881), *Les Jacobites* (1885), and *Pour la couronne* (1895) are his more ambitious metrical dramas. In a series of short stories entitled *Toute une jeunesse* he endeavoured to give a transcript of his early emotional experiences, but his gloomy tale *Le Coupable* (1896) has more interest and virility. Though banality of thought and sentiment not infrequently detract from the literary merits of his work, his simple, jealous patriotism, his aloofness from the prevalent style of scientific dissection, and the reality of his sympathy with the sufferings of the poor, are likely long to perpetuate his popularity.

Coppenhall, Monks and Church are two adjoining pars., 5 m. N.E. of Nantwich in Cheshire, England. The former is coterminous with the municipal bor. of Crewe.

Copper (symbol Cu, atomic weight 63.57, atomic number 29) is found as the metal in various parts of the world, chiefly in the neighbourhood of Lake Superior, but also in other parts of America, Cornwall, Siberia, and the Ural Mts. It is also found in combination with other elements, being an abundant element widely distributed. The name is derived from *æs pyrium* or bronze of Cyprus, the Romans having obtained most of their metal from that is. In the form of cuprous oxide (Cu_2O) it is found in Cornwall, S. America, and Australia, and is known as *cuprite* or *ruby ore*. Then again, the mineral *C. glance* is really C. sulphide (Cu_2S), while it is also found associated with sulphide of iron in the mineral *C. pyrites* ($\text{Cu}_2\text{S} \cdot \text{FeS}_2$), and again in the mineral *purple C. ore* ($3\text{Cu}_2\text{S} \cdot \text{Fe}_2\text{S}_3$). The basic carbonate of the metal is also found in the minerals *malachite* ($\text{CuCO}_3 \cdot \text{Cu(OH)}_2$) and *azurite* ($2\text{CuCO}_3 \cdot \text{Cu(OH)}_2$). These are the minerals chiefly

used for the extraction of C. on the large scale, but silicates, phosphate arsenates, and the oxychlorides are also known, and by modern methods the metal may sometimes be extracted from these, especially the silicates.

Methods of Extraction: 1. *Reducing process.*—From those ores which contain no sulphur, such as the carbonates and oxides, the ore may be smelted down in a blast furnace with coal or coke, when the ore is reduced; C. being left and carbon monoxide formed ($\text{Cu}_2\text{O} + \text{C} = 2\text{Cu} + \text{CO}$). 2. *English method.*—With mixed ores containing sulphides the process consists of six stages: (a) The ores (containing on an average 30 per cent of iron and 13 per cent of C., together with sulphur and silica) are calcined in a reverberatory furnace, some of the sulphur passing off as sulphur dioxide, and the metals becoming partly oxidised. (b) The calcined ore is fused, and the C. oxides react on some of the ferrous sulphide, forming cuprous sulphide and ferrous oxide (because C. possesses a greater affinity for sulphur and a smaller affinity for oxygen than the iron). This oxide of iron then unites with the silica, either present in the ore or added, to form a fusible slag, which is run off. That which remains is known as coarse metal, and consists of a mixture of ferrous and cuprous sulphides, containing about 30 per cent of C. This is allowed to flow into water, causing it to solidify in a granular form. (c) The coarse metal is again calcined, with the same effect as in (a) some of the sulphur passing off and the metals becoming oxidised. (d) This is now fused with refinery slag, and produces nearly pure cuprous sulphide, most of the iron passing into the slag, then known as metal slag, which is run off. The remainder after this process is known as fine metal, or white metal, and contains, perhaps, 75 per cent of C. (e) This white metal is then roasted in a reverberatory furnace. Some of the cuprous sulphide is oxidised into cuprous oxide, and this reacts on the cuprous sulphide left as the temp. rises, forming C. ($2\text{Cu}_2\text{O} + \text{Cu}_2\text{S} = 6\text{Cu} + \text{SO}_2$), while any remaining ferrous sulphide is turned into oxide. The metallic C. obtained is now known as blister C. (f) This is then refined by being melted on a hearth in an oxidising atmosphere. The impurities present oxidise first and volatilise off or form a slag with the siliceous matter in the furnace bed, forming a slag which is removed. When the C. begins to oxidise it reacts on any remaining cuprous sulphide, according to the equation above, and at this stage the metal is known as dry C. This is stirred with poles of wood and anthracite thrown on the surface to reduce it thoroughly to the pure metal.

Wet Processes.—(a) *By displacement.* The burnt pyrites obtained from the manu. of sulphuric acid contains from 3 to 4 per cent of C. It is not rich enough to be submitted to the smelting process, but it is ground and intimately mixed with 10 to 15 per cent of common salt. It is then roasted in a reverberatory

furnace, a large amount of the iron being thus removed as ferric oxide, while the C. remains mainly in the form of cupric chloride. This is lixiviated with water and the C. salt goes into solution, and the C. is precipitated from this solution by means of scrap-iron: $\text{CuCl}_2 + \text{Fe} = \text{Cu} + \text{FeCl}_2$.

(b) *Hydro-metallurgical*. Poor ores may sometimes be successfully treated by the hydro-metallurgical system, which consists in allowing the crushed ore to weather in the presence of water. After some months, the C. will have become converted into soluble C. sulphate, which can be run off in solution and the C. extracted by precipitation with iron or by electrolysis. (c) *Electrolysis*: Although this method is sometimes used for obtaining C. from white metal, and even from the ore, yet it is usually employed as a means of refining the already purified metal. Such refinement is necessary for most of the purposes for which C. is used, especially in electricity. Commercial C. refined in this way is one of the purest commercial metals, its purity being about 99.9 per cent. Ingots of the metal are hung in a series of tanks containing a solution of C. sulphate acidified with sulphuric acid. These form the anodes, and thin sheets of pure C. which are also placed in form the cathodes, on which, as the current passes, pure C. is deposited. The impurities pass into solution, unless they are silver and gold, when they settle as a slime on the bottom of the tank. So this method is also used to recover silver and gold, as well as to produce a very pure C., and the value of the precious metals is frequently considerable.

Properties.—It is a lustrous metal with a characteristic reddish-brown colour. This colour, however, is due to a thin film of oxide, and when the film is removed the colour of the pure metal is rosy pink. It is an extremely tough metal, and can be drawn out into a thin wire or hammered into a thin leaf. Small impurities considerably reduce this high ductility and malleability. When heated nearly to its melting-point it becomes brittle and can be powdered. Its sp. gr. is 8.94 (approximately). It is only slowly acted upon by dry air at the ordinary temps.,

but in moist air containing carbon dioxide it becomes covered with a green basic carbonate. Heated in air or oxygen it forms black cupric oxide, which flakes off the surface in scales. When volatilised in the electric arc it gives a rich emerald-green vapour. It is readily acted upon by nitric acid, and while dilute sulphuric and hydrochloric acids slowly attack it in air, strong sulphuric acid, unless heated, has no action upon it. It is an extremely good electric conductor, being second only to silver, and it is therefore used extensively in cables, for electric telegraphy, lighting, etc. It is also used extensively in electrotyping, because of its property of being deposited in a coherent form from solutions of its salts when electrolysed.

Copper alloys may be classified into: (a) Alloys with small proportions of added elements. These include arsenical C., nickel C., and manganese C., all similar in properties to pure C. but of greater strength and elasticity, and on this account used in locomotive engineering; silicon C. and cadmium C., used as hard drawn wire for electrical purposes where strength and hardness are needed together with good conductivity. (b) Soft alloys of high ductility. These include cartridge brass, Admiralty brass, and Dutch metal, used respectively for tube drawing, condenser tubes, and ornamental purposes. (c) Hard alloys of high elasticity. Wrought phosphor bronze is the typical alloy of this class. They are useful where elasticity and resistance to corrosion are required, as in small springs. (d) Alloys for high-speed machining. Alloys containing three parts of copper and two of zinc are suitable for this purpose, being cheaper and stronger than class (b). Muntz metal or yellow metal is used as sheets for ships' sheathing. (e) High tensile brasses containing 50 to 60 per cent of C. and 35 to 40 per cent of zinc, with small additions of aluminium, nickel, or manganese. They are similar to class (d) in general characteristics, but harder and stronger, and do not vibrate under alternating stresses; hence they make good castings for marine propellers and pump rods.

Consumption.

	Production		Consumption	
	1936 Short tons (2000 lb.)	Share of World Production	1936 Short tons (2000 lb.)	Share of World Consumption
U.S.A.	614,971	33.5	808,973	39.1
Chile	282,237	15.4	284,614	13.8
Canada	205,191	11.2	201,721	9.7
Rhodesia	154,337	8.4	141,094	6.8
Congo (Belgian)	105,500	5.7	140,543	6.8
Russia	91,491	5.0	125,001	6.0
Japan	86,672	4.7	82,673	4.0
Total Europe	236,910	12.9	1,032,304	49.8
Grand Total	1,777,309	100.0	2,816,923	100.0

Incomplete statistics for 1946 give totals and percentages not markedly dissimilar to those for 1936, except that production in Chile was 408,000 tons, Rhodesia fell to 129,000 tons, and the Belgian Congo rose to 144,000 tons.

See Copper Development Association. *Copper through the Ages*, 1934; E. D. Gardner, *Copper Mining in North America*, 1938; R. A. Wilkins and E. S. Bunn, *Copper and Copper Base Alloys*, 1943.

Copperas, or **Melanterite**, is ferrous sulphate heptahydrate, and is known also as green vitriol. It is prepared on the large scale by exposing heaps of iron pyrites to the action of air and moisture. The liquor which drains away contains ferrous sulphate and sulphuric acid, and the latter is mixed into ferrous sulphate by adding scrap-iron. It forms pale green monosymmetric crystals, having the composition $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$, and is readily oxidised on exposure to the air. It is used for making ink, for dyeing, and as a dressing for crops.

Copperhead, see MOCCASIN SNAKE.

Copperheads, term of opprobrium applied by men of the N. states of the U.S.A. during the Civil war to fellow northerners who opposed the war policy of the Union Gov. Many of the latter did this because they did not believe it possible to conquer the confederacy. In the later years of the conflict, the term was largely applied to N. Democrats. In the U.S.A. there are two especially deadly snakes, the rattlesnake and the copperhead. The rattlesnake is popularly supposed to give warning when it is about to attack by rattling the cup-like horny attachments at the bottom of its tail, whereas the copperhead is a deadly silent hunter. Hence the popular origin of the term as applied to political opponents.

Coppermine River, riv. 475 m. long, in Mackenzie dist., Canada. The many lacustrine expansions and rapids in its course render it useless for navigation. After a southerly direction as far as Lake Gras, it turns N.W., finally reaching Coronation Gulf, Arctic Ocean.

Copperplate, see under ENGRAVING.

Coppet, vil. on the lake of Geneva, 8 m. N. by E. of Geneva, Switzerland. Here are the ruins of a chateau where Necker and his daughter, Madame de Staël, spent part of their lives. Pop. 500.

Coppice, see COPSE.

Copra, commercial and native name for the sun-dried kernel of the coco-nut, which form a staple export from the S. Pacific is. The coco-nut oil obtained from the kernel is in much demand.

Coprolites, which are frequently used as artificial manure, consist of the petrified droppings of animals, principally of extinct reptiles and fishes. In diameter they vary from about 2 to 4 in., and in composition they have often a large quantity of phosphate of lime. They are most abundant in the shale of the Lias, and in various parts of N. America.

Copronymus, see CONSTANTINE V.

Copse, or **Coppice** (from Gk. *κολαφος* add Lat. *colpore*, to cut, through O.F.

copeis), small plantation of planted or self-sown trees, which are periodically cut over before they become timber-trees, either to beautify the landscape or more often for commercial reasons. Oak C. is valuable for making wheel-spokes, etc., ash for hurdles, hoops, and the handles of implements; hazel and willow for crates and hoops, and willow and osier for basket-making. Smaller pieces of C. wood, including chestnut, maple, elder, elm, and birch, are used in many countries for fuel and charcoal.

Coptic Language, descendant of the anc. Egyptian with a considerable admixture of Gk. It was divided into four chief dialects: the Sahidic or Thebaic, the Achmimic, the Bohairic (formerly called Memphis), and the Fayumic. The earliest of these is probably the Sahidic, while the Bohairic appears later than the others and then assumes the first place. The Bible was trans. into no fewer than three dialects before the fourth century. Hardly any of the C. literature is original. With the exception of some sermons of Shenute, a monk of Atrêpe, it consists chiefly of translations from the Gk. At first C. was almost monosyllabic like the Egyptian, but at a later period it became highly agglutinate. Hence the morphological side was hardly developed, but the phonology became the real basis of the grammar. After the Arabian conquest in the seventh century, the C. L. began to decline, and finally died out in the sixteenth century. In the form of the Bohairic dialect it has survived in the liturgy to the present day, though the epistle and gospel, after having been read in C., are also explained in Arabic. Arabic is now universally used.

Copts, native Christian descendants of the anc. Egyptians. The name is the Europeanised form of the Arabic *Kubt*, which probably derives from the Gk. *Αἰγύπτου* (Egyptians). A very large number live in Cairo and the other large tns. of N. Egypt, but they are also found throughout the country. They are, in general, the best educated section of the community. The hist. of the C. is intimately bound up with their faith. They claim to have received the gospel from St. Mark, first bishop of Alexandria, but they were easily corrupted and embraced the Monophysite heresy. This was condemned by the Council of Chalcedon in 431, and immediately a fierce struggle arose between the orthodox and the heterodox. The orthodox party, being supported from the imperial city of Rome, were at first in the ascendant, and the Monophysites did not scruple to call in the Muslims to their aid. Thus came the Moslem invasion in 640, and after a few years of Arabian rule the orthodox were almost entirely exterminated. A few still survive under the orthodox patriarch of Alexandria. The Coptic Christians in their turn were also cruelly oppressed by the Muslims, who forced them to submit to all kinds of degradation, and destroyed hundreds of their churches. Having been thus cut off for so many centuries from the influence of the rest of Christendom,

the Coptic Church has preserved its anct. liturgies and customs almost intact. It is therefore of great interest to students of liturgiology, and has received a good deal of attention in recent times. Except for their Monophysite heresy the C. hold the faith in exactly the same form as the Gks., with whom they share in holding the single procession of the Holy Spirit. Some few C. are Rom. Catholics and Protestants. At the end of 1937 the Abyssinian Coptic Church, which, since its foundation has been under the authority of the Coptic Church of Egypt

E.N.A.

COPTIC PEASANT

—whose patriarch nominated the archbishop and bishops of the Abyssinian Church from the Egyptian clergy, broke away from the mother church and claimed the status of an autocephalous body. The archbishop was deposed and the Abyssinian bishops elected one of their own members as the new *Abuna*.

Copula, term in logic which expresses the relation between the subject and predicate, and is always applied to the verb to be, whether expressed or implied. Example: 'Life is short,' here 'is' is the C., whilst in the sentence 'the child grows,' the C. is implied in the verb grows, viz. 'is growing.'

Copyhold, one of the anct. laws of land tenure. It existed in England until very recent years, although much modified in form. C. may be defined as holding at the will of the lord according to the custom of the manor, and dates back to feudal times. The lord of the manor bestowed a portion of his land on his labourers or

villains, who did him personal service in return for the land, which, however, often reverted back to the lord on the death of the tenant. Later on in hist. the tenant's right was observed, but many tiresome customs continued to survive, such as fines or heriots. C. is quite different from freehold in the manner in which it was conveyed. C. land was surrendered to the steward, who represented the lord of the manor; the steward then surrendered the C. to the new owner, and in each case the conveyance by surrender was made by a symbolical delivery. An Act passed in 1894 enabled (subject to the consent to the Board of Agriculture), C. to be converted into freehold. All C. land was enfranchised by the Law of Property Act, 1922, or in other words, C. tenure, together with customary freehold tenure, was abolished on the terms specified in the Act.

Copying, general name given to the many processes employed for reproducing, either in actual size or on an enlarged or reduced scale, a drawing, map, plan, document, or other object. In the case of drawings which are required to be the actual size of the original, the most convenient way is to trace them, which is done by placing a sheet of tracing paper over the drawing and going over the main lines with a pencil. A piece of paper coated with black lead or ruddle is then placed between the tracing and the sheet upon which the copy is required, and the traced lines gone over with a hard point, so transmitting faint lines on the paper, which serve as indications for filling in the rest of the drawing. If the copy is required of a different size from the original, the method of squares is usually employed. The original is covered with squares of uniform size by pencil lines, or placed under squared tracing paper, and a piece of paper prepared with a corresponding number of squares of proportionate size, according to the copy required. Each part of the drawing is then copied into its corresponding square on the copy. Another method is to take a photograph of the object to the exact size required. A later development of the photographic process is the minute reproduction on micro-film of letters and documents, etc. By this method extensive records can be retained in very small compass, reproduced in any enlarged size, or projected on a cinema screen. Engineers' drawings are frequently copied by the ferrocyanide process, which yields white lines upon a blue background and prevents any additional lines being subsequently added. The C. of handwritten letters is usually done by the ordinary C. press. The letter is written in C. ink and placed between sheets of damped paper to which the copy is transferred by pressure. For duplicating or manifold copies of forms or invoices, carbonised paper is placed between sheets of flimsy paper and transmits the impress of the pencil or typewriter type. Where many copies of a letter are required, the hectograph process is used. The letter is written in special ink and transferred by

pressure to a gelatine slab, whence it is retransferred to successive sheets of paper by gently pressing them upon the gelatine. Typewritten documents may be reproduced in large numbers by stencilling the document upon a wax sheet and then pressing a special kind of ink through the wax on to the blank sheet by means of an indiarubber roller, or by means of a duplicating machine. The lithographic process may be employed to obtain numerous copies of a letter in MS., and the photo-lithographic process for C. 'engineers' and other drawings in line. See LITHOGRAPHY.

Copyright means the sole right in the case of unpublished works to produce or reproduce a work or any substantial part of a work in any material form whatsoever, or to perform in public or give any acoustic representation of a work or any visual representation of it by means of any mechanical instrument; and in the case of a pub. work, the sole right to publish the work or any substantial part of it. C. also includes the sole right to produce, reproduce, perform, or publish any trans. of a particular work, to convert a dramatic work into a novel or other non-dramatic work, to convert a novel or other non-dramatic work or any artistic work into a dramatic work, to make any record, film, or other contrivance for mechanically performing or delivering any literary, dramatic, or musical work, and to authorise any of the above acts. The whole of the law of C. is now to be found in the Copyright Act, 1911, and the rules and orders in council made in pursuance of the Act, and as to musical C. also in the Musical Copyright Acts, 1902 and 1906. The law of C. as it existed before the Copyright Act, 1911, was unsystematic, inconsistent, and deficient. By the Act of 1911 all the previous statutes, extending back to 1734, were repealed and the whole law of C. consolidated and in many respects assimilated to principles familiar on the Continent. The two Musical Copyright Acts, 1902 and 1906 remain unrepealed. A further object of the Copyright Act, 1911 (which came into force on July 1, 1912), was to assimilate the law of C. throughout the empire, and to that end the Act provides that where any self-governing dominions accept its provisions C. relations with such dominions shall be in accordance with the system of the Berlin Convention. A considerable amount of new matter was added by the Act to the list of works entitled to C. protection, and the Act also profoundly modified the old conception of C. as a mere right of multiplying copies of an original work for the purpose of sale. C. formerly comprised only literary compositions and artistic works, the latter including engravings, paintings, photographs, designs, and sculpture. Progress in the art of mechanical representation or reproduction has led to the extension of C. protection to cinematograph and phonographic films and records respectively. Architectural works if original are also protected. Under the old law it was

necessary to register C. and it depended on both registration and pub. The infringement of an unpublished work merely gave a common law right to sue for damages. The new Act abolished registration in accordance with the recommendations of the Berlin Convention, with the result that an author is protected in respect of his unpublished works provided only he be a Brit. subject or resident at the time of making the work in such self-governing dominions of the empire as have adopted the Act, or a resident in any other part of the dominions of the empire. As respects a pub. work C. exists immediately on the first pub. within the Brit. dominions to which the Act extends. Pub. in relation to any work now means the issue of copies of the work to the public, either gratuitously or for payment. Pub. does not include the performance in public of a dramatic or musical work, the delivery in public of a lecture, the exhibition in public of an artistic work, or the construction of an architectural work of art, nor does the issue of photographs or engravings of works of sculpture and architectural works of art constitute pub. A dramatic or musical work is only pub. by being issued to the public in the shape of copies of the play or musical composition in question. The unauthorised performance of a play, musical piece, or any other work capable of representation necessarily amounts to an infringement of C. The importance of pub. since the passing of the Act of 1911 lies partly in the statutory classification and extension of the different modes in which C. arises, and partly in the computation of the term for which it subsists. Formerly the term was for the author's life and for seven years after his death, or for forty-two years following the date of first pub., whichever period was longer. Any extension of C. enjoyed by works then protected being in the interests of the author's estate. The term is now the life of the author and a period of fifty years after his death. In regard to all literary, artistic, dramatic, and musical works, C. subsists in the unpublished work from the date of the making or creation of the work, and from and after pub. the right continues for the life of the author and for a period of fifty years after his death; but after the expiration of twenty-five years (or thirty years in the case of a work in which C. subsists at the date of the passing of the Act) from the death of the author of a pub. work, it constitutes no infringement to reproduce the work, provided notice in writing be given and royalties in respect of all copies sold be paid to the owner of the C. The Act also stipulates that an author cannot assign the C. (otherwise than by will) or a period in excess of twenty-five years from the death of the author, after which the rights automatically revert to the estate of the author. Where the author dies without having pub. his work, C. subsists until pub. and for a term of fifty years after pub. C. in photographs subsists for fifty

years from the making of the original negative; and in the case of the works of joint authors C. subsists during the life of the author who first dies and for a term of fifty years after his death, or during the life of the author who dies last, whichever period is longer. Fair dealing with any work for the purposes of private study, research, or criticism does not constitute infringement of C. An author may also, after parting with his C., make use of any mould, sketch, or plan of his work, provided he does not repeat the main design of the work. Nor is it an infringement to recite in public any reasonable extract from any pub. work, or to publish in a newspaper a report of a lecture delivered in public, the pub. of which is not prohibited. It is an infringement of C. to permit for private gain a theatre or other place of entertainment to be used for the performance in public of a work without having obtained the consent of the owner of the C., unless the person so doing had no reasonable ground for suspecting that the performance would be an infringement. The law also makes provision for the issue of compulsory licences to reproduce works where the author or owner of the C. refuses to allow republication. The author is the first owner of the C. unless he has done the work on commission, in which case it belongs to the person who employed him. The civil remedies for infringement of C. are an action of damages, together with a claim for an account of the profits, and if a repetition is apprehended the owner may also ask for an injunction. An injunction will also be granted in the case of an unpublished work where the owner of the C. fears that his right is threatened, or that an unauthorised pub. is intended. Furthermore all copies printed and pub. must be delivered up to the owner. The owner may also take proceedings where necessary to get possession, not only of all infringing or pirated copies of his work, but also of all plates used or intended to be used for the production of such infringing copies. Under the Dramatic and Musical Performers' Protection Act, 1925, to make a record, directly or indirectly, from the performance of any dramatic or musical work without the written consent of the performers, or to sell or let for hire any record made in contravention of the Act or even to use for public performance any record so made is an infringement of C. In the First World War C. in works pub. or made in enemy ter. was vested in the public trustee (6 & 7 Geo. V., c. 32). In the Second World War the comptroller-general of patents, etc., was empowered to grant licences for the exercise of the Cs. owned by enemies or enemy subjects, and under the same Act (2 & 3 Geo. VI., c. 107) provision was made for the validity of licences already made with enemy owners of C. when the war broke out.

Registration at Stationers' Hall under the Act of 1842 terminated Dec. 1923. In 1924 the Stationers' Company estab. a

new register in which books and fine arts can be registered. A copy must be filed at Stationers' Hall and certified copies of the entries are issued; fees 5s. for a book, 2s. 6d. fine arts; certified copies in each case 5s. These copies are of use in giving evidence of work on a given date in case of infringement.

In U.S.A. C. law, registration is still necessary. The application for registration must specify whether the work in which C. is claimed is of the class of books, periodicals (including newspapers), dramatic or musical compositions, maps, works of art, or reproductions thereof, drawings, or plastic works of a scientific character, photographs, prints, and pictorial illustrations, motion pictures or motion picture photo-plays. Works not reasonably capable of falling under any of the above cannot be copyrighted. In 1928 C. legislation was enacted increasing the C. fee for registration of all pub. works to \$2, the fee being, previously, \$1; but, for an unpublished work, the registration fee is still \$1. Fees for most of the remaining C. services were also correspondingly increased. To secure registration: (1) The work must have been pub. in the U.S.A.; (2) two copies of the best ed. of the work must be sent to the C. Office, Library of Congress, Washington, promptly after pub. Books by Amer. authors must have been printed and bound in the U.S.A., but not books of foreign origin in other than the Eng. language. Books in Eng. pub. abroad prior to pub. in U.S.A. can secure *ad interim* C. for thirty days if a copy of the foreign ed. be deposited within thirty days of pub. abroad; which term will be extended to the full period when the ordinary conditions have been fulfilled. The original term of C. is twenty-eight years, but the author or his representative can, within one year prior to expiration, get a renewal for another twenty-eight years, or fifty-six years in all. C. may be assigned by any instrument in writing.

International Copyright.—For the mutual protection of works circulated in countries other than that in which they were first pub., certain nations signed a convention at Berne in 1887. The signatories were Great Britain, France, Germany, Belgium, Italy, Spain, Switzerland, Tunis, and Haiti, and subsequently Norway, Japan, and others joined the C. Union, but not the United States, Holland, or Russia. The basis of the Berne Convention was the reciprocal extension to foreign authors and publishers of similar rights to those enjoyed by native authors and publishers provided the formalities as to registration, etc., required by the country of first pub. were complied with. This convention was revised in 1896 and again at Berlin in 1908, and this, the so-called Berlin Convention, superseded the Berne Convention so far as those nations of the C. Union who ratified it are concerned. The signatories to the Berlin Convention include Great Britain, France, Germany, Spain, Denmark, Switzerland, Italy, Belgium, Holland and the Dutch colonies,

Norway, Sweden, Monaco, Japan, and Liberia. Great Britain signed and ratified a special convention at Vienna with Austria-Hungary.

Fresh modifications of the Berne Convention were made in its third revised form in 1948, because of the increasing importance of the broadcasting, television, film, and applied arts, and the convention now also protects the rights of authors in this domain. An author, for instance, now has the right during his lifetime to object to any distortion, mutilation, or other alteration of his works. He has also the exclusive right of authorising radio diffusion and communication to the public by loud-speaker or any other instrument of transmission. A new point has been introduced in the convention. It provides that if legislation in his country permits, as is the case in Belgium, the author shall enjoy the inalienable right to an interest in the sale of his work subsequent to its first disposal by him. Any dispute between countries concerning the interpretation or application of the convention is to be brought before the International Court of Justice.

The U.S.A. remains outside international conventions other than the Pan-Am. conventions made between them and other Amer. states, but power is vested in the president to give facilities by proclamation to foreigners to acquire C. in their works. Otherwise protection is gained by simultaneous pub. in the U.S.A. and the author's country. Similar observations apply in the case of Russia and China, who are also bound by no international code. Nor is Soviet Russia bound by any international agreement. Hence in the Second World War an Eng. author of international reputation was in an anomalous position. His country was at war with Germany, Italy, and Japan, and was allied with the U.S.A. and the U.S.S.R. Yet the C. of his works was protected in the three first-named countries (although of course he was unable to collect royalties), but in America and Soviet Russia it was difficult if not impossible to protect it; and the reason is that the latter nations did not subscribe to the international agreement.

The Copyright (Rome) Convention Order of 1933 extends the Copyright Act of 1911 to works by citizens of foreign countries in the C. Union on conditions set out in the order. See W. A. Copinger, *On the Law of Copyright*, 1870 (8th ed., 1948); T. Dawson, *The Law of the Press*, 1927; A. Plant, *Economic Aspects of Copyright in Books*, 1934; H. A. Howell, *The Copyright Law* (U.S.A.), 1942.

Coquelin, Benoît Constant (1841-1909), Fr. actor, destined to be a baker, but fortunately his histrionic talent was discovered, and he was allowed to enter the Conservatoire and studied under Régnier. Here he gained the second prize for comedy (1860), and in the same year played the part of the comic valet, Gros René, in Molière's *Dépit amoureux* at the Comédie Française. In 1864 he became *sociétaire* of that theatre, and for the twenty-two years following played with

conspicuous and well-deserved success the leading roles in over forty new plays. He excelled in the impersonation of characters with a humorous bias, and his originality was especially marked in such plays as de Banville's *Gringoire* (1867); Ferrier's *Tabarin*; Emile Augier's *Paul Forestier* (1871); Dumas's *L'Étrangère* (1876); Lonnou's *Jean Dacier* (1877); Pailleron's *Le Monde où l'on s'ennuie* (1881); and Erckmann and Chatrian's *Les Rantzau* (1884). As there had been some difficulty over his prov. and foreign tours, he gave up in 1886 his position at the Comédie Française and spent two years visiting with his company the chief cities of Europe and America. From 1890 to 1892 he was again associated with his old theatre, where he appeared as Labussière in Sardou's *Thermidor*, but in 1892 he again went on a foreign tour and never afterwards appeared at the Comédie. For two years from 1895 he acted at the Renaissance theatre in Paris, but in 1897 became director of the Porte-Saint-Martin. It was here that he created his most famous and probably his finest role, that of the inimitable Cyrano de Bergerac, in Rostand's play of that name (1897). Such was his success to this part that Rostand is said to have written *Chantecler* solely for C. But C. d. quite suddenly in the midst of the rehearsals for this new romantic drama, which was to have carried Paris by storm. In 1900 C. visited America once more, this time with Sarah Bernhardt, with whom he afterwards appeared in *L'Aiglon* at her theatre.

Coquelin, Ernest Alexandre Honoré (1848-1909), Fr. actor and author, brother of Benoît Constant C. Played at Odéon and the Variétés, but mainly associated with the Comédie Française, where his spirited and witty interpretation of a series of comic roles attracted large audiences. His humorous *Livre des contes* (1880) and *Fariboles* (1882), etc., afford delightful reading.

Coquerel, Athanase Josué (1820-75), Fr. Protestant divine, son of A. L. C. C. (*q.v.*), assisted in 1852 in the pub. of the first scientific theological review of his country (*Nouvelle Revue de théologie*). In such works as *Jean Calais et sa famille* (1857), *Précis de l'église réformée* (1862), etc., he gave expression to his enlightened ideas, whilst he wrote also on art in *Des Beaux-Arts en Italie* (1857).

Coquerel, Athanase Laurent Charles (1795-1868), Fr. Protestant divine, spent twelve years of his life in Holland (1818-1830). From 1831 to 1844 he ed. three papers, *Le Protestant*, *Le Libre Examén*, and *Le Lien*, and by his advocacy of a wider religious freedom excited the anger of the orthodox Calvinists. His contemporaries admired him chiefly for his inspired oratory; but he found time to write many works, including a *Réponse* to Strauss's *Life of Christ* (1841), and a treatise on the Reformed churches of France (1861).

Coques (or **Cocx**), **Gonzales** (1618-84), Flemish painter, was a pupil of Pieter Breughel (*q.v.*), and later of David Rycckaert the second. In 1671 he became

painter in ordinary to Count Monterey, governor-general of the Low Countries. Sometimes he depicted tavern and rustic scenes, but he excelled in portraiture, for which he took Van Dyck as his model. Rarely he painted life size, but most of his canvases are cabinet. His earliest portraits represent members of his own family; later he drew his friends, and soon men of note and rank came crowding to his studio, and the Archduke Leopold, the prince of Orange, and Charles I. of England vied with one another for the possession of his work. His 'Picnic' and 'Rest in the Fields' afford excellent illustrations of his high finish, rich tones, and mastery over the details of composition.

CORACLES IN WALES

These craft are used for fishing on the R. Towy, Carmarthenshire.

Coquette, used in a derogatory sense of a girl who uses every art to attract admiration and attention from the opposite sex, wishing thereby to please her vanity. The word is derived from the Fr. *coquer*, to strut like a cock, and hence, to swagger.

Coquimbo, prov. and tn. of Chile, S. America. The chief industry is mining copper, gold, and silver, and great iron-ore deposits exist (the combined output of iron-ore from C. and Atacama in 1947 was over 1,750,000 metric tons). The prov. is nearly entirely filled with branches of the Cordillera mts. Area 15,400 sq. m. Pop. 245,000. The tn. is one of the best ports on the Chilean coast with about 25,000 inhab. and exports of ores and hides. There is a naval wireless station on the coast.

Coquito, or *Jubæa spectabilis*, is a palm which constitutes a genus in itself. The

sap is evaporated by the natives of Chile to make it yield a palm-honey.

Cora, see *Corai*.

Coracle, or **Curraich** (Lat. *curruca*, Welsh *coriegl*), skiff with a slight wooden frame, covered over with hides, and made watertight by a coating of tar and pitch. Caesar describes the Cs. in use among the Britons of his day, and hist. speaks of a seven days' voyage by missionaries in 878 from Ireland to Cornwall in a C. made of two and a half skins. Cs. were oval in shape, about 3 ft. by 4 ft. in size, there being room for one person only. The rower propelled himself by a paddle. If two men went fishing in Cs., they held the net between them, hauling it up after a catch till their boats touched and the fish could in this way be secured. This kind of canoe is still used on the R. Severn and R. Towy, and in Clare. Cs. have disappeared from the Usk and the Wye, and on the Taff the last was seen in 1850. In Ireland and Scotland Cs. are no longer seen. Light boats, very similar, were built for crossing the lakes on the way to Klondike after the passage of Chilkoo Pass, Alaska.

Caracoid Process, beak-like projection in the upper part of the scapula, or shoulder blade. It may be felt by pressing the finger in the depression just below the collar-bone, two-thirds of its length outwards.

Coral, the solid support or hard skeleton of various marine organisms. It is secreted from sea-water, and is chiefly carbonate of lime. The Anthozoan polyps are the prin. source of the C. reefs of the world. The skeletons of many other organisms contribute to C. masses, such as Polyzoa and Mollusca, but these cannot be properly included in the term C. The reef-building Cs. are the Madrepora and Micandrina, confined to waters in which the temp. does not fall below 68° F. even in the coldest months. C. reefs are abundant in the W. Indies, on the coast of Brazil, and in the Central Pacific. The great C. reef regions are within the limits of the trade-winds and monsoons, with the exception of the Ellice and Marshall Is. According to Darwin, atolls were supposed to have been formed on submarine banks over a subsiding sea bottom, and this subsidence theory accounts for C. reefs over 100 ft. in thickness. Apart from that we really have few data to support the Darwinian theory of subsidence. Cs. may be roughly classed under two heads—horny, and lime or stone Cs. The former consist chiefly of a horny secretion from the polyps, while the stone C. consists almost entirely of lime firmly joined in a solid mass. All possible gradations, however, can be found, so that it is impossible to draw a sharp line between the two groups, the central point of the Cs. forming the family. Coralline C. is quite solid, and is produced in concentric layers by the living gelatinous substance enveloping it, and from which the polyps project. When the C. is taken out of water, the gelatinous living part soon decomposes and disappears. Beyond their general utility

and value as sources of lime, Cs. are not of any especial industrial importance with the exception of the red C. (*Corallium rubrum*) of the Mediterranean Sea. This C. is susceptible of a high polish, and is largely used for ornamental purposes. It has a shrub-like, branching form, and grows about a foot high, being as thick as the little finger of the human hand. Extensive fisheries are carried on in the Mediterranean, and it is exported to India. Red C. is also obtained in the Red Sea and Persian Gulf. It also occurs off the N.W. coast of Africa. Black C. is still more highly prized, and has a wide distribution, growing to a considerable height and thickness in the tropical waters of the Great Barrier Reef of Australia. It is also found in the Persian Gulf. From remote times, C. has been highly prized

CORAL

for personal ornaments and decorative purposes generally. In India, a great trade was carried on from the beginning of the Christian era, and it was esteemed as a substance endowed with sacred properties. A belief in its potency as a charm continued to be entertained throughout medieval times, and among the Romans, branches of C. were hung round the children's necks to preserve them from danger, and many medicinal virtues were attributed to it. In Italy, at the present day, C. is worn as a preservative from the evil eye. The range of value of C. varies according to colour and size, and its price is considerably affected by the fluctuations of fashion. Rose-pink C. is the most valuable. Good coloured C. commands high prices in China, where it is in great requisition for the button of office worn by the mandarins. It is also a favourite ornamental substance with the negroes of Central Africa and America.

Coral Fishery has, since the beginning of the Christian era, been a lucrative trade. The finest fisheries are along the N. coast of Africa, in Tunisia, Algeria, and Morocco. Before the sixteenth century these C. reefs were controlled by the It.

republics. For a time the Tunisian reefs fell into the hands of Spain, but the monopoly of trading was ultimately secured by France, who held it till 1793, when the trade was thrown open to other nations. For a short period the control lay in the hands of Great Britain, but finally was regained by France. Boats not bearing the Fr. republican flag have to pay heavy dues to fish. C. is only fished once in ten years, as it requires that time to develop. The boats vary in size from 3 to 14 tons. The raw material is made up chiefly in It. cities. There are also valuable C. reefs off the coast of Italy, Catalonia, and Provence.

Coral Islands and Reefs are low is. or reefs formed from the petrified calcareous skeletons of C. polyp. They may best be subdivided into three classes, one of which often develops from the other. *Fringing reefs* are found extending outwards from the shore of an is. from which they are not separated by a channel. *Barrier reefs*, on the other hand, are found at some distance from the shore along which they extend at a more or less uniform distance. The greater part of such a reef is submerged, its place being marked by the line of breakers, but in places it rises above the sea level, and here sparse vegetation is found. The channels which lie between reef and shore are of the greatest value as providing roadsteads for shipping. The greatest of barrier reefs is the Great Australian Barrier Reef off the coast of Queensland which stretches intermittently for over 1000 m. *Atolls* are small is. roughly circular in shape and enclosing a lagoon. These typical C. is. vary greatly in size, and have sometimes a length of over 70 m. Beneath the lagoon, to which there is usually access through a gap in the encircling ring, is a C. floor. The depths of these lagoons vary from a few feet to about 300 and frequently the lagoon forms a safe harbour for ships. C. polypi flourish most in the W. Pacific and in the shallow seas near Australia, Mexico, the W. Indies, and New Guinea. The reefs and is. are composed principally of rock which bears but little superficial resemblance to the organic substance which we recognise as C. The foundation is one of white limestone, which often further assumes a crystalline form under the influence of chemicals present in the salt water. To this are added C. fragments washed off from another part of the reef and rendered shapeless by pressure. Sand and the skeletons of other molluscs, radiates, etc., form the rest of the mass, and on this the living C. builds. The growth of the C. polyp is restricted by many circumstances. Warm salt water is required, free from cold currents, and with a temp. which does not fall below 68° F., and the polyp must also have abundance of food if it is to develop properly. The water must be clear, not muddy, and the deposit on which the polyp lives must be near the surface of the water and yet not below the level of the lowest neap tides. The rate of growth varies with the species and the conditions;

some species build at the rate of 1 in. per year, others at the rate of 3 in. per year, and still higher rates of progress have been chronicled in certain parts. Since the growth of C. is restricted by so many conditions, the circumstances and procedure by which is, and reefs have come to their present state have been much discussed. The first serious attempt to provide a theory was made by Adelbert von Chamisso (q.v.) who made a voyage through the South Seas from 1815 to 1818. He conjectured that the C. structures were built up in places where the sea bottom came near to the surface—in short on submarine mts. Growth took place on the sloping sides of the mts., and continued in an outward direction so that the atoll with its lagoon was the result. This conjecture, however, was hardly a happy one, since it is somewhat difficult to imagine a sufficient profusion of submarine mts. to account for the various C. islets and reefs scattered throughout the tropical and semi-tropical seas. The subject next engaged Darwin's attention during the celebrated voyage of the *Beagle* (1831-36). He propounded the view that the construction of the reefs had commenced when the land was near the surface of the sea, and that subsidence had then followed as the growth proceeded. When first built, therefore, every C. structure would be a fringing reef, when the land actually rose above the surface. As the land sank, construction would continue on the old foundations and a barrier reef would result. In time the land would entirely disappear, and the atoll, the final form, would be complete. Much evidence was brought to confirm this theory, and for long it was the generally accepted one, being supported by Profs. Dana and Jukes among others. The researches, however, of Prof. Semper, Agassiz, and others among the Atlantic reefs of Florida, etc., have rendered it unsupportable as a universal hypothesis. The condition of the C. structures here must be attributed solely to the natural growth of the polypi and the action of the sea, and Semper's researches among the Pelew Is. supported Chamisso's view in this case at all events. Darwin, however, has not precluded the possibility of some reefs arising in this way. In 1880 Sir John Murray, when present with the *Challenger* expedition, gave much attention to the subject of C. growths, and pub. a memoir which shows a partial return to Chamisso's position. Direct opposition to Darwin is shown by the fact that he considers the atoll to be the first stage in the growth and the fringing reefs to be the final one. He meets the objection that so many mts. are unlikely to occur, by saying that it is unnecessary to suppose that these were at first of anything like equal level. In some parts, land originally above sea level would have been reduced by the action of the sea, while in others land would have been raised by marine deposits. He also refines on Chamisso's explanation in other ways. He traces the stronger growth on the outside to the

additional amount of food which would be obtained there, and explains the lagoon by the statement that the dead C. on the inside would be removed by the solvent action of the salt water. The investigations of Dr. Guppy among the Solomon Is. (1887) have done much to support Murray's theory, but it is now generally felt that both this and the Darwinian hypothesis are true on various occasions. See C. R. Darwin, *Structure and Distribution of Coral Islands*, 1842, 1883; J. D. Dana, *Coral and Coral Islands*, 1872, 1890; Sir J. Murray, 'On the Structure and Origin of Coral Reefs and Islands' in *Proceedings of the Royal Society of Edinburgh*, 1879-80; W. Saville Kent, *Great Barrier Reef of Australia*, 1893; J. S. Gardiner, *Coral Reefs and Atolls*, 1831; B. Mallinowski, *Coral Gardens and their Magic*, 1938; R. Gibbins, *Over the Reefs*, 1948. See also ATOLL.

Coral-flower, Coral-tree, or Erythrina Corallodendron, beautiful species of Leguminosae allied to the corkcumb. The plant is a W. Indian tree bearing long racemes of dark red papilionaceous flowers.

Corallian (Fr. *Corallien*), in geology, the name of one of the divs. of the Jurassic rocks. The rocks forming this div. are mainly calcareous grits and limestones with rubbly coral rock.

Coralline, popular name applied to *Corallina*, genus of calcareous algae. *C. officinalis* is a beautiful seaweed of red colour, but others are often purple.

Coralline Crag, crag of from 40 to 60 ft. thick exposed at various localities in Suffolk, belonging to the Pliocene period. The crag is formed of friable calcareous clay, and contains an abundance of shells and corallines, hence its name.

Coral Sea, stretches between the New Hebrides to the E and Australia to the W., being part of the Pacific. The coral reefs give the sea its name. The C. S. was the scene of an Amer. naval and air victory over the Jap. Navy in May 1942. An exceptionally large Jap. naval force, which had been concentrated at the Louisiade Is. in the C. S., was attacked by an Amer. task force of ships and aircraft on May 4, and in an engagement lasting sev. days the Jap. Navy lost a number of battleships (estimated at over half a dozen), while inflicting only slight loss on the Amer. forces. For details see NAVAL OPERATIONS IN SECOND WORLD WAR.

Coral snakes, relations of the cobra in the family Colubridae. *Elaaps corallinus* is a typical specimen, it occurs in the tropical forests of S. America, and its small body, less than 3 ft. in length, is ringed with coral-red. It is highly poisonous, but has so small a mouth that it need not be dreaded by man.

Coram, Thomas (1668-1751). Eng. philanthropist, b. at Lyme Regis. A man of varied ventures by sea and land; settled in London, where, moved by the sufferings of the poor, he estab. the Foundling Hospital. In this work he was supported by Hogarth; but his charity so impoverished him that he ended his

days on a small annuity raised by subscription.

Coran, see **KORAN**.

Cor Anglais, or **English Horn**, wind instrument of the reed species, belonging to the oboe family, of which it is the tenor. It is related to the oboe as the basset horn is to the clarinet. A C. A. differs from an oboe in having a larger globular bell at the bottom, and a wider conical bore to the wooden tube. It has a compass of two octaves and a fifth, and possesses a piercing tone, its quality, however, being more mellow and mournful than that of the oboe. In his It. version of *Alceste*, Gluck wrote parts for C. A. (1767). Other examples are the shepherd's piping in *Tristan and Isolde*, and the faun's in *L'Après-midi d'un faune*. *Anglais* probably is a corruption of *angle*, many of the earlier instruments being crooked or bent.

COR
ANGLAIS

Corbeil, tn in the dept. of Seine-et-Oise, France, on the R. Seine, 19 m. S. of Paris by rail. It has important mills, printing works, and agric. trade. Pop. 11,500.

Corbel, in architecture, is a projected piece of stone, wood, or iron placed so as to support a pillar or a weight of materials. In Norman architecture the cornice is supported on C. stones, the ends of which are carved; and in Old Eng. castles the main beams of the floors were frequently carried on large C. stones, as at Porchester Castle. Gradually figures, chiefly the heads of men and animals, were employed for ornamentation. The term bracket is sometimes used for a C., but bracket is better applied as synonymous with cantilever.

Corbet, Richard (1582-1635), poet and bishop, was the son of a gardener at Ewell, Surrey, and was educated at Westminster School and at Christ Church, Oxford, of which he became dean. He was afterwards appointed chaplain to James I., bishop of Oxford, and bishop of Norwich successively. His only pub. writings were *Certain Elegant Poems* (1647), and *Poetica Stromata* (1648), the latter ed. with a life of the author by Octavius Gilchrist (1807).

Corbett, Harvey Wiley, Amer. architect; b. 1873, at San Francisco; son of Samuel James C., M.D., B.Sc., univ. of California, 1895; graduated Ecole des Beaux-Arts, Paris, 1900. Member of the firm of Helmle & C., New York. Lecturer in architecture, Columbia Univ. Member of advisory board of School of Architecture, Princeton. Designed and built Maryland Institute, Brooklyn Masonic Temple, Springfield (Massachusetts) Municipal Group, New York School of Applied Design for Women, Bush Terminal Office Building (New York), George Washington Masonic National Memorial (Alexandria, Virginia), Bush House (London, England), also King's Co. Hospital Buildings, Holy Innocents' Church, and St. Francis Xavier's School—all of Brooklyn.

CORBEL

Merton College Chapel, Oxford.

Corbett, James John (1866-1933), Amer. prize-fighter, b. San Francisco, California, U.S.A. He began work as a book-keeper in a local bank. After winning in some amateur boxing matches, he became a professional in 1881. In 1899 he knocked out the veteran Joe Choynski in twenty-eight rounds. He defeated Jake Kilrain in 1890 and fought a drawn battle with the famous negro boxer Peter Jackson. By this time he had earned the right to a contest with John L. Sullivan, who for many years had been world's champion heavy-weight pugilist. So firmly was Sullivan estab. in the esteem of the Amer. public that it was not thought that C. had any chance of winning. However, he defeated Sullivan in 1892 in New Orleans; and soon became known by the sobriquet Gentleman Jim. He successfully defended his title against Charlie Mitchell, the Brit. heavy-weight champion, but was knocked out by Bob Fitzsimmons at Carson, Nevada, 1897, by the blow which became famous as the solar plexus punch. His last fight was in 1903, when he was knocked out by Jim Jeffries. C. then went on the vaudeville stage and was a big success. He wrote his reminiscences under the title *The Roar of the Crowd* (1925).

Corbett, Sir Julian Stafford (1854-1922),

director of the historical section, Committee of Imperial Defence. Educated at Marlborough, and at Trinity College, Cambridge. Ford lecturer in hist. to Naval War College. Before the First World War he pub. a number of works on naval hist.; and, after it, contributed *Naval Operations* to its *Official History* (1920).

Corbetta, com. 23 m. N.N.W. of Pavia, in the prov. of Milan, Lombardy, Italy. Pop. 8000.

Corbie, tn. on the Somme, in the dept. of Somme, France, and in the arron. of Amiens. Once it was famous for its Benedictine abbey; now it is visited for its mineral waters, and has textile industries. Pop. less than 4800.

Corbie Steps, or **Crow Steps**, Scottish expression derived, no doubt, from corbel, the similarity of this word to corbie, Scottish for crow, accounting for the alternative name. From the fourteenth to the seventeenth century gables in Scotland were invariably finished by stepped slopes, called C. S. It was customary to arrange steps for the passage from one side of the roof to the other, hence arose the fashion of cutting the parapet alongside into steps.

Corbridge, par. on the Tyne in Northumberland, England, 3½ m. to the E. of Hexham. In the vicinity are coal mines, but the interest of the place to-day is mainly historic. The Rom. station known as *Corstopitum*, which served as an important basis for the military operations of Antoninus Pius, lay half a mile to the W. Ruins of two great granaries facing what must have been a broad highway were excavated in 1907. These had lain embedded in the earth since the fifth century, when the site was abandoned. Pop. 2500.

Corbulo, **Gnaeus Domitius**, Rom. general who lived during the reigns of Claudius and Nero. His popularity with the soldiers and notable conquests aroused first the envy of Claudius, who recalled him in the midst of his victories in Germany, and afterwards of Nero. From A.D. 54 he waged successful warfare against the Parthians, who were continually crossing the E. frontiers, till Nero in 67 sent for him to Greece. C. fell on his sword rather than give himself up to the emperor.

Corbusier, Le, see LE CORBUSIER.

Corby, tn. in Northamptonshire which has grown rapidly from a small vil. to its present size since 1930. It owes its importance to the iron and steel foundries based on locally found ironstone. The major expansion has taken place since 1933 and is due to the estab. of Messrs. *Stewarts & Lloyds Ltd.* steelworks, which employ about 6000 hands. The Brit. Oxygen Co. Ltd. has a research plant here. The anct. thirteenth-century church stands in the old vil. to the E., and contains a founder's tomb and a triple sedilia. There are a number of fine seventeenth-century stone houses. Pop. 14,000.

Coreyra, anct. name of Corfu (q.v.).

Coreyra Nigra, see CORZOLA.

Cord, derived from the Gk. through the Lat. *chorda*, the string of a musical instrument, now denotes a piece of thick string composed of sev. woven or twisted strands. In the seventeenth century in England, and in America, a cord of wood was cut timber, usually for fuel, measuring 8 ft. long by 4 ft. broad, and 4 ft. high.

Corday d'Armas, **Marie Anne Charlotte**, commonly called **Charlotte Corday** (1768-1793), b. at St. Saturnin, near Sées in Normandy, was of noble birth, and among her ancestors was Pierre Corneille. At first a strong supporter of the Fr. Revolution, she afterwards thought that it had gone too far in its atrocities, and on the overthrow and proscription of the Girondists (May 1793) she determined to support the opposing side. She chose Marat as her first victim, and, after two unsuccessful attempts, she gained admission to him under pretence of communicating news of the Girondists at Caen, and stabbed him in his bath, where he d. She was arrested, brought before the revolutionary tribunal, and condemned to be guillotined. Her execution took place on July 17, 1793. See A. de Lamartine, *Histoire des Girondins*, 1847; C. Vatel, *Corday et les Girondins*, 1872; and A. Dobson, *Four Frenchwomen*, 1890.

Cordele, tn. in Georgia, U.S.A. Pop. 7900.

Cordeliers, branch of the Franciscan or Grey Friars, so named from wearing a knotted cord for a girdle. Mentioned in Chaucer's *Trojan of the Rose* (line 7459 in Globe ed.). The name was also applied to the members of a club founded in Paris in 1790 in the former convent of the C. during the Fr. Revolution, the chief leaders of which were Marat, Danton, Hébert, and Camille Desmoulins. It fell in importance after the execution of Danton, and was ordered to be discontinued by the Convention of 1795.

Cordials are weak solutions of alcohol, supposed to have considerable medicinal value. Usually they are sweetened with syrups or cane sugar, and mixed with fruit essences or plant or essential oils to give a flavour. Caramel or burnt sugar is often used to colour C.

Cordier, **Henry Joseph Charles** (1827-1905), Fr. sculptor, was a pupil of Faginet and Rude. From the first he showed an alert interest in anthropology. The *Jardin des Plantes*, Paris, possesses his twelve busts of Algerians. Other of his notable works are statues of Arabian women and fellahs in onyx and bronze, polychromatic busts of a negro of Timbuctoo and an African Venus, and a statue of a young sculptor (Gk.) of the is. of Tinos.

Cordier, or **Corderius**, **Mathurin** (c. 1480-1564), Fr. schoolmaster, was for some time a teacher at the college of Navarre, Paris, where Calvin was his pupil, but taught for most of his life at Geneva, having embraced Calvin's religious views. He had a special gift for instructing children, and his graduated dialogues for beginners in Lat., entitled *Colloquiorum scholasticorum libri quatuor*, were still used in the schoolroom three centuries after

his death. In his *De corrupti sermonis emendatione* he attacked what was called the *Latin de cuisine*, whilst a Lat. grammar and *Miroir de la jeunesse pour la former à bonnes mœurs et à civilité de vie* were both written for young people.

Cordilleras (Sp., chains), name applied to the mt. systems of N., S., and central America; the C. of N. America being the Rocky Mts., and those of S. America the Andes.

Primero, Segundo, etc. (First, Second, etc.), which flow from the W., succeed in reaching the E. limits. The prin. products are wheat, maize, wood, linseed, hay, flour, cattle, hides, and marble. Pop. (1947) 1,455,000. 2. Cap. of the above prov. and the third largest city of the Argentine Republic, with (1945) 287,000 people. Some 435 m. N.W. of Buenos Aires. Founded in 1583, its early growth was due to the driving of cattle

INTERIOR OF THE MOSQUE, CORDOVA

Cordite, smokeless explosive used in the Brit. and other armies. It was introduced by Sir Frederick Abel; Nobel, the Swedish chemist, claimed that his patents covered the substance, but the claim was disallowed after a series of lawsuits in 1894-95. The explosive as prepared in 1891 consisted of 58 per cent nitroglycerine, 37 per cent gun-cotton, and 5 per cent mineral jelly or vaseline. This substance is now known as Mark I., but has since been superseded by C.M.D., which is composed of 30 per cent nitroglycerine, 65 per cent gun-cotton, and 5 per cent mineral jelly. C. has good explosive properties, but is particularly safe to handle. If ignited in the open air it burns slowly; it may be subjected to considerable shock without detonating, e.g. bullets fired through packages of C. fail to explode it. It is waterproof and is unaffected by ordinary climatic changes; it is very stable and remains unaltered for a considerable length of time, even when kept in contact with metallic envelopes. These properties make it a valuable propellant for warlike purposes, as there are few dangers connected with transport, storage, and manipulation. C.M.D. explodes with more regular pressure and with generation of gases of lower temp. than Mark I., thus causing less deterioration to rifling, etc.

Cordoba, Alaska, see **CORDOVA**.

Córdoba: 1. Central prov. of the Argentine Republic, having an area of 65,000 sq. m., consisting mostly of pampa land. In the W. the Sierras de C. and de Pocho rise sometimes to over 6600 ft., but the rest of the state is a plateau sloping down toward the E. Few of the five riva.,

from the Argentine pastures to the mining centres of the Andes. The local industries include the manuf. of shoes, soap, candles, carriages, and furniture. There are also flour mills, foundries, marble works, tanneries, and paper mills. C. is a centre of culture. There is an old and important univ., and the national observatory is one of sev. unusually fine buildings, including the National Academy of Sciences and the National Meteorological Bureau; there is a cathedral and many grey churches and anct. houses. 3. Tn., 3045 ft. above the sea, in a fertile valley with coffee plantations, 60 m. W.S.W. of Vera Cruz, in Mexico. Pop. 16,000.

Córdoba, Spain, see **CORDOVA**.

Cordon, line of military posts or sentries placed around a dist. or tn. to prevent any communication between it and the country beyond. When it is used to prevent a disease from spreading it is called a *C. sanitaire*.

Cordon Bleu, originally referred to the blue ribbon of the knight's grand cross of the order of the Holy Spirit, the first order of the Bourbon kings. To-day the term is humorously applied to good cooks. Properly it refers only to women cooks.

Cordova, or Córdoba: 1. Prov. of Andalusia, Spain, which after A.D. 756 became an independent Moorish kingdom. The plains produce fruit, wine, olives, grain; the slopes of the Sierra Morena pasture cattle and horses. Lead, copper, and coal are mined. The area is 5300 sq. m., the pop. (1945) 798,000. 2. Cap. of the above prov., on the Guadalquivir, is the city of the wonderful Moorish mosque built from 785 to 990, and taken from them by the Spaniards at the

point of the sword in 1236. It embodied all the styles of Moorish architecture in one noble composition (Calvert). It was 742 ft. in length, and 472 ft. in width, and had forty-eight watch-towers; it is now the largest of Christian temples next to St. Peter's. The pulpit, composed of 35,000 pieces of wood, was seven years in the making by eight artists. The Moorish bridge and water-mills, ruined walls, etc., still give an oriental air to the confused mass of small white houses which was so associated with Cordovan (*q.v.*) leather as to give its name to cordwainer (*q.v.*), the anct. Eng. word for shoemaker. Pop. 177,400. 3. Tn. in Alaska, U.S.A., the terminus of the Copper R., and N.W. railway, and the outlet for the Kennicott mines. Pop. 1000.

Cordovan, or Cordwain, very flexible kind of leather made from goatskin. Originated from Cordova in Spain. Dyed and finished in brilliant colours, it was used for soldiers' and courtiers' boots from the fifteenth century. There was a black variety made from horsehides which was in vogue with civilians in the same period.

Corduroy, cotton material made like a ribbed velvet. The fabric has cords running the length of the cloth, the cords or ribs being produced by a weft pile. It is generally all cotton, but may be made with a rayon pile for women's dress materials. A coarse heavy make is used for workmen's suits, for riding breeches, or for upholstery.

Corduroy Road, term used to designate a road which is formed of tree trunks or logs laid side by side in a transverse direction. Such roads are used chiefly in America, when a marshy piece of land has to be negotiated as a more or less temporary expedient. The origin of the term is the similarity of design of such a road to a piece of corduroy, in which the ribs run in similar fashion.

Cordwainer originally, in Sp., It., and O.F., signified a maker of, or dealer in, Cordovan leather, and thence in later Fr., a shoemaker. It is now obsolete, but survives as the name of the trade-guild or company of shoemakers; it is also used by trade unions to include all branches of the trade.

Core, internal mould which forms the interior of a cylinder, tube, pipe, or other hollow casting. The C. is made in a C-box, and has projecting portions known as C-prints, which rest in the prints of the mould. The model from which the object is cast is solid, and makes an impression, partly in the cope and partly in the drag. When the pattern is removed the C. is laid in its place, the projecting portions resting in the recesses made by the pattern prints. When the metal has been poured around the space and then cooled, the C. is broken out, leaving the casting hollow. To prevent the formation of blow-holes, the material of the C. must be porous, and vents should be provided to allow gases to escape from the interior of the mould.

Corea, see KOREA.

Coregonus, or Whitefish, genus of fishes in the Salmonidae, and usually to

be found represented in lakes. Their scales are large and silvery, the teeth are either minute or absent, and the height or front of the first dorsal is greater than its breadth. *C. oxyrinchus*, the houting, is a native of N. Europe; *C. pollan* is the pollan found in Irish lochs; *C. clupeoides* (or *C. lacepedii*) is the powan; the Welsh gwyniad (or schilly of Ullswater) is *C. Pennantii* (or *C. fera*); the powan and gwyniad are both found in the Eng. lakes, in Loch Lomond, and in lakes in Wales. The vendace (*C. vandesius*) is found in the lake of Lochmaben in Scotland, and *C. gracilis* is found in Derwentwater.

Corella, tn. of Spain in the prov. of Navarre, situated 49 m. S.S.W. of Pamplona. Pop. 7000.

Corelli, Arcangelo (1653-1713), violinist and musical composer, b. at Fusignano. Went to Germany in 1680, but returned to Rome in 1682, where he met Handel. Living at a time when the viol was yielding to the violin, C. was the first outstanding violinist and composer of music for that instrument as well as teacher. He is credited with having laid the foundation of the modern art of instrumental composition. His *Concerti Grossi*, or five books of twelve concertos each (short suites of non-dance pieces), are for two violins, cello, and harpsichord. They were only pub. shortly before his death.

Corelli, Marie (1864-1924), Eng. novelist, was the illegitimate daughter of an It. father and a Scottish mother. The first years of her childhood were spent in the family of a Marylebone labourer, named Cody. Later, she was adopted by the journalist Charles Mackay; at his death his son Eric was constituted her guardian, and he sent her to a Fr. convent to be educated. Her education was framed with a view to a musical career, but on her return home she wrote in 1886 a romantic story entitled *The Romance of Two Worlds*. This was so successful that the idea of a musical career was abandoned for the writing of novels, all of which were immensely popular. No writer of her day (unless it was her sparring partner, Hall Caine) had a larger number of readers. The critics invariably fell foul of her work, and for many years no copies of her novels were sent for review. The reason of her success lay not in the excellence of her work, but in the fact that it met so exactly the popular taste. Her novels had a distinct flavour of plot; and, although she usually (perhaps always) failed to display much comprehension of the affairs of this life, she wrote about everything with a cocksureness and an emphasis that were enough to convince her admirers that she had probed the subject to the bottom. Her chief novels are *Vendetta* (1886); *Thelma* (1887); *Ardath* (1889); *The Soul of Lilith* (1892); *Barabbas* (1893); *The Sorrows of Satan* (1895); *The Mighty Atom* (1896); *'Temporal Power'* (1902); *Holy Orders* (1908); *The Life Everlasting* (1911); *Rays of the Sea* (1917); *The Secret Power* (1921); *Poems* (ed. B. Vyver) (1925). See K. Carr, *Miss Marie Corelli*, 1901; B. Vyver,

Memoirs of Marie Corelli, 1930. Biography by G. Bullock, 1940.

Corentyne, or **Corentyn**, riv. of S. America, forming the frontier of Brit. and Dutch Guiana. It rises in the Acaari Mts., and has a length of 450 m. The C. is navigable for some distance from the mouth, but great cataracts in about 4° 20' N. lat. and sev. others higher up interrupt the navigation. *See also under* DUTCH GUIANA.

Corenzio, **Belisario** (1558 or 1560-1643), Gk. artist, b. in the prov. of Achala. Became a pupil of Tintoretto at Venice. Settled at Naples, where he painted pictures in fresco for the churches and was more successful in his frescoes than in oil paintings.

Coreopsis (Gk. *κόρη*, a bug; *opsis*, resemblance), genus of plants of the order Compositae. It takes its name from the fact that the seeds are generally awned and slightly winged and look remarkably like an insect. There are many species found in the U.S.A., Mexico, the Sandwich Is., and S. Africa. The flowers are cultivated for decoration, for they are very gorgeous and beautiful.

Co-respondent, denotes either generally a co-defendant with another or other parties to an appeal; or specially in the divorce court, any person cited in a suit for divorce or judicial separation, and charged with adultery with the spouse (respondent) against whom the petition is brought.

Corf, name formerly given in mining to a large and strong basket used in carrying ore, or coal, from the working-place to the surface. Tubs made of wood and iron are now used for this purpose; they are still sometimes termed corves. In fishing, a corf is the name given to a cage in which fish, particularly crabs, lobsters, etc., are kept alive in the water. Such corves are made from a large basket, or a box with holes in it.

Corfe Castle, vil. and par. in Dorsetshire, England, situated in the E. div. of the Isle of Purbeck, 6½ m. S.W. of Poole, and 21 m. E.S.E. of Dorchester. C. C. itself is situated on a high ridge, and is separated from the vil. by a ravine over which a bridge has been built. The castle dates from the eleventh century, though for a long time ascribed to Edgar; it was here on the site of the castle that King Edward the Martyr was murdered in 978 at the instance of his stepmother Elfrida. Many times the castle has been besieged; it was captured by the earl of Devonshire in Stephen's reign, and was twice besieged by the forces of the Parliament during the Civil war, being demolished after its capture in 1645. The prin. trade of the vil. is in fireclay and stone. Pop. 1400.

Corfu: 1. The largest of the Ionian Is., and of which the anct. name was Corcyra. About 700 B.C. it was colonised by the Corinthians, and soon estab. an extensive commerce. Rivalry soon broke out between Corcyra and Corinth, and in 664 B.C. a battle was fought—the most anct. sea-fight on record—between the two cities. In 433 B.C. it allied with Athens

and so caused the Peloponnesian war. Civil dissensions caused a decline in its power, and it was taken by the Romans in 229 B.C. In the Middle Ages it was taken by the Venetians, who held it until 1797, when it was ceded to France. Russia and Turkey captured it in 1799, but gave it back to France in 1807. It was in the hands of the Brit. from 1815 to 1863, when it was incorporated with Greece. The surface of the is. is mountainous: the climate in summer is hot and dry, and in the winter rainy. C., the first sight of which delights and surprises the traveller, has an area of 227 sq. m. and a pop. of about 105,000. The olive trees, planted by the Venetians, cover its rocky hills and valleys with a mantle of green, and fill its storehouses with oil. On all sides there is luxurious vegetation, pears, figs, pomegranates, and flowers. The best Gk. musicians come from C. The women balance extraordinary weights upon their heads gracefully. The excellent roads are a relic of the Eng. occupation. During the First World War C. played a useful part as a resting spot for the Serbian army, after its terrible retreat through Albania, and to-day more than 25,000 Serbians lie in C., the victims of typhus and cholera. 2. C., the chief tn. of the is., is famous for its harbour; the tn. has little other attraction besides a few picturesque streets. The Gk. postage stamps are usually printed here, and paper is made. On Aug. 27, 1923, the It. delegate on the Albanian Boundary Commission was found murdered on Gk. ter., and the It. dictator sent a fleet to C., which bombarded the dilapidated Venetian forts, and killed sixteen refugees and orphans. The Brit. Police Mission estab. a police school at C., and up to the end of 1926, 2998 cadets had been trained there. C. being somewhat isolated, has a local newspaper press. It., which was once universal, is no longer generally spoken. C. has no railway. The pop. is 34,000.

Corgi, *see* WELSH CORGI.

Cori (formerly **Corà**), tn. of Italy in the prov. of Rome, situated at the foot of Monte Lepini, 23 m. S. by E. of Tivoli. It was formerly a tn. of the Voisci, and important ruins of temples, etc., have been discovered, and remains of walls. Considerable damage was sustained by C. during the Second World War. Of the church of S. Maria della Trinità only the campanile survives; S. Pietro was a complete ruin and S. Salvatore was damaged throughout, and the roof of the high altar was destroyed; while the stone portal of the convent, built on the site of the temple of Janus, was deliberately destroyed; but the temple of Hercules and that of Castor and Pollux, the cyclopean walls, and the bridge attributed to Sulla were undamaged. Pop. 7400.

Coria del Ric tn. of Spain, situated on the Guadalquivir R., 6 m. S.S.W. of Seville. It is noted for the manuf. of jars for oil, and for almonds. Pop. 7177.

Coriander, or *Coriandrum sativum*, species of Umbelliferae which flourishes in Asia, America, and S. Europe. The plant is an ann., with a disagreeable smell,

but the globose fruit for which it is cultivated emits a pleasant odour when dried. On account of this fact it is used in confectionery as an aromatic flavouring, and it is also employed in the manuf. of liqueurs; in medicine it is used as a carminative.

Corigliano Calabro, tn. of Italy in the prov. of Cosenza, 6 m. W.N.W. of Rossano. It is a gloomy and badly built tn., but has a fine castle. Pop. (including commune) 16,000.

Corinaldo, com. and tn. of Italy, in the prov. of Ancona, 20 m. S.S.E. of Pesaro. Pop. 6550.

Coringa, seaport of India in the Madras presidency, 8 m. S. of Cocanada and 87 m. E.N.E. of Masulipatam. It was formerly of great importance, but is now much decayed owing to the extension of the delta of the Godavari. Pop. 4000.

Corinna, Gk. lyric poetess, b. at Tanagra in Boeotia and lived about 500 B.C. She is said to have been a disciple of Myrtis, and to have instructed Pindar in his youth, but afterwards contended with him in poetical contests. Alexandrian critics praise her work. Until 1907 only a few fragments were extant, which were collected in T. Bergk's *Poete Lyrici Graeci*, but considerable fragments were discovered in Egypt about that year.

Corinth, anct. city of Greece, lying between the gulf of C. on the W. and the gulf of Aegina on the E., 48 m. from Athens. It is situated on the S.W. end of the rocky isthmus of C., which connects the Peloponnesus with the mainland. Its citadel, the Acrocorinthus, was built on the N. slope of a steep mt. (1886 ft. high), with the famous fountain of Pirene near by. The city had three harbours—Schoenus and Cenchræe on the Saronic Gulf, and Lechaëum at its opposite end in the gulf of C. C. enjoyed splendid advantages from its situation, and became the chief trading centre in anct. times of E. and W. traffic. Its chief exports were the productions of ceramic art, and the inhab. also excelled in weaving and in metal-work. C. was supposed to have been founded by Sisyphus about 1350 B.C., but did not come into prominence until after the Dorian conquest. It was ruled by an oligarchy from 743 till 657, when Cypselus became tyrant. Under his rule and that of his son, Periander, the city increased in wealth and power, but in 582 the old constitution was restored. C. joined the Lacedæmonian league, incited the Peloponnesian war (431) upon Athens, and on the fall of that city, united with it and Thebes against Sparta in the Corinthian war (395–387). It was occupied by the Macedonians until 196, and joined the Achæan league, until it was sacked and almost destroyed by the Romans under L. Mummius in 146. Its treasures of art were carried off to Rome, and for many years the city lay in ruins, until Julius Cæsar rebuilt it in 46. During the Middle Ages it passed into the hands of the Venetians, from whom it was captured by Mohammed II. in 1458 and remained in Turkish hands until 1858.

In that year it was destroyed by an earthquake, and the new city was built 3 m. N.E. of the old site. At the time of its prosperity C. had numerous colonies including Syracuse, Apollonia, Coreyra, etc. The tn. was notorious for its luxury and licentiousness, and was beautifully laid out with gardens and fountains, statues and theatres. The anct. temple to Apollo, the theatre, the foundations of the Acrocorinthus, the Agora, and other important sites have been identified, and archaeological excavations have been undertaken by the School of Classical Studies at Athens. The worship of Aphrodite prevailed in the city. The

E. Buchanan

CORINTH, THE TEMPLE OF APOLLO

most celebrated Corinthians are Diogenes, the Cynic philosopher; Cleantes and Cleophantus, painters; and the statesmen Periander and Thucleus. At its height C. had a pop. of 300,000. It is now 5350. In the Second World War the liberating Brit. troops entered C. on Oct. 9–10, 1944.

Corinth, co. seat of Alcorn co., Mississippi, U.S.A., with foundries and machine shops. Owing to its position it played an important part in the W. campaigns of the Civil war. Pop. 7800.

Corinth (or Lepanto), Gulf of, separates the Morea on the S. from Hellas on the N. Numerous small rivs. run into the gulf, which communicates with the gulf of Patras by the strait of Lepanto. Earthquakes are very frequent, the seat of shock being generally between Patras and Poros. The gulf has a length of 75 m., and an average breadth of 15 m.

Corinth, Isthmus of, neck of land, situated in Greece, which unites the Morea to Attica, between the gulfs of C. and Aegina. Many remains of great antiquity have been discovered, including traces of the temple of Poseidon, and the Isthmian wall. A ship canal through the isthmus was begun in March 1882, and completed in Aug. 1893. The canal is

37 m. in length, and has a width at bottom of 69 ft., at the surface of 100 ft., and a minimum depth of 264 ft. The canal was destroyed by the Gers. in the Second World War, but was repaired and brought into operation again in 1948. The new tns. of Isthula and Poseldona are situated at the S.W. and N.E. extremities of the canal respectively.

Corinthians, First and Second Epistles to the. These two epistles included in the N.T. were written by St. Paul to the members of the Christian Church at Corinth, which he had estab. there during his stay of a year and a half. From internal evidence it is ascertained that the first epistle was written in A.D. 56 or 57 from Ephesus, and the second epistle was written from Macedonia in A.D. 57 or 58. There seem to have been two main reasons which induced Paul to write the first epistle—information which he had received from members of the 'house of Chloë' (1 Cor. i. 11) about the condition of the Christian Church in Corinth, and in answer to certain questions which he had received from the Corinthian Church by Stephanas, Fortunatus and Achaicus. From information received Paul learned of the different religious factions of the Christians and wrongs and abuses which were prevalent at that time in Corinth; and he maintained that the Church was the true state, and would be able to settle all disputes, both theological and civil, and condemned the factions and abuses existing in the Church. He also discusses and answers the questions sent to him from Corinth—questions dealing with marriage and celibacy, idolatry, the support of the ministry of the gospel, public worship, institutions such as the Lord's Supper, spiritual gifts, and the resurrection. The second epistle is closely related to the first and Paul determined to write it owing to the good effect on the Corinthians of his first epistle. The Pauline authorship of 2 Cor., in the case of 1 Cor., has been denied only by Ger. profs. with a reputation to make. St. Paul makes his salutation, mentions the Judaizers, and then gives a graphic account of his ministry as an apostle, its methods and its motives. He then describes how he waited for the coming of Titus from Corinth, and his joy at his arrival and the tidings which he brought; he exhorts the Christians to contribute to the collections for the saints in Jerusalem; and describes how the Judaizers assailed him when he was an apostle. Although their integrity has been questioned, it is beyond doubt that both epistles are authentic, and they admirably display the character of their author. For commentaries on the two epistles, see T. T. Shore, 1879; F. Galdet, 1886-87 (1 Cor.); H. L. Goudke, *The Westminster Commentaries*, 1903 (1 Cor.), 1927 (2 Cor.); E. Evans, *The Clarendon Bible*, 1930; J. Moffat, 1938 (1 Cor.), and R. H. Strachan, 1935 (2 Cor.), both in *The Moffat New Testament Commentary*.

Corinto, maritime tn. in the dept. of Chinandega, Nicaragua, Central America, 19 m. W.N.W. of Leon. It is the chief

seaport of Nicaragua on the Pacific. The prin. export is coffee. Pop. 3500.

Corio, com. and tn. of Italy in the prov. of, and 19 m. N.N.W. of the city of, Turin. Pop. 5000.

Coriolano, name of three engravers:

Coriolano, Cristoforo (d. 1600), native of Nuremberg. He cut the very clever portraits of the second ed. of Vasari, pub. at Florence in 1568.

Coriolano, Giovanni Battista (c. 1590-1649), is thought to be the son of Cristoforo, but probably was his grandson. His cuts in wood are few, his work consisting chiefly of engravings and etchings on copper.

Coriolano, Bartolomeo (c. 1599-1676), also said to be the son of Cristoforo. He was b. at Bologna, and studied under Caracci. He executed some very effective prints in chiaroscuro. His prin. work is 'The Fall of the Giants,' after Guido (1638). He was granted a pension by Pope Urban VIII.

Coriolanus, Gaius or Gnaeus Marcius, hero of an early Rom. legend. His original name was Gaius or Gnaeus Marcius and he received his surname Coriolanus owing to his capture of Corioli from the Volscians. Banished from Rome by the commons in 491 B.C., he fled to the Volscians, whose king, Attius Tullius, made him general of their army. He advanced against the Romans, and was only induced to lead back his army by the approach of Veturia, his mother, Volturna, his wife, and his two children. He returned to the Volscians, with whom he lived until his death. Some traditions state that the Volscians killed him on his return. The story is told in Shakespeare's *Coriolanus*.

Corisco Bay, bay of the Gulf of Guinea, W. Africa, in the bight of Biafra, extending from Cape Esteiras on the S. to Cape St. John on the N.

Corisco Island, small is. in Corisco Bay, belonging to Spain.

Cork, co. in Eire, in the prov. of Munster. It is the largest co. in Eire, covering an area of about 2881 sq. m. On the S. coast is the historic 'v. of Kinsale, with its fine harbour, and there are other smaller but good anchorages for yachts. The W. coast is bold and rocky, and is broken up by the bays of Bantry, Dunmanus, and Roaring Water. The surface is undulating, there being low ridges with valleys to correspond running E. and W., but in the W. it is much more mountainous. The highest portion of the co. is in the Boggeragh Mts. in the N.W., which reach to a height of 2118 ft. To the S. are the Shehy Mts., and the Cahra range is to the N. The prin. rvs. are the Blackwater, the Lee, and the Bandon, flowing from W. to E. The Blackwater rises in the co. of Limerick, and the Lee st. in the Gougane-Barra Lough—a very picturesque spot, and the Bandon has its source in Cullinagh Lough. There are no lakes of any considerable size, the largest being Lough Allua, which is an expansion of the R. Lee. The scenery in the W. of the co. is bold and rugged but in the centre there are

quiet green valleys, and some parts are well wooded. So far as climate is concerned, the prevailing winds are W. and S.W., thus making the atmosphere moist and warm. The ann. rainfall in the city of C. is 40 in., but it is somewhat higher over the whole co. The ann. mean temp. is 52° F., and the snowfall for the year is generally very light, and when it falls it never settles for long. There is excellent sea-bathing at many places along the shores of C. harbour and along the coast of the co. Bantry, Glengariff, and Youghal are much visited by tourists in the summer months. There is not much variety in the soil, there being calcareous limestones, mellow loams, grey and red sandstone, peat, and clay. The pop. is most dense near the sea, and along the prin. lines of communication. Oats, potatoes, and turnips are the chief crops grown, and as the pasture land is extending so are cattle, sheep, and poultry on the increase. There is deep-sea fishing, and the salmon and trout fishing is good in the rivs. C. is one of the co. said to have been founded by King John. Its boundaries were not always as far-reaching as they are at present. They now embrace a dist. which was once a separate co., namely Desmond. In 1598 there were two sheriffs in the co. of C., one especially for Desmond. About this date large tracts of land were given to settlers, and Sir Walter Raleigh and Edmund Spenser, the poet, received 40,000 ac. and 3028 ac. respectively. Of the castles in C., Blarney Castle is the most famous, partly because of the old legend attached to the Blarney stone, which is under the parapet at the top of the tower. Kilcolman Castle, near Doneraile, is the place where Spenser wrote his *Faerie Queene*. Pop., including the co. bor., 343,200.

The city of C. is a seaport situated at the head of the splendid inlet known as C. harbour, and also on the R. Lee. Up to the middle of the nineteenth century it was reckoned as second only to Dublin, but now Belfast surpasses it in commercial importance. The nucleus of the city is built on an is. formed by two arms of the R. Lee, and known as the N. and S. Channels. Electric trams connect the city with the suburbs, and cross both the St. Patrick's and Parnell bridges. Fine quays of cut limestone, altogether 4 m. in length, extend all along both branches of the Lee. The Protestant cathedral, founded in 1865, is dedicated to St. Finbarr, who was the founder of the original cathedral in the seventh century. The Rom. Catholic cathedral, on the N. side of the city, is also dedicated to St. Finbarr. The custom house occupies a fine position overlooking the riv., but the usual business and public buildings are on the is. There is a univ. college of the National Univ. of Ireland with over 1000 students. The original site of C. is said to have been in the neighbourhood of the Protestant cathedral. During the ninth century the tn. was many times ravaged by the Northmen, and according to some records it was burnt down in 821, and also in 1012. The harbour is the most

important one on the S. coast of Ireland; it is studded with is., its shores are well wooded, and is altogether most picturesque. It is due to the splendid dredging arrangements that ships drawing 20 ft. of water can reach the quays on all tides. Trade is carried on mainly with Bristol and some of the S. Wales ports. The imports are chiefly wheat and maize, and the exports cattle, provisions, butter, and fish. The chief local industries are distilling, ship-building, iron founding, and bacon curing. There were riots in and near the city in 1919-20, and the city hall and Carnegie Hall were burnt. C. is governed by a mayor, aldermen, and councillors. Pop. co. bor. 75,300.

Cork, tissue or layer of the bark of the C. oak (*Quercus suber*) which grows in Spain, Portugal, and some dists. of Europe bordering the Mediterranean. A tree first yields a supply when it is about twenty years old, and supplies are obtained about every ten years. The first production is of little value, but each successive supply increases in value. The C. is stripped from the tree by means of incisions made in longitudinal and transverse directions by a curved knife with a handle at each end. The pieces thus detached are soaked in water, scraped, washed, pressed flat, and dried. They are then placed over a coal fire which conceals blemishes and blackens and makes smooth the surface. The elasticity of C. makes it useful for stopping bottles and casks; its lightness for life-belts, artificial legs, and the floats of nets; and its impermeability to water for the soles of shoes. The uses of C. were known to the ancients.—Pliny mentions them. Plutarch says that Pontius Cominius swam the Tiber by the help of pieces of C., and the ancients Egyptians made coffins of it. The use of C., however, for stopping glass bottles was not known until the fifteenth century. Sp. black is made by burning the parings of C., and C. waste is employed in the manuf. of linoleum.

Cork, Earls of, *see* BOYLE.

Corleone, tn. of Sicily, situated 21 m. to the S. of Palermo on a hill near the source of the Belici R. Pop. (including com.) 20,000.

Cormac MacArt, or Cormac na Cuinn, king of Ireland from 218 to 254, was grandson of Conn Cead Cathach (Conn of the Hundred Fights). He reigned in great splendour, and was a great patron of art and learning. Schools of military science, law, and literature are said to have been founded by him at Tara in co. Meath. Some of his sayings are preserved in the *Book of Aicill*.

Cormac MacCulinnán (A.D. 901-8), king of Munster in Ireland, a descendant of Angus, was b. in 836. He reunited the offices of king and bishop, being bishop of Cashel. During his reign the country was troubled by the invasions of the Danes, and it was in resisting these that C. fell at the battle of Moy Albo. He wrote a chronicle in Irish verse, *The Psalter of Cashel*, and an etymological glossary of the Irish language, called *The Glossary of Cormac*.

Cormenin, Louis Marie de Lahaye, Vicomte de (1788-1868), Fr. politician. He was appointed auditor to the Council of State; in 1814 he rallied to the legitimate cause, and after the Hundred Days was made master of requests at the Council of State at the restoration of the Bourbons. He wrote many pamphlets about this time, and his *Droit administratif* (1821) for the first time collected the scattered fragments of administrative law, and gave shape to them. Louis XVIII. made him a baron, and Charles X. a vicomte.

Cormons, small tn. of Italy, situated 7 m. W. of Gorz (Gorizia). A statue to the Emperor Maximilian I. was erected here in 1903. Pop. 6500.

Cormontaigne, Louis de (1697-1752), Fr. military engineer who served in the war of the Sp. Succession. He entered the engineers in 1715, and was put in charge of new works—Forts Moselle and Bellecroix at Metz—which he had designed.

Cormorant, or *Phalacrocorax*, large web-footed bird of the order Ciconiiformes, sub-ord. Steganopodes. The C. *P. Carbo* has a bright shiny head and neck, with bluish-black feathers, sprinkled with white. The general colour above is a greenish black, the throat white, and the bill and feet are dark grey. It is found in all parts of the world in coastal regions. This bird is notorious for its voracious appetite. It collects the food in a kind of pouch formed by the dilatable skin at the front of its throat. Cs. feed entirely on fish, which they catch by swimming and diving under the water, sometimes to a considerable depth. There are more than thirty species, among which are the familiar shag, or green cormorant (*P. graculus*), and the small S. European *P. pygmaeus*, which is a freshwater bird.

Corn, collective term which is applied to the grain or seed of any cereal or farinaceous plant as a produce of agriculture. In England it is chiefly applied to wheat, in Scotland to oats, and in America to maize. See BARLEY, MAIZE, OATS, RYE, WHEAT, etc.

Corn, Indian, see MAIZE.

Cornaceæ, order of Dicotyledons, contains less than one hundred species of widely distributed shrubs and trees, usually with opposite and entire leaves. *Cornus* and *Nyssa* are two of the chief genera.

Cornaro, Caterina (1454-1510), member of a celebrated Venetian family who married in 1468 Jacques de Lusignan, king of Cyprus. Her husband obtained the protection of the republic of Venice and a dowry of 100,000 ducats. Caterina did not join her husband until 1472, and the following year was left a widow; she governed for her son, Jacques III., until his death in 1475, when the Senate decreed that she should abdicate in favour of the republic. This event did not take place until 1489, when it was made the occasion of a solemn ceremonial. Caterina retired to the castle of Asolo, near Venice, where she lived till her death; she had always a 'court' of poets and artists. She is buried in St. Saviour's, Venice. Her portrait

has been painted by many artists, including Palma the elder and Titian.

Cornaro, Luigi (1467-1566), Venetian nobleman, whose weak constitution was further weakened by his intemperance in eating and drinking. When he was forty years of age he gave up these habits on the advice of his physicians and began gradually to diminish the quantity of his food, and proceeded to abstemiousness, and within a year his health was in a perfect condition, and his spirits greatly recovered. In his eighty-third year he wrote *Discorsi sulla vita sobria* (*The Advantages of a Temperate Life*), which was pub. in Italy in the vernacular tongue, and in Lat. It was trans. into most European languages, and was at one time a very popular book. The best Eng. trans. is that dated 1779. C. also wrote three other treatises on the same subject.

Cornbrash (geology), sub-div. of rocks occurring at the upper layer of the Lower Oolite rocks of England, and the most persistent stratum of the series, extending as it does right across the country from Dorsetshire to the Yorkshire coast. It is a thin-bedded rubbly limestone, consisting of clays and calcareous sandstones, which pass into the forest marble, as at Bradford, or into beds of clay. It contains many echinodermata and brachiopods.

Corn-cockle, or *Lychnis Githago*, pretty little species of the Caryophyllaceæ of the same genus as the campion and ragged robin, and like them a common object in our fields.

CORNCRAKE

Corncrake, Landrail, or *Crex pratensis*, species of Rallidæ which is well known in Britain on account of its unmelodious voice. The general colour of the bird is a dullish brown, the bill and tail are short, the legs long and powerful, and the toes have sharp claws. It has a wide geographical range which extends throughout the milder regions of all the continents, and it often spends the summer in Britain, haunting dry meadows. It can swim and run easily, but its flight is heavy.

Cornea, see EYE.

Corneille, Pierre (1606-84), great Fr. tragic dramatist and the precursor of Molière in comedy, was b. at Rouen, and studied at his bp. His father was a legal official, and he was trained for the Bar. He tried for some time to obtain a practice at Rouen: he came to Paris in 1629. Here he produced the comedy of *Mélite*, which had already been played at Rouen. This was highly successful, largely on account of the extreme ingenuity and complexity of the intrigue, and was followed by *Chitandre*, *La Veuve*, *La Galerie du palais*, *La Suicanté*, and *La Place royale*. In 1663 C. was presented to Richelieu, who made him one of his five authors, a group of dramatists whom the cardinal kept to carry out plays for which he himself supplied the plot. But he had not sufficiently the spirit of a follower to remain in this position, and he was soon dismissed. At this period C. became acquainted with Sp. literature, and this marks the starting point of his greatness. In 1635 appeared *Médée*, a tragedy which showed a marked improvement on his earlier work, but in 1636 the *Cid*, founded on a drama by Guilhem de Castro, took Paris by storm. While following the Sp. poet closely in detail, C. shows in his treatment the spirit which was to dominate Fr. tragedy. The piece is classically conceived, the hardness and savagery of the Sp. are removed, the action is simplified and concentrated, and the whole drama is changed from the external world to the internal world of the heart. The greater number of the Fr. critics, represented by the recently founded Academy, and instigated by Richelieu, condemned the play severely, on account of its incomplete observance of classical rule. However, all their force was unable to change the popular verdict. As Boileau says:

'En vain contro le *Cid* un ministre se ligue,
Tout Paris pour Chimène a les yeux de Rodrigue';

and the phrase 'beau comme le *Cid*' passed into the language. For three years C. remained in retirement, and when in 1639 he reappeared with *Horace* and *Cinna*, he had learned the lesson of strict submission to the unities. Then came *Polyeucte* (1640), in which a Christian saint takes the place of hero, giving one of C.'s noblest tragedies; *La Mort de Pompée* (1643); *Rodogune* (1646); and *Héraclius* (1647). In 1643 had appeared *Le Menteur*, the comedy which first shows the style which Molière was to perfect. In 1647 C. was elected a member of the Academy, and produced *Andromède*, *Don Sanche d'Aragon*, and *Nicomède*, a kind of tragic-comedy where romantic heroism is mixed with irony, the whole forming the ground of much critical debate. In 1652 the failure of *Pertharite* drove C. from the stage, and he remained in retirement for six years, during which he commenced a trans. of the *Imitatio Christi* into Fr. verse. In 1659 he returned to the stage with *Œdipe*, feeling confident that his

powers were unimpaired. This was an illusion, and henceforth all his works show decline. Here and there are to be found scenes showing his old genius, but these are varied by much poor work. In 1674 his dramatic career ended with *Sertorius*. For ten years the poet remained silent, suffering from the death of his two sons and from domestic troubles, suffering still more from the sense of his vanished genius, and the knowledge that he was abandoned and despised by a new generation. At the age of seventy-eight he d. in Paris. C. is indeed the creator of the

PIERRE CORNEILLE

Engraving after a painting by C. Lebrun.

Fr. tragic drama. 'You know,' writes Racine in the eulogy of C. which he read before the Academy, 'in what a condition the stage was when he began to write. What disorder, what irregularity! . . . All the rules of art, and even those of decency and decorum, broken everywhere. In this infancy, or better in this chaos, of our dramatic poetry, C., after having for some time sought the right path and struggled against the bad taste of his day, inspired by extraordinary genius and helped by the study of the ancients, at last brought reason upon the stage, but reason, indeed, adorned with all the pomp, with all the ornaments which our language can provide. He had the happy gift of reconciling the credible and the marvellous, and left far behind him all the rivals there were.' While the drama of C. has not the freedom of the romantic type, it is by no means so strictly classical as that of Racine. C. accepted the unities, but only with difficulty. His great work is the creation of the

drama of the soul. His characters are exalted and superhuman, always masters of themselves and their emotions. Love he treats as a weakness, the will as the sole source of action. Stoicism and devotion to duty is the lesson he teaches. See C. A. Sainte-Beuve, *Portraits littéraires*, 1844; F. P. G. Guizot, *Corneille et son temps*, 1852; F. Brunetière, *Époques du théâtre français*, 1892; L. Batiffol, *Richelieu et Corneille*, 1936; M. Turnell, *The Classical Moment*, 1947; and lives by G. Lanson, 1898; P. Dorchain, 1927; also M. Turnell, *The Classical Moment*, 1947.

Corneille, Thomas (1625-1709), younger brother of Pierre C., twenty years his junior, *b.* at Rouen. He distinguished himself in early life by a comedy in Latin verse, which he composed while he was at the Jesuits' college. On the death of his brother, Pierre, Thomas took his place in the Académie, and contributed to the *Dictionnaire*, and afterwards became a member of the Academy of Inscriptions. Altogether he wrote forty-two tragedies and comedies. His earlier works are imitations of the Sp. dramatists, the chief being *Don Bertrand de Cigarral* (1650); *Le Géôlier de soi-même* (1655); and *Le Baron d'Albikrac* (1668). Of his comedies the best known are *Les Dames vengées* (1695, in collaboration with Visé); *Le Devin-ressus* (1679); and an adaptation from Molière's *Festin de pierre* (1677). He was, however, made famous by his dramas *Timocrate* (1656); *La Mort d'Annibal* (1669); *Ariane* (1672); and *Le Comte d'Essex* (1678). See G. Reynier *Thomas Corneille, sa vie, ses ouvrages*, 1892.

Corneil, see under CORNUTS.

Cornelia: 1. The daughter of Publius Scipio Africanus. She married Sempronius Gracchus, and was the mother of Tiberius and Caius Gracchus, the noted reformers. In her were exemplified the virtues of the best type of Roman matron, and a statue was erected to her during her lifetime, with the inscription 'Cornelia mater Gracchorum.' See Valerius Maximus, 4, c. 4; Cicero in *Brut.* 58, and *De Clavis Oratoribus*, 58, etc. 2. The daughter of Metellus Scipio, and married first Publius Crassus, and afterwards Pompey, by whose influence her father obtained the consulship. She was the helpless witness of her husband's murder by Achilles in the bay of Alexandria, and it is said that he attributed all his ill fortune to her unlucky influence.

Cornelia Gens (the family of the Cornelli) was a famous Roman family, who gave to Rome many exalted men in all branches of learning and art. The family had a patrician and a plebeian branch. The former branch had four great branches, those of Lentulus, Maluginensis, Rufinus, Scipio, each of which produced some great names. To the plebeian branch belonged Gallus, Tacitus the historian, Celsus the physician, Cornelius Nepos the biographer, and a great many others.

Cornelian, see CARNELIAN.

Cornelisz, Cornelia (Cornelis van Haarlem) (1582-1638), Dutch historical and portrait painter *b.* at Haarlem, who

received lessons in his youth from Pierre Aartzen and later from Porbus and Colinet. His 'Banquet of the Archers' Guild' (1583) is in the Haarlem Museum; and his 'Massacre of the Innocents' (1590) is in Amsterdam. Another well-known example of his art is 'The Deluge,' painted for the earl of Leicester. Also painted some Biblical pictures.

Cornelisz, Jakob, or **Cornelisz van Amsterdam**, fifteenth-sixteenth-century Dutch painter, whose works are represented in museums at The Hague, Berlin, Antwerp, and Vienna.

Cornelisz, Lucas (1495-c. 1552), Dutch subject and portrait painter, *b.* at Leyden. He received instruction in art from his father, Cornelius Cazelbrechtsen, who was the tutor of Lucas van Leyden. Owing to poverty he was forced to act as cook, but on going to England, about 1527, he was made royal painter by Henry VIII. Afterwards he was employed at the court of Ferrara in Italy from 1535.

Cornelius, name of a centurion of the 11th cohort stationed at Caesarea. In consequence of a special revelation Peter received him into the communion of the Christian Church directly by the rite of baptism without preliminary ceremonies such as circumcision, etc. This is generally regarded as being the beginning of the introduction of Gentiles into the Christian Church. Such a view is not quite justified by the fact of the case; for the introduction of the Ethiopian eunuch (Acts viii. 38) may have been prior to this, and C. could hardly be regarded as a Gentile, as he was a proselyte at the gate. There is, however, no doubt that the relaxation of the exclusiveness of the early church dates from this period. Legend tells us that C. founded a church at Caesarea and became bishop of Scamandros. See Acts x.

Cornelius, Aurelius, see CILIAUS, AULUS.

Cornelius, Peter (1824-74), Ger. author and musician, nephew of Peter von C. (q.v.). His opera entitled *The Barber of Bagdad* was produced at Weimar under the auspices of Liszt, who was his friend. The work was hissed off the stage, and Liszt resigned his post as conductor in consequence. C. went to Vienna and occupied himself in writing songs and poems, being very much under Wagner's influence. His second opera, *Le Cid*, was produced at Weimar in 1865. For the last decade of his life he was at work on his opera *Gundel* and other compositions, besides writing ably as fully on Wagner's music dramas. In 1867 he became teacher of rhetoric and harmony at the school of music, Munich, where he married Berthe Jung. Many of his original poems and trans. from the Fr. are still highly esteemed, and among his songs, the lovely *Waldnachtlieder* and *Brandlieder* are especially noteworthy.

Cornelius, Peter von (1783-1867), celebrated Ger. painter, was *b.* at Düsseldorf, and early exhibited a taste for art. At the early age of nineteen he was commissioned to paint the cupola of the church of Reuss. He visited Rome, and illustrated Goethe's *Faust* in a manner worthy of the subject. In 1808 he went

to Frankfurt, where he was well received, and in 1811 to Rome, where in conjunction with Veit, Overbeck, and others he founded practically a new school of Ger. art and revived fresco painting. In 1824 he was made director of the Academy of Munich; in 1841 he was made a member of the Academy of Berlin. He exhibited at Paris in 1855 four cartoons of the decorations of the Campo Santo, or royal mausoleum, of Berlin, which were widely admired. The frescoes in the Bartholdy Palace at Rome, representing the hist. of Joseph, are among his best works. Among his other works may be mentioned his great national picture 'Cycle of the Nibelungen,' his fresco illustrating Tasso's *Jerusalem Delivered*, the frescoes in the Glyptothek of Munich, and his colossal 'Last Judgment' in the Ludwigskirche at Munich. He d. at Berlin. C.'s art was essentially Ger., and he illustrated with remarkable felicity the masterpieces of Ger. poetry. He introduced into his work an objective and metaphysical element which was liable to abuse. In his compositions the noteworthy features are the grandeur of the conception and the sublimity of treatment rather than purely natural effects. Some of his frescoes are magnificently executed, in particular those of the Glyptothek in Munich. He had numerous famous pupils, among them Kaulbach, and some of the finest Ger. engravers, such as Amsler, Eberle, etc., selected his pictures to work on, and so enhanced their popularity. See lives by A. Kuhn, 1921, and K. Koetschau, 1934.

Cornell, Ezra (1807-74), Amer. philanthropist, b. at Winchester Landing, New York. In his early life he practised as a mechanic in Ithaca, but later on he became very rich through organising telegraph companies, and also putting up telegraph lines. C. Univ. was founded by him at Ithaca in the year 1868.

Cornell University, named after its founder, Ezra C. It was estab. in 1865 in Ithaca, New York. It received large endowments of public lands from the State in return for giving to one student every year, from each of the 128 dists. of New York state, a free education in agriculture and mechanics. Instruction is given in arts and sciences, architecture, engineering, economics, and agriculture. Now has over 5000 students and a faculty of over 1100 members. Its lands, buildings, and equipment are valued at nearly \$3,000,000, and it has a library of approximately 800,000 books. Receives large Federal grants and State appropriations.

Corner, word of Amer. origin, in the first instance used to denote a market given to a particular class of stock, e.g. railway C. Now, however, it is used for a speculation in the stock exchange in which a broker or brokers put up all the available stock of any particular commodity, such as wheat, with a view to forcing sellers of the stock or commodity to buy from those who formed the C. at their own price. A C. is generally brought off in a new security when by false dealing stock-jobbers are persuaded

to sell speculatively shares which really are in the hands of the set of people who cornered the market.

Corner, Julia (1798-1875), Eng. authoress who wrote for children. Her best known works are *The Child's Own Sunday Book* (1850); *Culverley Rise* (1861); *The Good Children* (1854); and *The Miller's Maid* (1867).

Cornet, lowest rank of commissioned officer in the cavalry, corresponding to ensign in the infantry. In 1871 the title of C. was abolished and that of second lieutenant substituted. The work of a C. was to assist the captain in the duties connected with his troop.

Cornet (Fr. *cornet à piston*; It. *cornetto*), treble wind instrument made of brass. It has a cupped mouthpiece, and a tube intermediate in size between a trumpet and a bugle, which give it a tone intermediate between these two instruments. Its open notes consist of C (below the treble staff), G, C, E, and above the staff C, B₂, C, and in addition four

VALVE CORNET

higher notes D, E, F, and G, and a fundamental note, C (an octave below the staff), but these last five notes are seldom used. Three slides give the connecting notes and half-notes of the scale, the first slide lowering the sound by one tone, the second by a semitone, and the third by three semitones. Three valves or pistons which are depressed by the fingers allow the air to pass through these slides. The C is used in orchestral and solo music and in military bands. Formerly the C. was played in a number of different keys, but, like the trumpet, it now exists, as an orchestral instrument, in the two keys of B flat and A.

Corneto Tarquinia, tn. and episcopal see in Italy, 63 m. from Rome. There is a fine cathedral there, also sev. old churches and palaces. Matches and pottery are manufactured there. It is noted for its Etruscan antiquities which were found at the adjacent Tarquinii. There still exists at Tarquinii a large Etruscan necropolis. Pop. 8000.

Cornett (Ger. *Zink*), old wind instrument, now in disuse, in no way resembling the modern valve cornet. It had a long, thin, slightly tapering stem, curved or straight, made of wood or ivory, and covered with leather. An offshoot of the C. was the serpent (q.v.).

Corn-flour, starchy ingredient of puddings, sauces, etc., obtained from finely ground maize or Indian corn. Also denotes flour made of rice or any other grain.

The starchy granules, after separation from the germ and gluten, are carefully selected and purified. The germ, after its oil has been extracted, is used for cattle food, as is also the residue of coarser constituents of the granules. See MAIZE.

Cornflower, or **Bluebottle**, or *Centaurea Cyanus*, species of the order Compositae, is a weed commonly found in wheat-fields.

CORNETTI OR ZINKEN

Treble and one-keyed tenor, 16th and 17th centuries

Cornhill, thoroughfare in the city of London, running between the Poultry and Leadenhall Street. The name goes back to the beginning of the twelfth century. Stow suggests that it may be on the site of an ant. corn market, and so have received its name, but there is no trace of one having existed at that date. At the beginning of the fourteenth century there were a prison, a pair of stocks, and a pillory used for the punishment of bakers, millers, and other offenders. It is now a busy commercial thoroughfare with business houses, banks, and insurance offices. The poet Gray was born here.

Cornhill Magazine, literary magazine, founded in 1860 by Thackeray, who was its first editor. To it he contributed *Lovel the Widower*, *Philip*, and *The Roundabout Papers*. In it appeared George Eliot's *Romola*, Matthew Arnold's *Culture and Anarchy* and *Literature and Dogma*, and it has also numbered among its contributors Ruskin, Mrs. Browning, Tennyson, Fitzjames Stephen, Leslie Stephen, and James Payn. It was formerly much illustrated, and brought out the cartoons of Richard Doyle, and sketches by Leighton, Du Maurier, and

Thackeray. Editors were Dutton Cook, Leslie Stephen, and later James Payn. The present editor is Peter Quennell; and the publisher John Murray, 50a Albemarle Street, London, W.1.

Cornice, in architecture, is the moulded projection which crowns or finishes the entablature, each order of architecture having its own peculiar C. The Grecian Doric C. is composed of few and bold parts, really of little more than a corona (the projecting and prin. member in every C.) finished above by one or two simple mouldings, and having attached a series of shallow platos or tablets called mutules, which are a distinctive feature of the Doric C. Dentils are peculiar to the Ionic C., and modillions to the Corinthian C. In the Gothic order there are various styles of Cs.; sometimes it was in the form of a row of corbels bearing the parapet, and sometimes small arches surmounted the corbels.

Corniferous Period (from Lat. *cornu*, horn, *ferre*, to bear). In Amer. geology this is the second of the four great divs. of the Devonian system, and includes the Schoharie grit and Corniferous limestone. It is a widespread formation, full of fossils, and rocks of this series, mostly sandstone, are found along the Appalachians in Ohio and in Canada, where they enclose valuable deposits of petroleum.

Cornigliano, com. in Italy, 3 m from Genoa, of which it is a residential suburb. Cotton spinning and dyeing are done here. Pop. 20,000.

Corniglio, com. in Italy in prov. of Emilia, 27 m. from Parma. Pop. 7500.

Cornimont, com. in the Vosges dept., France, with thread manufs. Pop. 4500.

Corning, Erastus (1794-1872), Amer. capitalist, b. at Norwich, Connecticut. Removed to Albany, New York, in 1814, and eventually became the owner of large iron works and banks. Principally known as connected with early Amer. railway development.

Corning, city of Steuben co., New York, U.S.A., situated on the Chemung R., in the S. part of the state, a centre of a dairying and tobacco growing region. Its industrial life consists of foundries, machine works, brick and glass works, and lumber mills. Pop. 16,200.

Cornish, Vaughan (1862-1948), Eng. geographer, b. at Debenham, Suffolk. Educated at St. Paul's School and Victoria Univ., Manchester. Gill memorial award, Royal Geographical Society, 1900. Grand Prix, Franco-Brit. Exhibition, 1908 for scientific photography. From 1935 occupied in geographical research and, particularly, in the movement for preserving the scenery of rural England. Dedicated S. Combe Farm on Sidmouth cliffs as an open space. President, geographical section, Brit. Association, 1923; of the Geographical Association, 1928. Pubs. include *A Strategic Atlas of the Occans*, *National Parks and the Heritage of Scenery* (1930); *The Poetic Impression of Natural Scenery* (1931); *The Scenery of England* (1932); *Ocean Waves and Kindred Geophysical Phenomena* (1934); *The Beauties of Scenery* (1943);

Geographical Essays (1916); *Photography of Scenery* (1946).

Cornish Language. The old C. L. belonged to the Cymric div. of Celtic, in which are also included Armorian (see BRITTANY) and Welsh. It survives in a few words still used in the fishing and tin-mining communities, as well as in the names of persons and places, but the last persons who spoke it (the last of all was reputed to be one Dolly Pentreath) died towards the end of the eighteenth century. The most interesting relics of the language extant are a few miracle plays, entitled *Guaries*, which were ed. and trans. by Edwin Norris (Oxford, 1859). Added to the trans. is a sketch of Cornish grammar, and a vocabulary from a thirteenth-century MS. (Cotton MSS.). The only dictionary is Williams's *Lexicon Cornu-Britannicum* (1865). Of the Cornish miracle plays the most considerable of the series were those known as the *Ordinalia*, of which two fifteenth-century copies are still in existence. Most of the Cornish miracle plays emanated from Glasney College at Penryn and date from 1350 to 1500. Two notable plays are *The Life of Saint Meriasek* (1504), and *The Creation of the World, with Noah's Flood*, the latter compiled by Wm. Jordan of Helston as late as 1611. See Richard Carew, *Survey of Cornwall*, 1602 (his knowledge of the C. L. was, however, very limited); H. Jenner, *Handbook of the Cornish Language*, 1904; and M. Nance, *Folklore recorded in the Cornish Language*. See also W. Borlase, *Antiquities of Cornwall*, 1754.

Corn Laws, name given to certain statutes passed in the Brit. Parliament relating to the exportation and importation of grain. Laws regulating trade in corn date as far back as the reign of Edward III. In the reign of Henry VI., with the object of securing a plentiful and cheap supply for home consumption, no corn was allowed to be sent out of the country. In the reign of Elizabeth little advantage was taken of the new law providing free importation, and practically all the corn grown remained in the country. Towards the end of the seventeenth century the legislators, who, being generally landowners, had the interests of agriculture at heart, conceived a new plan of promoting home production. Exportation was now encouraged freely by bounties, but the price of corn remained low and tended to decrease. In 1773 Burke passed an Act which exacted the small duty of 6d. on foreign corn, which might be imported when the home price was at or above 48s. a quarter. The exportation with its corresponding bounty were to cease when the home price was at or above 44s. This legislation was very beneficial to the rising manufacturing classes, but in 1791 it was repealed in the interest of the landowners when there was a prohibitive duty on corn below 50s. In 1815 Parliament enacted that foreign corn might not be imported into Great Britain until the home price of wheat had reached 80s. a quarter. The law caused great economic distress. In 1827 and

1828, more Liberal measures were brought before the House by Canning and Charles Grant. Agriculturists were gradually being convinced of the fact that the C. L. were based on a wrong principle, and that the interests of the general community were being sacrificed to the supposed interests of the landowners. England was still suffering from the effects of the Napoleonic war, and a series of bad harvests (1816 and 1837-42) increased the distress. Robert Peel attempted to effect a compromise by introducing a system of a sliding scale in the duties, depending on the rise and fall in the price of wheat. In 1836 an agitation was started in Manchester for the repeal of the C. L. and in the following year the Anti-Corn Law League was formed. Mr. Cobden and Mr. Bright were among the foremost of the advocates of Free Trade. The country was inundated with pamphlets on both sides of the question. In 1843 corn was allowed to be imported, at a practically negligible duty, from Canada, and before long it happened that Amer. corn came into England, through Canada, at the same rates. Peel, who was himself willing to abandon protection, could not hold his ministry together and resigned. He was obliged, however, to take office again, and in 1846 declared himself a convert to Free Trade. A fixed but reduced duty was placed on corn for three years, after which the C. L. were to be abolished. The price of corn did not fall greatly with the repeal of the C. L., nor did agriculture appear to suffer any great loss, while the country prospered in its industries. Towards the end of the nineteenth century, however, it was felt that the agric. interests of Great Britain had suffered considerably, and a Fair Trade party urged that a moderate protection should be given to benefit the agric. classes. In 1903, at a time when Great Britain was suffering from the S. African war, a registration duty of 1s. per quarter was placed on imported grain and flour, but the tax was abolished in the following year. In the meantime Joseph Chamberlain brought before the country his scheme of preferential tariff for the colonies, with a tax of 2s. on foreign grain. Owing to the unrestricted naval warfare waged by Germany during the First World War and the consequent urgency of the question of food production in Great Britain, the Brit. Gov. introduced Bills which were passed in 1917 and in 1918 in the hope of stimulating corn production in the United Kingdom. Although these were war measures, they remain permanently on the Statute Book, and their ultimate effect on the increased production of corn in Great Britain was practically nil. A converse problem, however, arose later, for in the seven years immediately before the outbreak of the Second World War, a world economic problem was the disposal at a remunerative price of the huge accumulations of wheat in America and Australia. In Aug. 1933 an international wheat agreement was concluded between the U.S.A., Canada, Australia, and the chief European powers for

the quantitative regulation of exportable wheat and its allocation among producers. But in the crop year 1938-39 world supplies exceeded 5,000,000,000 bushels for the first time in hist., and though the 1939-40 crop was substantially smaller than this record, largely owing to reduced acreages sown in the U.S.A. and India, the decrease was offset by a heavy carry-over, and the net effect of the great surplus of wheat stocks was the forcing down of the price below the lowest level previously recorded, which was in 1931. A world conference was proposed in Jan. 1939 to consider the problem, but no decision was reached before the Second World War broke out later in the year. See articles on PÉEL, BRIGHT, CORDEN, CHAMBERLAIN, FREE TRADE, and PROTECTION. Consult the text of the C. I. in *British Statutes* (16 vols.), London, 1882-1909; W. T. Thornton, *Historical Summary of the Corn Laws*, 1841; and J. S. Nicholson, *History of the Corn Laws*, 1904; C. H. Fay, *Corn Laws and Social England*, 1933.

Corno di Bassetto, see SHAW, GEORGE BERNARD.

Corno, *Molle*, name of the mt. which terminates the Gran Sasso Range in the Apennines, Italy. Height 9580 ft.

Cornouaille, dist. in Brittany in the dept. of Finistère; the chief tn. is Quimper. It is barren, rocky, and desolate, resembling in many features some parts of Cornwall in England.

Corns, growths caused by the thickening of the cuticle, generally on the toes, arising from continued pressure over a projecting portion of bone. They are either hard and dry when they are situated externally, or soft when they occur between the toes, which C. are often very painful. A hard corn begins by the thickening of the skin, as the pressure of the boot increases so does the irritation and thickening until the core of the corn is formed. The treatment of C. consists in the removal of all pressure (such as tight or bad-fitting boots), and then to pare or file away the hard skin and extract the root of the corn. If the corn is very hard it is best to soak the foot in hot water, and apply a solution of salicylic acid and collodion for sev. successive days and let it dry. This tends to soften the epidermis, and after a few applications the corn can be pared away when placed in hot water. Horses, as well as men, are subject to C., usually caused by the animal being badly shod (see under HORSE—DISEASES).

Cornu, *Maxime* (1843-1901), Fr. botanist, who, in 1872, graduated in natural science with a thesis, *Mono-graphie des Saprolégniques*. His books all deal with the anatomy, pathology, and physiology of plant life.

Cornu Ammonis, old Lat. name for the fossil shells well known to us as ammonites. They received their name from a fancied resemblance to the horns sculptured on the head of Jupiter Ammon.

Cornu Copiae, later called *Cornucopia*, a horn of plenty. It is used as a symbol of prosperity. In architecture and sculp-

ture the horn is often seen placed in the hands of Plutus, Fortuna, and others, who pour from it abundance of fruits or corn.

Cornude, com. in prov. of Venetia, Italy, 16 m. from Treviso. Pop. 3600.

Cornus, chief genus of Cornaceae, is widely distributed in all lands but Australia, and consists of twenty-five species of shrubs, trees, and herbs. *C. sanguinea*, the common dogwood or cornel, is a berry-bearing shrub with cymes of white flowers. It is found in England in woods and thickets, especially on a chalk or limestone soil, and its wood is used in making small instruments. *C. suecica*, the dwarf cornel, is a herbaceous plant about 6 in. high, with few flowers. It is a creeping plant growing in pastures in Scotland and Northumberland and its berries have tonic qualities. The bark of *C. florida*, *C. sericea*, and *C. coccinea* are used in the U.S.A. as substitutes for Peruvian bark. *C. canadensis*, or bunchwood, has large conspicuous flowers. *C. officinalis* is cultivated in Japan as a febrifuge.

Cornutus, L. Annæus, Stoic philosopher of the time of Nero, who exiled him for criticising his projected verse chronicle of Persian annals. One of his pupils was Persius, whose satires he revised. See G. Martini, *De L. Annæo Cornuto*, 1925.

Cornwall, Barry, see PROCTER, BRIAN WALLER.

Cornwall, Earl of, see GAVESTON, PIERCE.

Cornwall, S.W. maritime co. of England, bounded on the N. and N.W. by the Atlantic Ocean, E. by Devonshire, and S. and S.W. by the Eng. Channel. The Scilly Isles, 24 m. W. of Land's End, form part of the co. There are only two harbours of any importance on the N. coast, one formed by the estuary of the Camel, where Padstow is situated, and the other being the bay of St Ives; there are numerous small creeks of little importance. The coastline on the N. is formed of bold and rugged cliffs, and is famed for its wild, rocky scenery while the S. coast is still bold and rocky, but in a lesser degree, and its headlands are covered with luxuriant vegetation. Falmouth harbour, on the S. coast, is one of the finest in Britain. The surface of C. is extremely irregular, and from the Tamar to Land's End it is a series of rugged hills, alternating with wide stretches of moorland. Brown Willy (1368 ft.) is the highest point in the co. The chief riv. is the Tamar; it is tidal, and navigable for 19 m. The climate is mild, particularly in the S., and there the vegetation grows in almost tropical abundance, fuschias, geraniums, camellias, myrtles, and hydrangeas of considerable size flourishing in the Penzance and Falmouth dists. during the winter; in the Scilly Isles exotics grow in the open, and a good supply of early vegetables is the result of the development of market-gardening. The growing of anemones alone has an ann. value of £250,000 sterling. Fruit-trees, with the exception of the apricot, nectarine, and peach, thrive successfully. C. ranks high as an

agric. co.: the soil is rich in most parts, the crops plentiful, and very early in some localities. Oats form the most important grain crop; the green crops include swedes, turnips, and mangolds. The Cornish broccoli trade was expanded in 1925 with 1 lb. of Fr Roasoff seed, and developed into an industry worth £1,250 000 a year by 1939. Numbers of cattle and sheep are bred. C. formerly obtained much wealth from its mines, yielding tin, copper, lead, iron, zinc, bismuth, and arsenic. At one time C.

Lizard dist., and made into ornamental objects; it is noted for its beautiful colourings. The fisheries of C. are among the most important on the S.W. coast, and form another industry of the co. The chief fishing stations are on Mount's Bay and at St. Ives; mackerel, pilchards, and herrings are caught in large quantities, 20,000 hogsheads of pilchards being taken in an average year. In some respects the natives resemble the Welsh people, such as in their aptitude for oratory and an intense love and pride of country. It is a

MEVAGISSEY, A CORNISH FISHING PORT

John H. Stone

supplied half of the world's copper, and all Britain's tin. As late as 1913 5000 tons of tin were produced yearly, but at the present day 2000 mines are abandoned and only four are working. The decline has been caused by the easier worked Malayan sources for the difficulties of extraction in C. are considerable, and the cost therefore high. The rich lodes remain, however, and the newly formed Cornish Mining Development Association has set forth (1948) a plan for development which, it is stated, can eventually produce tin and by-product metals (arsenic, tungsten, etc.) to an ann. value of £3,000,000, providing sufficient capital and labour is available. A product also of great importance is China clay, the centre of this industry being at St. Austell. It is exported to the pottery dists. for the manuf. of porcelain and to Lancashire for cotton goods. The serpentine rock is largely quarried in the

co. full of prehistoric remains. They may be classed as follows: (1) Cromlechs, such as Lanyon, Mulfra, and Zennor, these all being found in the Land's End dist. The first is high enough for a man to ride under. (2) Rough monoliths, found in all parts of C. (3) Circles, of which the prin. is that known as the Hurlers, near Liskeard. (4) Alignments, or avenues of stones, a very interesting example of one being that called the Nine Maidens near St. Columb Major. The anct. remains also include hut dwellings, cliff castles, and hill castles. C. possesses many ruined castles, such as those at Tintagel and Launceston, parts of which date from Norman times. The co. belongs to the W. circuit, and the assizes are held at Bodmin. The co. tn. is Truro (pop. 12,000). C. is popular with holiday-makers and tourists. Area 868,167 ac. Pop. 317,900. See R. Polwhele, *The History of Cornwall*, 1816; W. Collins,

Rambles beyond Railways, 1851; M. Quiller-Couch, *Cornwall's Wonderland*, 1914; C. E. Vulliamy, *Unknown Cornwall*, 1925; A. Mee, *Cornwall*, 193; A. K. Hamilton Jenkin, *Cornish Miner*, 1927. *Cornwall and its People*, 1945.

Cornwall, co. seat of Stormont co., Ontario, at the foot of the long Sault Rapids of the R. St. Lawrence, 55 m. S. of Ottawa, 67 m. W. of Montreal, on the main line of the Canadian National railways, and on the Canadian Pacific railway and New York Central railroad. Situated on the St. Lawrence R. (bridge to New York State), it has unlimited cheap hydro-electric power. Has a good harbour for lake and riv. traffic. Began as the co. seat of an agrio. area that exported only potash, grain, and masts for sailing ships. To-day it is an industrial community, with textile and chemical plants, furniture, pulp and paper, fibre products, and draperies. It is the market centre of a rich mixed farming and cheesemaking dist. C. was founded in 1783 by United Empire Loyalists. It was incorporated as a tn. in 1848. Almost opposite is the Indian vil. of St. Regis, C. Pop. 15,000.

Cornwallis, Charles, Marquess (1738-1805), son of the first Earl C. On leaving college he entered the army, and in 1761 served a campaign in Germany. In 1762 he succeeded to the earldom and estates of his father. In 1770 he was made governor of the Tower. When the war of Amer. Independence broke out he accompanied his regiment and was victorious over Gen. Gates at Camden, 1780; also over Gen. Greene at Guilford, 1781; but at Yorktown, Virginia, disaster befell him, and the Eng. cause in America was completely overthrown. He escaped censure owing to the great esteem in which the king held him, and in 1786 he was appointed governor-general of India, and while there made many reforms, but on account of differences with Tippoo Sahib his plans were much interrupted. In 1791 he captured Bangalore, and after having concluded a treaty with Tippoo Sahib he returned to England in 1793. He was then raised to the rank of marquess, and in 1798 was appointed to the viceroyalty of Ireland, where he succeeded in subduing the rebellion of 1798, showing much integrity and wisdom in his method of obtaining peace. In 1801 he was replaced by Lord Hardwicke. In 1802 he negotiated the peace of Amiens. In 1805 he was sent to India as governor-general in the place of Lord Wellesley, but upon arrival at Calcutta his health had already broken down, and on the way up country, to take command of the troops, he died at Ghazipur. See W. S. Seton-Karr, *Cornwallis*, 1890.

Cornwallis, Sir William (1744-1819), admiral, was the younger son of Charles, first Earl C. He entered the navy in 1765, and in 1768 served at Louisbourg. In 1759 at the battle of Quiberon Bay, and for his services was made commander in 1762. He was afterwards engaged in the actions off Grenada (1779), St. Kitts (1782), and Dominica (1782). He was

made rear-admiral in 1793, vice-admiral in 1794, and admiral in 1799. In 1795 he encountered a Fr. force far greater in numbers than his own, but safely escaped, and he commanded the Channel fleet in 1801 and from 1803 to 1806. See C. F. M. Cornwallis-West, *Life and Letters of Admiral Cornwallis*, 1927.

Cornwell, John Travers (1899-1918), boy naval hero of the First World War who, at the battle of Jutland, stayed alone at his post on the *Chester*, though mortally wounded. He was awarded the V.C. posthumously.

Coro, tn. in Venezuela, S. America, cap. of the state of Falcón, about 210 m. W.N.W. of Caracas. It was founded in 1527, and was the cap. of the Sp. prov. from that date until 1578. Pop. 10,930, of whom many are Indians and mestizos. It has much declined since Caracas was made the cap. Its port is La Vela, which exports coffee and hides. Pop. 15,000.

Corocoro, tn. and mining centre in the dept. of La Paz, Bolivia. Copper ore is the chief product of the mines, and it is exported from Mollendo. Pop. 3000.

Corolla (from Lat. *corona*, a wreath or crown), inner whorl of floral envelopes which surround and protect the essential organs of the flower. The C. is made up of petals which are usually brightly coloured and often scented, in order to attract insects for the purpose of pollinating the flower. Another function of the petals together with the sepals is to protect the stamens and pistil when the flower is in bud, and in some cases from rain, etc., by closing when the sun goes in. When the petals are free from one another, as in buttercups, the flower is said to be polypetalous; it is gamopetalous when they are joined to form a tube or cup as in primroses. A flower is distinguished as hypogynous, perigynous, or epigynous, according as the base of the petals are inserted below, on a level with, or above the ovary, as in buttercup, rose, snowdrop, respectively. In many flowers, e.g. daffodil, there is no distinction between two floral envelopes, but the calyx and C. together form the perianth; in other cases there is calyx only, and C. is missing, e.g. meadow-rue. When all the petals are alike the flower is said to be regular, as in lily, otherwise it is irregular, as in orchid, pea, etc. Of irregular flowers the two best-known types of C. are the bi-labiate or two-lipped, as in the dead-nettle family, and the ligulate or strap-shaped, which occurs in the outer florets of the daisy. In some cases the C. is fugacious, i.e. it falls off as soon as it is gathered, as in flax; in a few cases it is persistent and remains in a withered condition round the fruit; this occurs in campanula.

Corollary, in mathematics, is a proposition which follows another proposition as a consequence, and therefore does not require any separate demonstration.

Coromandel, name of the oldest gold field in New Zealand. It is the centre of the gold-mining and kauri timber dist. on the C. (Colville) peninsula. It was discovered in 1852. Pop. 2000.

Coromandel Coast, name given to E. coast of India, between Cape Calimere and the mouth of Kistna R.

Coron, or **Koron**, seaport and fortress of Greece in Messenia, situated on the W. coast of the gulf of Kalamata, near the site of the anct. Colonides. The industry of the tn. is silk manuf. Pop. 2700.

Corona: 1. In botany, the crown at the mouth of the tube formed by the perianth (petals and sepals) in the genus *Narcissus*. 2. In architecture, the lower part or drip of a cornice which projects for some distance in order to carry off the rain.

Coronado, Francisco Vázquez de (1500-1545), Sp. explorer of the S.W. of the U.S.A.; appointed in 1539 governor of New Galicia; set out in 1540 to discover the 'seven cities of Cibola.' He explored E. Arizona, the Rio Grande, and Kansas. See G. P. Winship, *The Coronado Expedition*, 1896.

Coronation (Lat. *coronare*, to crown), ceremony of crowning the sovereign of a country. The practice of placing a crown on the head of a new sovereign dates from early times, as we read in the O.T. that Solomon was crowned. The kings of

W. & A. G. & Sons Ltd., Dundee

THE CORONATION CHAIR AND HIGH ALTAR, WESTMINSTER ABBEY

The term is also used of the crown or circlet suspended from the roof of a church to hold tapers, which are lighted on solemn occasions. 3. In astronomy, see SUN.

Corona Borealis and Australis, N. Crown and S. Crown. The first is a N. constellation, found in Aratus, who says it was formed by Bacchus in memory of Ariadne. It is situated between Bootes and Hercules, and the bright star of its cluster (marked α) may be seen about an hour E. of Arcturus, and about eight degrees nearer to the pole. N. Corona was the first nova to be observed with the spectroscope (1866). C. Australis is a small S. constellation, first found in Ptolemy's catalogue. It is situated between the front legs of Centaurus.

Coronach, name applied to a dirge which in years past was sung at funerals in Ireland. In the highlands of Scotland the singing of this dirge was called keening (as also in Ireland), but it is sometimes played on the bagpipes.

Israel and Judah were usually anointed with oil by the high priest, by which act they were consecrated to the service of God. This anointing with oil still forms part of the C. service of a Brit. sovereign. It probably resembles the hallowing of kings mentioned in the *Anglo-Saxon Chronicle*, and its form is in all essentials that used since the time of Richard I., though, of course, the service has been modified from time to time. The C. of the Brit. sovereign takes place in Westminster Abbey. The anct. C. chair is carefully preserved, and has been used at the C. of Eng. kings and queens since the time of Edward I. Under the throne rests the Stone of Destiny (*Lia Fail*), which, according to tradition, was the pillow of Jacob, and was, in the fifth century B.C., carried to Ireland and thence to Scotland. It was brought to England by Edward I. as a symbol of his conquest of Scotland, for on that stone the Scottish kings had always been crowned. The service is read by the archbishop of

Canterbury, after which the sovereign takes his C. oath. The oath in the Eng. service has always been very explicit, in this way differing from that of other European countries. After the revolution of 1688 the Brit. sovereign had to promise to maintain 'the laws of God, the true profession of the Gospel, and the Protestant reformed religion as it is estab. by law.' Special clauses were here added which were particularly obnoxious to the Rom. Catholic subjects in the United Kingdom. By an Act of Parliament in 1910 the oath was altered, and the objectionable phrases omitted. After the oath has been taken the sovereign is seated in the anct. C. chair above mentioned, and is anointed, on the head, breast, and palms of the hands, with holy oil from the ampulla. Next follows the investiture, when the sovereign dons the *colobium sindonis*, a white silk shirt, and is girt with a sword. The orb and the ring are also delivered to him, after which he is crowned by the archbishop. The sovereign then goes back to his throne, and receives the homage of the peers. It was formerly the custom for the consort of the sovereign to be crowned some months after the formal C., but at recent Cs. in England the consort was anointed and crowned after the acts of homage had been paid. The king and queen finally received the holy communion. In early times in Europe a king or queen was not recognised until the C. had taken place. Now the reign dates from the accession and not from the C., which is usually delayed for some months after the death of the late sovereign. *Consull L. G. W. Legg, English Coronation Records, 1901; H. Thurston, Coronation Ceremonial, 1911; P. E. Schramm, The History of English Coronations (trans.), 1937.*

Coronation Gulf, arm of the Arctic Ocean, the extreme N. point of Canada. It was discovered by Sir John Franklin (1786-1847), the Arctic explorer.

Coronation Scot, Brit. steam locomotive, built in Scotland for the coronation celebrations of Edward VIII. (which did not take place), incorporating the latest developments in streamlining. Achieved a maximum speed of 127 m.p.h. on a journey the average speed of which was 61 m.p.h. It was sent for propaganda and exhibition purposes to the U.S.A. in 1945, and presented to the Amer. Gov. in celebration of the armistice.

Coronea, anct. tn. in Boeotia, in Greece, and situated to the W. of Lake Copais. The Boeotians conquered the Athenians here in 447 B.C., and the Spartans defeated the Thebans and their allies in 394.

Coronel, Battle of, naval battle in the First World War fought on Nov. 1, 1914, off Coronel on the coast of Chile, between Rear-Adm. Cradock's squadron comprising the armoured cruisers *Good Hope* and *Monmouth*, the light cruiser *Glasgow*, and the converted merchantman *Otranto*, and a Ger. squadron commanded by Adm. von Spee consisting of the armoured cruisers *Scharnhorst* and *Gneisenau*, and the light cruisers *Leipzig* and *Dresden*. The Brit. ships were old and their arma-

ment immensely inferior to that of the Ger. cruisers. The flagship *Good Hope* carried two 9.2-in. guns, but for the rest only 6-in. guns were carried. The Gers. mounted a broadside of no fewer than sixteen 8.2-in. guns. The result was never in doubt, and the *Good Hope* and *Monmouth*, after a gallant fight against odds, were sunk, the Brit. loss being 1400 men. The other two boats escaped, the *Glasgow* eventually taking part in the battle of the Falkland Is. in which Adm. Cradock's defeat and death were completely avenged.

Coronella, genus of ophidians inhabiting Europe, Asia, and America. All are harmless, *C. laevis* (or *austriaca*), a species found in Britain, is called the smooth snake. It is about 2 ft. in length, feeds on lizards and mice, and is viviparous.

Coroner. The office of C. is one of considerable antiquity. The *Mirror of Justice* is cited by Coke to show that the office existed as early as the reign of Alfred. But there is no satisfactory evidence to establish an earlier period than that of Richard I. The name of C. is said by Lord Coke to be derived from Lat. *corona* (a crown), from the fact that the C.'s office had principally to do with pleas of the crown. In this general sense the lord chief justice is by virtue of his office supreme C. for England, with power to hold an inquest in any part of the kingdom. But the officers now usually understood by this term are the co. Cs., although the Coroners Act, 1887, which re-stated the qualifications of a C., expressly saved the powers of *ex officio* Cs. In early times the office of C. appears to have been one of great estimation; for by statutes of the reign of Edward I. and Edward III., they are required to be knights, or 'of the most meet and most lawful men of the county.' Before the Coroners Amendment Act there was a proprietary qualification, the idea being that the C. should have sufficient wherewith to answer to the people for his shortcomings. The property qualification is now practically dispensed with, as the Coroners Act of 1887 has in effect left the co. to pay any penalties incurred by the C. A C. must be a barrister, solicitor, or qualified medical practitioner of not less than five years' standing in his profession. The C. formerly had jurisdiction of a very comprehensive nature, embracing inquiries as to sudden death, treasure trove, wreck, whales, sturgeon, and deadlands (proceeds of sale of a personal chattel which had caused the death of any person ordered to be paid to charity). The Coroners Act, 1887, put an end to all these duties except the function of holding inquests *super visum corporis*, and as to sudden death and treasure trove. The prin. duty of a C. is, with the assistance of a jury composed of at least twelve men and not more than twenty-three, to inquire into the deaths of persons who have died suddenly by violence, under suspicious circumstances, in prison or at the hands of the hangman. C. Cs. are elected for life; but if they accept any office incompatible with their duties, such

as that of sheriff or alderman, or become incapacitated, they may be removed by means of the writ *de coronatore exonerando*; and a C. guilty of extortion, corruption, or wilful neglect of duty, is, by an Act of George II.'s reign, not only punishable as for misdemeanour, but also incapable of ever again acting as a C. The lord chancellor has power independently of the above Act, to remove Cs. for neglect of duty, upon petition presented by the freeholders of the co. A C. can enforce a post-mortem examination of the body and summon medical or other witnesses. He may also order exhumation, but would generally, in cases of doubt, first obtain the order of the home secretary. The C. must, but the jury need not, view the body. If the C.'s jury find a verdict of murder or manslaughter, the C. can commit the accused for trial, and, in manslaughter, admit him to bail. The verdict of the jury must be that of twelve at least. Under an Act of 1926, if the C. learns, before the verdict, that some person has been charged with murder, manslaughter, or infanticide, he must adjourn the inquest until the criminal proceedings are concluded. In consequence the C. has virtually ceased to exercise the function of committing persons for trial. Even if the justices decline to commit for trial, the prisoner is not generally tried on the C.'s inquisition. Under a local Act the C. of the City of London is empowered to hold an inquiry into the outbreak of fires, which inquiry may eventuate in a verdict of arson. A departmental committee appointed in 1936 to inquire into the law concerning Cs. reported that their jurisdiction should be limited to investigation of how, when, and where death occurred; that a C. should not have power to commit a person for trial on a charge of murder, manslaughter, or infanticide; that Cs. courts should be prohibited from passing censure; and that only barristers should be appointed to the office. Under the London Government Act, 1939, a C. for the co., or his deputy, is disqualified for being elected or being a member of the co. council.

Coronet. Inferior crown worn by the nobility. In England they were in use in the reign of Edward III., but the different forms given to the Cs. of the various orders of the peerage are of later date, as is also the use of the crimson velvet cap, lined with ermine and surmounted by a gold tassel, now worn within the C. Barons first wore Cs. in the reign of Charles II. They are worn by peers on the occasion of a state ceremony, such as the coronation of a king. In 1665 permission was granted by Charles II. to the peers of Scotland and Ireland to use similar Cs. to those worn by Eng. peers. The following are the different forms that are used throughout Great Britain: the C. of the Prince of Wales differs from the royal crown only by the absence of one arch. The C. of the other princes, sons of the king, have no arches. The C. of a duke bears over the rim of gold eight strawberry leaves. A marquess has four strawberry leaves,

alternating with as many pearls upon short points. An earl's C. has eight points of a greater height, with a pearl on each, alternating with as many strawberry leaves on the rim below. A viscount's C. has sixteen pearls set on the rim itself, while a baron has six in the same position. The pearls, so named are made of silver. No peer, unless of royal family, may have his C. adorned with jewels. The Cs. of foreign nobility have no caps, and are used only in blazonry.

Corot, Jean Baptiste Camille (1796-1875), Fr. landscape painter, b. in Paris. According to his father's wishes, he became an assistant in a Paris drapery business, but, after having served an apprenticeship of seven years, he resolved to become a painter. He first studied art with Michallon, on whose death he passed into the atelier of Victor Bertin. In 1825 he went to Italy, where he stayed for two years, studying the old masters and feeding his imagination upon the beautiful scenery that surrounded him. In 1827 he exhibited two lt. landscapes at the salon, 'Vue prise à Narni,' and 'Campagne de Rome.' He then settled in Paris, though he again travelled in Italy, in 1835 and 1843, as well as in England and Switzerland. In 1833 he won a medal of the second class, and in 1855 and 1857 medals of the first class. He received the cross of the Legion of Honour in 1846, and was promoted officer in 1857. C.'s genius was not early recognised, and he made his way slowly, but in later life wealth and honour were heaped upon him. In 1874 his admiring, almost worshipping friends, hurt by the indifference of the Salon gave him a gold medal. His pictures were sold at a very high price, but C. was indifferent to money. 'Illegar in the Wilderness' and 'Dante' he never parted with, refusing all offers for them. He was a gentle, kind-hearted man, very generous to his friends, and devoted to his mother and sister. He never married. C.'s early work is clearly influenced by his classical studies. He showed an extraordinary technical ability; his drawing is very careful and detailed, and his execution somewhat precise and severe. He peopled his landscapes with nymphs and goddesses. It was not till about 1843, after his return from his second visit to Italy, that he began to assert his full individuality. Following the example of Constable and other Eng. painters, he worked out of doors, choosing for his main sketching ground Barbizon, in the forest of Fontainebleau, and the valley of the Seine. He interpreted nature in her tender, elusive moods, on a hazy spring morning or a shadowy night. He was fond of painting mists, and his colours are of the most delicate shades of greys and greens. Some critics have objected that he did not paint in nature's blemishes. His pictures are imaginative visions of 'the light that never was, on sea or land.' Among his masterpieces are 'Danse des Nymphes,' 'Orphée,' 'Paysage,' 'Mao-beth,' 'Joueur de flûte,' 'Homère et les bergers,' 'Les Bûcherons,' 'Étoile du soir,' 'Effet de matin,' 'Plaisirs du Soir,'

and 'Baptême de Jésus-Christ.' See A. A. P. C. Blanc, *Les Artistes de mon temps*, 1876; G. Geoffroy and A. Alexandre, *Corot and Millet*, 1902; E. Meynell, *Corot and his Friends*, 1908; also lives by A. Michel, 1905; M. Lafargue, 1925; C. Manclair, 1930; P. Jamot, 1936.

Corowa, tn. on the N. bank of the Murray, New S. Wales, Australia. There are lead mines in the neighbourhood, and the tn. is noted for its butter, wine, and dried fruits. Pop. 2500.

Corozal, tn. in Bolivar, Colombia, 75 m. from Cartagena. There is an active trade in cattle, tobacco, and straw mats. Pop. 11,000.

Corporal, in the Brit. Army, a non-commissioned officer ranking below a sergeant. The derivation of the word is somewhat doubtful, but similar terms are in use by other countries for non-commissioned officers of corresponding rank, as *caporal* in France, and *caporale* in Italy. A C. is distinguished by wearing two chevrons on both sleeves. While he has certain advantages, and on occasion may be given the command of a small number of men, C. usually takes his place in the ranks as a private during parade. In the household cavalry there is a C. of horse, the equivalent of the sergeant elsewhere; while in the navy the term ship's C. is applied to a petty officer who takes orders from the master-at-arms.

Corporal, name of the linen cloth used in the Rom. Catholic and the Anglican churches to cover the sacred elements of the eucharist. There are generally two in use, one spread on the altar for the vessels to stand on, and the other is used to cover over the chalice.

Corporal Punishment, see FLOGGING.

Corporation. A C. is an association of individuals which by a legal fiction is regarded as a single person. The distinguishing characteristic of a C. is expressed in the maxim that a C. can never die, and consequently the death or change of the persons who administer the corporate property has no effect upon the ownership, which subsists in the artificial person or legal entity of the C. The notion of a C., together with its various corporate attributes, is a conception borrowed from the Rom. legal idea of a *collegium*, having a right of universal or perpetual succession. In the Eng. system Cs. are said to be either sole or aggregate. The best examples of Cs. sole are the king and a parson. A C. sole implies a succession of single persons occupying a particular office, each assuming the rights and powers of his predecessor. The conception of a C. sole appears to be quite indigenous to Eng. law. The constitutional dogma that the king cannot die is supposed to have originated in turbulent times, when it was desirable to make an impression on superstitious minds. A C. aggregate is defined by Blackstone to be one which consists of many persons united in one society; hence many writers consider Cs. aggregate to be the only true form of C. Illustrations are the mayor and commonalty of a city or tn. (see under Borough), now called a municipal C.

Cs. are also classified as eccles. and lay. Illustrations of the former are bishops, deans, and chapters. The latter are divisible into *civil*, or such as exist for temporal purposes, and *ecclesiastical*, or such as are constituted for the perpetual distribution of alms, e.g. hospitals supported by voluntary contributions. Modern writers frequently classify Cs. into eccles., municipal, trading, charitable, and educational. Lay Cs. may also be divided into *privileged*, i.e. endowed by the law with special powers in excess of the ordinary law for the purpose of carrying out some work to the public advantage, e.g. chartered companies; and *unprivileged*, the most common examples being registered joint-stock companies. These latter entities are assimilated rather to ordinary partnerships in many respects. A C. can only be created by the king or an Act of Parliament; but when any such body has existed from time beyond legal memory (i.e. the death of Richard I., 1199), it is presumed to have originated in one of these ways. The essential characteristics of a C. are the use of a common seal, the power of making by-laws, the capability of suing and being sued in its corporate name as a single person (so that the C. as an entity is responsible for the acts, contracts, and defaults of its members), the power of the majority to bind the C., and the power at common law to acquire and hold land. The power to hold land is, however, restricted by the Mortmain Acts, which make it necessary for a C. to obtain the licence of the Crown before it can acquire land for any purpose. The dissolution of a C. may be effected by a surrender to the Crown, where all the members concur. See also BOROUGH.

In the U.S.A. C. is the equivalent of the Eng. joint-stock company. See COMPANY.

Corporation Duty, duty of 5 per cent levied by the Customs and Inland Revenue Act, 1885, on the ann. value of income or profits accruing to a corporation (q.v.) from all its real and personal property. This duty is a substitute for death duty, which a corporation escapes inasmuch as by a legal maxim it can never die, even though the physical persons composing it may. But a corporation is liable to pay succession duty on realty acquired under a will, and legacy duty on a gift of personality.

Corporation Profits Tax is the name given to a tax which was first imposed in the budget of 1920-21. It imposed a tax of 1s. in the pound on the profits of limited liability companies. The net proceeds from this tax for the year 1928-1929 amounted to £817,129.

Corporative State, state whose polity is characterised by a political organisation in the nature of an industrial parliament instead of a chamber of deputies. This political machinery was gradually evolved in Italy by the Fascist gov. of that country. In 1934 a National Council of Corporations was constituted, consisting of representatives of all the chief trades, while the governing body of each individual corporation included representatives of the state administration and

of the Fascist party. Its salient feature was the equal proportion of representatives of capital and labour for each section of a corporation, together with an additional element of technical experts. The name corporation was that originally applied to the Fascist trade unions which were designed to replace the old labour unions or confederations. In 1938 the Grand Fascist Council resolved to replace the then existing chamber of deputies by a new chamber of the Fascist corporations as the legislative and representative organ of the state. The new council was to be formed by a combination of the National Council of the Fascist party and the National Council of Corporations, and in 1938 the new chamber thus formed entirely replaced the old parl. system. When Franco defeated the republicans in Spain he set up a C. S. on the It. model.

Corps, Army, signifies the organisation of a number of combatant troops under one commander, and consisting of divs. of infantry, each supplemented by a number of brigades of cavalry and batteries of artillery (armoured car units would now take the place of cavalry for the most part). As such it was abolished in the Brit. Army in 1906, but restored in the First World War. It comprised not fewer than 60,000 men.

Corps of Royal Engineers, see ENGINEERS.

Corpulency, see OBESITY.

Corpus Christi, one of the prin. feasts in the Rom. Catholic Church: founded by Pope Urban IV. in 1264 in honour of the Blessed Sacrament. The festival is kept on the first Thursday after Trinity Sunday.

Corpus Christi: 1. Thriving city and seaport, cap. of Neuces co., Texas, U.S.A., on C. C. Bay, 192 m. W.S.W. of Galveston. Much cotton is grown in the vicinity and it is a popular resort of visitors. It has extensive trade in fish, oysters, turtles, canned food, and fruit. Pop. 57,300. 2. Lagoon in the gulf of Mexico between the is. of Mustang and coast of Texas.

Corpus Christi College: 1. One of the colleges of Cambridge Univ., founded in 1532 by the brethren of two guilds of C. C. and the Virgin Mary in Cambridge, for the purpose of educating clergy to take the place of those who had died during the plague. Henry, duke of Lancaster, alderman of these guilds, procured a royal charter for ratifying the endowment. The college was also known as St. Benet (Benedict) from a neighbouring church of that name, at which the fellows worshipped. In 1578 Sir Nicholas Bacon added a chapel to the building, and Archbishop Parker bequeathed to it his valuable manuscript library. Christopher Marlowe and John Fletcher, the Elizabethan dramatists, were members of the college. 2. One of the smaller colleges of Oxford Univ. It was founded in 1516 by Richard Fox, bishop of Winchester, and lord privy seal, for a president, twenty fellows, twenty scholars, and two chaplains. The main buildings consist of the quadrangle, hall, chapel, and library. In 1706 Dr. Turner erected an additional building overlooking Christ Church walks.

C. C. was the first college in Oxford to throw open its professorial lectures to all members of the univ., and the first to establish an endowed chair of Gk. It has numbered among its scholars Nicholas Udall, Hooker, John Keble, and Thomas Day.

Corpuscles, Red and White, see under BLOOD.

Corpus Delicti (Lat., body of the offence), in the Scots criminal law means the substance of the crime or offence alleged, together with the attendant circumstances, as specified in the libel (the summons containing the prosecution's allegations). The C. D. must be satisfactorily proved before a conviction can be obtained.

Corpus Juris Civilis, literally a body of civil law, a term denoting the main body of Rom. law, at the time of the Emperor Justinian, incorporated in the *Codez*, *Pandect* or *Digest*, *Institutes*, and *Novell*.

Correggio, tn. in a fertile plain, n.w. of Reggio nell' Emilia, Italy, 11 m. N.E. of Reggio. Here Antonio Allegri, surnamed C., was born and died. Pop. 19,100.

Correggio, Antonio Allegri da (c. 1494-1534), It. painter, surnamed C. from the place of his birth, a small tn. near Modena. Nothing very definite is known about his life. Vasari and contemporary historians record that he lived and died in poverty, but from existing documents it appears that he received a high price for his pictures, and that his relatives were tradespeople in comfortable circumstances. It is quite uncertain who was his first teacher. He is said to have studied under Francesco Bianchi-Ferrari at Modena, but his early work shows no resemblance to that of this artist; Giambattista, Lombardi, Andrea Mantegna, and his uncle, Lorenzo Allegri, a local painter of little note, have also been named. Lombardi was head of the academy at Correggio, and very probably taught him anatomy. In his treatment of mythological subjects, and in his figures of children, he clearly shows the influence of Mantegna. C.'s figures of children have never been surpassed. In writing of them, Annibale Caracci said: 'Everything that I see astonishes me, particularly the colouring and beauty of the children, who live, breathe, and smile with so much sweetness and vivacity.' Traces of the influence of Raphael and of Leonardo da Vinci may also be found in C.'s work, but at the same time his style is peculiarly his own. It is remarkable for chiaroscuro. The lights and shades imperceptibly glide into one another, and his exquisite, delicate colours attain perfection. In 1518 C. was engaged on frescoes for the Camera di San Paolo (the chamber of the abbess) in the monastery of S. Ludovico at Parma. There he also executed frescoes for the cupola of San Giovanni, and his 'Assumption of the Virgin' for the cathedral excited the highest praise from Titian. In 1530 he returned to Correggio, where he lived till his death. He had early attracted the attention of Lady Veronica Gamba, and still retained her patronage. C. devoted himself to mythological and

sacred subjects. The frescoes at Parma (1518) represent Diana, drawn in a car by white stags, with cupids peering through vines. Other mythological pieces are 'Mercury teaching Cupid to read,' in the National Gallery, London; 'Jupiter and Antiope,' in the Louvre; and 'Danae,' in Rome. Among his sacred pictures are the famous 'Notte' (1529), a beautiful picture of the nativity in the Dresden Gallery; 'Ecco Homo,' in the National Gallery; and 'The Marriage of St. Catherine,' in the Louvre. His greatest fresco work is, perhaps, that in the cupola of the cathedral at Parma, already mentioned. The Madonna, surrounded by a

ANTONIO ALLEGRI DA CORREGGIO

Engraving after a self-portrait, Parma Cathedral.

host of singing and adoring angels, goes forward to meet her son, Christ. The frescoes in the cupola of San Giovanni show Christ in the clouds, with His twelve apostles seated below. See C. Ricot, *Antonio Allegri da Correggio*, 1896; H. Thode, *Correggio in Kunstler-Monographien*, 1898; S. Brinton, *Correggio*, 1900; T. Sturge Moore, *Correggio*, 1906; and P. Rol, *Il Correggio*, 1921.

Correlation of Organs, interdependence which appears to exist between certain structures in an organism. Instances are given in the works of Cuvier, Isidore Geoffroy Saint-Hilaire, Charles Darwin, and others, but the laws governing them are still obscure. Hairless dogs have imperfect teeth, and pigeons with short beaks have small feet. Sometimes the correlation seems particularly whimsical, as in the case of male white cats with blue eyes, which are generally deaf. The only generalisation possible is the rule that certain structures are so intimately associated that variation in one is always accompanied by variation in the other.

Correspondence Classes. Chautauqua Literary and Scientific Circle in 1878 inaugurated a system of education by C.

exercises being sent out to pupils residing in all parts of the U.S.A., the work being sent back to tutors for correction, and the corrected exercises and explanations returned to the pupils. Britain has adopted the same system in connection with univ. extension organisation. See CHAUTAUQUA INSTITUTE. The Univ. Correspondence College is one of the chief institutions of the kind; it prepares pupils for London Univ. examinations, and degrees may be obtained through preparation by C. alone. The college magazine, pub. weekly, is *The University Correspondent*. Text-books are pub. in connection with the C. C. by the Univ. Tutorial Press.

Correspondence Schools. In 1856 Charles Toussaint, a Frenchman, and Gustav Langenscheidt, a Ger., founded a school for teaching foreign languages by correspondence. Later, with the popularisation of Univ. Extension lectures, C. S. became numerous, especially in the U.S.A. In America in 1873 the Society to Encourage Studies at Home was formed, and in 1875 a Correspondence Univ. was started 'to supplement the work of other educational institutions by instructing persons who from any cause were unable to attend them.' About 1880 Thomas J. Foster, an Amer., started a column in his paper, *The Mining Herald*, open to questions and answers on mining problems. He then prepared a course on the subject of coal-mining and later the International Correspondence Schools of Scranton, Pennsylvania, were formed. In England C. S. are held to help students through qualifying examinations such as the matriculation and general schools examinations. There are also a number of commercial C. S. that offer courses in accountancy, journalism, commercial art, etc. Similar commercial C. S. exist also in the U.S.A. In Canada, owing to vast tracts of sparsely inhabited country, education is carried on to a large extent by correspondence. The educational authorities of Toronto issue courses of instruction in the usual secondary school subjects.

Corrèze, dept. of S. Central France, part of the old prov. of Limousin. The surface forms a lilly tableland, especially in the N.E. dist., which is broken up by various fertile riv. valleys. The chief rivs. are the Dordogne, Vézère, and Corrèze. The climate is generally cold and damp, but milder in the S.W. valleys. Wine of medium quality is produced from the vineyards in the dists. around Brive. Sheep, pigs, and goats are extensively reared, and poultry farming and cheese-making form an industry to many of the inhab. The mineral products include slate, coal, iron, stone, and alabaster. The most important industry of C. is that of the manuf. of fire-arms at Tulle, the cap. of the prov. There are also flour mills, breweries, oil, and dye-works. The dept. is divided into the two arrons. of Tulle and Brive, and the means of communication are by the Orléans railway and the Dordogne, which is navigable. Pop. 284,000.

Corrib, Lough, lake in W. Ireland, in the co. of Galway and Mayo. It is the second largest in Ireland, being 27 in. in length, with an extreme breadth of 7 m. It is very shallow, and contains about 300 is.; its outline is very irregular, and it is drained by the R. Corrib into Galway Bay. It is connected on its N. side with Lough Mask, by means of a partly underground channel.

Corriehe Moor, on the borders of Kincardine and Aberdeen shires, in the par. of Banchory Ternan, about 15 m. from Aberdeen. In Oct. 1562, the earl of Huntly was here defeated by Queen Mary's soldiers, under the command of her half-brother, the earl of Moray.

Corridor (Fr. *corridor*, from It. *corridore*; Lat. *corridorium*, from *currere*, to run) gallery or passage in a large building, such as a palace, hotel, or hospital, on to which many different apartments open.

Corrie, see CIRQUE.

Corrientes: 1. Prov. of the Argentine republic, bounded on the W. by the Paraná and on the E. by the Uruguay R. The N. dist. is low and marshy, but the S. is fertile with some forests. The chief industries are connected with cattle rearing, maize, cotton, indigo, tobacco, fruits, especially oranges, sugar, and timber. Its prin. riv. is the C., 120 m. long. Area 34,325 sq. m. Pop. (1914) 347,000; (1945) 1,382,000. 2. Cap. of the above prov. on the E. bank of the Paraná, below the confluence of this riv. and the Uruguay, some 300 m. N. of Buenos Aires. It is surrounded by orange groves and trades in hides, maté, cotton, wool, sugar, and tobacco. Cattle, sheep, and horse rearing and shipbuilding are carried on. Pop. 65,000. 3. Cape in the prov. of Buenos Aires, Argentina, the end of the Tandil Sierra.

Corrievechan (Gaelic, Breacan's cauldron), whirlpool off Argyllshire, Scotland, between the is. of Scarba and Jura, caused by the meeting of tides about a rock some 15 ft. below the surface.

Corrigan, Michael Augustine (1839-1902), third Rom. Catholic Archbishop of New York, U.S.A. He was b. in Newark, New Jersey, and graduated at Mount St. Mary's College, Emmittsburg (1859), and later became prof. of theology at Seton Hall College, S. Orange. In 1873 he was made bishop of Newark by Pius IX., and in 1885 succeeded McCloskey as archbishop of New York.

Corroboree, name applied by the aborigines of Australia to a nocturnal convention. Strange rites are performed, and there is also wild and furious dancing round the camp-fires. These Cs. take place on all great occasions. It is 'the medium through which the delights of poetry and the drama are enjoyed.' It is also the occasion for gymnastic displays and religious observances and, in fact, for all sorts of festivities. See W. M. Roth, *Ethnological Studies*, 1897; B. Spencer and F. J. Gillen, *The Native Tribes of Central Australia*, 1899; and *Native Tribes of the Northern Territory*, 1914.

Corrosion of Metals, loosening or eating

away of the substance of metals by changes of chemical composition. The dangerous effects of corrosion may be the weakening of a metallic structure, as in bridges, boilers, etc., or the introduction of metallic poisons into water and food-stuffs. Some metals do not readily enter into chemical composition. For this reason gold, silver, platinum, and copper are sometimes called the noble metals, and they are accordingly useful where the maintenance of purity is of first importance. For many purposes these metals are much too expensive, and the liability of such metals as iron, lead, and zinc to corrosion is compensated for by their comparative cheapness. Iron is particularly prone to enter into chemical combination. Dry air has no effect on iron at ordinary temps., neither has water from which all dissolved air has been expelled. Water and air in conjunction, however, lead to the formation of ferric hydroxide, or iron rust. The rust forms slowly at first, but is of such a porous nature that it aids in bringing the moist air and the iron into closer contact, and the corrosion, once started, proceeds apace. Rusting is promoted by the presence of CO₂, acid vapours, and ammoniacal salts, but is retarded by the presence of alkalis. In order to prevent corrosion, the metal may be covered by paint, oil, varnish, etc., or, to better effect, by a thin film of the black oxide of iron. In Bequerel's process for oxidising iron, the metal is made the positive electrode in a solution of sulphate of iron and sal ammoniac, the oxide being deposited as the result of electro-chemical action. In Barff's process the iron, heated to redness, is exposed to superheated steam at a temp. of 650°, the oxide being formed by decomposition of the water vapour. For cooking utensils, etc., iron is often covered with a plating of tin, zinc, or nickel. The plating should be continuous, as an attack of rust at one spot quickly spreads to other parts. Water-pipes are protected from rust by being plunged while at a red heat into a mixture of tar, pitch, and linseed oil. Rusting in boilers is usually the effect of the oxygen dissolved in the water, and may be to some extent avoided by turning the air expelled from the heated water into the steam space directly, without allowing it to come into contact with the under-water portion of the boiler. Zinc slabs are now fitted into some boilers so as to set up galvanic action in which the zinc, as negative plate, dissolves, while the iron, as positive plate, is unaffected. In bridges and other steel structures, the prevention of corrosion is a matter concerning public safety. The best method recognised is to paint after thorough cleaning. The whole surface is first examined for rust and scales, because the hydroxide would be produced underneath the paint if the process had once started. A dressing of boiled linseed is then applied to promote the adherence of the paint. Red lead is used for the first coat, and every riveted surface should be painted before the parts are put together. Finally

the whole structure receives a coat of red iron oxide paint, which should be renewed at least once in every three years. Iron-work below water, as the pillars of piers, should be embedded in concrete.

The corrosion of other metals does not usually affect the strength of structures much, but in some cases it has poisonous effects. Drinking-water is often stored in lead-lined cisterns and conveyed in lead pipes. Certain salts, particularly those of ammonia, promote the formation of lead hydroxide, a soluble salt. The solution usually proceeds slowly, but as the effects of lead poisoning are cumulative it should be attended to where it is suspected.

Copper combines with acetic acid to form verdigris. It may therefore give rise to poisoning if vegetable substances are allowed to ferment in copper utensils. It is probable, however, that many cases of so-called copper poisoning are due to ptomaines, as the formation of sufficient verdigris to cause serious poisoning argues uncleanness out of the ordinary. See F. L. Hinde, *Corrosion of Lead in Buildings*, 1934; U. R. Evans, *Metallic Corrosion, Passivity, and Protection*, 1937.

Corrosive Sublimates, Mercuric Chloride ($HgCl_2$), is formed by passing chlorine over heated mercury. It is prepared on a large scale by heating a mixture of mercuric sulphate and common salt. It sublimes as a white mass, dissolves in water, readily melts, and volatilises unchanged. It dissolves without decomposition in sulphuric and nitric acids. It is a violent poison, the best antidote to which is the white of an egg or albumen, since it forms an insoluble compound with albumen. Because of its strong antiseptic properties it is largely used by taxidermists.

Corrugated Metal. Iron and other metals are corrugated in order that their rigidity and power to resist buckling may be increased. It is done by means of pairs of ridged rollers through which the metal is passed. Its most extensive use probably is in galvanised iron, i.e. zinc-plated iron, for roofs of buildings. The principle is of great value mechanically as, for example, in flues of boilers, where the corrugation adds to the strength and increases the heating surface, while it is further used as flooring for bridges.

Corrupt Practices Act, see BRIBERY and ELECTIONS.

Corry, tn. in Erie co., Pennsylvania, U.S.A., 37 m. S.E. of Erie, in a natural oil and gas dist. The chief trade is in steel, lumber, flour, leather, and bricks. Pop. 6900.

Corsairs, pirates of the Middle Ages. They plundered ships of their own or any other nationality, their one object being to procure booty. After the discovery of America, the Mediterranean, and the Atlantic Ocean, even as far N. as Iceland, especially became infested by them. The richly laden ships from the Indies were the especial prey of the Moors in revenge for their persecution by the Spaniards in Spain. They built citadels in Algiers, Tunis, and Tripoli, and produced great

leaders like Khair ed Din (Barbarossa), Uruch, and Dragut. Turkish C. waged war upon the vessels of Christian nations. In course of time that of C. became a recognised calling, and a sovereign would sometimes call in their aid in time of war. This they sold and retained a large portion of the profits. Many attempts to suppress the C. were made by Christian govts. in the interests of their trade. But only at the congress of Paris in 1856 were the powers able to come to an agreement, and even then the U.S.A. and Mexico would give no formal undertaking. The U.S.A. and Spain did not revive the custom during the war of 1898.

Corseul, tn. in Côte-du-Nord, France. It is situated to the N.W. of Dinan, and is the site of many ruins, among them a Rom. temple and other Rom. remains. Pop. 2500.

Corsham, tn. in Wiltshire, England, 3½ m. from Chippenham; with an anct. church, and extensive quarries of Bath stone and the anct. mansion of Lord Methuen called Corsham Court. Pop. 4000.

Corsica (Fr. Corse), large is. in the Mediterranean, forming a dept. of France. It lies to the N. of Sardinia, from which it is divided by the Strait of Bonifacio. Its greatest length is 114 m., and breadth 52 m. It has sev. rvs., the Golo being the longest. The coast-line is rugged, and affords many bays and harbours, the most important being Porto, Sagone, Ajaccio, Valinco, St. Florent, Ile Rousse, and Calvi. The climate varies from warmth in the lowlands to extreme cold in the mt. regions, snow lying six months of the year on the highest summits. The soil is very fertile, but lack of enterprise in the inhab. makes agriculture backward. The uncultivated dists. are covered with a dense growth of arbutus, thorn, myrtle, and broom, known as the maquis. The culture of fruit, the vine, citrons, and olives, vegetables, and tobacco, also the rearing of sheep, goats, and silkworms, are the chief industries. The chief exports are wool, wood, wheat, wine, cork, tobacco, silk-worms, oranges, etc. In the inaccessible parts of the mts. live a peculiar breed of sheep, called moutons, and in the E. parts wild boars and stags are found; the latter are exceedingly scarce. There are mines of anthracite, antimony, copper and silver lead, also valuable stone, such as alabaster, jasper, marble, porphyry, red and blue granite. At Guagno, Pardini, Gultera, and Orozza there are mineral springs. The manufs. are not of much importance, consisting chiefly of the preparation of preserved citrons, of macaroni, an extraction of acid from the chestnut bark, and the manuf. of cigars. The character of the Corsican is one of dignity and pride; he has much native courtesy, which is shown in the hospitality he extends to strangers, but to his fellow-countrymen he is relentless when once roused, but the custom of the vendetta (exploited in the Corsican *nouvelle*, *Colomba*, by Prosper Mérimée, 1840), has died out. The C. peasant is invariably a small landowner, but he is generally too proud and too idle to work,

and the women in consequence are often prematurely old-looking. Its, however, from the Apennines come over in gangs and do part of the hard work and then return home. There is nothing commonplace in C. scenery. It is full of freshness and novelty. Here is a corner of Algeria, there one of Italy, of Greece, of Provence. The pop. is 267,800. The original inhab. of C. were probably Ligurians, and the first civilised people who estab. themselves there were Phœceans of Ionia, who landed about 560 B.C., and founded the tn. of Alalia. At the end of the sixth century these people were driven out by the Etruscans, who in their turn had to make way for the Carthaginians, and these again were followed by the Romans. In time the Genoese came into possession, who surrendered it to the Fr., being unable to subdue the Corsicans who had risen under Gen. Paoli. Britain was appealed to for assistance, and in 1794, after hard fighting, C. offered the sovereignty to King George III. of England. Brit. rule lasted for two years, then C. passed once more into the hands of France, and since the settlement of 1815 they have remained united. On Nov. 11, 1942, after the successful landing of allied forces in N. Africa, Hitler sent Ger. troops into unoccupied France, and invited it. troops to occupy C., asserting that the move was necessary to forestall allied plans for an attack on the is. and on the S. coast of France. Pétain made a formal protest, but the Vichy Gov. made no show even of passive resistance. Fr. troops (non-Vichy) liberated C. on Oct. 4 (1943), Ger. consolidation on the is. having been prevented by the prompt action of local patriots before the landing of Free Fr. forces. The lt. part of the garrison held Bastia long enough to get their forces away. The conquest of C. by the Allies was a strategic blow against the whole Ger. position in Italy. C. is divided into four arrons., Ajaccio, Bastia, Corte, and Sartène. The prin. and cap. tn. is Ajaccio, the seat of the bishop of C. and the bp. of Napoleon. Bastia, a seaport on the E. coast, was the former cap. of C. The tn. dates from 1383 and derives its name from the Bastion of St. Charles, and under the Genoese it was long the chief stronghold in the N. of the is. and the residence of the governor. On the div. of C. in 1797 into the depts. of Liamone and Golo, Bastia remained cap. of the latter, but when the two were once more united, Ajaccio superseded Bastia. *An Account of Corsica*, by J. Boswell, appeared in 1768. See also Prosper Mérimée, *Notes d'un voyage en Corse*, 1840; F. Girolami-Carona, *Géographie générale de la Corse* (Ajaccio), 1893; R. Le Jolindre, *La Corse et les Corses*, 1904; J. M. Jacobi, *Histoire générale de la Corse*, 2 vols., 1833-1835; L. H. Caird, *History of Corsica*, 1899; C. de Cesari-Rocca and L. Villot, *Histoire de la Corse*, 1916, 1927; P. Allorge, *Histoire du peuplement de la Corse*, 1926; D. Archer, *Corsica, the Scented Isle*, 1929; A. R. Dugmore, *Corsica the Beautiful*, 1930; A. Ross and J. Minton, *Time was away: a Notebook in Corsica*, 1948.

Corsicana, cap. of Navarro co., Texas, U.S.A., on the Houston and Texas Central and the St. Louis S.W. railroads. It is a trading centre for cotton, wool, oil, and agric. produce. Pop. 15,200.

Corsite, variety of diorite (q.v.) found near Ajaccio in Corsica; known also as Napoleonite. It forms a beautiful ornamental stone on cutting and polishing, and is composed of anorthite feldspar, hornblende, and a little quartz.

Corslet, kind of cuirass or breastplate used to protect the body by soldiers in the sixteenth and seventeenth centuries. It was made of leather or of fine light steel chain.

Corso, It. word, meaning race or race-course, used alike of a slow procession of handsomely decorated equipages, and of the mad gallop of a frightened riderless horse. The word has been given to various streets, generally the main street, in some It. tns., through which processions frequently take place. The best known is the C. (anct. Via Flaminia) in Rome, which is the scene of the famous carnival.

Corssen, Wilhelm Paul (1820-75), Ger. classical scholar and philologist. In 1858-1859 he won the prize, awarded by the Royal Prussian Academy of Sciences, for a thesis on Lat. pronunciation and accent, with his *Ueber Aussprache, Lokalismus, und Betonung der Lateinischen Sprache*. Among his other works are *Kritische Beiträge zur Lat. Formenlehre* (1863); *Kritische Nachträge zur Lat. Formenlehre* (1866); and *Ueber die Sprache der Etrusker*, 2 vols. (1874-75).

Corstopitum, see CORBRIDGE.

Cort, Cornelis (1530-78), Dutch designer and engraver. He studied engraving with Jerom Cockx of Antwerp, and about 1565 he went to Venice and worked for Titian, executing copper-plates of 'St. Jerome in the Desert,' 'Prometheus,' 'The Magdalen,' and others. At Rome he founded a famous school of engraving. By his art he much increased the circulation of the works of Raphael, Titian, Clovio, Muziano, Barocci, and other painters.

Cort, Henry (1740-1800), Eng. iron-master, who invented a process, called puddling, of purifying iron, a process which has been superseded by the invention of Bessemer steel.

Cortazar, tn. of Mexico, in the state of Guanajuato. Pop. 9000.

Corté, tn. in central Corsica, situated on a steep rock with overhangs the Tavignano and the Restonica. Marble is found in the neighbourhood, and there is active trade in wine and timber. It is the centre of a great variety of excursions. Pop. 5000.

Cortés, name given in Spain and Portugal to the representative assembly of the nation. Formerly there were different C. representing various dists. of Spain, the chief being the C. of Castile and that of Aragon, each with its own constitution, which was frequently modified. During the Fr. invasion under Bonaparte, it framed a new constitution, known as the 'Constitution of 1812.' See SPAIN, *Constitution and History*.

Cortés, Hernán or Hernando (1485-1547), conqueror of Mexico. He was b. at Medellín, a vil. of Extremadura in Spain, and was first sent to study law at Salamanca. His high spirits and love of adventure led him westwards, so that in 1504 he sailed for Santo Domingo to join his relative, Ovando, governor of Hispaniola. In 1511 he distinguished himself under Velásquez in his expedition for the conquest of Cuba, and subsequently became alcalde in Santiago. In 1518 C. was chosen by Velásquez to command an expedition into the interior of New Spain (Mexico), which had just been discovered by Grijalva. He set sail on Nov. 18 with

HERNÁN CORTÉS

a fleet of seven vessels from Santiago de Cuba. Early in the following year he reached the R. Grijalva, and captured Tabasco, after a fierce fight with the natives. Velásquez, meanwhile, had revoked the commission of his lieutenant, but C. refused to turn back. He landed at San Juan de Ulloa, where he took many captives, one of whom, Marina, he made his mistress. She was of great help to him on his adventures, and acted as interpreter. Moving a little to the N. he founded the colony of Villa Rica de Vera Cruz, and then, marching inland, defeated the Tlascalans, and destroyed the tn. of Cholula, whose inhab. were plotting against him. C. and his men were now regarded as descendants of the sun, destined by prophetic tradition to come from the E. and subdue the Aztecs. For this purpose the Tlascalans and Cholulans joined him in a march on Mexico. On Nov. 8, 1519, C. entered Tenochtitlan, the cap. of Mexico, and was received with honour by the Aztec chieftain. But, hearing that the native leaders were conspiring against him, he captured Montezuma (or Motecuilzoma) by a trick, and held him as a hostage. In April 1520 C. heard of an expedition, headed by

Narváez, and sent by Velásquez against him, and set out with a small band for San Juan de Ulloa. He took Narváez prisoner and persuaded the Spaniards to join his standard. During his absence, however, the Aztecs had revolted against his lieutenant, Alvarado. In the revolt Montezuma lost his life, and C. returned to the city only to retreat with all his men on June 30, *la noche triste* (the unhappy night). C. drove off the pursuing Mexicans at Otumba, July 7, 1520, but retreated to Tlascala to recuperate. In the following year he laid siege to the stronghold of the Aztecs, and, after three months' fighting, he again entered their city. C. rebuilt it and filled it with Sp. colonists, and, using it as his headquarters, sent out expeditions to the Gulf Coast and to Tampico. His enemies in Spain and Cuba were at work, however, and in 1528 Estrada arrived to take command, and C. was obliged to return to Spain. There he was royally received and created marquis of the Valle de Oajaca. In 1530 he returned to Mexico, but, as he was no longer governor, he found that his schemes were continually being thwarted. In 1536 he explored the coast-line and discovered lower California. He returned to Spain in 1540, but obtained no redress for his grievances, though he was received with honour. He accompanied Charles V. on his disastrous expedition to Algiers, 1541. He died in retirement near Seville, and was buried there, but his remains were subsequently reinterred in Mexico. See W. H. Prescott, *History of the Conquest of Mexico*, 1843; the *Dispatches*, trans. G. Folsom, 1843; Sir A. Helps, *Life of Cortés*, 1871; F. A. Ober, *Hernando Cortez*, 1905; H. D. Sedgwick, *Cortés the Conqueror*, 1927; C. Walker, *Guatemala, Last of the Aztec Emperors*, 1934; and S. de Madariaga, *Hernán Cortés: Conqueror of Mexico*, 1942.

Cortland, co. seat of C. co., New York, U.S.A., on the Tioughnioga R. in a dairying and cattle-breeding region, with manufs. of wire netting, wire cloth, furniture, etc. Pop. 15,800.

Cortona, tn. and episcopal see of Italy, in the prov. of Arezzo, 69 m. S.E. of Florence. It is surrounded by the ant. Etruscan walls, still in fair preservation, and is one of the oldest cities of Europe. A medieval castle, the highest point of C., stands 2130 ft. above sea level. There is a cathedral dating from the eleventh century, and restored in the eighteenth century, which contains pictures by Luca Signorelli, a native of the tn. (1441). There are also old churches with paintings by Fra Angelico, Pietro da Cortona, and others. The museum contains many Etruscan curiosities. The Palazzo Pretorio, C.'s only important building to suffer damage in the Second World War, was blown up by the Gers. when they retreated. Pop. 32,000.

Cortona, Pietro (Berettini) da (1596-1669). It. painter and architect, so called from his bp., Cortona, his real name being Berettini. His prin. works are in the Barberini and Sacchetti palaces, Rome, and in the Pitti palace, Florence. His

'Nativity' attracted the notice of Pope Urban VIII., and he enjoyed the patronage of successive pontiffs. His architectural works include the façade of Santa Maria in Via Lata, and the church of San Martino (Rome), in which he was buried.

Cortoriacum, see COURTRAI.

Corum, see CHORUM.

Corumba, tn. and fortress of Brazil, in the prov. of Matto Grosso, on the r. b. of the R. Paraguay. It is an important trading centre and there are very large deposits of manganese. Pop. 8500.

Corundum, aluminium ore, consisting solely of the oxide, Al_2O_3 . It possesses a high sp. gr. and is only inferior to the diamond in hardness. It crystallises in the hexagonal system. The sapphire, oriental ruby, oriental topaz, oriental

tion, and cavalry and infantry barracks. C. was probably at one time a Phœnician settlement. In 1588 the Sp. Armada took shelter on its way to England in the harbour, and in 1598 the tn. was burnt by the Eng. under Drake and Norris. There is a monument erected to Sir John Moore, who fell here in 1809. Pop. (prov.) 916,000. (tn.) 105,000.

Corvallis, tn. in Oregon, U.S.A., seat of the state agric. college. Pop. 8300.

Corvée, term applied to unpaid and forced labour paid by a tenant to his lord, or by subjects to a state. The system of unpaid labour dates from the earliest times, and was fully developed in the republic of Rome. Instead of paying taxes, the citizens performed *operæ publicæ*, which consisted chiefly of keeping roads

THE HARBOUR, CORUNNA

emerald, and oriental amethyst are all forms of C., although the name is usually reserved for the coarser specimens. The precious forms, of course, owe their value to the lustre of their polished surfaces, and their beautiful colours. The ordinary forms are dull in appearance, however, but they vary in colour as do the precious ones; being green, blue, and red, inclining to grey. Emery is an impure form of C. containing oxide of iron. C. is used for cutting and polishing all gems except the diamond, which is too hard for it.

Corunna (Sp. La Coruña, Fr. La Corogne), cap. of the prov. of C. in Spain, situated on the bay of C. The tn. consists of an upper and lower part. The former contains the anct. buildings, and is still surrounded by its old walls and ramparts, but the latter, which started only as a little fishing vil., known as Pescaderia, has long ago outgrown it. The harbour lies on the E., is very commodious, and is protected by the forts of San Diego and San Antonio. Many foreign boats call in here on their way to S. America. A state tobacco factory is one of the chief industries, and the herring and sardine fisheries give employment to many of the natives. The exports include agric. produce, wine, and fish, while the imports are chiefly coal and manufactured goods. The tn. possesses two hospitals, a school of naviga-

and bridges in a state of good repair. The Rom. landlords could also demand free labour on their estates for a certain number of days from their tenants or *coloni*. The freemen also were under certain obligations as a condition of their freed state, and their *operæ officiales* generally consisted of unpaid work on their landlord's estate. In the Middle Ages the C. became a recognised part of the feudal system. The fixed services that the serf was obliged to pay regularly were called *operæ rigæ*. Those that were only demanded in times of exceptional stress were called *operæ corrogatæ*, i.e. services or works requisitioned, from Lat. *rogare*, to request. This term became corrupted into *corolatæ*, and later *corveïæ*, and finally developed into the present form C., which became the general term for all such unpaid labour. The tenants and serfs performed certain kinds of personal labour, such as working in the fields, threshing corn, etc., in payment or partial payment of rent, small allotments, called *mansî*, being distributed among them. As well as this, they performed public services, such as repairing high roads, bridges, churches, and castles, entertaining messengers, and carrying dispatches, as a sign of fealty to their feudal lord. C. could also include conscription, for in time of war they were

enlisted in their lord's army. C. existed in France till the time of the Revolution, of which it may be said to have been a cause. It was revised (1824, 1836, and 1871) under the name of *prestation*, when it was enacted that every able-bodied man is responsible for the condition of his local roads, and must give three days' labour or its equivalent in money to keep them in repair. C. has been from the earliest times used as a means of irrigating the canals and reaping the harvest. It is thought that the great pyramids were probably built by forced labour. By this means the Nile barrage above Cairo was constructed (1841-67), but C. labour was abolished under Brit. rule in 1891. *Consult* N. D. Fustel de Coulanges, *Histoire des institutions politiques de l'ancienne France*, 1875-92.

Corvette (Lat. *corbita*, a slow ship of burden, from *corbis*, basket), sailing warship smaller than a frigate, having three square-rigged masts and carrying her broadside guns under a covered deck. In the Second World War the term was revived for small escort vessels with anti-submarine devices. Large numbers of Cs. were built in E. U. and Canadian shipyards, and were instrumental in reducing losses from U-boat action in the W. Atlantic area.

Corvey, or **Korvey**, famous Benedictine abbey, near Hoxter, Westphalia, situated on the R. Weser. It was founded by the monks from Corbie, in France, in the ninth century, under the patronage of the Emperor Louis le Débonnaire. Its abbots were chosen from the princes of the Holy Rom. Empire. There is an interesting church dating from the seventeenth century. In 1811 its library of over 150,000 vols. was given to Marburg Univ. The abbey was under the direct supervision of the pope until 1793, when Pope Pius VI. converted it into a bishopric. It was secularised in 1803, and was held successively by Nassau, Orange, Westphalia, and Prussia.

Corvinus, Matthias, *see* MATTHIAS CORVINUS.

Corvisart-Desmarteis, Jean Nicolas, Baron de (1755-1821), Fr. physician, who is remembered especially for his contribution towards the knowledge of percussion. He wrote extensively on medical subjects, his works including *Aphorismes sur la connaissance et la curation des fièvres* (1799-1801); and *Nouvelle méthode pour reconnaître les maladies internes de la poitrine par la percussion de cette cavité* (1808).

Corvus, member of the family of Corvidæ, such as the rook, raven, jackdaw, and various kinds of crow.

Corvus (Raven or Crow), anct. S. constellation described by Ptolemy (second century A.D.). It consists of four prin. stars of the second and third magnitude, and is situated below Virgo, between Libra and Crater. The constellation is sometimes called Hydra or Corvus, as strictly ♀ contains part of the body of Hydra. Aratus (c. 270 B.C.) included Hydra, Crater, and C. in a single constellation.

Corvus, Marcus Valerius (c. 370-c. 270 B.C.), soldier famous in early Rom. hist. He obtained his surname, C., a raven, after fighting in single combat with a Gaul, 349 B.C., on which occasion he was assisted by a raven which settled on his helmet and flew into the face of his foe. He was twice dictator (342 and 301), and between 348 and 299 was consul six times.

Corwen, par. and mrkt. tn., a favourite resort for tourists and anglers, on the r. b. of the Dee, Merionethshire, Wales, 9 m. W.N.W. of Llangollen. Pop. 3000.

Cory, William Johnson (1823-92), Eng. poet, b. at Torrington, and educated at Eton, where he was subsequently a master. He was a brilliant writer of Lat. verse. His chief poetical work is *Ionia* (1858), containing poems in which he revealed a true lyrical gift.

Coryate, or **Coryatt**, Thomas (c. 1577-1617), Eng. traveller, son of George C., rector of Odcombe and a Lat. verse writer, b. at Odcombe, Somersetshire. He was educated at Westminster School and at Oxford, and became a court fool to James I. *Coryate's Crudities hastily gobbled up in Five Months' Travel* (1611) is an account of his travels on foot through France, Italy, Switzerland, Germany, and Holland, which began in 1608. He hung up the boots which he used on this tour in Odcombe church. In 1612 he set out again and passed through Constantinople, Greece, Alexandria, Cairo, Jerusalem, Babylon, Lahore, and Agra, but died at Surat. *See* A. à Wood, *Athenæ Orientalis*, ii., 169-92, 1813-20; McLehose's ed. of the *Crudities*, 1905.

Corybantes (Gk. κορυβαντες), priests of Cybele or Rhea, in Phrygia, whose worship they celebrated by dancing or wild, ecstatic orgies to the accompaniment of the drum and cymbal. Besides the power of music the C. exercised also cures by magic and other arts of superstition. They were also credited with prophetic powers.

Corydon, co. seat of Harrison co., Indiana, U.S.A., on Indian Creek, 20 m. S.W. of Louisville, Kentucky; manufactures wagons and building and lithographic stone. Pop. 2000.

Corygaun, or **Korigaun**, tn. of India, in the Bombay presidency, on the Bhime, 16 m. N.E. of Poona. Here 800 of the E. India Company's sepoys under Capt. Staunton kept 25,000 Maharrats under the command of the peshwa himself in check on Jan. 1, 1818.

Corylus, genus of Betulaceæ, contains seven well-known species, which grow in N. lands. *C. avellana* is the common hazel-nut found in Europe, Asia, and America; *C. colurna*, the Constantinople nut of Asia Minor; *C. rostrata*, the horned hazel-nut of the Carolinas. There are many varieties of *C. avellana* which yield the cob-nuts or filberts used as dessert.

Corypha, genus of tropical palms, contains six species with gigantic fan-shaped leaves. *C. umbraculifera*, the tala or talipot palm, is a native of Ceylon, which serves sev. useful purposes. The trunk reaches a height of 100 ft., and the leaves are 14 ft. broad and 18 ft. long; fans and

umbrellas are made from the leaves, which are also used in thatching and employed as writing material; while the pith of the trunk furnishes a sort of flour from which bread is made. *C. talliera* is a stately species which inhabits Bengal and is known as the fara or talliera; the natives write on the leaves with a stool style.

Coryphæna, genus of acanthopterygious fishes, commonly known as dolphins, represents the family Coryphenidae, which is nearly related to the mackerel family. The species are large and brilliantly coloured, with hues of metallic yellow, blue, and silver; their bodies are elongated, compressed, and covered with small scales. In diet they are carnivorous and feed largely on flying fish. The length to which they usually attain is about 6 ft. *C. hippurus* inhabits the Mediterranean.

Coryphæus (Gk. *κορυφή*, head), leader of a Gk. chorus. Hence the word is applied to any leader in the realm of science or art. At Oxford the word is used to denote the assistant of the choragus in the musical praxis, founded by Dr. Heather.

Corystes, brachyurous crustacean, found in the seas of Europe. *C. Cassirelaunus* is a crab commonly seen on the shores of France and England, especially at Plymouth, and the carapace is marked like the face of a human being.

Coryza, catarrh of the mucous membrane lining the nasal passages, commonly called cold in the head. See CATARRH.

Cos, is. in the Ægean Sea. See KOS.

Cosa, Juan de la (c. 1450-1510), Sp. navigator and cartographer, thought to have been born at Santona in Calabria, and died at Tabasco in Darien. After having explored parts of the W. coast of Africa, he accompanied Columbus on his famous voyage of discovery in 1492, acting as pilot. He held the same position under Alonso de Hojeda in 1499, and in 1501 himself led an expedition in N. America, and in 1509 was appointed *alguacil mayor* over Uraba (Darien). He was killed in the following year during a skirmish between the Spaniards and the Indians. He executed two very interesting coloured maps on vellum, one marking the Sp. dominions acquired in Africa in 1500, and the other showing the lands discovered by Columbus and his successors.

Coghuc, George (1866-1918), Rumanian poet, b. at Hordou in Transylvania. He made trans. of the *Æneid* and of Byron's *Mazeppa*. He is chiefly read for his lyrics, which appeared in *Balade si Idile* (1883, 1893) and *Fire de Tori* (1896).

Coscinomaney (Gk. *κόσκινο*), divination by means of a sieve and a pair of shears, employed in ant. times for the discovery of thieves and other suspected persons. The sieve was supposed to tremble or move round when the name of the guilty person was mentioned.

Cosecant, **Cosine**, **Cotangent**, see under TRIGONOMETRY.

Coseguina, or **Conseguina**, volcano of Nicaragua, near the gulf of Fonseca, not far from the Pacific Ocean. Altitude

3830 ft. The eruption of 1835 was one of the greatest ever known in geological hist.

Cosel (Polish *Koźle*), tn. of Silesia, on the R. Oder, 26 m. S.S.E. of Oppeln. It has flour mills; celluloid was, however, its chief manuf. before 1939. Pop. 10,700.

Coseley, suburb of Wolverhampton, Staffordshire, England. In the vicinity there are coal and iron mines. Pop. 25,000.

Cosenz, **Enrico** (1812-98), It. soldier and politician, b. at Gaeta. He fought against the Austrians in Upper Italy (1848), distinguishing himself at the defence of Venice. On its surrender, he took refuge in Turin, but returned to join one of Garibaldi's regiments, The Hunters of the Alps, of which he became colonel in 1859. Under the dictatorship of Garibaldi he was appointed minister of war, and commanded an attack on Rome in 1870. From 1881 till 1893 he was chief of the general staff of the It. Army.

Cosenza (ant. *Consentia*, city of the Bruttii), 1. Tn. and archiepiscopal see of the prov. of Calabria, S. Italy, situated at the foot of La Sila, 33 m. N.W. of Catanzaro, between the Crati and the Iusento, and commanded by an old castle. The old part of the tn. contains steep, narrow streets, and is most unhealthy, while the modern part has good buildings and thoroughfares. The Gothic cathedral is on the site of an older one which was destroyed by earthquake, 1184. There are two academies of science, and the manufs. are of steel and iron, also pottery. C. was taken by the Allies, advancing from the toe of Italy, in Sept. 1943, when the civic library was badly damaged, and a considerable number of books were destroyed; while the cathedral and the church of S. Francesco sustained roof damage. Pop. 40,000. 2. Prov. of Calabria, S. Italy, which includes the N. part of the Calabrian peninsula between the gulf of Taranto and the Tyrrhenian Sea. It is mostly mountainous. The mts. are densely covered with forests of oak, chestnut, and beeches, and tin, lead, silver, and other minerals are found there. The chief products are rice, corn, olive oil, wine, fruits, liquorice, rock-salts, silks and cotton. It has been often mentioned by classical authors, e.g. by Varro, who speaks of its apple-trees fruiting twice a year, and by Pliny, who praises its wine. Pop. 546,000.

Cosgrave, William Thomas, president of the executive council of the Irish Free State, 1922-32, was b. in 1880, son of Thomas Cosgrave, tn. councillor, Dublin. He was educated at the Christian Brothers' School, and engaged in the grocery trade; became a member of the Dublin Corporation in 1909, and from 1916 till 1922, when he retired from the corporation, was chairman of its finance committee. In 1913 he joined the Irish volunteers, and sided with the rebellious section in Aug. 1914. He was in the Easter rising in Dublin in 1916; and, on capture, was detained in Frongoch Camp, Merioneth, till Christmas. In 1917 he was elected Sinn Féin M.P. for Kilkenny city; and from Dec. 1918 till 1922 he was M.P. for the N. div. of Kilkenny co. To the first legalised Dail

Eireann he was elected in 1922 for cos. Carlow and Kilkenny, which he represented till 1927; but in 1919 he joined those members of Parliament who constituted themselves the revolutionary Dail, and held the post of minister for local gov. in the revolutionary cabinet—consequently he was among the proscribed in the time of the Black-and-Tans. From Jan. 1922 he was minister for local gov. in the Irish Free State set up by the treaty. He acted as deputy for President Griffith during the absence of the latter in London in 1922; and, after Griffith's death in Aug. and the assassination of his successor Michael Collins (*q.v.*) the same month, C. was chosen president. In 1923 he represented the Irish Free State at the League of Nations Assembly and at the Imperial Conference. He became member for Cork in the Dail elected 1927; and in 1928 he signed the Kellogg Pact and visited U.S.A., where he was received by the president, and Canada. After de Valera's party, Fianna Fail, came into power in 1932, he led the Fine Gael opposition.

Coshery, or **Coshering**, was the ancient feudal right of an Irish chief to quarter himself and his retainers on his tenantry at his own pleasure.

Coshoceton, city and co. seat of C. co., Ohio, U.S.A. It ships coal, grain, flour, livestock, and wool, and manufs. paper, glass, advertising novelties, etc. Pop. 11,500.

Cosimo (Cosmo) I. (*d.* 1574), duke of Florence, afterwards grand duke of Tuscany, was the son of Giovanni de' Medici. The elder branch of the house of Medici had become extinct, and C., who was descended from a collateral branch of the house, was proposed as successor and supported by the Emperor Charles V. C. defeated his enemies at Montemurlo and became absolute lord of Florence. He was a harsh and cruel ruler, but succeeded in establishing the independence of Tuscany. In 1552 he added Piombino and the is. of Elba to his estates, and in 1555 captured Siena, which, however, was allowed to retain its municipal institutions. In this way he united Tuscany under one gov., and in 1569 he received from Pius V. the title of grand duke. C. was a patron of art and literature, and founded the Florentine academy and the Academy del Disegno, and restored the univ. of Pisa.

Cosimo de' Medici, *see* MEDICI.

Cosimo, **Piero di** (1462–1521), It. painter, b. at Florence. He was a pupil of Cosimo Rosselli, and afterwards the master of Andrea del Sarto. Leonardo exercised great influence over him, but he was somewhat eccentric, fantastic in design, and his figures wanting in accurate proportions; his colours were often admirable. His masterpiece was his 'Conception,' now in a gallery in Florence, where are also four mythological pictures, and a Madonna. His 'Perseus and Andromeda' is full of fine detail. Some of his other works are 'Death of Procris,' in the National Gallery, London; 'Coronation of the Virgin,' in the Louvre, and 'Christ and the Baptist,' in Berlin.

Cosin, John (1594–1672), bishop of Durham. He first became known as an author in 1627, when he pub. his *Collection of Private Devotions*. In 1634 he was made master of Peterhouse, Cambridge; in 1640 vice-chancellor of the univ., and dean of Peterborough. For nineteen years he was an exile in France, being denounced by the Puritans for his extreme theological views, though opposed to popery, and was deprived of his benefices. But at the Restoration he received his preferments back, and became bishop of Durham, 1660.

Cosine, *see* TRIGONOMETRY.

Coslin, *see* KOSLIN.

Cosmas Indicopleustes, merchant and traveller of Alexandria, who lived during the sixth century. During his early life he visited Abyssinia, W. India, Ceylon, and other places. He eventually became a monk, and during his seclusion wrote in Gk. a work in twelve books called *Topographia*, 548. This was trans. in 1897 into Eng. by the Hakluyt Society. In the work he propounds absurd theories as to the shape of the earth, denying that it is round, and upholding the scriptural account of the world. Some people think he was a Nestorian.

Cosmas and Damian, patron saints of physicians, were born in Arabia in the third century, and educated there. They are supposed to have practised in Sicily, but were tortured and killed under the persecution of Diocletian in 303. In 1279 a college of surgeons was founded in Paris by Pitard (who had accompanied St. Louis to Palestine as his surgeon), which was under the protection of St. C. and St. D. and became known later as the Collège de St. Côme.

Cosmetics (Gk. *κοσμήν*, to adorn), word applied to all chemical preparations used for improving the appearance of skin, hair, and eyes, etc. Face powders consist of zinc oxide, Fr. chalk, and orris root finely powdered and perfumed. Some C. are comparatively harmless, while others are more or less poisonous, and dangerous to use. Hair C. are composed of lard and white beeswax, to which is added a suitable perfume. A distinction may be made between hygienic C. which have a health-giving, refreshing, or beautifying effect (*e.g.* eye-washes, creams, lotions, eau-de-cologne, bath-salts, soap, anti-sweat preparations, toothpaste) and æsthetic C., designed to disguise or hide real or supposed bodily deficiencies (*e.g.* eye-brow pencil, mascara, rouge, depilatories, hair-dye, lip-stick, nail-polish or lacquer, powder, paint).

Cosmic Radiation. Gases are nearly perfect insulators of electricity under ordinary circumstances, and owe what little conductivity they possess to the presence of relatively small numbers of charged molecules or ions. Some ions are continually produced in a gas by radioactive materials in it or in the walls of the containing vessel, but experiments dating from 1903 (Rutherford, McLennan) showed that not all the ions are produced in this way, and that some are due to the action of an extremely penetrating

radiation capable of passing through many feet of lead or thousands of feet of water. This radiation is now called the C. R., and has a penetrating power enormously greater than that of X-rays or any other known radiation. Its source is at present uncertain, but it comes from outside the earth's atmosphere, and almost certainly from outside the solar system. Its intensity at high latitudes is greater than at the equator, and at any locality the ionisation produced by it increases with altitude to about 15,000 ft. and then diminishes again. The primary radiation entering the atmosphere apparently consists chiefly of protons, or positively charged hydrogen atoms, travelling at enormous velocities. In the atmosphere these produce showers of mesotrons, particles whose mass is about one-ninth that of a proton, and bearing either positive or negative charges of electricity. After short lives of a few millions of a second the mesotrons spontaneously disintegrate, producing electrons of high energy. These ionise the air through which they pass. The means by which the protons acquire their enormous velocities are at present obscure. See P. M. S. Blackett, *Cosmic Rays*, 1936; R. A. Millikan, *Cosmic Rays and Mesotrons*, 1939; J. G. Wilson, *About Cosmic Rays*, 1948.

Cosmogony, theory of the origin of the universe and its inhab., and in all races except among the very lowest type of savage some theory is found in their mythology or theology. There is a surprising variety in the various explanations, the only common ground seeming to be that water is usually regarded as the starting-point, from the depths of which the land has been drawn up by some supernatural power. Among other conceptions may be mentioned that of the Egyptians who conceived of a world egg, and the Hindu tortoise supporting elephants supporting the world. Then the Polynesian conception involved an air god Tangaloa, hovering over the waters. But in the Babylonian C. deciphered by George Smith, and also perpetuated in the Gk. of Berosus, we arrive at startling similarities to the creation story as told in Genesis 1. The Zoroastrian conception involved a personal deity creating at his own free will. Again, one of the old Phœnician C. refers to organic matter as being due to spontaneous emanations. Modern cosmogonists are divided naturally into two great camps, according as they are Theists or Pantheists. A belief in Theism almost inevitably leads to a C. which explains the creation of matter and order and life, as being the outcome of the omniscient will. Pantheism, on the other hand, will lead to a belief in the universe as being itself the deity, and this will lead to a belief in matter as having existed from eternity. Apart from these C., the problem, as narrowed down to the origin of our own globe, and its system, and similar systems, has occupied men's minds considerably. Laplace, on observing the motion and relationship of the planets, was able to lay down the founda-

tions of the nebular theory or hypothesis (q.v.) for which Herschel collected so many proofs, and of which physicists are not altogether sceptical even to-day. Of course, another theory is that the earth has originated from meteorites. Thus, in so far as it touches modern science at all, it can be seen that the tendency would be to trace backwards the causes and effects thus reaching back to the early stages in cosmic growth, but not to the actual creation itself. This after all was the standpoint of the old philosophies, for Plato recognised a personal creator, and Aristotle postulated an uncaused cause. Democritus, on the other hand, in strange similarity to some modern scientists, conceived a self-created universe, which sprang from a fortuitous concourse of atoms. See also ADAM, CREATION, MATERIALISM, THEOGONY, HEGEL, and the various religions. See J. C. Smuts, *Holism and Evolution*, 1926; Sir J. Jeans, *Astronomy and Cosmogony*, 1929; W. R. Inge, *God and the Astronomers*, 1933.

Cosmology, variant of cosmogony, both terms denoting an account of the origin or evolution of the universe or of its orderly development out of a primordial chaos. The word cosmogony, however, is now usually limited to those mythological accounts of the genesis of the world and of mankind which have no more than a historical or anthropological interest, while C. is applied to all those accounts which have a more scientific or philosophical value. Philosophy, as a term of general application, was not restricted, by Aristotle or his successors, to logic, aesthetics, psychology, and ethics, and he includes under that title all his physical inquiries. After the synthesis of knowledge by Aquinas in the Middle Ages the term philosophy ceased to be applied to inquiries concerned with the particulars as such, and the details, e.g. of physics, were left to the scientific specialists, while philosophy limited its inquiries to the relation of the physical universe to the ultimate ground, origin, or author of things. This inquiry was long entitled rational C., and may be said to be part of the general science of metaphysics. C., as defined above, may be illustrated by some of the more widely known attempts by philosophers or scientists to explain the origin or evolution of the world from chaos or formless void. Empedocles estab. earth, air, fire, and water, as the four elements (though the word element is not used by him. This, in his view, explained the infinite variety of the world, and generation is merely change of composition; Anaxagoras differed from his predecessors in regarding mind (*nous*) as a substance which enters into the composition of living things and distinguishes them from dead matter. He was impressed by the fact that the movement of the elements was not haphazard, but gave birth to an ordered and harmonious world. With the Manicheans the forming of the world is in itself the beginning of the deliverance of the 'imprisoned elements of light,' and the world is represented as an orderly structure of various

heavens and various earths, which is borne and supported by the aeons, the angels of light; and in the sun dwells the primal man himself, as well as the glorious spirits which perform the work of redemption; while in the moon the mother of life is enthroned. According to Descartes God created matter and motion and then left them to work out their own salvation independently. He supposes the existence of matter and the laws of motion, and then concludes that if all of this had been created by God, the resulting world would have resembled our world, including the planets, their forms, sizes, organisation, the laws of gravity, the nature of light, and all the other elements with which we are familiar. Herschel thought that gravity shows that bodies are urged downwards by some force or effort, or that there is a will existing somewhere directing the action; and he attributes consciousness to this will—which consciousness Schopenhauer denies. Kepler's idea of the universe, like the Pythagorean cosmos, was threefold—consisting of the centre or sun, the surface or sphere of the fixed stars, and the intermediate space occupied by ethereal matter. See also NEBULAR HYPOTHESIS.

The cosmological argument for the existence of God is a form of first-cause argument, which is itself derived from Aristotle's argument of the unmoved mover. The first-cause argument is simple—it points out that everything finite has a cause, which in turn had a cause, and so on. This series of previous causes cannot be infinite, and the first term in the series must itself be uncaused, since otherwise it would not be a first term. There is therefore an uncaused cause of everything, and this is obviously God. The argument takes a somewhat different form with Leibniz: he argues that everything in the world is 'contingent,' i.e. it would be logically possible for it not to exist. According to him everything has a sufficient reason; therefore the universe as a whole must have a sufficient reason, which must be outside the universe; this sufficient reason is God. The ultimate assumption of his argument is that the forces of the universe are in the hands of a perfectly wise Intelligence, and that, as in man there is a rational power of initiation and guidance, so in the world as a macrocosm there is a primal reason which governs the movements and co-ordinates them to a desirable end. Kant, however, holds that this cosmological argument depends on the ontological. If the existence of the world can only be accounted for by the existence of a necessary being, then there must be a being whose essence involves existence, for that is what is meant by a necessary being. But if it is possible that there should be a being whose essence involves existence, then reason alone, without experience, can define such a being, whose existence will follow from the ontological argument, for everything that has to do only with essence can be known independently of experience.

C. also embraces the biological specu-

lations of Darwin respecting the ultimate origin of living things as influencing anthropological speculation generally, and the extension of his concept of self-preservation beyond the organic world to the cosmos as a whole. Coming to the speculations of Darwin's contemporaries we may mention Czolbe's mechanistic view of the world order, which he combined with teleological conceptions of the world. Lotze defends the mechanical view of the world as worked out by modern science, applies the mechanical method to all depths of phenomena, and attempts to apply the method to the question of the genesis of the world and its order. Metaphysical teleology also describes von Hartmann's system: to him the world is a manifestation in time of an ontological principle, styled the unconscious, which is at once will and intelligence. Finally, we may notice the 'emergence' of world order or 'emergent evolution' of Samuel Alexander—the emergence of totally new things from combinations of the old. In recent years the term C. has been applied to the mathematical concept of universal space-time developed by Einstein from the Newtonian system and further elaborated by de Sitter, Eddington, and Milne. See A. K. Rogers, *A Student's History of Philosophy*, 1901; A. E. Taylor, *Elements of Metaphysics*, 1903; S. Alexander, *Space, Time, and Deity*, 1920; A. N. Whitehead, *Process and Reality: an Essay in Cosmology*, 1929; H. Macpherson, *Modern Cosmologies*, 1930; Sir A. Eddington, *The Expanding Universe*, 1933; E. A. Milne, *Relativity, Gravitation, and World Structure*, 1935; J. A. McWilliams, *Cosmology: a Text for Colleges*, 1939; G. Lemaître, *L'Hypothèse de l'atome primitif. essai de cosmologie*, 1946; B. Russell, *A History of Western Philosophy*, 1947; G. J. Whitrow, *The Structure of the Universe*, 1948.

Cosquin, Emmanuel (1841-1922), Fr. folklorist and lawyer, native of Vitry-le-François. C. is chiefly famous for his writings on folklore, which appeared in *Romania*, and were pub. in book form, *Contes populaires de Lorraine*.

Cossa, Pietro (1834-81), It. dramatist, b. in Rome. He taught in a school at Leghorn, and wrote *Mario, Sordello, Monaldeschi, Puschni*. His tragedy, *Nero* (Eng. trans. by F. E. Trollope, 1870), was acted with success, and after this he continued to write classical plays, such as *Cleopatra, Messalina, Cecilia, Paulo e il suo Secolo*. C.'s own favourite comedy; other works: *Teatro Poetico* (in 7 vols.), and a vol. of lyrics. See life by Trevisani; and Arcari, *Di P. Cossa e del Dramma in Italia*.

Cossacks (Russian *Kozak, Kazak*), name which seems to have had various meanings assigned to it, among them 'an armed man,' or a freebooter, but came to designate a certain section of the Russians who were invested with military powers. They seemed to be a people of mixed origin, partly Tartars and Poles, but principally Russian. The first seem to have come into prominence during medieval times, and they were employed by the rulers of

Poland to defend their frontiers, as they were a warlike people and quite suitable for the task. The Cossack community was divided into ten *voiskos*, and the *stanitsa*, or vil., is the centre of their community life. All men were compelled to military service, which lasted for twenty years or longer. They were thus able to form themselves into military bands which were at the service of the Russian Gov. when needed. Their education stood at a high level as compared with that of the other Russians. Their chief occupation was agriculture, though they were also engaged in cattle and horse breeding. The Don C., one of the two chief branches of this people, settled first in the land round the R. Don, and afterwards round the Dnieper, these being known as the Zaporogian C. Later on other sections of these C. were formed—from the sixteenth century onwards—among them those who settled in the Kuban valley, those of the Volga, the Ural R., and Siberia. The Little Russian C., or the C. of the Ukraine, were regularly estab. by Stephen Bathory, king of Poland, during the latter half of the sixteenth century. During the next century, however, they were unjustly treated by the Poles, and resolved to rise against this tyranny. This they accordingly did, and their leader Chmielnicki organised the great rising of 1648. He was at first entirely successful, but eventually put himself and his Cossack followers under the protection of the tsar of Russia. The Cossack pop. numbers considerably over 2,000,000.

During the course of the First World War the C. distinguished themselves by their customary *elan* throughout the campaign on the E. front, and in the Middle E. In the heavy fighting on the Sty and about Kovel in 1915 the C. rendered good service for the Allies, while the Kuban C. also distinguished themselves on the Armenian front. In May 1917 a detachment of C. under Sotnik Gamaly was sent by Gen. Baratoff to join the Brit. forces in Palestine, via Kermanshah. After the overthrow of the tsar the C. became a power to be reckoned with and republican agitators were cautious in their dealings with them. At the congress of Workmen's Councils in 1917 resolutions were passed for the creation of a special Cossack army and for the granting to all C. the lands which happened to be in their hands. When Kerensky (*q.v.*) felt that his power was declining he appealed to the C. for support against the Bolsheviks, but the C. refused because he had previously treated them with contempt. This led to his downfall. The Don ter. was the theatre of campaigns in 1917 and 1918 between the Bolsheviks and the volunteer army of Alaxeev (*q.v.*) and Kornilov. Public opinion on the Don, sedulously fomented by Ger. agents, was drifting strongly to the left, and Kaledin, the hetman of the Don C., though sympathetic towards the whites or volunteers, could do little to help the latter. The fever of revolution spread among the C., and there was a tragedy in every family

where the children were Bolshevik, and the fathers counter-revolutionaries. With the advance of the Bolsheviks on Novocherkassk, the situation of the Don seemed hopeless, and Kaledin, having lost trust in his C., shot himself. But the faith of the volunteer units of the whites in their leaders Kornilov and Alaxeev remained unshaken by misfortune, and they now began from this part of the country their campaign for the 'salvation and regeneration of Russia,' the campaign commencing with Kornilov's march on the Kuban (Feb. to March, 1917). But Kuban had now become predominantly Bolshevik, the Kuban Gov. had taken refuge in the hills, and Kornilov found all manner of difficulties in his projected attack on Ekaterinodar. When the attack did take place Kornilov was killed by a shell which burst in the room of a house in which he had his headquarters. The whites thereafter had to march back to the Don, and, in the interim, made all preparations for reorganising their forces for a second march on the Kuban. The army was increased by volunteers from 12,000 to 100,000, and though the Bolsheviks were now all-powerful in Odessa, the Crimea, and the Ukraine, and their navy was concentrated on Novorossiisk, so great was the enthusiasm of the whites or volunteer army, under the spell of the wizardry of the posthumous fame of Kornilov, that in their second advance on the Kuban they eventually captured Ekaterinodar (Aug. 2). A series of engagements followed later at Armavir in Oct., but enough had now been accomplished by the volunteer army in the Don ter. to make the issue as between the whites and the reds throughout Russia an open one for some time. The sequel came only in 1919 with the death of Kolchak and the defeat of Denikin (*see also* DENIKIN, KOLCHAK, KORNILOV). Although the C. were not in favour of Bolshevism, they soon gave up their anti-Bolshevik policy and returned to their homes. The ter. of the C. of the Don was declared a republic in 1918, but now forms part of the Rostov and Stalingrad regions of the R.S.F.S.R. Cossack cavalry provided mobility in the difficult task of resisting strongly mechanised Ger. assaults in the Caucasus region in July-Sept. 1942, especially as they were fighting on their own ground in defence of its fields and vila. *See* R. von Erckert, *Der Ursprung der Kosaken, vorzüglich nach neuesten russischen Quellen*, 1877; A. H. Springer, *Die Kosaken*, 1877; W. Cresson, *The Cossacks*, 1919.

Cosseir, or Kossel, seaport tn. situated on the W. coast of the Red Sea in upper Egypt. It possesses a citadel, and goods from Egypt to Arabia, or vice versa, are sent through this tn. Pop. about 3000.

Cossimbazar, *see* KASIMBAZAR.

Cossus, genus of lepidopterous insects, is typical of the family Cossidae, the goat-moths or carpenter-worms. The larva is a wood-borer, and the pupa is enclosed in a cocoon. *C. ligniperda* is one of the largest of Brit. moths, measuring from 2 to 4 in. from tip to tip of the expanded wings. The insect resides in and feeds

upon the wood of the oak, poplar, aspen, and willow, and the caterpillar emits a very disagreeable odour.

Costa, Claudio-Manoel Da (1729-90), Brazilian poet, native of Marianno, Minas Geraes. His two vols. of poetry, some written in Portuguese and It., gained for him a reputation. The poem *Villa-Rica* is noted for its historical matter. His intimacy with Ribeiro caused him to be implicated in the political agitation of 1789, and he was imprisoned at Villa Rica, where he died, as is supposed, by poison. See S. Romero and J. Ribeiro, *Compendio da Historia da Litteratura Brasileira*, 1909.

Costa, Isaac Da (1798-1860), Dutch poet and theologian of Jewish descent, was educated at Amsterdam and Leyden. His first great poem, *De Verlossing van Nederland*, appeared in 1814, and seven years later a collection of romantic poems, *Poezy*, placed him in the front rank of national writers. In 1822 he became a Christian, and was thenceforward an ardent supporter of his adopted faith, writing many theological as well as poetical works. He also trans. the *Persians* and *Prometheus* of Æschylus, and ed. the poems of Bilderdijk, his literary foster-father.

Costa, Lorenzo (1460-1535), It. painter, native of Ferrara. He belongs to the Bolognese school. His celebrated picture 'Madonna and Child,' besides frescoes, are in the Bentivoglio chapel in the San Giacomo Maggiore. His pupil, Francia, was much influenced by him, and both worked in the chapel of St. Cecilia. He went to Mantua in 1509, and was patronised by the Marquis Francesco Gonzago. Most of his best paintings are at Bologna: the 'Madonna and Child enthroned' hangs in the National Gallery, London. See J. Crowe and G. Cavalcaselle, *History of Painting in Italy* 1902.

Costa, Sir Michael (1810-84), musical conductor and composer, son of a Spaniard, b. in Naples. He came to England, conducted Zingarelli's *Cantata Sacra* in Birmingham (1829), and settled in London in the next year, when he produced *Kenilworth*. C. conducted at Covent Garden and at the Philharmonic concerts, besides at other musical festivals in the provs. Although he was the greatest conductor of his time, his compositions are now forgotten. Some of C.'s works are *Ecco quel fiero istante*, *Alma*, *Don Carlos*, and *Eli and Naaman*.

Cost Accounting is the term applied to that system of accounting by which the cost of production or service rendered at any particular stage in the manu. or part-manu. of any commodity is ascertained. It differs from the ordinary system of accounting in that the latter simply gives the results of the business or section of the business as a whole, without attempting to dissect the cost of manu. or service rendered at any particular period in the course of manu. The two systems are, however, usually worked concurrently by independent staffs, although to bring out the best of both systems some sort of liaison is necessary. The value of the C. A. system lies

in the results of costs that are put on record, and so are always handy for reference for comparative purposes. It provides a safe check against wastage, either in material or time, and is a sure means of discovering that section of a business which is not pulling its weight. It would, of course, be impossible to formulate any system of C. A. that would be applicable to all businesses. Indeed it would be safe to assert that each large business, apart from fundamentals, has its own system, that system which has been found from experience to be best adapted to its own particular requirements. The cost of a product or job would be obtained from the following details: (1) The prime cost, which would embrace cost of raw materials and wages. (2) Shop expenditure, which would embrace foremen's wages, power, plant, maintenance, etc. (3) Overhead charges, which would embrace cost of distribution and administrative charges.

Costanzo, Angelo di (1507-91), Neapolitan historian and poet, b. at Naples. His most important work was his *Historia del Regno di Napoli, 1250-1489* (1581-82), which was written in clear style, and was the work of over thirty years.

Costa Rica, the most S. state of central America, bounded on the N. by Nicaragua, on the E. by the Caribbean Sea, by Panama on the S.E. and S., and by the Pacific Ocean on the W. Lies between 8° 17' and 11° 10' N. lat. and from 82° 30' to 85° 45' W. long. Its area is estimated at 23,000 sq. m., and it is divided into seven provs.: San José, Alajuela, Heredia, Cartago, Guanacaste, Puntarenas, and Limón. The Atlantic coast, with the exception of Port Limón, has few indentations, but along the Pacific shore are the two large gulfs of Nicoya and Dulce. Across the country S.E. to N.W. extends the Sierra Talamancá, a continuation of the Cordillera of Chiriquí. Some of the peaks attain a great altitude, the highest being over 12,500 ft. There are a number of volcanoes, including Orosí (5,200 ft.) and Poás (8,670 ft.). The only active ones are Irazú (11,500 ft.) and Turrialba (10,900 ft.). The rivers are not useful for navigation, the chief being the Revantagón and Turcoles. The San Juan partly separates C. R. from Nicaragua. The country is rich in minerals. Gold, silver, copper, zinc, nickel, lead, coal, mercury, and iron are found. The chief industry, however, is agriculture, the soil being fertile and the climate mild and temperate. The region of concentrated settlement in the highland forms the nucleus around which the C. Rican state is organised. It is a region of expanding pioneer settlements, of people vigorously at work transforming empty country into a country of farms and permanent homes. Coffee is cultivated to a very large extent, and on the success of the crops depends largely the revenue of the country. Coffee forms 50 per cent of the total exports, and in 1944 it was estimated at 22,400 metric tons. Bananas rank second in importance, forming about one-third of the total export trade, but they have

somewhat declined owing to the havoc caused by the 'Panama disease.' Vanilla and sarsaparilla are grown; sugar is still exported, but not in such great quantities; while cacao is rapidly increasing in importance. There is considerable trade in timber and cattle. In the wooded dists. are found mahogany, india-rubber, ebony, Brazil-wood, cedar, and oak. There are thousands of square miles of public lands in C. R. that have never been cleared, on which can be found quantities of virgin rosewood, cedar, mahogany, and other cabinet woods. The Second World War temporarily stimulated the collection of

1917, however, Gen. Frederico Grana-dos ousted Alfredo Gonzalez from the presidency and himself assumed office. President Wilson of the U.S.A. persistently refused to recognise his claims, and when C. R. followed the action of the states by breaking with Germany in May 1918, he totally ignored the gov. as then formed. His opposition extended even to excluding representatives from C. R. to the League of Nations, but the state later became a member of the League. In the presidential elections of Feb. 1948, the National Union leader, Otilio Ulate, decisively defeated Calderon, candidate

COSTA RICA: THE VOLCANO OF IRAZÚ

E.N.A.

wild rubber, the estab. of plantation rubber on 3000 ac., and the planting of abaca or hemp. The chief imports are cotton goods, rice, chemical products, tanned leather, fats, industrial machinery, mineral oil, railway materials, and paints.

C. R. was discovered by Columbus in 1493, and colonised in 1502 or 1530. Its political life, like that of many of its neighbouring states, has been unsettled. It formed a part of the captain-generalcy of Guatemala until 1821, when for two years it was connected with Mexico. From 1824 to 1839 it formed part of the federal republic of the states of central America. It was not till 1848 that C. R. was fully estab. as a republic. C. R. has been involved in sev. boundary disputes, the first of these, with Nicaragua, being settled by the president of the U.S.A. in 1888; and with Colombia, in 1921. The dispute with Panama was also settled in 1921, after Panama had entered and held the ter. to which it laid claim, but diplomatic relations were not resumed until 1928. Internally C. R. has had a much more pacific hist. than most of the central Amer. states during recent years. In

of the Communists, but the gov.-controlled congress declared the election void and refused to give Ulate his credentials as president-elect. In the ensuing civil war the gov. was overthrown and a junta set up to govern pending the adoption of a new constitution. In the elections of December (1948) elections were held for a constituent assembly and Ulate's National Union party won three-fourths of the seats. Colonel Jose Figueres, as provisional president, has governed the country since the suppression of the civil war in May (1948). The C. Rican Army was abolished on Dec. 1 (1948) on the eve of C. R.'s ratification of the Inter-Amer. Treaty of Reciprocal Assistance drawn up at Rio de Janeiro, but Figueres immediately ordered a general mobilization when C. R. was invaded from Nicaragua by forces led by supporters of the exiled former president, Rafael Guardia, seeking to overthrow the military junta of Figueres. The invaders seized the tn. of La Cruz, 5 m. inside the border, and pushed inland to Liberia. C. R. and Nicaragua signed a pact of friendship in Washington on

Feb. 21, 1949, both countries having agreed to a peaceful settlement of their dispute. C. R., like Colombia, has been able to make use of its contrasted regions as a source of strength; it is one of the few countries in Lat. America which have been able to develop a strongly coherent national life. To a smaller degree than in most other countries has the political and economic power been concentrated in the hands of a very few, and for this reason C. R. is an example of an effective democracy, affording a notable example of what can be done in road construction, building and operating schools, and organising other public services under the monotonous weather conditions of a tropical land. The president serves for a term of four years, aided by the nine secretaries of state whom he appoints. The Constitutional Congress is the legislative body, of forty-four deputies elected for four years, one-half of whom retire at the end of every two years.

Much Eng. capital is invested in the republic. Education is compulsory and the elementary schools are free. There are secondary schools for boys and girls at San José, a normal school at Heredia, and colleges at Alajuala and Cartago. C. R. can boast one of the lowest percentages of illiteracy in Lat. America. Sp. is the language of the country. The national religion is Rom. Catholicism, but toleration is granted to all sects. The cap. is San José, with a pop. of 79,000 (with suburbs). The other important tns. are Cartago (13,100), Limón (10,200), Heredia (10,800), Alajuala (10,300), Puntarenas (8800), and Liberia (3900). The total pop. of C. R. is 746,500. See L. Fernandez, *Historia de Costa Rica, 1502-1821* (Madrid, 1889; M. de Périgny, *La République de Costa Rica* (Paris), 1918; L. F. Guardia, *Historia de Costa Rica* (San José), 1939; P. E. James, *Latin America* (New York), 1941; and J. and M. Brosanz, *Costa Rican Life*, 1944.

Cost-book System, system of partnership which obtains in various Cornish and Devonian mines. The system consists in a particular method of keeping the accounts and so managing the affairs of the partnership that the exact financial state of the concern can be readily ascertained. The Stannaries Act provides that the cost-book, which contains an abstract of the working expenses and returns on sales, must be made up and laid before the shareholders once in every sixteen weeks. The process of formation of a cost-book company is by first obtaining a licence to search for minerals; if ore is found a lease is granted for a term of years, and then a meeting of the co-adventurers is called to decide on the constitution of the company. Cost-book companies may be registered under the Companies Act, 1908. A member of a cost-book company is at liberty to transfer his shares without obtaining the consent of the other members, and he may also insist on the company taking back his shares and paying him for them. A cost-book company, or rather partnership, is not dissolved by a member merely obtain-

ing an account against the other members or by transferring his shares, or by the death or bankruptcy of any member. The interest of a deceased member devolves as personalty on his next of kin. Members or shareholders cannot, like ordinary partners, bind fellow members by any contract other than one for necessities required for the working of the mine in accordance with the custom of the locality. Cost-book mines are commonly managed by an agent of the shareholders, but such agent cannot make the members liable on a bill of exchange.

Cost of Living. Although the C. of L. must be of prime importance to the majority of the pops. of the different countries of the world, yet over normal periods the variation up or down is so gradual that it is only noticed by statisticians and political economists. But the advent of the two world wars brought such a sudden rise in the price of all those commodities which are necessary to civilised life that the C. of L. became a matter of the most urgent concern to millions of wage-earners not only in the belligerent countries, but throughout the world. During the First World War and up to the present time wages have been fixed for very large sections of the community on a C. of L. basis determined by the C. of L. index number issued by the Ministry of Labour. The index number compares the level of prices or the purchasing power of the money of one period with another. The year 1900 is often taken as the standard, but for practical purposes the C. of L. as stated in the *Ministry of Labour Gazette* represents the average level of retail prices of certain commodities compared with their retail prices in July 1914. The figure given by the Ministry of Labour represents the increase over the July 1914 average. The commodities include ordinary food-stuffs, rent, clothing, fuel and light, and such miscellaneous items as would make up the budget of the average citizen. The index number of the standard year is said to be 100, and rises or falls at different periods are registered against this figure. In the autumn of 1920 the average level of retail prices of commodities in the Ministry of Labour statistics was no less than 175 per cent above the pre-war level of 1913. By 1934 it had dropped to 34 per cent, but after the outbreak of war in 1939 it rose to 74 per cent by Jan. 1940. In 1944 the monthly average was 100-101; in 1945 it varied between 102 and 107, being 103 at the end of the year. The fallacy implicit in the comparison is that it does not take into account the permanent increase in the standard of living in the inter-war period.

Costello, John Aloysius (b. 1891), Irish lawyer and statesman, called to the bar in 1914. Att. Gen.-General, 1926-32; helped to draft the statute of Westminster. Member of the Fine Gael party, he succeeded de Valera as Prime Minister of Eire in 1948.

Costello, Louisa Stuart (1799-1870), Eng. authoress and miniature painter. She wrote poetry, but is chiefly known for her works on travel, memoirs and

romances. Her prin. books are *Songs of a Stranger* (1825); *Specimens of the Early Poetry of France* (1835); *A Pilgrimage to Auvergne* (1842); *Catherine de' Medici* (1848); *Memoirs of Anne of Brittany* (1855); *Béarn and the Pyrenees* (1884); *The Rose Garden of Persia* (1887).

Costello Giubileo, see FIDANE.

Coster, Laurens Janszoon (c. 1370-1440), supposed by some to have been the inventor of movable types and therefore the precursor of printing, was born at Haarlem. Junius, in his *Bataria*, states C.'s claim. Twenty years before Gutenberg he had the idea to carve out characters from cubes of wood; these he put together to form inscriptions to accompany engravings. Later on he used metal instead of wood. A dishonest workman having stolen some of C.'s apparatus, took them to Mainz, where he set up a printing business, taking Gutenberg as partner. The problem as to who really was the inventor of printing has never been solved. Junius lived a hundred years after C.'s death. The rival claims of Gutenberg and of C. are set forth by A. van der Linde in *The Haarlem Legend of the Invention of Printing by Coster* (trans., 1871); Hessel in his *Haarlem, the Birth-place of Printing* (1887); and by Wyss in *Zentralblatt für Bibliothekswesen* (1888).

Costigliole, com. in Piedmont, in prov. of Alessandria, Italy, 8 m. S. of Asti, with silk industries. Pop. 10,000.

Costroma, see KOSTROMA.

Costs. This word in law properly means the sum of money a litigant is ordered by the court to pay to his opponent to recoup the latter for the expense he has incurred in connection with the litigation. The principle of Eng. law is that C. are in the discretion of the presiding judge, but as a working rule it may be said that C. generally follow the event. There is a difference to be observed between the practice in the king's bench courts and that of the chancery courts. The right to C. in the king's bench or common law courts depends on whether the action was tried by a judge alone, or by a judge and jury, and, further, whether it was of such a kind that it ought properly to have been tried in a co. court. When the action is tried by a judge alone the C. are in the absolute discretion of the judge, who in practice would never deprive a successful litigant of C. except for very good reasons, as, for example, where the action was frivolous or vexatious. Frequently plaintiffs in libel actions who recover contemptuous damages are deprived of C. If the action be tried with a jury as well, the C. will follow the result, unless the judge 'shall for good cause otherwise order.' In general it may be said that the judge will be guided by similar principles in each of the above two cases. It is really almost entirely a question of the conduct of the parties. A judge may also make an order that each side pay his own C. There is no appeal from the judge's order except where he deprives a successful litigant 'for good cause,' it being for the court of appeal to say whether such 'good cause' existed. Where an action tried in

the high court ought, by reason of the amount recovered or the value of the subject matter involved, to have been tried in the co. court, the successful party will only get C. on the co. court scale unless a high court judge certifies that there was sufficient reason for bringing the action in the high court. The C. of a chancery or equity action have always been a matter for judicial discretion, and in no way dependent on statutory enactment. The discretion is, however, judicially exercised, and in general the successful party can only be deprived for sufficient cause shown. The party against whom C. are awarded may not have to pay the whole of his opponent's bill of C. Usually C. are directed to be taxed, i.e. the bill is sent to the taxing master's office, and the various items allowed or disallowed. The net amount allowed by the master is called taxed C. Generally C. are taxed 'as between party and party,' i.e. only those items are allowed which are really indispensable to the adequate conduct of the action. C. may, however, be allowed on a more liberal scale, viz. as between solicitor and client, when the successful party will be allowed as many of the charges or expenses which he would have been compelled to pay his own solicitor as fair justice to the other party will permit.

Costume Design, Theatrical. In the early Gk. drama the actors performed their parts in various masks of three readily discernible types—the comic, tragic, and satiric. The wide mouth of the mask served as a megaphone, carrying the voice to the full extent of the theatre, and the set mask showed the wearer's characteristics in a building perhaps too vast for the detection of facial expression. The tragic actor was further distinguished by his long coloured and embroidered robe (the *chiton*), with sleeves and high belt, his tall headdress (*onkos*), his cloak (*chlamys*), and his buskins (*colthurni*) or high thick-soled boots, which made his height impressive, and were graded in thickness according to the importance of the wearer. The comic actor was contrasted by his low shoe (*soccus*), his lack of headdress, abbreviated or absent *chiton*, the costume usually skin-fitting and the padding in various parts of the figure to give him a ludicrous effect. In addition, the colours of the actors' clothing had a symbolic significance.

The Rom. dramatic costume was closely modelled on the Gk., coloured wigs replacing the headdress—white wigs for the aged, black for youths, and red for slaves. Kings wore crowns and were gorgeously apparelled, while beggars were clad in rags.

The It. comic play, or the *Commedia dell' Arte*, developed the still-familiar figures of Harlequin, Columbine, Pantaloon, and Punch. The original Harlequin wore a long jacket laced in front, multi-coloured patches sewn on the breeches, a bat and wallet hanging from his belt; his head was shaved and his cap adorned with a tuft of feathers or the tail of a hare, rabbit, or fox. Later the patches became

blue, red, and green triangles symmetrically arranged, and finally became of diamond shape. Columbine, usually the wife or sweetheart of Harlequin, wore originally the long wide skirt and the apron of a peasant, and later took to the abbreviated skirt of the ballet so much more adapted to the dancer. Pantaloon, in a brown mask, with hooked nose and white beard, was attired in red, with a black cloak and soft noiseless slippers. The anct. Pulcinella, or forerunner of Punch, was always clothed in white, his back was humped and his stomach padded, his mask bore a crooked nose, and his headdress was at times a skull-cap, at others a cone-shaped hat.

by her complicated train. Provided the dress did not detract from the dignity of thought and sublimity of expression of the play, the critics were satisfied. The change came with John Kemble (*q.v.*), who is credited with being the first Eng. actor to make a close study of 'dressing a part on its merits.' Yet even Kemble was guilty of such gross anachronisms as playing Macbeth in a bonnet of the Black Watch Regiment. It was not strict historical accuracy he aimed at so much as a combination of suitability and restraint. But later both he and Macready (*q.v.*) were strongly influenced by the researches of James Robinson Planché (*q.v.*), dramatist and student of costume.

TWO SCENES OF A GREEK KOMOS

From a vase painting.

The early Eng. plays were all connected with religious subjects, and the most notable costumes were those worn by the devil, who was represented with the head of a beast and his body clothed in the skin of an animal. In the times of Shakespeare the prevailing costume of the day was usually worn, but concessions were made in the Rom. dramas, when the leading actors were adorned with breast-plates and plumed helmets. Dressing to suit the part is of comparatively recent date. In the middle eighteenth century Garrick played Macbeth in a contemporary suit of black silk, with silk stockings and a tye wig; Spranger Barry (*q.v.*) played Othello in a full suit of gold-laced scarlet, cocked hat, knee-breeches, and silk stockings; and Mrs. Yates, as Lady Macbeth, appeared in enormous hooped petticoats and huge flounces. It was not that these great actors of George II.'s and George III.'s day were oblivious of these solecisms. Benjamin West (*q.v.*) (1738-1820), the historical painter who introduced modern costume into historical painting, tried to induce Garrick to reform stage costume on his lines; but Garrick was aware that the public would not have tolerated the change; for they had grown accustomed to actors in the dress of their own period irrespective of the century in which the story of the drama passed. The incongruity was not apparent to them, and when, in the previous century, Pope and Addison satisfied the theatrical costumes of their day, it was not on the score of anachronism, but because the hero overdressed, as by wearing a huge plume of feathers, or because the heroine distracted the attention of the audience

and it was to Planché that the Eng. stage owed the first real advance in the reform of costume design. Macready went further than all his predecessors, and is said to have been so impressed with the importance of 'becoming' his dress that after rehearsal he went to bed in it. This practice appears to have been followed by Sir Henry Irving (*q.v.*), who, aware of the reactions of the actor to dress, showed a taste and aptness in the art of costume design that proved the main factor in the present development of that art on the Eng. stage. In our day there have been spasmodic signs of a reaction, as exemplified in the paradox of Hamlet in a top-hat and frock coat; but such experimentation may be regarded as no more than a satire on the pagantry of Sir Herbert Beerbohm Tree's productions. Not seldom, too, has the stage been the medium of introducing, especially to women, new fashions: Miss Violet Vanbrugh, for example, focused attention on the allure of the corselet and stock collar, and Miss Mary Moore, in *Mrs Gorrings's Necktie*, revived the popularity of the Alsatian bow, while to Kate Vaughan was due the vogue of the lace-trimmed petticoat.

Before the Second World War the influence of the Russian stage had its effect on theatrical costume throughout Europe. Early in the twentieth century Diaghilev (*q.v.*) introduced the Russian ballet to Paris, London, and Berlin, and the spectacular beauty of scenery and costume displayed originated in the brilliant imagination of the great artists Benois and Bakst (*q.v.*). The Bakst tradition is continued by many modern artists. See E. Aris, *Costume: Fanciful, Historical,*

and *Theatrical*, 1906; M. Willson Disher, *Clowns and Pantomimes*, 1925; A. Nicoll, *Development of the Theatre*, 1927; P. L. Duchartre, *Italian Comedy* (trans. by R. T. Weaver), 1929; R. Fulöp-Miller and J. Gregor, *Russian Theatre* (trans. by P. England), 1930; M. Fernald and E. Shenton, *Costume Design and Making*, 1937; and F. M. Kelly, *Shakespearean Costume for Stage and Screen*, 1938.

Costume, see FASHION.

Costus, genus of tall herbaceous plants with pinnately veined leaves. They grow in the tropics and bear brightly coloured flowers in spikes, the enlarged lip of the flower being the conspicuous part. Owing to the spiral arrangement of the leaves on the stem the genus is popularly known as spiral flag. Sev. species are cultivated in England under glass, the most attractive species being *C. igneus*, with orange-red flowers, and *C. malortianus*, with gold and orange flowers.

Cosway, Richard (1742-1821). Eng. miniature painter, son of the master of Blundell's School, Tiverton, where he received his education. His success in life is said to have been due to his clever portrait of Mrs. Fitzherbert, which gained for him the interest of the Prince of Wales.

Coswig, tn. of Anhalt, Germany, 12 m. from Dessau. There are textile manufs. and coal mining. Pop. 12,000.

Cotabato, see COTABATO.

Cotangent, see under TRIGONOMETRY.

Coteaux, com. and minor part of Haiti, W. Indies, 12 m. S.S.E. across the peninsula from Jérémie. Pop. 12,000.

Côte d'Or, dept. of E. France, part of the old prov. of Burgundy. Area 3391 sq. m. A chain of hills known as the Plateau de Langres runs through the centre of the dept., and in the S. is the chain of the C. The N.W. dist. of Châtillonais is densely wooded, and there the Seine takes its rise. Other rivs. are the Rhône and the Loire, and a canal, which connects the Saône with the Yonne, is 94 m. in length. C. is divided into three arrons.: Dijon, Beaune, and Montbard, the tn. of Dijon being the cap. of the dept. The climate is equable and healthy, the plains and valleys are fertile, and there is rich pasture land. The prin. wealth of the prov. lies in its vineyards, and it is here that the celebrated Burgundy wines are produced. Other products are wheat, barley, potatoes, hops, and a little tobacco. Sheep and cattle rearing take place in the W. dist. The manufs. (pre-1940) include iron, which is found in the dist., steel, tools, and machinery, paper, tiles, and bricks; there are also flour mills and breweries. Chief import is coal, and there is great export trade in wine, brandy, and live-stock. Pop. 335,600.

Cotelerius, Jean Baptiste (1627-86), eminent Fr. Hellenist, b. at Nîmes. He held the office of prof. of Gk. at the Royal College in Paris with great distinction. He pub. *Monumenta Ecclesiae Graecae* in 3 vols. (1677-86), and various other works.

Cotentin, Anne Hilarion de, see TOURVILLE, COMTE DE.

Cotentin, dist. of France which forms part of the dept. of La Manche, on its N. coast being Cape La Hague. This portion of land was originally the diocese of Coutances. Its chief tn. is now Cherbourg. The C. peninsula was the scene of hard-fought engagements in the battle of Normandy in July 1944. Cherbourg was captured on June 22-26, 1944, and though fanatical groups continued to resist for a short time, all resistance in the N. C. came to an end by July 1. On July 28 the Ger. escape route through Coutances was sealed with the capture of the city by the U.S. 4th Armoured Div., which, with the 6th Armoured Div., formed the spearhead of the 7th Corps. The enemy withdrawal, following the loss of Coutances, began to degenerate into a disorderly retreat. See further WESTERN FRONT IN SECOND WORLD WAR, *Battle of Normandy*.

Cotes, Francis (1725-70), Eng. portrait painter, one of the originators of the Royal Academy of Arts. He was a Londoner by birth, and became a pupil of George Knapp. He took an active part in the artistic life of the country. His portraits in crayons were unrivalled, and he was also a good painter in oils. His chief works are portraits of Mrs. Child of Osterley Park, and of the beautiful daughter of Wilton, the sculptor, afterwards the wife of Sir Robert Chambers. His portraits have been engraved by Bartolozzi, Ryland, Green, MacArdell, and others.

Cotes, Roger (1682-1716), famous Eng. mathematician, b. at Burbage in the co. of Leicester. He was educated at St. Paul's School, London, and at Trinity College, Cambridge, becoming a fellow of Trinity in 1705, and in the following year Plumian prof. of astronomy. In 1713 he wrote a valuable preface to the second ed. of Newton's *Principia*, and about the same time took holy orders. His death at the very early age of thirty-four brought the tribute from Newton that 'had Cotes lived we might have known something.'

Côtes-du-Nord, maritime dept. of the N.W. of France, formed from part of Brittany. Area 2787 sq. m. Off the steep rocky coast lies Bréhat and other small is. In form C. is an undulating plateau, with three ranges of hills in the S. portion. The climate is mild and equable. On the high lands the soil is poor, but along the coast, where seaweed and marl are used as a fertiliser, it is much richer. Wheat, oats, and buck-wheat are largely grown, also potatoes, mangels, apples, and plums. The culture of flax is an important industry, and the dept. is famed for its breeding of horses. Slate, lime, and china-clay are found, and the flour mills, tanneries, iron-works, and ship-building yards form a source of employment to many of the natives. The chief imports are coal, wood, and salt, and the exports are horses, flax, and agric. products. The fishing industry is of great importance. C. is divided into the four arrons. of St. Brieu, Dinan, Guingamp, and Lannion. The cap. tn.

is St. Brieuc. The dept. contains many interesting churches dating from the twelfth century. Pop. 526,900.

Cotgrave, Randle (d. 1634), the author of our earliest Fr. dictionary. He was of a Cheshire family, but little is known of his early life. He was educated at St. John's College, Cambridge (1587), and afterwards became secretary to Wm. Cecil, Lord Burghley. In 1611 he pub. his *Fr.-Eng. dictionary*, of which there was a second ed. in 1632. It was a remarkable book of its time, and is still of great value to the philologist.

Cöthen, see KÖTHEN.

Cotignac, Fr. tn. situated in the dept. of Var, and near it is the church of Notre Dame de Grâce, a centre for pilgrims. Pop. 1500.

Cotignola, tn. of Ravenna prov., Italy. Contains sev. monuments, which were more or less severely damaged in the Second World War. The house of the Storza was demolished, the church of S. Stefano badly shattered, and the tn. hall was mined and bombed by the Gers. Pop. 10,000.

Cotillon (Fr. petticoat), name of a lively dance of Fr. origin, of the time of Louis XIV., not to be confused with the quadrille, and performed by eight persons. It developed into the form of a quick waltz, and was danced to the music of waltzes, polkas, mazurkas, and galops. The dance is a very favourite one on the Continent and in the U.S.A.

Cotin, Charles (1604-82), wealthy Fr. preacher and poet, and the counsellor and almoner of Louis XIV. He was versed in philosophy, theology, and the Heb., Syriac, and Gk. languages. His *Oeuvres Mêlées* was pub. in 1659 and his *Oeuvres Galantes* in 1663. Boileau frequently mentions him in his satires, and Molière in his *Femmes Savantes* satirises him under the name of Trissotin.

Cotinga, bird of the family Cotingidae, commonly known as the Chatterers. It is found only in tropical America. The plumage of the male is especially magnificent at certain times of the year. The general colour of the female is plain grey or green. It feeds on fruit and insects.

Cotman, John Sell (1782-1842) eminent Eng. artist. b. at Norwich, where he was educated at the grammar school. Showing an aptitude for painting, he went to London about 1798 to study, and there made the acquaintance of a number of famous artists, including Turner. He returned to Norwich in 1807, and obtained a livelihood by giving lessons in drawing, while he also painted many landscapes and a number of portraits. Mainly by Turner's assistance he was successful in obtaining the post of drawing-master to King's College, London, in 1834. Unfortunately he suffered from fits of melancholy, and in his later years bore much suffering with courage. He is perhaps the best of the 'Norwich school,' and, in addition to the large number of water-colour drawings he produced, he found time to publish sev. vols. of excellent etchings. See L. Binyon, *John Crome and John Sell Cotman*, 1897, and S. D. Kitson, *The Life of John Sell Cotman*, 1937.

Cotman, Joseph John (1814-78), landscape painter, the second son of John Sell C. As an artist he had much original power, but his ill health was an insurmountable bar to any success in life. He produced many drawings of great merit.

Cotman, Miles Edmund (1810-58), landscape painter and the eldest son of John Sell C. He painted riv. and sea views, and etched a few plates, his work showing much taste and skill.

Coto Bark (*Cortex coto*), officinal bark obtained (since 1876) from Bolivia, used formerly in cases of diarrhoea, colic, and for neuralgia, gout, rheumatism, and excessive perspiration. Its exact source is not known. It may be derived from *Palicourea densifolia*. The bark is in flat pieces destitute of cork, cinnamon-brown outside and darker underneath. It has an aromatic smell and a bitter pungent taste. See H. Watts, *Chem. Dict. ii.*, *Syd. Soc. Lxx.*, 1882.

Cotoneaster, genus of Rosaceae closely allied to the hawthorn genus *Crataegus*. The species are favourite shrubby plants which grow wild in N. lands. In Britain *C. vulgaris* was formerly found in N. Wales upon the cliffs at the Great Orme's Head, but the pretty rose-petalled flower is now extinct.

Cotopaxi, volcano in the E. range of the Andes in Ecuador, S. America, and about 35 m. S. of Quito. The cone of the volcano is beautiful in appearance and snow-clad. Estimated by Whymper to be 17,613 ft. above sea level (the top is about 10,000 ft. higher than the elevation of the valley). C. is the highest active volcano. There have been numerous eruptions, the most violent being probably that of 1768.

Cotrone, seaport and fort. tn. in the prov. of Catanzaro, Calabria, Italy. It is on the site of the anc. Crotona founded by the Achæans, 710 B.C., and was taken by Agathocles of Syracuse in 299 B.C. It was the residence of Pythagoras and of Milo, and was for a long time one of the richest and most populous cities of Magna Græcia. It has a fine citadel, but its streets are narrow. Exports olives and oranges. Pop. 11,600.

Cotswold Hills, range of oolitic limestone hills in Gloucestershire, England. They extend over a length of about 50 m., the highest peaks reach to a height of 1100 ft. (Cleve Hill is 1134 ft.), but the average height is between 500 and 600 ft. The Thames takes its rise in the E. slopes. Large flocks of sheep are bred in the dist. Most people associate the word Cotswold with the line of hills extending across Gloucestershire from Wotton-under-Edge to Aston-sub-Edge, which is about 40 m. by 30 m. wide in some parts. The hills, however, really commence at Bath, spread northwards into Gloucestershire, and over the border of that co. into N. Oxfordshire, S. Worcestershire, and Leicestershire. The range of the C. H. is, roughly, divided into two portions by the valley of the Churn, and the scenery E. and W. of this valley differs to a great extent.

The C. H. were of considerable importance in anc. times, as is shown by

the old tracks on the high parts, and the early Brit. forts and Rom. camps. The dist. was of equal importance during the Middle Ages, when the woollen industry of the Flemings was at the height of its prosperity, and the splendid par. churches, imposing houses, and solidly built inns are evidences of the wealth of those bygone days. In the byways beyond the chief tns. of the Cotswolds, still old-world and unspoilt, little vils. with their houses of soft, warm-hued stone are a source of delight to artists and tourists.

served Tudor mansions in England; Bear Hill, near Woodchester; and Painswick Beacon (922 ft. high), with a Brit. hill-top fort on the summit. *See also under the names of the tns.* *See H. Branch, Cotswold and Vale, 1904; O. G. S. Cranford, Long Barrows of the Cotswolds, 1925; H. J. Massingham, Cotswold Country, 1938; J. A. Gibbs, A Cotswold Village, 1939, and F. Derrick, Cotswold Stone, 1948.*

Cotta, com. of Saxony, Germany, in the dist. of, and a W. suburb of the city of, Dresden.

Valentine (Sons Ltd., Dundee

UPPER SLAUGHTER IN THE COTSWOLDS

Among the chief tns. are Gloucester, Cheltenham, Stroud, Evesham, Cirencester, Chipping Norton, Stow-on-the-Wold, Tewkesbury, Malmesbury, Lechlade, Pershore, and Tetbury. Among the smaller tns. and vils. may be mentioned Painswick, Minchinhampton—noted for its common—Chipping Sodbury, Charlton Kings (in the grounds of Ashley Manor are the biggest oaks in the country, and there are traces of a Rom. camp at Battle-down Knoll), Broadway, Burford, Chipping Campden—noted for its market hall—Upper Slaughter, Lower Slaughter (with a delightful riv. which flows down the middle of the street between stone banks and grassy verges, and eventually joins the Windrush at Burton), Amberley (with a beautiful common on which, at Rose Cottage, Mrs. Craik wrote *John Halifax, Gentleman*), Sapperton (where the present poet laureate, John Masefield, lives), and Wincombe. Other features include Compton Wynates, 10 m. from Banbury, one of the most beautiful and best pre-

Cotta, Ger. publishing firm, founded in Tübingen by Johann Georg C. in 1640, and later one of the most flourishing in Germany. The family was originally of noble It. descent. The founder (1631–1692) married the widow of Philipp Braun, a univ. bookseller, and took over the management of the business, and so estab. the future of the firm. Subsequently the business was allowed to languish, but Johann Friedrich, Baron C. von Cotten-dorf (1764–1832), restored the fortunes of the firm. The connection rapidly extended, and in 1794 he started the *Allgemeine Zeitung*; also *Die Horen* in 1797 with the assistance of Schiller. He made friendships with many literary men, amongst whom were Huber, Pfeffel, Herder, Schelling, Fichte, Richter, and Voss, whose works he pub. In 1811 the business was transferred to Stuttgart. In 1824 he set up a steam printing press in Augsburg, and founded in the following year a literary institute in Munich. His son, Georg, Baron C. von Cotten-

dorf (1796-1853), further extended the business by buying various publishing concerns in Leipzig and Munich, founding periodical pubs., and issuing eds. of the Ger. classics. His younger son, Carl von Cottendorf (1835-88), took on the business at the death of his father. During his time sev. of the branches were sold, and after his death the business passed into the hands of A. and P. Kröner.

Cottabato, or **Cotabato**, chief tn. of a dist. of the same name in Mindanao, one of the Philippine Is. The dist. is mountainous, and the chief peak, Mount Apo, is a volcano. The tn. is situated on the Rio Grande de Mindanao. Pop. 2500.

Cottarli, see **BORDARI**.

Cottbus (Kottbus), industrial tn. on the R. Spree in Brandenburg, Germany. It has manufs. of cloth, linen, carpets, and machinery; and brewing and tanning are also carried on. In the Second World War C. was captured, after protracted fighting on the Oder, by Marshal Zhukov's forces in April 1945 in the course of the battle for Berlin.

Cottet, Charles (1863-1925), Fr. painter, b. at Puy. He was a pupil of Puvis de Chavannes, and of Roll. He made his name by his gloomy, sombre, and impressive scenes of life on the coast of Brittany. In 1889 he exhibited two pictures in the *salon* of the Champ de Mars, and in 1890 his 'Storm on the Meuse' was produced. Another picture of great power is 'A Burial in Brittany,' 1895, now in the Lille Gallery. His fine triptych in the Luxembourg at Paris, painted in 1898, marks the full development of his powers, and is one of the series of the 'Pays de la Mer.'

Cottian Alps, that portion of the main chain of the Alps extending from the Graian Alps on the N. to the Maritime Alps on the S., lying on the borders of France and Italy, and forming a div. of the W. Alps, as distinct from the Dauphiné Alps to the W. The C. A. have more than thirty peaks exceeding 10,000 ft., of which the most important are Monte Viso (12,609 ft.), Aiguille de Scolette (11,500 ft.), Aiguille de Chambeiro (11,155 ft.), Rognosa d'Etache (11,106 ft.), Dents d'Ambin (11,096 ft.), Rochebrune (10,906 ft.), and Rognosa di Sestrières (10,753 ft.). There are some twenty passes or cols, among which is the pass of the Mont Genève, between the Cottian and Graian Alps, connecting the valleys of the Rs. Dora Riparia in Piedmont and Durance in the Hautes Alpes. This is one of the oldest of the Alpine passes, and is the lowest carriage road in the W. Alps, while it is believed by many authorities to be the roadway used by Hannibal when crossing into Italy. There is also the famous Mont Cenis pass between Susa and Modane, constructed by Napoleon, and once the most used of the roadways, while the railway tunnel of Mont Cenis, 7 m. long, passes under the Col de Fréjus about 15 m. away. Other passes are the Col de Longet, Col d'Agello, Col de la Traversette, Col de

Sestrières, and the Col des Echelles. Here also are the Waldenses, who took refuge in the valleys of the C. A.

Cottingham, tn. of Yorkshire, England, E. Riding, 4 m. from Hull, Howdenshire div. Pop. 6000.

Cottle, Joseph (1770-1853), bookseller and author. He set up in the publishing business in Bristol (1791), where, through Robert Lovell, he made the acquaintance of Southey and Coleridge, making offers to each of them of 30 guineas for their poems; and in addition 50 guineas for Southey's *Joan of Arc* and 1½ guineas to Coleridge for every 100 lines of poetry he might write. C. was chiefly responsible also for Coleridge's periodical *The Watchman*, and, after an introduction to Wordsworth, pub. the *Lyrical Ballads* (1798). On retiring from business C. produced *Malvern Hills* (1798), and sev. other vols. of his own verse. It was he who handed over to Coleridge De Quincey's donation of £300, and he had some extremely sanctimonious correspondence with the poet protesting against his indulgence in opium. His *Early Reflections* (1837, 1847) contains an injudicious and unworthy exposure of Coleridge, and the book is condemned, moreover, for inaccuracy and confusion.

Cotton, Sir Arthur Thomas (1803-99), Eng. general and irrigation engineer, who in 1828 began his life-work on the irrigation of S. India. The scheme for the waters of the Krishna was his, though it was carried out by Maj.-Gen. Charles Orr. Before his efforts Tanjore and the adjoining dists. were threatened with ruin from lack of water; they afterwards became the richest part of Madras. C. founded a school of Indian hydraulic engineering, and much of his work was done in the teeth of opposition and discouragement.

Cotton, Charles (1630-87), Eng. poet and translator of some note. He was b. at Beresford in Staffordshire, and is said to have been educated at Cambridge. His father, himself a brilliant man, numbered among his friends Ben Jonson, Selden, Izaak Walton, and Donne, and possessed estates in Derbyshire which were lessened in value through law suits. The younger C. travelled on the Continent as a boy, and although he was always interested in literature we have no record of his following a calling. In 1656 he married a cousin, Isabella, the sister of Col. Hutchinson. He was open-handed and improvident, of engaging manner and appearance, while he seems to have been continually embarrassed by pecuniary matters. His *Ode to Winter* has been eulogised by Wordsworth and Lamb, but his most meritorious work is a trans. of Montaigne's essays, first pub. in 1685. His *Scarronides*, or *the First Book of Virgil Translated*, was pub. anonymously in 1684, and was revised in later eds., becoming more gross on each occasion. He also wrote *The Compleat Gamester* (1674); *Wonders of the Peake* (1681), and contributed to the fifth ed. of Walton's *Compleat Angler*. See C. J. Sembrower, *The Life and the Poetry of Charles Cotton*.

1911, and G. G. P. Heywood, *Charles Cotton and his River*, 1928.

Cotton, George Edward Lynch (1813-66), Eng. educationist who became an assistant master at Rugby, co-operating heartily with Arnold. In 1852 was appointed headmaster of Marlborough College, which he raised to a high position. In 1858 C. became bishop of Calcutta, his chief work being the estab. of schools for Brit. and Eurasian children.

Cotton, John (1584-1652), Eng. non-conformist divine, b. at Derby. He was a tutor at Cambridge, and was later appointed vicar of Boston, Lincolnshire. Cited to appear, for his Puritan views, before Laud at the high commission court, he fled, in 1633, to New England, and rechristened Trimountain, his landing-place, Boston. Here he preached and helped to frame the civil laws for the state of Massachusetts. He was reputed a profound scholar, and was the author of nearly fifty works, including a catechism, forms of prayer, and a defence of the interference of civil authority in religious matters, in a famous controversy with Roger Williams.

Cotton, Sir Robert Bruce (1571-1631), eminent Eng. antiquary, was b. in the co. of Huntingdon, and educated at Westminster School, London, under the famous Camden. At an early age he commenced to collect old MSS. and coins, in which he was greatly helped by the dissolution of the monasteries some fifty years earlier. He was a member of and read papers at the meetings of the Antiquarian Society, and rapidly acquired a great reputation. Elizabeth referred to him a question of precedence between England and Spain, while similar requests were made by members of the gov. Under James I. he rapidly came into royal favour, and received a baronetcy in 1611, one of the earliest granted, while the king employed him on sev. antiquarian researches. In 1615 he was imprisoned on suspicion of being implicated in the murder of Sir Thomas Overbury, but was released without trial after eight months. He returned to Parliament, where his influence was used in opposition to the Crown on constitutional grounds, while he strongly opposed the suggested debasement of the coinage. A pamphlet entitled *The Proposition to Bridle Parliament* falling into the king's hands was found to be a copy of the original in C.'s library, and it being considered dangerous to the state, C. was imprisoned and a trial by Star Chamber appointed. On the day fixed, however, an heir to the throne was born, and to mark the event Charles I. released C. and the others implicated. The use of his library was, however, denied to C., who sickened and died through the consequent depression. Although writing many pamphlets, he produced no outstanding work. The library with its additions from C.'s descendants was bequeathed to the nation in 1700. At the fire in 1731 at Ashburnham House, Westminster, 114 of the total 958 vols. were destroyed, and 98 partially destroyed. The library is now incorporated

with that of the Brit. Museum. See J. Planta, *Catalogue of the Manuscripts in the Cottonian Library* (London,) 1802.

Cotton, Sir Stapleton, see COMBERMERE, VISCOUNT.

Cotton, Gun, or Pyroxyline, name of an explosive substance produced by the action of nitric acid on cotton. Sulphuric acid is used to absorb the water formed by the nitric acid as it gradually combines with the cotton. G. C. possesses four or five times the explosive power of gunpowder, and is generally moulded into disks of suitable sizes. When free it burns readily, and only explodes when fired with a detonating fuse, or if heated in confinement. The presence of water does not interfere with its explosive powers, and a detonator in a small quantity of dry G. C. will explode the wet mass. This is very useful, as it can be carried in a wet condition, being then safe to handle, yet ready for use.

Cotton Printing, see CALICO PRINTING.

Cotton Seed Oil is obtained by pressure from the C. S., of which it constitutes nearly one quarter, and is used for a great many purposes, such as a substitute for olive oil, or an ingredient in the manuf. of soap, candles, and gramophone records.

Cotton Spinning and Manufacture.

Cotton Fibre.—So far as authorities have been able to ascertain, India is the accredited hp. of C. manuf., and it would seem probable that the processes of spinning and weaving have been carried on from the earliest date of which we have any record. India had an export trade in C. in the reign of Amasis, 569-525 B.C. It is probable that the consumption of raw C. for the making of garments existed long before Herodotus. The C. plant is indigenous to nearly all tropical and semi-tropical countries. It is a wool-bearing shrub, called *Gossypium* by scientists, and is largely distributed all over the torrid zone. No sooner does the C. plant arrive at maturity than its swollen capsules or pods burst with a natural force into three or five segments to display its fleecy product. It has been calculated that there are about 137 varieties of C. The main species in use, however, are *Gossypium Barbadesense*, *G. herbaceum*, *G. hirsutum*, and *G. arboreum*, or *G. peruvianum*. These include, respectively, Sea Is. and Egyptian (the finest varieties of all C.); Amer. Upland C.; Indian, African, Chinese, and other Asiatic varieties; and the fourth species named comprises grades of C. grown in India, S. and Central America, and Asia, and is the most universally consumed. C. is classified according to grades and staple lengths. Grades comprise a range of characteristics such as colour, feel, presence of extraneous material, etc., which are less susceptible to accurate measurement than staple lengths, which largely determine the spinning capacity of the fibre. No general agreement has yet been reached for an international standard, so that the staple descriptions of different countries are not strictly comparable. Many different types of C. exist, with distinct but overlapping ranges of staple. According to the

United States Dept. of Agriculture, C. with a staple range between $\frac{1}{2}$ in. and $1\frac{1}{2}$ in. constituted 60 per cent of the world production between 1927 and 1928, and 1931 and 1932.

The increasing output of comparable staple ranges in the Soviet Union, S. Brazil, and the irrigated regions of India have materially raised the share of this group in the world total in recent years (before the Second World War). C. below $\frac{1}{2}$ -in. staple predominates in the indigenous growths of China and India. The adoption of shorter stapled and earlier maturing varieties to reduce the incidence of boll weevil and the general

COTTON PLANT

A, cotton; B, section of seed; C, seed; D, calyx.

shift of C. growing towards the W. sub-humid zones largely accounts for the preponderance of the staples below 1 in. in the output of the U.S.A. India is also endeavouring to grow finer C., both on account of the restricted market for short staple varieties, and because the growing domestic manufacturing industry is consuming larger quantities of the finer types. Under the microscope a C. fibre appears as a flattened twisted tube, thicker at the edges than in the centre, and being of equal diameter for about three-fourths of its length; after which it gradually tapers for the remainder of its length, at the same time becoming more cylindrical. This peculiarity of the C. fibre to twist on its axis is the prin. cause of the C. fibres being so admirably adapted for spinning. It should be stated that unripe fibres and C. in a wild state do not possess these readily twisting qualities. Botanists show that a good staple contains from 300 to 800 twists in its length, the mean length varying from 1.7 in. as in Sea Is. to 0.9 in. as in the best Indian quality; in an ordinary variety, the number of twists ranges to over 150. Strength depends upon the number of twists and fineness of diameter and upon the length of the fibre. The length of C. fibres grown in the U.S.A. varies from $\frac{1}{2}$ in. to $1\frac{1}{2}$ in.; Sea Is. fibres from $\frac{1}{2}$ to $2\frac{1}{2}$ in.; Egyptian from 1 to $1\frac{1}{2}$ in.; Brazilian from $\frac{1}{2}$ to $1\frac{1}{2}$ in.; Indian

from $\frac{1}{2}$ to 1 in.; Peruvian from $1\frac{1}{2}$ to $1\frac{1}{2}$ in. The fibres vary in diameter as follows: Sea Is., $1\frac{1}{2}$ in.; Egyptian, $1\frac{1}{2}$ in.; Amer. (ordinary), $1\frac{1}{2}$ in.; Indian (best quality), $1\frac{1}{2}$ in.

Cotton Crop and Production Statistics.—The largest C. crop is produced in the U.S.A., and it remains the most marketable C. because it is the most adaptable to general domestic use. But besides the countries already mentioned, C. is grown on Russian ter. in Asia, and (under the auspices of the Brit. C.-growing Association) in Uganda, Nyassaland, W. Indies, W. Africa, and the Sudan. But the three greatest grades for general consumption are cultivated in the U.S.A., Egypt, and India. In round figures about 25,000,000 bales, averaged at 500 lb. each, are consumed, in all parts of the world, annually. The most recent statistics (1939) give the following figures for C. seed: U.S.A., 7,500,000 tons; Brit. India, 2,400,000 tons; Russia, 1,700,000 tons; China, 1,600,000 tons; Brazil, 1,100,000 tons, and Egypt, 1,000,000 tons. C. (ginned): U.S.A., 4,100,000 tons; Brit. India, 1,025,000 tons; Russia, 820,000 tons; China, 700,000 tons; Egypt, 490,000 tons; and Brazil, 475,000 tons. In the decade before the Second World War the C. industry was subjected in certain countries to gov. measures designed either to expand or restrict acreage by means of loans and subsidies. The demand for C., together with the market position of alternative commodities, largely influenced the ann. acreage under C. World acreage under C. rose steadily from 75,700,000 ac. in 1933-34 to 94,700,000 ac. in 1937-38. In 1938-1939 a fall to about 80,000,000 ac. occurred, largely owing to the smaller area sown in the U.S.A. and to reduced planting in China. Acreage planted to C. in the U.S.A. represents (1939) about 40 per cent of the world total. Acreage planted in India (before the war) showed much smaller fluctuations than in America. In 1938-39 it was estimated at 23,500,000 ac., the smallest area planted since 1932-33. The area under C. in Brit. Empire and foreign countries in 1938-39 was as follows: *Empire*: India, 23,500,000 ac.; Burma, 500,000 ac.; Uganda, 1,500,000 ac.; Tanganyika, 300,000 ac.; Anglo-Egyptian Sudan, 500,000 ac.; other Brit. ter., 200,000 ac. *Foreign*: U.S.A., 26,400,000 ac. (i.e. acreage harvested); China, 7,500,000 ac. (estimated on the basis of production figures); Brazil, 6,200,000 ac.; Soviet Union, 5,100,000 ac.; Egypt, 1,900,000 ac.; Argentina, 1,000,000 ac.; Mexico, 800,000 ac. (1937-38); Korea, 600,000 ac.; Belgian Congo, 1,000,000 ac.; Turkey, 700,000 ac.; Fr. W. Africa, 300,000 ac.; Peru, 400,000 ac.; Haiti, 300,000 ac. (1937-38); other countries, 1,700,000 ac. The record production figures were those for 1937-38, when production for Brit. Empire countries totalled 2,273,000,000 lb.; and for foreign countries, 16,313,000,000 lb. as compared with a grand total approximately 5,000,000,000 lb. less, the major part of

the decline being in Amer. production, the chief cause of the decline being the planned reduction of acreage in the U.S.A., where, additionally, modern mechanical methods in cultivation include the use of the flame-thrower weeder, the C. picker, and the four-row cultivator, thus reducing considerably the labour force necessary. It should be noted that the unit yield of C. varies in different countries, and also in the same country through weather and soil conditions; but broadly the yield per acre of the chief producing countries is as follows. In lb. per acre: Peru, 463; Egypt, 383; Soviet Union, 361; Anglo-Egyptian Sudan, 270; U.S.A., 211; Brazil, 145; Argentina, 113; Uganda, 87; and India, 84. The largest exporters of raw C. are the U.S.A., India, Egypt, and Brazil. Figures (in millions of lb.) for exports in 1937 and 1938 were as follows: U.S.A., 3035 and 2289; India, 1474 and 1022; Egypt, 882 and 786; Brazil, 521 and 592. Other countries: Peru, 178 and 153; Uganda, 135 and 161; China, 84 and 301; Belgian Congo, 71 and 94; Soviet, 85 and 36 (first quarter only).

RAW COTTON MANUFACTURING PROCESSES. Ginning.—The preparation for each season's crop of raw C. begins in Jan. and goes on until March, this work consisting of clearing and breaking up the ground. Planting of seeds commences in April, ending at the latest about the middle of the month. The picking of the ripe C. starts in Aug. and is completed in Dec. or the middle of Jan. The new season's crop of Amer. C. begins to arrive in Lancashire about the middle of Sept. or the beginning of Oct. The chief markets for the sale of the world's C. are New York, New Orleans, Liverpool, Bombay, Havre, Bremen, Milan, and Amsterdam. It is sold on 'spot,' but principally in 'futures,' for delivery at some future date arranged by those who contract its sale, which is governed by the strict rules of the various C. exchanges. Every C.-producing country has a variety of grades or quality, the prices being arranged accordingly. The base price for Amer. C. is known by the term of middling and Egyptian good brown, there being grades below and above these qualities. Every decimal point above or below the basic price means $\frac{1}{10}$ cent. The first process through which raw C. passes after being picked from the plants (by hand and sometimes by machinery) is that of ginning, which consists of separating the seeds from the raw material. This is usually performed by different types of gins operated in close proximity to the plantations. This is an important process, as C. before being picked is composed of two-thirds seeds, and it is absolutely essential to separate these before the C. can be used for spinning, or even for baling. The first C. gin was invented in 1793 by Eli Whitney, an Amer. (q.v.), and its productive capacity completely revolutionised the C. industry. The gin most in use is the saw gin, so called by the fact that the fibres are torn from the seeds by a series of circular saws, which press against a grid to prevent

the seeds from passing beyond a certain stage of the machinery, with the consequence that the fibres are plucked from the adhering substance or the seeds. It is not a perfect process by any means, as it tears the fibres too much and injures them. Roller gins have been introduced as rivals to the saw gin, but in spite of the damage which the latter inflicts on the fibre, it continues to hold its place, owing to its rapidity of production. It may be briefly stated that of the sev. types of gins in use, the most universally adopted are the Macarthy (or roller) gin and the Eagle (or saw) gin. After leaving the ginning houses the C. is pressed by machinery into bales, varying in weight from 200 lb. as in the case of Peruvian C., to 500 lb. as in the case of Amer. C., and 730 lb. as in Egyptian C. There are both round bales and square bales, some being called after the inventor of the particular bales in use.

Mixing and Blending.—On arriving at the spinning mill the raw material begins to pass through a series of processes, all more or less remarkable for the ingenuity with which they have been devised. Mixing is the first process. The C. is taken from the bales in its closely packed and matted condition and piled in stacks. It is allowed to stand in storage compartments for sev. days to permit the fibres to expand to their natural condition, and also to take out any excessive moisture. The blending is done for economic reasons, as it has been learned by experience that the required quality of yarn may be effected by mixing a higher grade of C. with a lower one. It is essential that there should be a proper blending of shades if the C. is meant for yarn that has not to be dyed; but the chief consideration is that of getting a mixture of grades of fairly even fibres, so as to obtain the necessary evenness and elasticity in the yarn. It is the practice in some mills still to do the mixing by hand. In that case the raw material is spread in layers, one grade being on top of the other. Great stacks are built up in this way between compartments with lattice sides to allow a passage of air to get to the C. It is, however, the practice in the large mills to mix C. now by machinery. Bale-breakers are used for this purpose, and it is claimed that the work is done not only more quickly, but more efficiently, as the C. is mixed in smaller pieces. There are three types of bale-breakers, the spiked roller machine, the porcupine machine, and the hopper breaker, which is the one now most commonly in use. One of these machines will mix 750 lb. of Egyptian C. in about 10 min. and 500 lb. of Amer. in 5 to 10 min. The labour saving thus effected is considerable. One machine will mix over 150,000 lb. of C. a week. When the bales of C. have been opened, and the raw material properly mixed and stored, the next process is that of scutching.

Scutching and Carding.—The scotch is a machine consisting of beaters running at from 1000 to over 1500 r.p.m.; its object is to clean the C. and form it into

laps in the shape of rolls of paper used in connection with printing. The machine by its revolving blades beats the rough dirt out of the C., and by an ingenious process of fans and rollers forms it into a continuous sheet, which is formed into a lap at the back of the machine. The laps, or rolls of C., formed at the scutcher are conveyed to the carding engines. The laps have been formed even in weight and thickness, but the fibres are mixed up anyhow. It is the function of the carding engine to straighten them out, or, in other words, comb them, as a woman would comb her hair. The machine turns the C. into a sliver or rope of gossamer fibres, delivering the sliver into a revolving cam. There are different types of carding engines in use, but the one most generally adopted is the revolving flat carding engine. Its name is derived from the travelling 'flats' on which the cards are placed. The wire teeth of the cards come in contact with the wire clothing of a cylinder running at about 26,000 r.p.m. The flats, however, travel (over the cylinder) at a slow pace and in the same direction as the cylinder, and the C. is thus cleaned and combed by contact with the surface of the teeth on the flats and on the cylinder. The wire teeth are of varied counts or thickness or thickness, according to the class of C. most used at the mill; they vary from 300 to 650 points per sq. in. In mills devoted to the spinning of fine counts, C. is put through combers after having been through the carding engine. Here the sliver is re-made into small laps, which are carried to a second lot of carding machines. Other processes having a similar purpose are introduced; but, whether mills of fine or coarse counts, the object of carding is to prepare the C. in slivers for the drawing frames. The function of this machine is to put several slivers together and draw them out into one. By this means the fibres or slivers become well blended together and all irregularities eliminated. It passes from the drawing frames, to the flyer or slubber frames, where the attenuated sliver is subjected to a slight draft, or in simpler language the fibres are stretched and twisted together, but only to a small extent.

It passes through three rows of draft rollers running at different speeds, twisted by the flyers and wound on to bobbins or tubes; only enough twist, however, is given to the roving to enable it to run on to the bobbins without breaking. But the object is to lessen the thickness of the sliver made at the drawing frame; from being the thickness of an ordinary rope, it is reduced to a string or roving. In factories where fine counts are produced, the next process is the intermediate frame. It adds a little more twist to the roving and stretches it a little more, thus lengthening and thinning it. It is from Sea Is. and Egyptian C. that the fine counts of yarn are made. Coming from the intermediate frame, or the slubber frame, as the case may be, the roving is now passed through the roving frame or Jack frame, where it is further stretched

and thinned and twisted. It receives the roving from two bobbins per spindle, and by means of the larger draft, makes two rovings into one finer and thinner than either of the two.

Spinning—Mules and Spindles.—In all the processes previously mentioned, from the carding engine, the object has been to bring the thick sliver more and more to the fineness of the yarn to be spun on the spinning mule, and afterwards prepared for the loom where it is woven into a fabric. Practically all the movements of the machinery are automatic, the workers simply being attendants upon the machines. For the past hundred years or more the tendency has been to increase the size of the machines and accelerate the speed of production at the same time. The spinning mule itself has, no doubt, been the most improved. It should be observed that the C., so far as we have followed it, has passed through depts. all on one floor—in what are known as the blowing-room and the card-room. These processes are in nearly all cases carried on on the ground floor of the mills. It is in the upper storey that we come to the actual spinning, especially where mules only are used. The bobbins manufactured on the roving frames are conveyed to the spinning rooms above where they are fixed in long rows or creels forming part of the spinning mule. Generally two bobbins of roving are used to make one thread of yarn. The double roving passes through three sets of rollers running at different speeds, in order to stretch it still further—indeed to stretch, by the draft in the rollers, to the fineness of the actual yarn when it is given its final twist to strengthen and harden it. One spinner and two helpers—sometimes three helpers—look after a pair of mules. With the headstock or driving parts of the mule in the centre, a pair of mules consists of two long moving carriages, carrying, on an average, about 1000 spindles each. There are also smaller mules, and larger ones having as many as 1300 spindles each. The carriage of the mule is continually moving to and fro, a distance of about 60 in. out and 60 in. back again towards the rollers and the creels of bobbins. In its outward run it twists and stretches the yarn; for instance, on 60's twist, the stretch of yarn coming from the rollers is about 60 in., but the quantity wound on to the 'cop' or the spindles during the inward run of the carriages is 64 in. per stretch. The distance that the carriage travels from the rollers is called a draw, or a stretch, there being about three performed each minute. Hence each spindle winds on about 192 in. of yarn every minute; or a pair of mules of 2000 spindles, managed by one spinner and two helpers, make 384,000 in. of yarn every minute of the working day, or over 1,000,000 yds. a week. The spindles vary in speed, as the motion of the carriage does, according to the counts being spun. Generally speaking, a mill of 80,000 spindles would yield about 32,000 lb. of yarn per week. Spinning is the most interesting and the most ingenious process

referred to, so far, in the treatment of the C. In the United Kingdom mule spinning is the most prevalent. Out of a total of 57,000,000 spindles about 46,000,000 are mule spindles, the bulk of the remainder being ring-frame spindles. In most other countries it is the other way about, the ring spindles being predominant. The U.S.A., for instance, has, in round figures, 35,500,000 C-spinning spindles, of which only about 5,000,000 are mule spindles; the remainder are ring-frame spindles. The mule is capable of turning out much finer counts of yarn than the ring-frame. The principle of spinning to-day is, except for improvements, exactly as it was when invented

of C., which as soon as it had begun to pass through was received by the second rollers, which revolved with three, four, or five times the velocity of the first pair. By this admirable and simple contrivance the roving was drawn out into yarn of the necessary degree of tenuity, a twist being given to it by an adaptation of the spindle and fly of the common flax wheel. It was this invention and the jenny of Hargreaves for multiplying the spindles in one machine that established the C. factory system. Hitherto all the spinning had been done in the homes of the spinners. But the two methods were not very well adapted for the production of very fine yarns or even yarn which the

REPLICAS OF (LEFT) HARGREAVES'S SPINNING JENNY, AND (RIGHT) CROMPTON'S MULE SPINNING FRAME

by the mechanical geniuses of the latter part of the eighteenth century. Richard Arkwright is usually regarded as the founder of the C. factory system. He directed his attention to the matter of C. spinning machinery about 1767. He erected his first mill at Nottingham in 1769, and put up one at Cromford in Derbyshire in 1771. Perhaps the most distinct departures from the old domestic spinning wheels were made by Arkwright and James Hargreaves, a poor weaver of Standhill, near Blackburn. Hargreaves invented the spinning jenny in 1764, in which spindles were fixed in a perpendicular position, or very slightly inclined. It should be also pointed out that in 1738 John Wyatt and Lewis Paul brought out a machine for spinning with rollers. Arkwright patented the spinning or water frame in 1764, which, while drawing out the carding or roving, gave to it a twist and pressure necessary to produce the hardness and firmness which fitted it so admirably to the purposes of the warp; it was also capable of producing finer yarn than had been done prior to that time. It consisted of two pairs of rollers, turned by means of machinery, the lower one of each pair being furrowed or fluted longitudinally, the upper ones covered with leather, and, pressing upon the lower, enabled them to take hold of the roving

manuf. of Brit. fabrics required in order to compete with goods of Indian manuf. The water frame spun twist for warps, but the yarn was defective in fineness and tenuity. The jenny of Hargreaves was capable of turning out weft. But the great waste of labour and time rendered a combination of the two machines eminently desirable; and it was in 1779 that Samuel Crompton, a weaver living at the Hall-in-th'-Wood, near Bolton, invented a machine which combined the essential principles of Arkwright's frame with the property of the stretching possessed by Hargreaves's jenny. Hence it became known as the mule. By means of this invention the roving was first drawn out of the rollers as in the water frame, and then stretched and spun by spindles without bobbins after the rollers had ceased to give out the rove. By this means the yarn was made finer and of a more uniform degree of tenuity. At first the mule was constructed with only twenty spindles, but by successive improvements it has been increased to 1350 spindles; and a pair of mules which form a mule jenny-gate, in charge of one spinner and two helpers, consists to-day of any number of spindles from 2000 to 2700 and 2800.

Warps for Weaving.—Warps for weaving are made up of hard twist, and weft

yarn (containing little twist) is used in the shuttles and interlaced with the warp, thus forming the cloth. Formerly the yarn was wound on to the spindles by hand; but in 1825 Richard Roberts, a Manchester engineer, perfected a system of self-action in mules which gradually dispensed with the hand-mule, of which there are very few, if any, now in existence. The self-acting mule (eventually made capable of spinning the finest counts) is now universal. However, in the above inventions one may perceive the whole principle of spinning cotton yarn. Improvements that have been added from time to time have made the mule into a very complex and highly productive machine, and the cost of a C. mule spinning mill in the United Kingdom to-day is estimated at about £2 per spindle, including the building, gearing, etc. This is higher than pre-1914 rates, following on the boom in 1919 when prices rose to as much as £7 per spindle. In contrast to mule spinning, spinning on the ring-frame, now making considerable progress in this country, is performed on a machine that has no movable carriages. It resembles the frame in the card-room employed in the preparatory processes. Unlike the mule, it spins the yarn on a continuous system, drawing the roving from a creel of bobbins. Also unlike the mule, it does not wind the yarn on a bare spindle, but on bobbins or paper tubes. From the rollers (which deliver the roving) the rove passes through thread-guides, placed over the centre of the spindle, and is wound upon the spindle by means of a ring and traveller. The ring is borne upon a movable rail, which moves upwards and downwards, thus providing the necessary traverse for the building of the cop of yarn. Hence the origin of its name. The ring-frame is mostly used for coarse, and sometimes medium, counts of yarn. Counts of any number can be spun on the mule, from 1's to upwards of 350's. The term count means one hank of 840 yds. of yarn, or one pound in weight. Hence 350's mean 350 hanks of 840 yds. each to the pound. As a further example, 40's count of yarn means 40 hanks to the pound. The finer the yarn, of course, the more hanks are required to make up one pound in weight. As a rule, fine yarns (that is over 50's and 60's counts and spun from Egyptian C.) are made from double roving, as compared with a single thread for counts below 50's and 60's. Yarn as delivered by the spinning machines is unsuitable, both in form and condition, for immediate conversion into cloth. There are various methods of warping—that is, the making of the warp and attaching it to the loom. In fact, after C. yarn has been spun on the mules, it has to undergo almost as many processes to prepare it for the loom as it had to go through in making it suitable for the mule. The yarn cops are first of all wound upon warping bobbins, there being various types of machines for this purpose. This is followed by warping, which consists in placing the thread together to form a warp in a manner that it can be

evenly wound upon the beam of the weaver's loom.

Sizing of the Yarn.—Next comes the sizing of the yarn; this is an important feature. It is necessary that all single-twist warp yarns should be sized. The object is to increase the strength and smoothness of the yarn to enable it to bear the strain of weaving; sizing also increases the weight and bulk of the yarn and improves the appearance of the cloth. Among the substances used are flour, starch (from wheat, rice, sago, maize); dextrine and gum tragacanth are also used. For making the yarn soft and pliable mixings are applied containing tallow, grease, oils, wax, soap, and glycerine. For weight china-clay, barytes, and Fr. chalk are added. Zinc chloride is one of the substances put in to prevent mildew. Magnesium chloride, calcium chloride, glycerine, and common salt are used to help the cloth to retain the qualities given to it by sizing, which has now become of a far more scientific character than formerly. The main secret, however, of getting the right sizing is in the boiling. There are sev. makes of machinery for applying the size to the yarn, also for drying the yarn afterwards. The warps for weaving are made of single threads mostly, but sometimes of doubled yarn; for doubling there is special machinery. The object is to give the threads a twist in the opposite direction to the twist of each single thread; this renders the doubled yarn stronger, smoother, and more elastic than a single thread would be that is equal in counts to the doubled thread. Doubled yarn is mostly used in sewing C. and lace, and in making heavy fabrics like sail-cloth. Yarn is also gassed before being woven. It is run through gas-flames to take off all loose fibres adhering to the surface. Yarn is gassed principally for the manu. of sewing threads, lace, and mercerised goods. Before weaving also yarn that has to undergo bleaching or dyeing is reeled into hanks of a suitable size. Yarn for export purposes is also reeled into hanks of 840 yds. of yarn each.

Weaving.—Weaving is an ant. art. Woven goods were used by the Egyptians over 6000 years ago. Woven cloth has been preserved as specimens of work of the lake dwellers of prehistoric times. The shuttle is mentioned in the Bible and other ant. books. The art of weaving consists in interlacing a continuous thread amidst a series of parallel threads. No doubt weaving was carried on in its primitive forms till the invention of the fly-shuttle by John Kay of Bury in 1733. Before this shuttle with its apparatus for sending it to and fro across the lathe of the loom, it was the custom to have two weavers for each loom, one at each end to throw back the shuttle. With Kay's introduction one weaver could manage a loom, and double the quantity of cloth woven each day. Of course, the invention was adapted to the hand loom. The steam power loom was first constructed by Dr. Cartwright, who was granted a patent in 1785. Kay had to fly from the

country on account of the attitude of the workers towards inventions that displaced labour. Cartwright's first looms were also destroyed by mobs of working men. In 1813 there were about 2400 power looms in the United Kingdom; in 1914 there were 805,452 looms engaged in C.-weaving; in 1929 there were 739,887, the proportion of the world's looms owned by Great Britain having decreased by over 3 per cent since 1914. In the U.S.A. there were 747,379 looms in the same year. Like spindles in spinning, looms have continued to increase in speed.

cheek, 1838; improved temple, 1840; further improved weft fork, 1841; loom brake, 1845; automatic let-off, 1837; rocker motion, 1859; loose frog, 1863; double beam let-off, 1867; practical self-threading shuttle, and broad loom shuttle motion, 1868. These patents form the basis of automatic weaving. Improvements have been added to them from time to time, the most effective being the drop-box motion, to operate the rising and falling of the shuttles according to their use for putting in different shades and colours to make up the patterns of

Cotton Board, Manchester

'COMBERS' IN A MODERN COTTON FACTORY

Prior to the invention of Kay's fly-shuttle, looms did not average twenty picks per minute. A pick is the passing of the shuttle containing cops or spools of weft through the opening of the warp threads carried by the operation of shedding; or, in simpler language, a pick is the passage of the shuttle across the looms.

Weaving is generally divided into the manuf. of grey goods and coloured goods. The quantity exported each year amounts to about 80 per cent of the total production in the United Kingdom. The loom invented by Cartwright gave the first suggestions of all the automatic motions that have been added to looms since, such, for instance, as warp-stop motions, weft-stop motions, let-off and take-up operations. The complete power loom was constructed by Richard Roberts in 1830. Other prin. inventions that have been added to looms are shedding motion, 1803; revolving temple, 1816; multiple harness motion, 1821; weft fork, 1821; first automatic shuttle changer, 1834; improved weft fork, 1834; picker

the cloth. Various labour-saving introductions have made it comparatively easy for one weaver to manage four and six looms, as in the ordinary Lancashire loom, to sixteen and twenty-eight, and even up to thirty-two as in the latest Northrop type of automatic looms. Other processes enter into the manuf. of C. fabrics which hardly come within the scope of this article. These include bleaching, dyeing, printing, finishing, and mercerising, as well as testing yarn and cloth by chemical means.

The Cotton Bale.—Bales of raw C. are packages of highly compressed C., together with its impurities and short fibres. Up to 5 per cent of a bale is not C. at all, but waste matter such as leaf, seed coatings, dust, etc. An estimate of the amount of such waste is made before the bale is bought, but such an estimate is rarely accurate because it is made by mere inspection, and even a mistake of a half of one per cent may cause serious loss when bales are bought by the thousand. But an answer to this problem seems to have

been found in the laboratories of the Brit. C. Industry Research Association at the Shirley Institute, Manchester. A machine called the Shirley analyser has been produced which indicates the amount of raw C. by completely separating it from the waste. This it does by utilising the difference in buoyancy between the C. fibre and the waste in moving air. The raw C. is fed into the machine and introduced into a uniform, controlled stream of air. The heavy waste falls through this stream into a receiving tray, but the more buoyant fibres of C. are swept on by the stream to a collecting drum. The two are then weighed, and thus the proportion of waste in a single bale is known. If the bales all belong to the same consignment the percentage of waste in the one which has been tested is taken as that for the whole.

Mercerising.—Mercerising was invented in 1850 by John Mercer (see MERCERISED COTTON), a calico-printer of N.E. Lancashire. There are now many patent methods in use. The process of mercerisation is to give to C., yarn, and cloth the appearance of silk, to prevent shrinkage, and to give to the vegetable fibres a greater attraction for dyes. In many cases mercerised C. has displaced silk; indeed, it has such a lustre that it can be scarcely distinguished from silk. Mercerisation also increases the strength of yarn and cloth. Its action is to remove such resistance to dyes as arise from wax, oil, and other natural colouring substances always present in C. fibres. As a result of mercerisation the yarn has been noticed to have increased in strength to the extent of 50 per cent. The bleaching, dyeing, and finishing of C. have developed considerably of recent years. The bleaching is now carried out at all stages of manuf.—those of raw C., slubbings, rovings, cops, cheeses, hanks, and warps, and in the cloth pieces. By far the greater quantity, however, is bleached in a woven state. Dyeing also is now carried on at all stages of manuf. Of late years, the practice of dyeing yarns in forms other than in hanks has grown considerably. The development has not only increased economy in the cost of production, but also through the gradual introduction of a whole range of colouring matters faster than the majority of the direct dyes, and almost as readily applied. There are sev. methods of bleaching, but the old chloride of lime bleach is still the most successful, both in regard to results and cost. Calico printing is now carried on extensively. In this process there are four distinct operations as follow: Preparation of the cloth for printing; application of the colouring matter; the fixing of the colouring matter; and the finishing. The printing rollers are engraved in various ways. Hand engraving is applied mainly to very fine work. The pentagraph method is used for bold designs, this being an etching process on a coating of varnish. Photo-etching is also applied for transferring the necessary design on to the copper rollers used in the printing machines. Fine designs are also im-

planted on the roller by a process of milling; in this case the copper roller is run over hardened steel rollers which contain a relieved impression of the required design.

THE BRITISH COTTON INDUSTRY.—This is carried on mostly within a radius of thirty or forty miles of Manchester, where the humidity of the atmosphere is highly suitable for spinning and weaving. The area also has a good supply of coal and water. Spinning is done in S. Lancashire, principally in the dists. of Manchester, Oldham, and Bolton. Oldham tn. is the centre of the coarse-spinning area, and Bolton is the centre of the fine-spinning area. C. weaving is mostly confined to the N. and N.E. of Lancashire, the prominent dists. being Blackburn, Preston, Burnley, Nelson, and Accrington. Blackburn and Burnley dists. have about 100,000 looms each. C. knitting and lace making are carried on in Derby, Leicester, and Nottingham, and sewing thread is manufactured at Paisley in Scotland. The capital invested in the Brit. C. industry had decreased in 1929-1930 by 10 per cent since the boom of 1920. Ten years of depression had been caused by foreign competition, especially in the Far-E. markets. About 40 per cent of the pre-1914 export trade had been lost, and home consumption only amounted to about 25 per cent of the C. goods produced in Lancashire. Exports to India dropped by half, owing to Indian home manuf. and to Jap. competition. Some few years before the Second World War the Brit. Gov. somewhat improved the Brit. colonial market for Lancashire C. piece goods by a system of quantitative restriction of imports specially directed against Jap. imports into the Brit. colonies. There was a further sharp decline in the Brit. C. industry following the world economic depression of 1930. The decline in the C. industry of the United Kingdom in the eight years 1930-37 is shown in the following totals of operatives for those years: 1930, 564,090; 1931, 550,110; 1932, 517,950; 1933, 499,930; 1934, 467,440; 1935, 442,400; 1936, 420,350; 1937, 408,580. Brit. exports of C. piece goods in 1937 were rather less than one-half of what they were in 1928, and though there has been in recent years a larger demand from the home trade, it has not compensated for any considerable proportion of the loss of 1,900,000,000 sq. yds. of overseas business. In 1928 India took more than two-thirds of the shipments to Brit. countries; in 1937 it took less than one-third of those shipments, and this is the chief influence in bringing about the decline in Lancashire's C. trade. The year 1938 proved to be the worst for the export of C. piece goods since 1860, and the worst for yarn exports since the C. famine of the early 1860's. The production of C. yarn fell by 22 per cent, the production of C. piece goods by at least 25 per cent, exports of yarn by 23 per cent, and exports of C. piece goods by 23 per cent; and the decline in the production of C. piece goods for the home

Type of Product	1938
Cotton yarns:	
grey and unbleached	110,002,900 lb.
bleached and dyed	12,947,300 lb.
Cotton Manufs.: woven piece goods:	
grey unbleached	446,678 cwt.
white bleached	633,365 cwt.
printed	306,281,000 sq. yds. or 494,006 cwt.
dyed in the piece	368,777,000 sq. yds. or 837,286 cwt.
Manufactured wholly or in part of dyed yarn and commonly known as coloured cottons	78,581,000 sq. yds. or 177,904 cwt.
Lace and lace net	24,943,900 sq. yds.
Finished threads	13,502,255 lb.
Handkerchiefs	16,742 cwt.
Other goods, including surgical dressings, cotton cleaning waste, etc.	—

QUANTITIES AND VALUES OF UNITED KINGDOM EXPORTS OF COTTON

market was almost as great. In 1939 a Cotton Industry (Reorganisation) Bill was introduced by the president of the board of trade. Its chief aims were to reduce the excess capacity in the C. industry, the result of serious contraction suffered in the last twenty-five years, which overlay the markets, and to counteract weak selling by schemes of price-fixing. Admittedly an imperfect measure, the Bill at least represented a united effort to remove the evils due to excessive individualism. Owing to the outbreak of war, however, the Bill was postponed by a special Act passed at the end of Oct. 1939. The Cotton Industry Act, 1940, provides for setting up a board to perform specified services for the benefit of the C. industry. Among the services specified are advertising to stimulate exports, research and experiments relative to the manuf. or consumption of the products of the industry, and the collection and pub. of statistics. The Act also provides for payments by C. spinners to meet the expenses of the board and to help the Empire C. Growing Corporation. The Amer. C. industry is in a flourishing condition, owing to the large domestic consumption of C. goods, the use of automatic machinery, and the enterprise which discovers new uses for C. products. In 1927 (the peak year) the U.S.A. exported 564,883,855 sq. yds. of C. cloth, valued at \$76,788,437. The quantities and value of United Kingdom exports of C. yarns and manufs. in 1938 and 1948 are shown in the table above.

The use of C. in England for manufacturing purposes dates back to the thir-

teenth century. The first account that can be traced of the importation of raw C. was in 1298. In all probability it was brought from Portugal, and was used exclusively in the making of candle wicks. But at the commencement of the fourteenth century practically all our C. and woollen fabrics were sent from other European countries. Flemings were encouraged to come to England by Edward III. in 1328, and they settled in Manchester and laid the basis of the Brit. manuf. of C. goods. They founded what became the famous 'Manchester Cottons,' and as is now well known, Manchester developed into, and still remains, the world's greatest 'cottonopolis.' It was these imported Flemings that paved the way for the valuable mechanical inventions, mostly of Lancashire origin, that gave the Brit. textile trade a start of all other nations. For the first thirty years of the eighteenth century practically no progress was made in the C. industry in England. The importation in 1790 was 30,000,000 lb., and 459,000,000 lb. in 1840. But eight years later commenced those great inventions which revolutionised the manufacturing world, and upon which, along with the steam and engineering inventions of James Watt, the C. factory system was founded. C. goods are now exported by Britain to about fifty countries. Britain's chief markets for C. piece goods are India, Australia, Brit. W. Africa, Netherlands, Dutch E. Indies, Argentine, Switzerland, Egypt, and China. With regard to the number of persons employed in the C. industry of the United Kingdom, the

YARNS AND MANUFACTURES FOR THE YEARS 1938 AND 1948

Balfour Committee report records 569,000 in 1927, 40 per cent male and 60 per cent female. In 1936 the total number of employees was 398,677. In 1938 29.8 per cent of insured persons in the C. industry were unemployed. Hours of labour are forty per week.

Government Controls.—No C. yarn may be spun in Britain without gov. approval given according to the purpose for which the product will eventually be used. But since the end of the Second World War there has been some relaxation in controls in the elaborate and detailed direction estab. in the third year of the war. It seems to be agreed among manufacturers and merchants that the harm to the industry is not that the controls have been retained but that the changes in the system have generally been belated, so that on balance the system has probably done more harm than good, though it is generally admitted that any system of gov. control is bound to lag behind the times. To-day it is assumed that the C. industry's important job is to earn foreign exchange, especially dollars; but this was a revolution in gov. policy and is the opposite of the purpose for which the mechanism of detailed control was started. Until 1941 the spinners and manufacturers remained free to accept what orders they wished. Then they were turned over to war work by means of 'preference directions,' the gov. ordering them to give preference to contracts for war work (including, before lend-lease, exports) to the neglect, if necessary, of other contracts. This system, however, broke down because the preference directions took all

of the reduced production, and supplies of civilian clothing became so small that rationing was necessary. It was at that point that the gov. began to allocate the output of C. goods, allowing firms to accept only authorised orders. Complete 'planning' of production began in 1942; its objects were to ensure that enough C. goods were produced for the forces (including, later, demobilisation clothing), for use by other industries, and for the civilian clothing ration. Exports, were, in general, unimportant. Until 1947 the (Labour) Gov.'s chief aim in controlling the C. industry was to keep down the price of clothing. Its second aim was to increase the clothing ration and its third aim was to supply C. goods to the colonies, where they were urgently needed to give people something to work for and to check inflation. Exporting on commercial principles, the earning of useful foreign exchange, and the rebuilding of Lancashire's trade connections received little attention; and it was not until the convertibility crisis of 1947 that the gov. began to look to the C. industry for dollars. The gov.'s critics, however, suggest that since its awakening to the need to earn dollars, the gov. has been reluctant to alter the controls to fit the new policy, and that the most conspicuous example of this reluctance is the retention of export licensing, which was only stopped in 1949. Some manufacturers and merchants think that exports would now (1949) be bigger if all the controls were lifted from the industry and that Lancashire would then have a better chance of holding its trade in the face of reviving foreign competition.

The core of the gov. control of the C. industry is the utility scheme. This applies to almost all the C. goods made for sale in the shops, either as cloth or as finished garments. About three-quarters of all cloth made for the home market must be utility—that is to say, it must be made according to detailed specifications laid down by the gov., fixing the structure of the cloth, the type and count of yarn from which it shall be woven, and the method of finishing. The gov.'s reason for keeping on the utility control is that it is a convenient instrument for controlling prices. The aim of the scheme was, in fact, from its inception to keep clothing at home as cheap as possible, and gov. policy in this connection (1949) still in practice puts that need before the need to export.

The *Race Cotton Commission*, appointed in 1948, was the (Labour) Gov.'s first experiment in state buying as a permanent policy, though it has not yet entirely justified itself in the eyes of its supporters. The case for appointing the commission was based on sound criticisms of the C. market, but the validity of the gov.'s promise that the spinners would be assured of a long-term stability in the prices of their materials may be judged from the fact that the commission has altered its price-list nearly a score of times in the first year of its existence. So far (1949) the Lancashire spinner has not suffered any direct loss or made any direct gain from the commission's change in prices; for if he has signed a contract to sell yarn and before he has bought the necessary raw C. its price rises the commission pays him the difference between the new price and the old; if the price falls he pays the commission. Conversely, if the spinner is holding stocks of C. without orders for yarn, he pays the commission when the price rises and is paid by them when the price falls. That this 'cover' scheme gives the spinner better protection than he got by 'hedging' on the Liverpool 'futures' market was one of the gov.'s strong arguments in 1946 when many dealers were pressing for the Liverpool market to be reopened. So far, however, the scheme in its present form has proved unworkable and in any case applies only to the spinner, for the manufacturers and merchants of clothing have no protection from changes in the price of raw C., though before 1939 they were able to cover themselves by dealing in futures, and some occasionally did so.

COTTON GROWING IN THE U.S.A.—The growing of C. and its manuf. have for many decades played a very large part in the economic life of the U.S.A. Although the farmers of the S. states vary their crops, C. is still by far the most important element in farming in the S. The total ann. value of the C. crop of the U.S.A. has averaged something like \$1,500,000,000. The leading C. states are Texas, with 6,100,000 ac. devoted to its growth and producing over 1,650,000 bales; Mississippi, over 2,280,000 ac. and 1,040,000 bales; Arkansas, 1,625,000 ac. and 1,240,000 bales; Alabama, 1,520,000 ac., and 800,000

bales; Georgia, 1,045,000 ac. and 555,000 bales (compared with a previous average of 956,000 bales); N. Carolina, 378,000 ac. and 420,000 bales; S. Carolina, 925,000 ac. and 695,000 bales; and Oklahoma, 520,000 ac. and 260,000 bales.

In the early days of C. manuf., the raw material was grown in the S. and manufactured in the N., principally in the New England states which had almost a monopoly of the business. Since the First World War a veritable revolution has taken place in the industry. With water power, cheap coal, and cheap labour in the S., it suddenly occurred to business men that it was more economic to manuf. C. right in the section where it was mainly grown. The result is that to-day the S. has more spindles in operation than New England. Recent figures showed the S. with 15,000,000 spindles as against 9,000,000 in the New England states. N. Carolina had 5,740,000 spindles; S. Carolina, 5,586,000 spindles; Massachusetts, 4,204,000 spindles; Georgia, 3,140,000 spindles; and Rhode Is. 1,768,000 spindles. The average number of active spindles is about 25,000,000. See also under DYES AND DYE-STUFFS.

See G. Watt, *The Wild and Cultivated Cotton Plants of the World. A Revision of the Genus Gossypium*, 1907; W. Balls, *The Cotton Plant in Egypt*, 1919; W. E. Dodd, *Cotton Kingdom*, 1919; G. W. Daniels, *The Early English Cotton Industry*, 1920; B. Bowker, *Lancashire under the Hammer*, 1928; A. P. Wadsworth and J. de L. Mann, *The Cotton Trade and Industrial Lancashire, 1620-1780*, 1931; Political and Economic Planning, *The British Cotton Industry*, 1931; H. B. Brown, *Cotton*, 1937; J. T. Marsh, *Mergerising*, 1941; I. Moberg, *The Cotton Loom Ficer's Manual*, 1942; H. Hargreaves, *A List of Recorded Cotton Insects of the World*, 1948; and *The Cotton Year Book* (ann.).

Cotton Weed, or *Dicotyles maritima*, is found chiefly on rocks round the coast of Britain, W. Europe, and the Mediterranean. It is a perennial, and is covered with long silky hairs. It belongs to the family Compositae.

Cotton Wool, name given to C. in its raw, woolly state as gathered from the balls or capsules of plants of the genus *Gossypium* and family Malvaceae (*Gossypium herbaceum* or *album*, *G. barbadense* or *nigrum*, *G. arboreum*). It consists of the soft, downy fibres (3 to 2 in. long) surrounding the C.-seeds. These hairs or fibres are separated from the seeds and freed from impurities, wax and fatty matters being removed by boiling in dilute caustic potash. Bleaching-powder and hydrochloric acid are used in preparing C. W. for use, and it is frequently washed. Prepared sheets or rolls of it are used like C. batting for stuffing and quilting. A soft, downy substance resembling fine wool, it is usually enclosed between glazed surfaces for such purposes, not very thick, and sold by the yard. A specially prepared kind is used in surgery for dressing wounds, etc. It is absorbent, soft, and elastic, and is often steeped in disinfectants. See COTTON; WADDING.

Cotton-worm, popular name of the larva of *Atelia xylinæ*, a species of Noctuidæ, or owlet-moths, nearly allied to the army-worm. This caterpillar is to be found in both N. and S. America, where it ravages the cotton crops and leaves other plants alone. The destructive nature of this creature sometimes costs the U.S.A. sev. millions of dollars in one year.

Cottrell-Lodge Method, method of precipitating dust and smoke particles by a high-tension electric discharge, discovered in 1883 by Sir Oliver Lodge, and developed on an industrial scale by Lodge and Cottrell. It is used to purify the fumes from cement and other furnaces, sulphuric acid works, smelting plants, factories, and so on. The apparatus consists of chambers containing electrodes maintained at high voltage, e.g. 75,000, and the dust particles are attracted to these electrodes. From time to time the deposited solid is shaken off by the action of an automatic hammer. The C. M. not only helps to purify the atmosphere of industrial dists., but enables valuable solid by-products in the fumes to be collected easily: thus the rare metal thallium is obtained from the flue dust of sulphuric acid works.

Cottus, the genus of acanthopterygious (spiny-finned) fishes, which includes the bull-heads and miller's thumbs, is typical of the family Cottidæ. The species are to be found round the coasts and in fresh water of the N. temperate zone. *C. gobio* is the common bull-head (q.v.) of streams in Britain.

Cotyledon: 1. Genus of plants belonging to the order Crassulaceæ. They are to be found in most parts of the world, especially S. Africa, and owing to their succulence they grow in dry situations, on rocks, walls, etc. There is only one Brit. species, *C. umbilicus*, the wall pennywort, common chiefly in the W. and S. of England; this has a spike of greenish-yellow pendulous flowers which often take on a pinkish tinge when fading; it flowers throughout the summer. 2. The seed leaf of a plant. In some plants, e.g. broad bean, the Cs. are the lobes of the seed itself, and contain a store of food for the embryo on germination; the existence of one or more Cs. is the basis on which flowering plants are divided into the two classes of Monocotyledons and Dicotyledons.

Cotys, or **Cotyto**, Thracian goddess, whose festival, the *Cotyttia*, was celebrated during the night and which resembled that of Cybele. She was afterwards worshipped at Corinth and Athens.

Coucal, or **Centropus**, genus of bush-birds of the family Cuculidæ; the species inhabit Asia, Africa, and Australia. They are strong-billed birds which feed on small animals, from insects to young birds, and in habit they are chiefly terrestrial. Unlike many of their allies (the cuckoos) they build their own nests. *C. sinensis*, the crow-pheasant, is an Asiatic species.

Cough, Sir Arthur Thomas Quiller, see **QUILLER-COUGH**, SIR ARTHUR T.

Couchant, term in heraldry, used to describe the position of a beast lying down with its head up. If its head rests on its paws it is dormant.

Couch-grass, or *Triticum repens*, weed which infests agric. lands. The name is a corruption of quitch grass or quick grass. The root contains sugar, and is used medicinally.

Coucy le Château, Fr. tn. 10 m. due N. of Soissons. The fine castle was destroyed in the First World War by the Gers. when they withdrew to the Hindenburg line in March 1918. During the final Ger. offensive it was taken in April 1918 by the Ger. forces in their attack on the Aisne-Oise Canal.

Coucy, Raoul (Renaud) de, Fr. troubadour of the twelfth century, who became Châtelain de C. in 1186, and took part in the Third Crusade (1189-91), being killed by the Saracens in 1203. His few songs were pub. by Fath as *Die Lieder des Châtelain von Coucy* (1883). He was the hero of *Le Roman du Châtelain de Coucy et de la Dame de Fayel*, a romance of the fourteenth century (perhaps by one Jakemon Sakesep). Crupellet's ed. appeared in 1829, a reprint in 1895. See G. Paris, *Romania*, viii., 1879.

Coué, Emile (1857-1926), apostle of auto-suggestion as a method of cure for disease, was b. in Troyes, in the dept. of Aube, France. He carried on business as a chemist at Troyes, 1882-1910, and was led, by an accidental occurrence in his business, to belief in the curative power of imagination and expectation. His fame was almost entirely due to his sincere simplicity and charity. He opened a free clinic at Nancy in 1910, and after the First World War lectured throughout France and in England and America—on his famous text 'Day by day and in every way I am growing better and better.'

Coueron, tn. of France, situated on the Loire, in the dept. Loire-Inférieure. Pop. 8,600.

Coues, Elliott (1842-99), Amer. ornithologist and biologist, b. at Portsmouth, New Hampshire, U.S.A. He was prof. of anatomy at Washington and founded the Amer. Ornithologists' Union. His chief works are *Key to North American Birds* (1872); *A Field Ornithology* (1874); *Birds of the North-west* (1874); *Birds of the Colorado Valley* (1878); *New England Bird Life* (1881), and *Dictionary of North American Birds* (1882). He also pub. a notable vol. on N. Amer. mammals, *Fur-bearing Animals* (1877) and sev. works on early travel in the W.

Cougar, or **Cougaur**, see **PUMA**.

Cough, explosive expulsion of air from the respiratory passages produced by reflex action. The nerves of the mucous membrane lining the upper air passages are particularly sensitive to irritation caused by foreign substances or inflammation. The action of coughing consists of a deep inspiration; followed by the closure of the glottis. The expiration suddenly bursts open the glottis, producing a current of high velocity which tends to sweep obstructive particles outwards

through the mouth. The action—which is automatic, although it can be modified by voluntary efforts—normally has a salutary effect in preventing these particles reaching the lung field and setting up foci of infection there. It may, however, lead to excessive disturbance and exhaustion in some diseases unless controlled by morphine or other respiratory depressants. Coughing may be caused by irritation in the nasal passage, pharynx, larynx, trachea, bronchial tubes, or lungs, due to the presence of particles of dust or food, or to inflammation caused by a cold. The breathing of acrid vapours has the same effect, and gastric or purely nervous disturbances may constitute a cause. Some varieties of C. may be recognised by their characteristic sound: pleurisy gives rise to a half-suppressed C., bronchitis causes a loud and explosive C., whooping C. is accompanied by a violent inspiration, which causes the characteristic whoop, while the purely nervous C. has an affected sound. The treatment depends on the predisposing cause, as it is often inadvisable to check a C. as such. It is to be observed, however, that continued coughing produces an ultra-sensitive condition of the respiratory passages, and, as so often happens, nature's method of eliminating irritating substances may be too vigorous for the comfort of the organism as a whole. In young children coughing may produce hernia, and there is possible danger of rupture of blood-vessels in consumptive patients. Remedies fall into two classes: those tending to help in the expulsion of irritating substances, and those tending to allay the sensibility of the nerves causing coughing. Examples of the former class are such expectorants as ipecacuanha, tartar emetic, and squilla, while preparations of opium, aconite, and bromides act as sedatives.

Couillet, com. of Belgium, Hainaut prov., very near Charleroi. It has coal-mines, chemical works, ironworks, and furnaces. Pop. 12,900.

Coulanges, Numa Denis Fustel de, see FUSTEL DE COULANGES.

Coulmiers, vil. of Loiret dept., France, 12 m. from Orléans. In 1870 the Bavarians under von der Thann were defeated here by Aurelle de Paladines. Pop. 315.

Coulomb, Charles Augustin de (1736-1806), Fr. scientist, b. at Angoulême. He is well known for research work in connection with magnetism and electricity, and he invented the torsion balance for measuring the force of electric and magnetic attraction. In 1779 his essay, *Théorie des machines simples*, secured a prize offered by the Academy, of which he afterwards became a member.

Coulomb, practical unit of quantity of electr. city, being the quantity conveyed by a current of one ampere in one second. It is so called after the famous Fr. physicist and engineer.

Coulommiers, tn. of France, in the dept. of Seine-et-Marne, 13 m. S.E. of Meaux. It has printing works, sugar refineries, and Brie cheese manuf. Pop. 6600.

Couldson, urb. dist. of Surrey, England, about 4 m. from Croydon. Pop. 40,000.

Coulter, John Merle (1851-1928). Amer. botanist and educationalist, b. at Ningpo, China. Educated at Hanover College. Botanist on the U.S.A. Geological Survey in the Rockies, 1872. President of the Amer. Association for the Advancement of Science (q.v.) in 1918. Pubs.: *Plant Relations* (1899, 1910); *Plant Structures* (1899, 1904); *Plant Studies* (1902, 1904); *A Text Book of Botany* (1906); *Manual of Rocky Mountain Botany* (revised ed., 1909); *Fundamentals of Plant Breeding* (1914); *Evolution in Sex Plants* (1914), and *Plant Genetics* (1918).

Coumarouna odorata, or *Dipteryx odorata*, species of Leguminosæ which yields the sweet-scented tonka bean of the perfumers. It is a native of Fr. Guiana, where it forms a large forest tree, locally called coumarou. The Creoles string the seeds into necklaces and also put them among their linen, both for their scent and to keep away insects.

Council Bluffs, city of S.W. Iowa. U.S.A., cap. of Pottawattamie co., near R. Missouri, on the Union Pacific. Chicago and N.W., and other railways. Railway bridges connect it with Omaha, Nebraska, across R. Missouri. High bluffs affording a magnificent view border it on the E. There is a state institution for the deaf and dumb. The manufs. include iron, agric. implements, machinery, wire-fencing, and carriages. It has large cattle yards, flouring mills, and grain elevators. Pop. 41,400.

Council of Industrial Design, see DESIGN.

Council of National Defense (U.S.A.), body created by Act of Congress in Aug. 1916, and inaugurated in the spring of 1917, to co-ordinate the industries and resources of the nation. It included the secretaries of war, navy, interior, agriculture, commerce, and labour, and it was responsible for the creation of sev. organisations, each of which had special functions bearing directly on the successful prosecution of the war. The C. was assisted by an advisory commission. The principle underlying its formation was adopted throughout the States, and state Cs. of N. D. were formed with duties similar to the parent body.

Council of Ten, see TEN.

Councils, Church (Lat. *concilium*, from *cum*, together, and root *cal*, to call), assemblies of eccles. dignitaries for the purpose of regulating some point of faith or discipline. The hist. of C. C. can be carried back to the second century A.D., when the churches of Asia Minor held C. to decide against Montanism. These early C. were evidently of a somewhat informal nature. Neither their composition nor their jurisdiction was clear. At various times more important C. comprehending a diocese or a prov. were called, but the rise of oecumenical C. throws these into the background. These general C. were convoked by the emperor. Bishops alone, or the representative priests or deacons of absent bishops, had the right to vote in early time. Abbots were later

included, and cardinals who held no bishopric. At the Vatican Council cardinals, bishops, and generals of religious orders were allowed to vote. There is not the slightest proof that the papal legates exercised the presidency. Even Ultramontane writers of the Rom. Church agree that there is no more than a probability that they did so at Nicaea. The question as to the superiority of the pope to an oecumenical council was hotly contested during the Middle Ages, but Rom. Catholics have now had the matter settled for them by the Vatican Council. Many medieval theologians also held that the decisions of a general council were only binding when they were received as such by the whole Church, and this practically resolves itself into a question as to which C. are oecumenical. St. Augustine, in a treatise against the Donatists, affirms that plenary C. assembled from the whole Christian world may be corrected, but by the beginning of the seventh century it was generally held that general C. were infallible. The modern Rom. Catholic theory is that the decrees of a council only become binding when ratified by the pope. Though there is some difference in the manner of numbering the oecumenical C., the following method, that of Hefele, is the one generally adopted in the Rom. Church: (1) The first of Nicaea (A.D. 325), held in the height of the Arian controversy at the summons of Constantine, drew up the major part of the Nicene Creed. (2) The first at Constantinople (381) completed the Nicene Creed, defining the divinity of the Holy Spirit. (3) The Council of Ephesus (431), held to defend the faith against the Nestorians, safeguarded the personality of Christ by giving the title of *Θεοτόκος* (Mother of God) to his mother. (4) The Council of Chalcedon (451) condemned the opposite heresy of Eutyches. (5) The second of Constantinople (553), held against Nestorianism. (6) The third of Constantinople (680) condemned the Monothellite heresy. (7) The second of Nicaea (787) was concerned with the iconoclast controversy, and defined the respect to be paid to images. (8) The fourth of Constantinople (869) attempted to secure the peace of the E. and W. Churches by deposing Photius of Constantinople, who had unjustly obtruded himself into this see. These eight C. were convoked by the emperor, and the first seven alone are recognised by the E. Churches. All the rest are subsequent to the great schism. The four Lateran C. (Nos. 9-12) dealt with questions of discipline and condemned the Waldenses and Albigenses. The dates are 1123, 1139, 1179, 1215. In 1245 was held the first of Lyons (No. 13), in 1274 the second of Lyons (No. 14). The fifteenth council was held at Vienne in 1311. The sixteenth, the Council of Constance (1414-18), ended the scandal of the rival popes. Then came the C. of Basle (1431 ff.) and Ferrara-Florence (1438-41), usually combined as No. 17. The C. of Lateran V. (1512-17) and Trent (1545-63) were reforming C. The twentieth, held at the Vatican in 1869, defined

the infallibility of the pope. The great work on the subject is K. J. von Hefele's *Konziliengeschichte* (7 vols.), 1855-74, completed by J. Hergenrother, 1887-90.

Countdouriotis, Paul (1855-1935), Gk. admiral and president; b. in the isle of Hydra. Successfully commanded navy in Balkan war of 1912-13. Minister of marine, 1915 and 1917-19. Regent on death of King Alexander, 1920; and again on departure of King George II., Dec. 1923. In April 1924 proclaimed president. Resigned March 1926, but resumed on Aug. 25. Re-elected June 3, 1929. Resigned Dec. 9, 1929.

Counsel, see ADVOCATE; BARRISTER.

Counsellor, in law, one who gives advice in legal matters, now always termed counsel. The term C. is retained as the full description of a king's counsel in the ceremony of calling new 'silks' within the Bar. The peers of the realm are hereditary Cs. of the Crown.

Count (Lat. *comes*, a companion), name derived from classical times, practically synonymous with the Eng. word earl of the present day. In the earliest times it was merely the name given to an attendant, but those who were the attendants of the Rom. emperor came, by reason of their office, to be much more important officials than mere attendants, hence the meaning of the word changed slightly. This was also the case under the Emperor Constantine, who made the word a title of some of his officials. Under the king of France the word also meant more than attendant, the *comes palatii*, or C. of the palace, being the second highest official of the state. He eventually came to act as the representative of the king during the absence of the latter. This same title was used also in other countries, and the Cs. palatine, as they were called, ruled over certain provs. and made the title hereditary by handing it down to their eldest son. Later on, however, in France there were numbers of people who bore the title of C., many of them merely assumed by the people who owned them, and so pure courtesy titles. This title, however, does not exist in England, the nearest approach being that of an earl's wife, who is a countess. In Germany the Graf seems to have been identical with the C. of other countries; the word still remains in the Eng. words margrave (or marquess) and landgrave.

Counter: 1. (Lat. *computare*, to reckon). Round piece of metal, wood, or some other substance, used by the ancients in making calculations, now only for reckoning points in card games, gambling games, etc. From the original sense of a means of counting money comes the use of the word in shops for the barrier across which goods and change are handed. 2. Circular parry in fencing (from Lat. *contra*, against). 3. Blow given as a parry to the opponent's lead in boxing.

Counterfeit, see COINING.

Counterfort, term used in architecture to denote a buttress or arch built against a wall to strengthen it. Cs. are frequently used when outward pressure is exerted on the opposite side of the wall by heavy

constructional work, and in terraces to resist the pressure of soil.

Counterguard, term used to designate the rampart built lower than and running along the length of a bastion or ravelin, a ditch lying between them.

Counter Irritants form a class of remedies used externally, which by setting up irritation relieve pain or congestion elsewhere in the system. Their effect is probably due to reflex action, caused by the impression they produce on the nerves of the skin. They are divided into three classes: (1) *Rubefacients*, which increase the heat and redness, e.g. hot water; (2) *Vesicants*, which produce blisters, e.g. cantharides; and (3) *Pustulants*, of which croton oil is an example. The use of the stronger C. I should only be under medical advice, as great harm can be done by careless or injudicious treatment.

Countermine, see under MINES; MILITARY.

Counterpoint, musical term which has been cleverly defined as the art of combining melodies. The name is found in use in the fourteenth century, when a system of notation by points was in vogue. A single melody was shown by a line of points, and C. was formed by the addition of one or more lines of points to the original, each line denoting a distinct melody, but so contrived that when the notes were produced at the same time, the whole formed a correct harmony. This is known as strict C., and the rules were closely followed for many years, although in later music the laws have been widely relaxed, perhaps with the result of reducing the rich effect acquired by rigid adherence to the rules. When the melodies are so written that their position can be altered without loss of harmony by the transposition of either below or above the other one, then the combination is known as double C. Triple, quadruple, and larger combinations of C. are also used, but are only possible at the octave, and in these cases the melodies are so arranged that any one of them may be used as a base to the remainder. Bach is generally considered to be the greatest exponent of the art of contrapuntal writing, while there are many text-books and writings on the subject, an outstanding work of the last century being that of Cherubini. See J. J. Fux, *Steps to Parnassus*, 1944.

Counterpoise (from the Lat. *contra*, against, and *pensum*, weight), settling of one weight against another of equivalent power on a balance, thus forming an equilibrium.

Counterscarp, military term to denote that side of a ditch in fortifications which confronts the attacking force, the inner side being known as the *escarp* or *scarp*.

Countersign, military term for a watchword or sign previously arranged to prevent unauthorised persons from passing a line of sentries.

Counter-tenor, name of the highest adult male voice, usually called alto. See 'VCL; CONTRALTO.

of Seine-ravalling Duty, term applied to it has prime importance duties imposed by Brie cheese protect home industries against

unfair foreign competition or the dumping of foreign products on an unprotected market. Examples of C. Ds. are the duties fixed by the Brit. Gov. under the Safeguarding of Industries Act.

Countervallation, or **Contravallation** (Lat. *contra*, against; *vallum*, a rampart), term used with reference to fortifications, and signifying a chain of forts constructed round a besieged place to prevent any sorties by the garrison. These redoubts, which are put up by the besieging army, may be disconnected or joined by means of a parapet. This term, however, has practically ceased to be used, as in modern warfare the practice is very little resorted to, on account of the adoption of different tactics.

Countess of Huntingdon's Connection, or **Huntingdonians**, sect of Calvinistic Methodists founded in 1748 by Selina, countess of Huntingdon (1707-91), widow of the ninth earl. Coming under the influence of John Wesley, she became a member of his religious society in Fetter Lane in 1739, but when he renounced Calvinism she supported George Whitefield, and made him her domestic chaplain in 1748. Whitefield's personality and preaching attracted many notable people to her house in Park Lane, including Lord Chesterfield, Bollingbroke, and Horace Walpole. Later the countess built chapels in Brighton (1761), Bath (1765), Tunbridge Wells (1769), Worcester (1773), Spa Fields, London (1779), and many other places, while in 1768 she instituted Trevecca College, near Talgarth, Breconshire, for the theological training of her chaplains. She succeeded from the Church of England in 1783 when the bishops refused to ordain her protégés, thus becoming a dissenter; and in 1790 she evolved a scheme for the perpetuation of the connection after her death. In 1792 the lease of Trevecca House expired and Cheshunt College in Hertfordshire was opened, but was transferred to Cambridge in 1906. Spa Fields chapel was transferred to Golders Green in 1910. See the ann. reports of the Countess of Huntingdon's Connection.

Count Out, Forty members must be present either in a debate in the House of Commons or in a committee of the whole House, and it is the duty of the Speaker or Chairman (as the case may be) if he is not satisfied that there is a quorum of forty members to give the order for withdrawal of strangers and for the summons of members from the precincts of the House. Two minutes only are allowed for additional members to assemble, when if, after twice counting those present, it is found there are under forty, the House adjourns.

Country-dance, originally a dance practised by country people in the open air. The generic name for all Eng. dances of a rural or native origin. They were introduced into France (1715-23) under the erroneous name *contre-dances*, and passed on to Italy and Spain. The word is especially applied to dances with two long lines of an indefinite number of couples facing each other. The dancers

are continually changing their places, as in the 'Swedish' and 'Sir Roger de Coverley.' In recent years there has been in Great Britain a revival of interest in these dances, under the leadership of Mr. Cecil Sharp (*q.v.*), and this movement is now directed by a society. See Steele, *Spectator*, 2 (1711).

'Countryman, The,' quarterly jour. pub. in London, created in 1927 under the editorship of J. W. Robertson Scott (*b.* 1866) of Burford, Oxfordshire. Its price of 2s. 6d. and its pocket size were innovations at the time of its first pub., but its circulation rose to 60,000. It covers every aspect of rural life.

County (derived from the Lat. *comitatus*, through the Fr. *comté*). C. or shire is a term used to designate a specific area of a kingdom for administrative purposes. In the United Kingdom the boundaries of the Cs. in some cases confine dists. which were formerly old kingdoms, notably Kent, Surrey, and Sussex, while other Cs. have been formed by Acts of Parliament. The Cs. are themselves combinations of hundreds, and have their own officers for the administration of certain local matters and an elective C. council. In the U.S.A. Cs. are divs. of the states made by the state legislature primarily for purposes of law, their powers differing widely in each state.

County Council created by the Local Government Act, 1888, as the unit of local government for the management of the administrative and financial business of a co. or div. of a co. Before the Act the vast increase in the activities of the state in matters of local government found expression in the periodical creation of numerous local boards acting independently of each other, and in the gradual extension in all directions of the administrative duties of justices of the peace in quarter sessions. The consequent overlapping of local governmental areas, nearly every public authority dividing the country differently and with no reference to other divs., led to a lack of coherent principle in the performance of these delegated state duties. The Act of 1888, by creating a body, in area and personnel truly representative of cos., effected a considerable measure of uniformity in the world of local government. The word county, or administrative county, as used in the Act is not synonymous with county in the ordinary sense. By adopting the existing tn. councils in the municipal bors. (see also BOROUGH) as co-ordinate bodies with the C. Cs., the term C. C. includes a number of tns. with a pop. of over 50,000 each in the category of administrative cos.; but under the Local Government Act, 1933, a bor. council may not promote a Bill to constitute the bor. a co. bor. unless the pop. is 75,000 or upwards. (The first Schedule to the Consolidating Act, 1933, gives forty-nine administrative cos. for England (excluding London) and twelve for Wales; and eighty co. bors. in England and five in Wales.) Means were provided for creating increasing tns. administrative cos. as occasion requires. Further, some cos. possess more than one

C. C., e.g. Yorkshire is divided into three administrative cos., the N., E., and W. Ridings, the W. Riding comprising so much of the wapentake of the co. of York as is not included in York bor. Lincoln is divided into three administrative cos., and Suffolk and Sussex into two each; while the administrative co. of London, under the London C. O., comprises the metropolitan portions of Middlesex, Kent, and Surrey. The C. C. consists of a chairman, alderman, and councillors without restriction as to sex. The chairman is elected annually by the C. C. from among the co. aldermen and councillors, or persons qualified to be aldermen or councillors; and unless he resigns or ceases to be qualified he continues in office until his successor becomes entitled to act as chairman. During his term of office the chairman continues to be a member of the C. C., notwithstanding the provisions of the Act of 1933 as to the retirement of co. councillors at the end of three years. Aldermen are elected by the C. C. from co. councillors or persons qualified to be co. councillors; the number of aldermen is one-third of the whole number of co. councillors, and in every third year, being the year in which co. councillors are elected, one-half of the number of senior aldermen must retire. Co. councillors are elected for three years, and they must retire together in every third year on March 8. Clerks in holy orders and peers owning property in the co. may serve as aldermen or councillors, and, generally, the qualification for councillors is the same as for bor. councillors. Persons of either sex registered as co. electors, or enrolled burgesses of any non-co. bor., are qualified as co. electors, the qualifications for the franchise being the same for men and women (Representation of the People Act, 1928).

The constitution of the London C. C. differs somewhat from that of other C. Cs. Each parl. div. in London co. elects two members to the council with the exception of the City, which elects four, making a total of 124 councillors. The twenty aldermen are elected as in the case of other councillors. The functions of the C. C. comprise a great variety of duties original and supervisory, and the Ministry of Health may transfer to it any such statutory powers, duties, and liabilities of the Privy Council, or any gov. dept. as appear to relate to matters of an administrative character arising within the co. The co. police are under the joint control of sub-committees appointed by the C. C. and the justices of quarter sessions. The C. C. since the Education Act, 1902, is the educational authority of the dist. except within the limits of urb. dists. of over 20,000 inhab., and of bors. of over 10,000 inhab. For educational purposes a C. C. may raise, or aid a dist. council in raising, any sum of money necessary up to a penny in the pound on the local rate. A C. C. has the same power of making by-laws as a bor. It is also the highway authority for all co. roads (see HIGHWAYS and below) and may make contributions towards the cost of maintaining and

improving any highway or public footpath although not a co. road; and it has special duties as to the repairs of co. bridges. It has certain duties appertaining to public health, administering the Acts relating to noxious insects and pests, preventing abuses in the sale of bread and coal, and the spread of contagious diseases amongst animals (see CONTAGIOUS DISEASES (ANIMALS) ACTS), and the pollution of rivers. Under the Housing Acts, it may assume the powers of a defaulting rural dist. council in the duty of providing housing accommodation for the working classes, and is charged with the duty of electing a co. medical officer of health. It may prepare draft schemes for small holdings and lend money to tenants purchasing small holdings. It sanctions the compulsory purchase of land for allotments to the working classes (statutory provisions on the powers of C. Cs. to acquire and deal in land are to be found in the Local Government Act, 1933, part viii.). It grants music, dancing, and race-course licences. It appoints the coroner (*q.v.*), for the shire, the co. surveyor, and the public analyst. It may fix the boundaries of dist. and par. councils and make orders for grouping par. into one administrative unit. Over smaller local governing bodies it exercises under various Acts large supervisory powers, and generally it is responsible for the proper working of the Local Government Acts within its boundaries. Its powers in relation to finance are considerable. It levies the co. rate. It does much of the work once exclusively performed by Quarter Sessions. It sanctions loans by par. councils, and itself has large borrowing powers on the security of its ann. revenue, subject to the control of the Ministry of Health: chiefly for the execution of permanent works. The revenue of the C. C. apart from the co. rate is derived chiefly from royalties, fines, tolls, and rents, together with State subventions of a share of the moneys arising from estate duties and certain co. licences, mainly those for the sale of intoxicating liquors. Very extensive powers have been vested in the London C. C., and others have been added. With the necessary modifications the Local Government Act of 1888 was extended to Scotland and Ireland. The Act of 1894 applies only to England and Wales.

There has been a distinct trend in modern legislation to use more and more the machinery of the C. Cs. for the administration of local government. We have seen above that the Education Act of 1902 transferred to them work of the highest importance from a national point of view, and, as a result, there has been a perceptible levelling up in the standard of elementary education throughout the country. More work was given to them by the Local Government Act of 1929, which abolished Boards of Guardians and transferred the functions of the poor law authorities as from April 1, 1930, to the council of the co. or co. bor. comprising the poor law area for which the poor law authority had previously acted. To-day, however, local authorities are no longer

responsible for the relief of destitution, a National Assistance Board having been set up to administer a state scheme. In view of the remarkable development in road transport in the last two decades, the administration and maintenance of roads became a matter of vital importance, and the same Act made certain provisions with regard to them which affected C. Cs. As from April 1, 1930, the following are co. roads: (1) main roads; (2) roads constructed by a C. C. with the aid of an advance by the Road Board (no longer existing) or Ministry of Transport; (3) roads declared by a C. C. to be main roads; (4) roads constructed under Development, etc., Roads, etc., Act, 1909; (5) highways in rural dists. which before April 1, 1930, were controlled by rural dist. councils; (6) classified roads which were or are vested in urb. dist. councils; (7) any ordinary road which a C. C. on application of an urb. dist. council declares to be a co. road or which the Ministry of Transport so declares on appeal by an urb. dist. council. Co. roads, however, may cease to be such by an order of the Ministry of Transport on application of the C. C. An urb. dist. council may claim to maintain a co. road within its area but the C. C. must pay for the work. The following lists are a broad attempt to show the present distribution of functions to C. Cs., co. bor. councils, and the London C. C. The lists are, however, liable to much local variation. C. Cs. registration of births, deaths, and marriages; various by-laws; adoption and boarding out, etc., of children; education (including school medical service and meals); registration of electors; licensing of entertainments (theatres, cinemas, race-courses); analysis of fertilisers and feeding stuffs; inspection, analysis, etc., of food and drugs; housing (assistance in rural areas); land charges registration; libraries and museums; motor vehicles and drivers' licensing; nursing homes registration; parks and open spaces; petroleum storage and stations; police (through a joint standing committee of the C. C. and the co. justices); remand homes; prevention of pollution of rivers; maintenance of roads and bridges; inspection of shops; inspection of weights and measures; and protection of wild birds. The functions of co. bor. councils include all the above and, in addition, the following: provision of allotments; baths, swimming baths, and wash-houses; control of building; cemeteries; control of common lodging houses; electricity meter testing; notification and disinfection of infectious diseases; mortuaries; suppression of nuisances; sanitary services—drains, refuse disposal; sewerage; smoke abatement; and vaccination. The functions of the London C. C. include most of those of the C. C. generally, excepting registration of births, deaths, and marriages; registration of electors; analysis of fertilisers and feeding stuffs; food and drug inspection; libraries and museums; police; and wild birds protection. But the London C. C. has the following additional functions: control of building; slum clearance; road construc-

tion, as well as maintenance; and prevention of Thames floods.

In Canada. In Ontario, Quebec, and New Brunswick, where rural local government areas are known as cos., the C. C. is made up of the elected reeves and deputy reeves of the townships and vils. In some cos. the smaller tns. are also part of the co., and in that case the mayor of the tn. is also a member of the C. C. These Canadian C. Cs., whose presiding officer is chosen by the council and is called warden, control all matters of general interest to the whole co., such as health, education, welfare, and roads.

County Courts are local civil courts established throughout England by an Act passed in 1846 for the purpose of recovering small debts and demands; but all the modern provisions as to C. Cs. are to be found in the Act of 1924, and in the Consolidatory Act passed in 1934. Originally the jurisdiction was limited to claims where the amount involved did not exceed £20, but by the combined operation of a series of Acts of Parliament the jurisdiction has increased to such an extent that they have absorbed a large amount of the business that would ordinarily have occupied the attention of the *nisi prius* courts of assize. Historically a co. court is an ant. institution the evolution of which is to be traced from the judicial side of the shire-moot and the old court of requests or 'loser Court of Equity for the hearing of poor men's suits.' The direct progenitor of the co. court is, however, to be sought in the later court of requests and other small local civil tribunals, which took over much of the jurisdiction of the shire-moot. Subsequently the civil jurisdiction of the old co. court to all intents and purposes ceased when a few years later the circuit judges of the Curia Regis were granted commissions of *nisi prius*. From that time the ant. co. court became merged in the courts of requests down to 1846, when the latter, together with most other minor local civil courts, were abolished, and a new kind of co. court for the prosecution of small claims set up. By the Act of 1846 the country was divided into co. court dists. There are now fifty-nine such circuits, excluding London, with one judge for each circuit. By a later Act the lord chancellor is empowered to appoint two judges for any circuit provided the total number does not exceed sixty. The salary of a co. court judge, originally £1200 a year, is now generally £2000 a year. He must be a barrister of seven years' standing and not over sixty years of age. A co. court judge may neither practise at the Bar nor sit in Parliament. Actions in co. court are tried by a judge alone, unless one of the parties demands a jury. A co. court jury consisted formerly of five men, but the number is now eight. The overwhelming majority of cases are tried without a jury. In equity suits, and in actions in which the amount claimed does not exceed £5, trial is without a jury; in actions for libel, slander, malicious prosecution, seduction, breach of promise,

either party may demand a jury; any other action shall, if either party so requires, be tried with a jury unless the judge is satisfied, on application by the other party, that the action is more fit to be tried without a jury. A characteristic feature of co. court procedure is the absence of *pleadings* defining the questions at issue. Various amending Acts have gradually enlarged the jurisdiction of the C. C. with the result that they now have unlimited jurisdiction in all common law actions where the parties consent in writing to the action being tried there; and, further, jurisdiction (1) in all actions arising out of contract or tort (i.e. actionable wrong) where the debt demanded or damage claimed does not exceed £100. (2) In equity suits where the amount or value of the matter in dispute does not exceed £500. (3) In actions of ejectment and the actions concerning title to land where the ann. value or rent of the land does not exceed £100. (4) In probate and admiralty actions limited to £200 personally and £300 respectively. (5) In remitted actions from the high court. Actions may be remitted from the high court to the co. court by agreement between the parties, or on the application of one party provided the subject-matter and amount are within the co. court jurisdiction, and if the high court thinks fit; and there is also provision for remission of actions of tort where the plaintiff is impecunious. On the other hand the defendant to a co. court action may in any action on contract where the plaintiff claims more than £20, or, on tort, more than £10, object to the co. court hearing the case, and if he gives security for the sum in issue and costs up to £150 the co. court judge will transfer the action to the high court, provided he is satisfied that an important question of law or fact is involved. It is to be noted that a plaintiff who sues in the high court where he might in the first instance have sued in the co. court will lose his case if, in an action on contract, he recovers less than £40, and, in an action on tort, less than £10; and if he recovers less than £100 or £50 respectively, he will only get costs on the co. court scale—unless the high court thinks that there was sufficient reason for his proceeding in the high court or the defendant objected to transfer. The procedure in beginning an action is simple. The party wishing to proceed to law fills in a 'precipe,' which may be obtained gratis at the co. court office. This precipe is a slip of paper on which plaintiff writes particulars of the action, the remedy or damages claimed, and the name and address of his solicitor (if any). An affidavit of the plaintiff showing the ground of the application must also be filed. A fee is payable on entry of the plaint, and if the claim exceeds £2, ordinary summonses must be served by the bailiff, for which an additional fee is chargeable. On the issue of a summons a plaint note is given to the plaintiff. This is an acknowledgment of the fee paid, and gives the date when the summons is returnable. The summons is under the

seal of the court and is served by a bailiff of the court.

County Hall, Westminster, is the headquarters of the London Co. Council. It is situated on a site of 6½ ac., part of which was reclaimed from the riv. foreshore, running northwards along the E. bank of the Thames from Westminster Bridge. The foundations for the building designed by Ralph Knott were laid in 1913, but the work was delayed by the war, and the C. H. was not formally opened until 1922. The style is a free treatment of Eng. Renaissance, and the total cost was approximately £3,533,000. The actual façade is faced with Portland stone, and the roof covering is of red tiles.

weeks immediately before and after the four quarter days. Quarter sessions in hors. are fixed by the bor. recorder. The court is constituted by two or more justices of the peace presided over by a chairman. Generally speaking, the criminal jurisdiction of the C. S. is restricted to minor felonies and misdemeanours, the more serious crimes being tried at assizes. They are forbidden to try treason, murder, or any capital felony or any felony punishable by penal servitude for life. They also exercise jurisdiction in rating appeals and the licensing of places for the sale of intoxicants.

Coup. A *coup d'état* is an arbitrary stroke of policy, carried out suddenly

COUNTY HALL, WESTMINSTER, LONDON

L.C.C.

There are nine floors, each containing about 100 rooms. The council of 144 members meets in the octagonal council chamber facing on to the Thames and the members' terrace. The council determines the principles, but delegates administration to standing committees which meet once a week or once a fortnight. All the work of the London Co. Council is discussed and organised, and most of the detail planned and administered within the C. H., which, in addition to accommodating the council and the twenty committees, houses a staff of 3000 people.

County Rates are taxes levied by co. councils (*q.v.*), in connection with local government expenditure to meet deficiencies not provided for out of revenue or local taxation grants. Some purposes for which a co. rate may be levied are the cost of the assizes and co. sessions, half the cost of the co. police, and expenses under the Education Act, 1902.

County Sessions, the general or quarter sessions of the peace for the co. sit to try such crimes as statute law expressly permits them to try and hear appeals against summary convictions where a right of appeal is given by statute to the person convicted. Quarter sessions in cos. must be held within a period of three

both violently and illegally by the ruling power, with entire disregard of the prerogatives of other parts of the body politic. The two most famous instances are Napoleon Bonaparte's C. of 1799, ending the directory by his 'whiff of grapeshot,' and that of Louis Napoleon, which broke up the national assembly by force, 1851. A *coup de main* is a sudden and successful attack, made to capture a position instantaneously. A *coup d'œil* (glance) means a rapid, comprehensive view of a complicated matter, often used of the faculty of taking a general survey of a military position and estimating its advantages and disadvantages. *Coup de grâce* is the merciful final blow which puts a victim out of pain, hence a decisive or finishing stroke. A *coup de théâtre* is a trick of the stage, or any sudden sensational act.

Coupar-Angus, par. and tn. of Perthshire, Scotland, near R. Isla, 12 m. from Perth, 15 m. from Dundee. There are remains of a Rom. camp, and also of the Cistercian Abbey, founded 1164 by Malcolm IV. Manufs. coarse linen, fabrics, jute, and leather. There are steam saw-mills and agric. implement works. Pop. 2000.

Couped (Coupé), term in heraldry used

to describe the head or any limb of an animal, or a part of a plant, represented as cut off clean and smoothly in a straight line. Where the representation is jagged and uneven, as if forcibly torn off, it is blazoned 'crased,' or 'slipped,' Coupé (from Fr. *couper*, to cut) is also applied to an ordinary with extremities cut off so as not to reach the shield's boundaries.

Couperin, François (1668-1733). Fr. musician, son of Charles C. (1638-79). The greatest member of a large musical family. Learnt music from his father and from Jacques-Denis Thomelin, organist of the king's chapel. Appointed organist at the church of Saint-Gervais in 1685, where he remained until his death. In 1693 he succeeded Thomelin as organist to the king, and in 1717 received the title of Ordinaire de la Musique de la chambre du Roi. He had been connected with the court before and taught the royal children. In wider circles, too, he was famous as harpsichord teacher and had down his system in the treatise *L'Art de toucher le clavier* (1716). He married Marie-Anne Ansalet c. 1689, and they had two daughters, the second of whom, Marguerite Antoinette, became a distinguished harpsichordist. Works include four books of harpsichord pieces (c. 230); forty-two organ pieces; four *Concerts royaux* for harpsichord, strings, and wind instruments; ten chamber concertos. *Les Gouls-réunis*; four suites for strings and harpsichord. *Les Nations*; chamber sonata *Le Parnasse, ou l'Apothéose de Corelli* and *L'Apothéose . . . de Lully*; two suites of pieces for viols with figured bass; some miscellaneous chamber works; twelve songs for one, two or three voices; church music includes *Laudate pueri Dominum*, *Leçons de Ténèbres*, a number of motets, etc. See life by A. Tessler, 1926, and H. Quittard, *Les Couperins*, 1913.

Couperus, Louis-Marie-Anne (1863-1923), Dutch poet and novelist, b. at The Hague, but spent his boyhood years in the Dutch E. Indies. His first works were two collections of poems, *Een Lent von Vaersen* (Springtide of Verse) (1884) and *Orchideen* (1886). His first novel, *Eline Vere* (1888), a vivid picture of society at the Dutch cap., won him fame. He united in his writings the ideas and tendencies of both Fr. and Scandinavian literature. Other works are *Noodlot* (1890); *Extase* (1891); *Illusie*; *Majesteit* (1893); *Wereldvrede* (1894); *Metamorfose* (1897); *Langs Lijnen van Geleidelijkheid* (1899); *De Stille Kracht* (1901); *Oberlichtende Dremfels* (1903); *Dionysus* (1904). C. also wrote the fairy-tales *Psyche* (1897) and *Fidessa* (1899). His translator, A. Texeira de Mattos, made a great success with the Eng. version of *Van Ouden Menschen, de dingen, de bijgaan* (1906)—viz. *Old People, and the Things that Pass* (1919). He d. at De Steeg of blood-poisoning.

Couple, in statics, consists of two equal forces acting in opposite directions along two parallel straight lines. It is impossible for a C. to keep a body in equilibrium, for any C. tends to rotate the body. The distance between the lines of action

of the two forces is known as the arm of the C., and the moment is the product of one of the forces into the arm.

Couplet (from Lat. *copula*, a bond), any two lines of poetry rhyming together. They are usually of the same length and contain the complete expression of an idea. The poetic writers of Queen Anne's time made frequent use of the C. in aphoristic versification. Long poems in this rhythm necessarily become monotonous. Pope and Dryden used the heroic C. (rhymed iambic pentameters) frequently.

Coupon, document attached to a share warrant, bond, or other negotiable instrument, indicating the dates on which dividends or other periodical payments will become payable. Share warrants are a device for legalising the issue of fully paid shares payable to bearer, and when issued the name of the shareholder is struck off the register, because as henceforth the holder is the person who happens to hold the warrant; the company neither knows who he may be nor who is entitled to the dividends. Hence the necessity for attaching Cs. dated with the successive dates on which dividends will be paid, during sev. years following the issue of the warrant; to the person producing them. The Cs. attached to bonds issued for any term of years represent the total number of periodical payments for interest, whether quarterly, half-yearly, or yearly, as will become payable, the date of such payments being printed on each C. On the date of any one payment maturing, the holder of the bond merely detaches the C. and presents it for payment at a specified bank.

'Coupon' Election, general election of Dec. 1918, which returned the Coalition Gov. of Lloyd George. After the armistice Lloyd George and his Cabinet resolved on an immediate election in order that he might go to the peace conference with the authority of a new Parliament behind him. The gov. fought the election as a coalition and both Liberal and Conservative supporters of the coalition received a letter of support from Lloyd George and Bonar Law, leader of the Conservatives. The Asquithian Liberals were refused such a letter, as also were candidates of the Labour party, other than a few who remained with the gov. This letter from the leaders of the gov. was nicknamed a C., and so the election has become known as the C. E., the nickname being used as a term of abuse by reason of the fact that the decision to dissolve Parliament at that date and in those circumstances has been so severely criticised by many historians.

Courante, or **Coranto**, fr. dance which was popular in the seventeenth century. The term is also used in music for a movement with a distinct rhythm generally forming part of a suite and coming immediately after the Allemande.

Courbet, Gustave (1819-77). Fr. painter, chief of the realists, b. at Ornans, near Besançon. He left the study of theology for art, became a pupil of Steuben, d'Angers, and Hesse in Paris, but was

largely self-taught. C. was much influenced by Flemish and Venetian masters. He was a member of the com., 1871, and in 1875 was condemned to pay the costs of re-erecting the Vendôme column, which he had caused to be pulled down. Among his portraits and figure-paintings are 'Homme à la Pipe' (1844); 'Casseurs de Pierres' (1850); 'l'Enterrement à Ornans' (1850) (now in the Louvre); 'Fair Dutchwoman' (1853); 'Démolisses de la Seine' (1857); 'Man with a Leather Belt' (1870). C. is at his best with landscapes of his native Franche-Comté such as 'Combat de cerfs' (1861); 'Remise de chevreuils' (1866). 'The Wave' (1870) is now in the Luxembourg. See W. C. Brownell, *French Art*, 1902, and lives by H. d'Iderville, 1878; L. L. Bénédite, 1911; C. Léger, 1929; P. Courthion, 1931.

Courbevois, suburb of Paris, in the arron. of St. Denis, on the l. b. of the Seine. It is an industrial dist. given over to bleaching greens, textiles, and chemical works. Pop. 54,100.

Courcelles, com. in the prov. of Hainaut in Belgium, about 5 m. N.W. of Charleroi, with coal, iron, and glass industries. Pop. 18,000.

Courier (or **Courier de Méré**), Paul Louis (1772-1825), eminent Fr. writer, b. in Paris, son of a wealthy bourgeois and educated at the Collège de France and at a military academy, devoting himself at both institutions to Gk. literature. He started as a pure writer of belles-lettres but by force of circumstances and the chicanery of politics he became a journalist and the leading Fr. pamphleteer, noted for his irony. For a time he lived in Florence, where the accidental blotting of a page in a MS. of Longus led to the *Lettre à M. Renouard* (1810), which first showed his literary powers. In *Pétition aux deux Chambres* (1810) he described the grievances of the peasantry; in *Lettre à Messieurs de l'Académie des Inscriptions* (1819), the most brilliant of all his writings, he flayed that learned body for having preferred to him in their last election a man whose only advantage was noble birth. His best known writing, however, was his *Simple discours*, one of a series of pamphlets addressed to his 'fellow villagers' and signed 'Paul Louis Vigneron', in which he satirised the proposal to purchase Chambord for the duc de Bordeaux. For this he was fined and imprisoned for two months. He was shot on his small estate in Touraine by a farm hand whom he had dismissed from his service. As an author and satirical writer he was brilliant, rich in contemporary historical knowledge and classical quotations. The whole of his works were collected by Armand Carrel and pub. in 4 vols. in 1830.

Courier (derived from the Fr. *courir*, to run), term applied to servants whose duty is to relieve their employer of trouble when travelling by making all the necessary arrangements for transport, hotel accommodation, securing passports, etc. Prior to the formation of the post office, messengers were employed to deliver letters and messages and were

known as *Cs*. Important dispatches to foreign embassies are still frequently delivered by the king's messenger or Foreign Office *Cs*.

Courlan, Caran, Crying Bird, and Crazy Widow, popular names of the wading-bird *Aramus scolopaceus*, which is found in S. America. The bird is noted for its peculiarly dismal cry.

Courland, see KURLAND.

Cournot, Antoine Augustin (1801-77). Fr. mathematician, philosopher, and economist, b. at Gray. He is chiefly noted for work on the calculation of probabilities, and his foundation of the so-called mathematical school of social economy. He wrote *Recherches sur les principes mathématiques de la théorie des richesses* (1838); *Exposition de la théorie des chances et des probabilités* (1843), and *Principes de la théorie des richesses* (1863).

Cours, com. of France, in the dept. of Rhône, on the Trambouze, where cotton goods, called Beaujolais, are manufactured. Pop. 5900.

Coursing, pursuit of hares by greyhounds, not by scent, but by sight. In ant. times other game also was coursed, generally deer: the sport is described by Arrian about A.D. 150, also by other classic authors (see W. Dansey, *Arrian on Coursing*, 1831). Our own ancestors probably practised it as much to fill the larder as for sport. In Saxon and Norman times only nobles and landowners had the privilege of keeping greyhounds, but in the reign of Elizabeth rules for the sport of C. were drawn up by the duke of Norfolk, and during the next century open competitions came into vogue. Still no regular 'club' was formed until 1776, when Lord Orford founded one at Swaffham, Norfolk, and soon afterwards the Ashdown Park club was formed, holding its meetings at Lambourn, Berkshire. The sport spread widely, some of the finest courses being on the downs at Amesbury, Stockbridge, etc. After the passing of the Game Laws in 1831, C., which had hitherto been almost restricted to clubs, was more generally taken up, and in 1880 the passing of the Ground Game Act, greatly altering the conditions of the sport, led to the estab. of many enclosed courses. These were much favoured by betting men, as the whole run could be watched from a stand, but it was found that the system encouraged breeding entirely for speed, training for other qualities being neglected, and with keen sportsmen open courses are now most in favour. The season lasts from about Sept. to March, the Altcar or Waterloo meeting, which decides the championship, coming in Feb. The Waterloo Cup, the courser's Derby, is so called from having been originated in 1836 by the proprietor of the Waterloo Hotel, Liverpool, who gave the cup and was lucky enough to nominate the first winner, Lord Molyneux's Milanio. In 1882 the *Greyhound Stud Book* was estab., and no dog not appearing there with properly traced pedigree can compete at any meeting under the rules of the National Coursing Club, a representative

association formed in 1858, which governs C. all over the kingdom. Courses vary a good deal in their character; some particularly favour speed, e.g. Kempton Park, Surrey, where at the Jan. meeting the very fastest dogs are to be seen. But though speed is highly important, cleverness tells greatly in the estimation of points, and it is in the breeding and training for all requisite qualities that judgment, skill, and luck are required. A competition is held thus: the slip-steward seeing that each slipper in turn is ready, punctually, with his brace of hounds in leash, a hare is started (at an open meeting by beaters), and when it has about 60 yds. start, the hounds are simultaneously released, and the judge follows the run on horseback. He decides the points as follows: on *speed*; the *go-by*, when a greyhound starts a clear length behind, and in a straight run gains a clear length's lead; the *turn*, bringing the hare round at a right angle or more; the *wrench*, turning it at less than a right angle; the *trip*, throwing it over, but failing to kill; the *kill*. The judge may declare a 'no course' if the trial is not satisfactory, or a tie if points are equal. His decision is signalled by the flag-steward. The victory goes not necessarily to the greyhound that kills, but to the one that does most to make the kill possible. Some experienced dogs are artful, and manage to get the kill themselves after leaving all the work to the others; this tendency has often been proved hereditary. C. in the Eng. style has been taken up in Australia and the U.S.A.; in the latter the prairie jack-rabbit often takes the place of the hare.

Courtauld, Samuel (1876-1947), Brit. industrialist and art patron, second son of Sydney C., of Huguenot descent, of Braintree, Essex; educated at Rugby School. He entered the family business of silk manufacturers, and soon became manager of the Halsestead mill, and, by 1908, was general manager of all the company's textile factories under H. S. Tetley, who had played a leading part in the development of rayon in England—a branch of textiles in which C.'s were pioneers. Samuel C. was early trained in the chemical side of the rayon industry in Krefeld, Germany. In 1915 he was appointed to the board of the company and, in 1917, joint managing director with Henry Johnson; and finally, in 1921, he became chairman, thus succeeding to the leadership of the business founded ninety-six years previously by his great uncle, Samuel C., and by his grandfather. There have been in Brit. industry few parallels to the way in which C.'s came to dominate a new field and for a long time to hold the lead in research and production of artificial silk; and for all this C. was largely responsible during his twenty-five years as chairman. He spent his great fortune munificently. Not only did he form a collection of paintings of the Impressionist and post-Impressionist schools, chosen with conspicuous taste, but his generosity enabled the Tate Gallery to acquire masterpieces

that would otherwise never have entered the public collection. In 1931 he founded and endowed the C. Institute of Art in the univ. of London, the first institute to be created in this country for the appreciation of art and the study of art hist.; and to house the institute he handed over his house in Portman Square, one of the finest examples in London of the work of Robert Adam, and with it the greater part of the collection of the Impressionist pictures which he had formed, the rest being bequeathed to the National Gallery. C. was also a trustee of the National Gallery.

Courtaulds Ltd., textile and artificial silk manufacturers, estab. in 1824 as Samuel Courtauld & Company. The production of artificial silk was begun in 1904, with headquarters at Coventry, and in 1910 factories were set up in the U.S.A., Germany, and Russia. The company was incorporated in its present form in 1913. Three years later it absorbed its only Eng. competitor, the Brit. Glanzstoff Manufacturing Company, and by 1922 controlled the whole of the Eng. artificial silk industry. It also acquired interests in the Brit. Cellophane Company, Morton Sundour Fabrics Company, and, jointly with Imperial Chemical Industries, all capital of Brit. Nylon Spinners. Spinning factories are estab. at Halsestead and Braintree in Essex, Halifax in Yorkshire, and Leigh in Lancashire. Other factories are at Flint, Coventry, Nuneaton, Wolverhampton, Bocking, Bradford, Droylsden, Greenfield Preston, Rochdale, and Trafford Park. In 1941 the Brit. Gov. acquired from the company about 95 per cent of its holding in Amer. Viscose Corporation (for the sake of the dollar exchange). The capital of the company, authorised and issued, is £32,000,000 (£24,000,000 ordinary and £8,000,000 preference stock).

Court Baron, necessary court of a baron. It is partly administrative and partly judicial. Other courts at the manors were the customary court and court leet.

Courtenay, name of a distinguished Eng. family, which was at one time widely distributed in the W. country. The founder is supposed to have been Athos, who fortified Courtenay in Gâtinais in the early eleventh century. Renaud, his descendant, was one of the magnates who fought in the Crusades under Louis le Jeune. With his daughter Elizabeth went the estate of C. to her husband Peter, son of the Fr. king, Louis the Fat. There were numerous lines of royal Cs., sprung from Peter of France. In England a house of C. has flourished since the reign of the first Angevin monarch, and its first known ancestor was Renaud. Sir Hugh de C. shared in the honours of Crécy and Calais, and was one of the knight founders of the order of the Garter. By his wife, a sister of the famous Talbot, earl of Shrewsbury. Another Hugh C. had issue Thomas, fifth earl of the C. line, whose wife was Margaret Beaufort, daughter of John, earl of Somerset. The earldom was extinguished by attainder after the wars

of the Roses, but on the restoration of Henry VI. John C. was restored to the earldom. Sir William C., a cousin of Henry C., who was beheaded for correspondence with Cardinal Pole, was head of a knightly line of Cs. whose seat was Powderham Castle. The title of Earl of Devon, sev. times forfeited and recovered, is still held by the Cs. *See also* succeeding article.

Courtenay (Courtney), William (c. 1342-96), Eng. prelate, fourth son of Hugh, earl of Devon, and Margaret Bohun. He studied at Oxford, becoming chancellor of Oxford Univ., 1367; bishop of Hereford, 1370; bishop of London, 1375. He vehemently opposed Wycliffe and the Lollards, and as Wycliffe's prosecutor (1377) was involved in a quarrel with the duke of Lancaster. C. became archbishop of Canterbury, 1381-98. In 1382 he summoned a council, which met in the Black Friars' monastery to pass judgment on Wycliffe's heretical teaching. Wycliffe was allowed to go free, but many of his followers were compelled to recant. C. was a staunch upholder of the Church's rights, and discouraged interference from either king or pope, though ready to submit to their decrees in all other matters. *See* vol. iv. of W. F. Hook's *Lives of the Archbishops of Canterbury*, 1860-76.

Courtenes, Franz (b. 1853), Flemish *genre* and landscape painter. His pictures of autumnal woods and desolate snow-covered stretches are particularly fine. Examples of his work are 'Golden Rain, Coros' (Brussels Gallery); 'After a Day of Snow'; 'Morning in the Campino' (1881); 'Auszug der Herde'; 'Ein frischer Morgen'; 'Die Wolfe des Meeres.'

Courtières, Gabrielle Anne de Cisternes de, see DART, COMTESSE DE.

Courtesy Titles, titles granted by general consent and custom to certain individuals, especially the near relations of peers, to which the holders have no actual legal right. Such titles are common in countries such as Great Britain which have various different orders of nobility. A peer may have as many as sixteen inferior titles (like the duke of Atholl), and while known himself by his highest title or titles, his eldest son bears one of the inferior titles by courtesy (C. T. are borne by the eldest sons of dukes, marquesses, earls, viscounts, and barons). The courtesy title need not be the next highest, and may differ in different generations. It does not affect the legal status of the holder, who, as a commoner, is still eligible for the House of Commons. Younger sons of dukes and marquesses take the title lord, while the daughters assume that of lady, still retaining it if they marry men of lower rank. The title honourable is applied to the children of earls, viscounts, and barons. In Scotland a viscount's or baron's eldest son is styled master. Similarly the judges of the court of session in Scotland are called lord, though they may not sign themselves thus.

Court for Crown Cases Reserved, see CROWN CASES RESERVED.

Court-hand, name for the O.E. style of

handwriting, a modification of the Norman (as distinguished from the modern or It.), which was used in the Eng. law-courts from the sixteenth century till abolished by George II. in the early eighteenth century.

Courthope, William John (1842-1917), Eng. literary historian, prof. of poetry at New College, Oxford, 1895-1901. Among his works are *The Three Hundredth Anniversary of Shakespeare's Birth* (1864); *The Genius of Spenser* (1868); *Ludibria Lunnæ* (1869); *The Paradise of Birds* (1870); *Addison* (in Eng. Men of Letters series) (1884); *History of English Poetry* (1895-1909). He ed. Pope's works (10 vols.), with a biography, 1871-89. C. was for a time joint editor of the *National Review*.

Court Leet, old court of record that originally had an almost plenary jurisdiction in the trial of crimes. Any lord of a manor with a right of 'sac and soc' (the right to hold a court for one's tenants and the right to the amercements or fines respectively) was entitled to hold a C. L. Their decline followed on the passing of the statute of Marlborough, 1267, but Cs. L. are still occasionally held once a year before the stewards of certain lordships or manors.

Courtney, William Leonard (1850-1928), Eng. journalist and author, b. at Poona, India; educated at Somersetshire College, Bath, and at Oxford. He became headmaster of Somersetshire College (1873), fellow of New College, Oxford (1876), and was for many years treasurer of Oxford Univ. boat club. He came to London (1890), joining the *Daily Telegraph* staff. He ed. *Murray's Magazine* (1894), and succeeded Harris as editor of the *Fortnightly Review*. Among his works are *The Metaphysics of John Stuart Mill* (1879); *Studies in Philosophy* (1882); *Constructive Ethics* (1886); *Studies New and Old* (1888); *Studies at Leisure* (1892); *The Idea of Tragedy* (1900); *The Development of Martenlinck* (1904); *The Feminine Note in Fiction* (1904); *The Literary Man's Bible* (1907); and *Rosemary's Letter Book* (1909). His drama, *Kil Marlowe*, was produced at St. James's Theatre in 1893. *Undine*, a dramatised version of De la Motte Fouquet's tale (1813), appeared in 1902.

Courtney of Penwith, Leonard Henry, first Baron (1832-1918), Eng. statesman, b. at Penzance. A pronounced Liberal in politics, C. was under-secretary of state for the Home Dept., 1880-81, for the Colonies, 1881-82. He succeeded Cavendish as financial secretary to the treasury, resigning office in 1884. He was chairman of committees and Deputy Speaker 1886-1892. He opposed his party on the Transvaal war question, and retired from the House of Commons in 1900. He was ennobled in 1906. He stood alone in the House of Lords as an opponent of the prosecution of the war against Germany. He was an early advocate of proportional representation. Among his works are *The Working Constitution of the United Kingdom and its Outgrowths* (1901). D. at Cheyne Walk, Chelsea.

Court of Appeal, *see* APPEAL.

Court of Arches, *see* ARCHES.

Court of Record, *see* RECORD.

Court of Session, supreme civil tribunal of Scotland. In its present form it was estab. in 1532 by the Act of Institution of the C. of S., as a development of previously existing tribunals which were generally independent committees of the Scottish Parliament. Originally composed of the lord chancellor and fourteen members or senators, the C. of S. now consists of thirteen judges, all laymen. It has an Outer House in which sit eight lords ordinary of co-ordinate jurisdiction, and an Inner House divided into a first and a second div., each div. consisting of four judges of co-ordinate jurisdiction. The president of the first div. is the lord president; of the second, the lord justice-clerk. The two divs. of the Inner House are mainly appeal courts, but they have an original jurisdiction in certain actions relating to div. of common lands (commonalty), sale of bankrupt estates, curatory of the insane, and sale generally. At the hearing of an appeal from a jury case, which comes before the div. upon a Bill of Exceptions or motion for a new trial, the judge who presided at the trial sits along with the div. Original actions in the Outer House are heard in the first instance before any one of the five lords ordinary selected by the pursuer (plaintiff), but certain causes are specifically appropriated to particular judges, e.g. the second junior lord ordinary has exclusive jurisdiction in appeals from sheriffs in causes respecting church buildings. Appeals against valuations of lands and heritages, registration appeals, and election petitions are heard by specially constituted Cs. of S. The C. of S. exercises no criminal jurisdiction as such, but gives a civil remedy in cases of perjury, fraudulent bankruptcy, forfeitures, and breach of arrestment, etc. The C. of S. has exclusive jurisdiction in exchequer, maritime, and tithes (tithe) causes, and has superseded the consistorial and commissary courts in actions of status such as declarators (*q.v.*) of marriage, or separation, and the C. of S. alone may try questions of heritable right, unless the ann. value of the subject-matter does not exceed £50, or the total value does not exceed £1000. The C. of S. may not review sentences and proceedings of a church court unless the latter has exceeded its jurisdiction or acted maliciously so as to violate a civil right, and where the value of the subject-matter in dispute does not exceed £25, the case may not be brought in the C. of S. There are two sessions, winter and summer, lasting from Oct. 15 to March 20, and from May 12 till July 20, respectively.

Courtois, Jacques (1621-76), Fr. painter, commonly called Le Bourguignon. He studied painting with his father, Jean C., and won his reputation as a battle painter. His scenes of the camp, the march, and the battlefield may be found in most of the prin. galleries of Europe. He entered the Society of Jesus in Florence, taking the habit in Rome

(1655), where he lived piously, and where he died.

Court, Presentation at, formal presentation to the sovereign of subjects whose status entitles them to this honour. In monarchical countries this ceremonial function is considered as the highest honour, and serves as a credential. Having once obtained this privilege people may claim to be presented by their country's representative at any foreign court and to be received everywhere. In England the names of all those desiring to be presented and of their presenters must be sent some days in advance to the lord chamberlain. The privilege is strictly guarded from abuse, and none are admitted unless accepted and approved of both by the sovereign and the lord chamberlain. Each lady who makes a presentation is required to become sponsor (in its fullest sense) for her presentee. Cases of undesirable introduction are rare, but should they occur a notice may be printed in the *Court Circular*, that 'the presentation is cancelled.' Those who are not Brit. subjects may be presented to the king of England by their own ambas. At the end of Victoria's reign ladies were most frequently presented at drawing-rooms held at Buckingham Palace in the afternoon. When the Prince and Princess of Wales presided on her behalf, such presentations were by royal command counted as a presentation to the sovereign. Gentlemen are presented usually at levees at St. James's Palace, held in the morning. The first levee was held at Buckingham Palace, 1840. King Edward replaced the drawing-rooms by courts, held at Buckingham Palace in the evening, but levees continue to be held at intervals also. There is an elaborate ceremonial at these functions, and full court dress must be worn by those invited. Presentations can be made at Holyrood Palace in Scotland to the lord high commissioner to the general assembly of the Church of Scotland.

Courtrai (Flemish *Kortrijk*) *tn.* in the prov. of W. Flanders, Belgium, 26 m. S.W. of Ghent, 16 m. from the Fr. border. The *tn.* is built on both sides of the R. Lys, over which is a fine old bridge with Flemish towers. The *tn.* is very picturesque with its old walls, its castle, and famous belfry. The Gothic church was founded by Baldwin, count of Flanders, in 1238, and the *tn.* hall dates from 1526. C. is a busy manufacturing *tn.*, and is celebrated for its table damask, fine linen, and lace. To the Romans it was known as *Cortoriacum*, but gained its industrial importance in the Middle Ages. Here, in 1302, was fought a 'battle of the Spurs' (not to be confused with Henry VIII.'s battle at Guinegate, 1513), when the citizens of Ghent, Ypres, and Bruges won a glorious victory over the Fr. Army, calling the battle after the golden spurs they plucked off the vanquished dead. C. was occupied by the Gers. in 1914, and recovered by the Allies in 1918. Again occupied by the Gers. in 1940, but liberated by the Brit. troops in 1944. Pop. 41,000.

Courts, Ecclesiastical, see ECCLESIASTICAL COURTS.

Courts-martial, courts usually convened for the purpose of trying offences against military or naval discipline, and also for administering martial law. Previous to 1640 ordinances were issued by the king for the trial of those offences, and justice was administered under the old court of chivalry of which the earl marshal was the president. The military laws adopted by the commanders during the Thirty Years war, however, were not without their effect on Eng. military law, and we may safely say that C.-M. were instituted in the reign of Charles I. They did not receive parl. sanction, however, until the Mutiny Act of 1689 was passed and from that date until 1879 C.-M. administered the discipline laid down in the articles of war. In that year the Army Discipline and Regulation Act was passed, and two years later the Army Act (1881) superseded that. C.-M. are divided into three different classes: (1) A dist. court-martial, (2) a general court-martial, (3) a field general court-martial. A dist. court-martial is convened by a general officer having authority to do so; it must be composed of at least three officers, each of whom has served at least two years, and it can give punishment to the extent of two years' imprisonment. A general court-martial is the only court which has authority to try an officer, or to pass a death sentence, or a sentence involving penal servitude. It must consist of nine officers, five of whom have at least the rank of captain in the United Kingdom, Gibraltar, or Malta. Elsewhere in the dominions it must consist of at least five officers. A field general court-martial is convened when it is held necessary by the officer in command of troops outside the United Kingdom, or by an officer on active service, and when it is impossible to convene an ordinary general court-martial. The court must consist of at least three officers, each of whom has at least one year's service. The ordinary procedure of an ordinary court-martial must be maintained as far as possible, and the prisoner is allowed to conduct his own defence and to address the court himself. The experiences of the First World War gave an impetus to the humanitarian tendency in the infliction of punishment upon military offenders, and to this tendency may be traced the modification of the power of C.-M., particularly in the abolition soon after the war of the death sentence in certain cases. These cases are leaving one's commanding officer in order to go in search of plunder; sleeping or being drunk when on sentry duty; breaking into a house in search of plunder; forcing or striking a soldier who is acting as a sentinel; and forcing a safeguard. Public opinion also strongly animadverted on certain forms of field punishment, in view of which flogging and the tying of offenders to guns or vehicles have been abolished. Following the recommendations of the committee, appointed after the war, improvements were effected in procedure and in the requirements as to

the qualifications of officers constituting a court, and regimental C.-M. were abolished, a change justified by the marked diminution of crime in the Brit. Army. Sentences of C.-M. during the First World War were not always put into execution and the services of offenders were retained in the field by the operation of the Army Suspension of Sentences Act, which, passed in 1915, is still operative. In Oct. 1946, as a sequel to the quashing of the sentences on 243 Brit. paratroopers for mutiny against their living conditions in Malaya, a number of M.P.s demanded that persons sentenced by C.-M. should have the right to appeal to high court judges either through the court of criminal appeal or some special court.

The R.A.F. has its own code of law, which is largely based on military law, and, in consequence, its court-martial procedure is analogous to that of the army.

Naval Courts-martial.—These courts are held under the authority of the Naval Discipline Act, 1866, which was amended in 1884. From the time of the Stuarts down to the time of the third George, discipline in the navy was regulated only at the discretion of the commanders, under the authority of the Admiralty. In more cases than not, this meant that the law was badly administered, and depended too largely upon the whims and fancies of the commander. Under the Naval Discipline Act, however, the court must consist of from five to nine officers of certain fixed rank. The court also must be held on board one of H.M. ships of war, and there must be at least two such ships together at the time. The sentence, save in the case of the death penalty, does not need confirmation by the commander-in-chief of the station. The court also has the power of reducing the gravity of the charge, and sentencing the prisoner on the reduced charge. The Naval Discipline Act also lays down definitely the jurisdiction of the courts which have by that Act authority to deal with any offender who is for the time being directly or indirectly connected with the navy or naval authorities.

Courts-martial Reform.—A reorganisation of the system of army and air force C.-M. is recommended in the report of the Lewis Committee (pub. as *Cmd.* 7608, 1949). The changes recommended include the provision of legal aid before and during trial, the appointment of directors of legal services in the two service ministries, the estab. of a C.-M. appeal court, and a reconstitution of general and dist. C.-M. It is suggested that the judge advocate general (*q.v.*) should be appointed on the recommendation of the lord chancellor (instead of by the Crown) and be responsible to him. His new title should be chief judge martial and he should enjoy a status and remuneration not less than that of a puisne judge of the high court. In the Lewis Committee's view general C.-M. should be composed of a judge martial or his deputy and five officers of at least the rank of

lieutenant or flying officer. Dist. C.-M. should be under a permanent president and restricted in jurisdiction to offences for which the maximum penalty is imprisonment, and to soldiers and airmen below warrant rank. It is also proposed that the field general court-martial should be called an emergency court-martial, and that it should not be held in peace time in the United Kingdom. In special cases, such as sentence of death for treachery, the sentence should not be executed immediately unless the convening officer and the next two senior officers in the force (who did not sit on the court-martial) affirm the conviction and conclude that the interests of discipline so require. The report also makes far-reaching proposals in relation to appeal against conviction. Whenever the accused has pleaded not guilty it is proposed that he should have the right of appeal on a question of law. The court of appeal, to be called the C.-M. appeal court should, it is recommended, be formed of the chief judge martial, the vice-chief judge martial, and the judges martial, with the assistance of king's counsel from a panel approved by the lord chancellor. It is not proposed that the court should hear appeals against sentence. Certain of the above new features proposed by the Lewis Committee already form part of the naval C.-M. system. In regard to others the Admiralty is taking administrative action on similar lines to the War Office and Air Ministry. In particular the judge advocate of the fleet will in future be appointed by, and will be responsible to, the lord chancellor instead of the first sea lord. It has been decided to set up a committee under Mr. Justice Pilcher, of similar composition to the Lewis Committee and of equal authority, to examine the naval C.-M. system. A decision as to legislation on such major recommendations of the Lewis Committee as have not yet been adopted will be withheld until the Hicher report is available.

Couserans, or Conserans, Le, anct. dist. of the Pyrénées in France, situated near the frontier. It forms a part of the dept. of Ariège at the present time, but was at one time a dependency of the former prov. of Gascony, its cap. being St. Lizier.

Cousin, Jean (1501-89), Fr. painter and sculptor, b. at Soucy, near Sens. Very little is known of his life. He began as a painter on glass. The windows in the Sainte Chapelle, Vincennes, are considered his best work. The windows of St. Gervais, Paris, representing the death of St. Lawrence, and others in the church of Sens, are among his finest work. His most celebrated picture in oils is the 'Last Judgment,' now in the Louvre. Oil paintings had previously been confined to portraits among his countrymen, and therefore C. is regarded as the founder of the Fr. school, certainly in the historical dept. C. was also a goldsmith, miniaturist, and wood engraver. In sculpture his prin. work is the monument of Adm. Chabot, in the church of the Celestines.

He also wrote books on geometry and perspective. His chief publs. are *Livre de Perspective* (1560) and *Livre de Portraiture* (1571). *Consult* A. Firmin-Didot, *Etude sur Jean Cousin*, 1872.

Cousin, Victor (1792-1867), Fr. philosopher and historian, b. at Paris and educated at l'Ecole Normale, Paris. By 1811 he was Royer-Collard's assistant lecturer in philosophy at the Sorbonne. C. was at first a follower of the Scottish psychological ('common-sense') school of Reid and Dugald Stewart; after his visit to Germany, 1817-19, he showed the influence of Kant, Hegel, Fichte, and others. In 1820, after the assassination of the due de Berry, C. was for a time dismissed from his office because of his Liberalism. During his second visit to Germany, 1824-25, he was arrested at Dresden, suspected of revolutionary tendencies, and detained for some months at Berlin. He returned to France and regained his position, in 1828, under Martignac's ministry. By this time he had pub. his eds. of Proclus and Descartes (1820-26), and the first vols. of his trans. of Plato. C. became director of l'Ecole Normale in 1830. He was minister of public instruction in the Cabinet of Thiers in 1840, and a member of l'Académie des Sciences Morales et Politiques. After the revolution of 1848 C. aided the gov. of Cavaignac, publishing an anti-socialistic pamphlet, *Justice et Charité*. He retired from public life after the coup d'état of 1851. He was founder of the 'eclectic' system, so named by himself; this system or school derived its doctrines partly from Scottish philosophy and partly from Ger. Among his chief works are *Fragments philosophiques* (1826-28); *Cours d'histoire de la philosophie* (1827-40); *De la métaphysique d'Aristote* (1835); *Œuvres inédites d'Avicenne* (1836); *Cours de philosophie professée en 1815* (1836); *Cours d'histoire de la philosophie moderne* (1841); *Cours d'histoire de la philosophie morale au XI^e siècle* (1846); *Leçons sur la philosophie de Kant* (1851); *Études sur les femmes et la société au XVI^e siècle* (1853-56) (Mme de Longueville, Mme de Sablé, Mmes de Chevreuse et de Hautefort); *Des pensées de Pascal* (1842); *Jacqueline Pascal* (1844); and *Du vrai, du beau, et du bien* (1858) (his best-known work). See C. E. Fuchs, *Die philosophische Cousins*, 1847; P. Janet, *V. Cousin et son œuvre*, 1885; and J. Barthélemy Saint-Hilaire, *V. Cousin, sa vie et sa correspondance*, 1895.

Cousin (Lat. *consobrinus*), kinsman (like the Lat. *consanguineus*, a blood relation), especially applied to the child of one's uncle or aunt. If A and B are C's, A's child is a first C, once removed to B. The children of brothers or sisters are C's-german (full or first C's). Children of C's-german are second C's to each other. In some parts of Cornwall and Somerset cousin merely means friend or comrade (cf. Scottish friend, meaning kinsman). European sovereigns used to call each other C. or coz (see Shakespeare's *Henry V.*). This name is still used by sovereigns for their nobles.

Cousin-Montauban, Charles Guillaume Marie Apollinaire Antoine, Comte de Palikao (1796-1878). Fr. general. He commanded the Anglo-Fr. forces in the expedition against China, winning the victory of Palikao in 1860. For this the Emperor Napoleon granted him his title after the fall of Peking. He was Premier and war minister from Aug. to Sept. 1870, at the beginning of the Ger. war. After the disastrous battle of Sedan he fled from the country, refusing the dictatorship offered him. C.-M. wrote *Un ministère de vingt-quatre jours* (1871) describing his experiences.

Cousins, Samuel (1801-87). Eng. mezzotint engraver, apprenticed to S. W. Reynolds. He produced his 'Lady Acland and Children' and 'Master Lambton' after Lawrence in 1826. These engravings won him a reputation, and were followed by numerous plates after Lawrence, Landseer, Reynolds, Millais, and others. 'Marie Antoinette in the Temple' is another famous work. C. became A.R.A. in 1835, and first academical engraver in 1855, retiring in 1880. He left £15,000 to found academy annuities for poor artists. See *Pycroft's Memoir*, 1887.

Coustou, name of three Fr. sculptors: Nicolas Coustou (1658-1733), Fr. sculptor, b. at Lyons. His chief works are a statue in marble of Louis XV. (in the Louvre), 'Daphne pursued by Apollo' (in the garden of the Tuilleries), and the 'Descent from the Cross,' commonly known as 'Le Vœu de Louis XIII.' (in the choir of Notre Dame).

Guillaume Coustou (1678-1716), brother of Nicolas, and with him a pupil of his uncle, Antoine Coysevox (q.v.). He entered the academy of Paris in 1701 with 'Hercule sur le Bûcher.' He executed the bas-reliefs of the chief entrance to the Hôtel des Invalides, and the statues of the façade of the Château d'Eau, opposite the Palais Royal. Other works of his are a statue of St. Augustine, 'Faith and Religion,' and 'Jesus Christ in the Temple.'

Guillaume Coustou (1716-77), son of the above, b. in Paris. He won the Prix de Rome at the age of nineteen. He designed the sculptures formerly in front of the church of St. Geneviève, and executed in bronze 'The Visitation.'

Coutances, cap. of an arron. in the dept. of La Manche, France. 5 m. from the Eng. Channel. It stands on the slope of a hill, on the summit of which rises a medieval cathedral (thirteenth century), which is one of the finest examples in Normandy of the early Pointed style. The church of St. Peter's, built in the Gothic style, is also of great interest. The tn. stands on the site of anct. Constantia of the Romans. It has manufs. of silks, muslins, lace, etc. Amer. motorised infantry and two tank divs., in the battle of Normandy, 1944, drove through the Ger. defences and cut their road between St. Lô and C. (July 25). This was a decisive blow, for the Amer. general, Omar Bradley, then sent a succession of columns toward Avranches, C., and

Granville, which split up the retreating Ger. forces, while trapping a considerable body of the enemy below C. See also COTENTIN. Pop. 6400.

Couthon, Georges (1755-94), Fr. politician and revolutionary leader, who became president of the Clermont tribunal in 1789. He disapproved of the Sept. massacres, but voted for the death of Louis XVI. Gradually he became more and more Radical, and sided against the Girondists. His entrance into Lyons was, however, marked by comparative

GEORGES COUTHON

moderation. He helped Robespierre to destroy the partisans of Hébert and Danton, but shared his leader's fate in 1794. See F. Meggs, *Correspondance de Couthon*, 1872; F. V. A. Aulard, *Les Orateurs de la Législative et de la Convention*, 1885-86; and H. Morse Stephens, *History of the French Revolution*, 1886-91.

Coutras, tn. in the dept. of Gironde, France, on the Dronne, 26 m. N.E. of Bordeaux. It is the site of the famous victory of Henry of Navarre over the Catholic League, headed by Henry III., 1587. The trade is chiefly in wine and flour. Pop. 5200.

Coutts, Baroness Angela Georgina Burdett, see BURDETT-COUTTS.

Coutts, Thomas (1735-1822), famous London banker, of Scottish birth, founder of the bank house, Coutts & Co., of which he became sole manager on the death of his brother James in 1778. He became banker to George III., and left a fortune of £900,000. C. married twice, his second wife being the actress Harriet Mellon. His grandchild was Lady Angela Burdett-C. (d. 1906). See R. Richardson, *Coutts & Co.*, 1900, and R. Chambers, *Biographical Dictionary of Eminent Scotsmen*, 1875.

Couvade (Fr. *couver*, to hatch), term

applied by anthropologists for the curious custom prevalent among sev. races in different parts of the world, requiring that the father at, and sometimes before, the birth of a child shall retire to bed and fast from all animal food. The mother continues her work in the fields until a few hours before the birth, and returns to it as soon after as she can stand, while the father affects to suffer all the physical pains and is waited on hand and foot by the women. The custom existed in ant. times among the Corsicans (recorded by Diodorus) and among the Sp. Basques (recorded by Strabo); the statement that the custom still exists among the latter has been proved to be incorrect. It is still found in Guiana, in Tibet, and in some parts of China and India. No certain explanation can be found. Prof. Tylor adopts the view that it is the transition between the older matriarchal system, by which children reckoned their descent from the mother alone, and the later patriarchal system of tribe organisation. See E. B. Tylor, *Early History of Mankind*, 1865; A. Giraud-Teulon, *Les Origines de la Famille*, 1884; and Lord Avebury, *Origin of civilisation*, 1900.

Cove, see Q. KENSTOWN.

Covenant (through O.F. from Lat. *convenire*), mutual agreement made by two persons or groups of persons, or by a person or persons with their god or gods. The term (Heb. *berith*) is much used in the O.T. for various kinds of agreements. They were looked upon as sacred and binding, the children of Israel being particularly forbidden to make any C. with the Canaanites. More important, however, than these contracts are the C's. made between Yahweh (Jehovah) and his chosen people. All these C's. are considered to be summed up in the C. made with Moses on Sinai, spoken of in Isa. lv. 3 as 'the everlasting covenant.' It was, however, perpetually renewed throughout the O.T. period, particularly with chosen individuals such as Adam, Noah, and Abraham, before Moses, and by the mouth of the prophets in later times. This C. is expressly conditional. God is the active agent promising favour and prosperity to the Israelites, but the Israelites have their part to perform. They must be submissive and obedient if the C. is to be valid. Their failure to adhere to their side of the contract finally made the old C. to be annulled and a new one, the N.T. C. in Jesus Christ, to be made. This rests on a basis of faith, and is fully dealt with by St. Paul and the writer of the epistle to the Hebrews as the fulfilment of the original C. made with Abraham. See 2, Schultz, *Old Testament Theology*, vol. ii., 1892.

Covenant, in law, is a written agreement under seal (i.e. in a deed) between two or more persons whereby some act is agreed to be done or not to be done; or upon the happening of some event, some liability is agreed to be borne by some party thereto. C's. may be express, e.g. not to use a house for any other purpose than as a dwelling-house; or implied, e.g. in a conveyance on sale the words 'as

beneficial owner' imply C's. that the vendor of the land has a right to convey, that the land is free from encumbrances, that the purchaser shall be left in quiet enjoyment of the land, and that the vendor will make any further deed for the conveyance of the land that may prove necessary. C's. are said to 'run with the land' when they bind any one to whom the land in respect of which they have been entered into is assigned. A breach of C. gives rise to an action of damages, and in some cases the covenantor may sue for an injunction to restrain a threatened or intended breach.

Covenant of the League of Nations, short statement of essentials to the formation of the League of Nations, incorporated in the treaty of Versailles, 1919. It contained twenty-six clauses, and might be regarded as the constitution of the League. Its primary purpose was the prevention of war, and of necessity it envisaged the League as an organic body capable of seeing to its own development and did not therefore do more than provide in general language such tentative machinery for securing international peace as at the date of the treaty was likely to command mutual agreement among the signatories of the treaty. There was no outlawry of war as such in the C., and the obligations laid on the signatories in the matter of the prevention of war were definitely limited in scope. These obligations were imposed by Articles 12, 13, 15, and 16. Under Article 12 the members of the League agreed to submit disputes either to arbitration or to inquiry by the League council, and, in any case, not to resort to war until three months after the award by the arbitrators or the report by the council. This article contained no absolute prohibition of war; it merely made provision for an interim period during which other means than resort to war might be employed towards finding a settlement. In the event of one disputant being dissatisfied with the award of the arbitrators and declaring war on the other disputant, who might have faithfully observed the award, a purely negative obligation was imposed by Article 13 on all members of the League other than the recalcitrant disputant, viz. that they would not resort to war against the complying disputant. In the case of a dispute submitted in the first instance, not to arbitration, but to inquiry by the council, it was provided by Article 15 that the members would not go to war with any other party to the dispute which complied with the recommendations of the council's report. But if the report was not unanimous, no obligation whatever was imposed on League members, who 'reserved to themselves the right to take such action as they shall consider necessary' the maintenance of right and justice. Again, if a disputant failed to wait the stipulated time until the machinery set up by the League for seeking a solution other than war had been put into operation, then, under Article 16, the recalcitrant member was deemed to have committed an act of war against all other

League members, and two sanctions, the one economic, the other military, naval, or aerial, might come into operation. In many cases the mere threat of an economic blockade would be effective, as was shown by the sudden cessation of the invasion of Albania by Yugoslavia in 1921. But, indeed, the threat was inadequate on the face of it because the C. provided no clue to the questions as to who was to say when the military sanction should operate, or who was to decide its nature and direct its application against the common enemy. The C. imposed no compulsory contribution of military, naval, or air forces, and the duty of the council was solely one of recommendation, for there was no definitely organised force at the disposal of the League council. These defects of Article 16 of the C. were discussed at the 1921 assembly of the League, with the result that its text was altered by resolution so as to speed up the operation of sanctions in a crisis. This resolution imposed on the council the duty 'to give an opinion whether or no a breach of the covenant had taken place', but the assembly made it clear that the council could do no more than *invite* members to apply the economic blockade, and then later on *recommend* certain particular contributions towards the forces it might be proposed to employ against the recalcitrant state. It is to be noted, however, that this amendment was never ratified by the requisite number of members, and could not therefore be included in the official text of the C.

It did not follow from the restricted character of these obligations that the prin. articles of the C. were always valueless. On the contrary, they were sometimes instrumental in averting war, as, for example, in the case of the Greco-Bulgarian frontier dispute of 1923. But, generally speaking, the C. proved a *fulmen brutum* and, in one instance, the ill-advised action of the Brit. Gov., in applying economic sanctions to Italy when Mussolini invaded Abyssinia, not only proved entirely ineffective, but gravely imperilled the traditional friendship that had so long subsisted between the Brit. and It. nations. No really grave dispute between two great nations was ever averted by the C., and when such disputes threatened to assume a serious aspect, one or other of the disputants adopted the course of resigning its League membership and reserved its entire freedom of action. Even small nations were undeterred by the League. Thus, in the prolonged dispute between Paraguay and Bolivia over the Gran Chaco, the C. machinery failed of its purpose. Again, the League failed to check Italy in the Corfu incident of 1923, and during the ensuing years it became evident that when a totalitarian state regarded its vital interests as being affected in a dispute it declined to tolerate League interference. In 1932 the C. machinery was strained to breaking-point when Japan invaded Manchuria and, again, in 1935-36, in the Italo-Ethiopian war. It was attempted

to explain away the former of these failures by assuming that there existed no reliable central government in China, and that Japan had really confronted the League with a *chose jugée*. The ensuing Lytton report plausibly stressed the interests of Japan and, to some extent, this emphasis reflected that by no means negligible section of world opinion which applauded Japan's adventure as calculated to restore order and good government in China. The report, however, did not even placate Japan and, in face of her condemnation as an aggressor by the League, she resigned her membership in order to pursue, thenceforward, her own course in China. When the clouds began to darken the Italo-Ethiopian political horizon, strenuous efforts were made to avert the threatened It. invasion of Abyssinia by action under Article 15, while the League council also strove to appease Italy by formulating a comprehensive programme of reforms in Abyssinia under a guarantee of collective assistance from Great Britain and France; and when this programme was rejected the League applied economic sanctions, only to abandon them soon afterwards as ineffective. It is perhaps needless to observe that no attempt was made to invoke the machinery of the C. in the case of the invasion of Austria, Czechoslovakia, and Poland by Hitler, and thereafter the European political situation developed as if there were no League in existence.

It may be noted that Article 8 of the C. reflected the recognition by members of the necessity for reducing national armaments 'to the lowest point consistent with national safety,' and entrusted the council with the duty of making plans for the reduction of armaments and the supervision of munitions factories. That, however, was as far as the framers of the C. went in the sphere of disarmament (*q.v.*). Brief reference may also be made to Article 10, which stated that the members undertook to 'respect and preserve, as against external aggression, the territorial integrity and existing political independence of all members'; and that 'in case of any aggression or threat of aggression,' the council 'shall advise upon the means by which the obligation shall be fulfilled.' This article, however, was so ambiguous, when read in conjunction with the rest of the C., that it was almost meaningless; and indeed it was against this particular article that much of the opposition to the C. in the U.S.A. was directed. The two cardinal objections by the U.S.A. were that the article might involve the U.S.A. continually in purely European disputes over frontier adjustments, and that its natural interpretation was to perpetuate for all time the territorial *status quo*. Finally mention may be made of Article 14, which contained provision for instituting a Permanent Court of International Justice, but the court was not estab. until 1921 (*see* INTERNATIONAL COURT OF JUSTICE, COURT OF; OPTIONAL CLAUSES).

In 1938 at the nineteenth session of the

League assembly the Brit. representative summarised his gov.'s attitude to the revision of the C. thus: (i) there should be no unconditional obligation on states to apply Article 16, as each case must be considered on its merits; but (ii.) there should be a general obligation between states to consult as to whether and, if so, to what extent they would act in common under that article; (iii.) each member should be free to judge of its own participation in action under Article 16; and (iv.) the foregoing three principles should in no way diverge from the principle that

the council which had to call for action (sanctions) if forcible restraint was to be used. According to the Dumbarton Oaks plan, the council (called, for this reason, the security council) would alone shoulder the burden of keeping the peace; and for this purpose it would be aided by a military staff committee consisting of the chiefs of staff of the great powers (or their representatives). Moreover, in order that an aggressor state might be immediately restrained, all member-states of the United Nations Organisation would have entered into agreements with

WERE IMPRISONED

resort to war was a matter of concern to the whole League. Further consideration of the question of League reform was, however, indefinitely postponed by the growing tension in Europe leading to war in the succeeding year.

The C. has been described by Dr. Gilbert Murray as a 'call to repentance.' It rang with a moral tone; it called for the renunciation of war, for justice, and for 'a scrupulous respect for all treaty obligations'; it declared that any war or threat of war, wheresoever it might occur, was 'a matter of concern to the whole League.' Perhaps it was because these aspirations came to nothing that the Dumbarton Oaks conference (Aug.-Oct. 1944) produced a plan that invoked no principles, but contained practical arrangements for restraining an aggressor. Under the League C. a dispute likely to lead to war could be brought before either the assembly or the council, although it was

the security council to determine their quota of military assistance for collective operations. This quota would include air force contingents which would be held, in each state, immediately available. There would therefore be an international force which could, in whole or part, be mobilised at the security council's command, if the interruption of diplomatic and trade relations, for which the council would first call, proved ineffective. These powers, vested in the security council, were much more precise and formidable than the powers of request for sanctions allowed to the council of the League. See further under UNITED NATIONS, CHARTER; S.A. FRANCISCO CONFERENCE.

Covenanters, name given to all subscribers to the various undertakings entered into by members of the Reformed Church in Scotland, from 1557 onward, for the defence of their faith; is especially associated with the signatories of the

Solemn League and Covenant (see also COVENANTS, THE), 1638-43. The Scottish Presbyterians co-operated with the Eng. Puritans in putting down episcopacy, and were in their turn crushed by Cromwell and the Independents. Charles II., needing Scottish support, signed the covenant in 1650, and again in 1651, but after the Restoration denounced it as unlawful (1662). The nobles mostly yielded, but thousands of the Scottish people stood firmly by their principles and attempted resistance. The battle of Rullion Green (1666) dispersed the insurgent army, and fearful persecutions followed, lasting for years. In 1679 the C. rose again, and won a small victory at Drumclog, but were completely crushed three weeks later at Bothwell Bridge. The cruelties of Dalzell, Claverhouse, and Lauderdale are notorious in Scottish hist., and the martyrology of the cause is told in many a legend. 224 C. were removed from imprisonment in the Tolbooth and Canongate of Edinburgh, and 167 (of whom forty-five were women) lodged in unspeakable conditions in the 'Whigs' Vault of Dunottar Castle, near Stonehaven. After their ultimate release some took the Oath of Allegiance, but others, refusing, were sent to the plantations in America. The struggle was at last ended by the revolution of 1688. Scott's *Old Mortality* gives a vivid account of the insurrection of 1679. See J. Alkman, *Covenanters in Scotland*, 1848; F. Hewison King, *The Covenanters*, 1913; A. Smellie, *Men of the Covenant*, 1911; and R. C. Bosanquet, *Cavaliers and Covenanters*, 1932.

Covenants, The, in Scottish hist., were certain public religious bonds entered into by the whole Scottish nation. They were two in number, the National Covenant and the Solemn League and Covenant, but they were preceded by sev. earlier religious bonds entered into by leading reformers and statesmen at the beginning of the Reformation period. The National Covenant is also known as the Short Confession of Faith to distinguish it from the more elaborate exposition set forth by Parliament in 1560. It was drawn up at the command of James VI. by John Craig, one of his chaplains, its aim being to maintain the Protestant faith with the Presbyterian organisation, and to resist the attempts being made by the papal see to regain its hold upon Scotland. It gives a short account of the faith which is to be supported, and then contains an oath of allegiance to the king in support of the same. The National Covenant was subscribed by all ranks of society in 1581, on the order of the king, Privy Council, and general assembly. It was renewed in 1590, after the defeat of the Armada, and again in 1598. It was once more brought into use in 1638, to unite the people in resistance to the attempt of Charles I. to impose episcopal organisation and a prayer-book on the Eng. model upon the Scottish people. In Greyfriars churchyard at Edinburgh, the covenant was signed by multitudes, and copies were then sent throughout the country. Many

are still extant, a notable copy, bearing the names of many distinguished men, being in the library of the Faculty of Advocates at Edinburgh. The Solemn League and Covenant was a treaty between the Eng. and Scottish nations by which the Eng. Parliament received help from the Scots against Charles I. on conditions given therein. The covenant was signed in England by the Parliament, the Assembly of Divines, and all classes, and it was also universally signed in Scotland. The Protestants of Ireland also subscribed to it. Its aim was to preserve and propagate the reformed faith by securing uniformity of doctrine, worship, discipline, and government throughout the three countries, and this uniformity was generally understood to signify uniformity on the Presbyterian model. The National Covenant was renewed by Parliament in 1640, the Solemn League and Covenant in 1648, and both were subscribed by Charles II. at Speymouth in 1650 and at Scone in the following year. After the Restoration both C. were declared unlawful (1662) and later treasonable (1685). See W. L. Mathieson, *Politics and Religion in Scotland, 1550-1695*, 1902.

Covent Garden, square in London between Long Acre and the Strand. The name is corrupted from Convent Garden, the dist. being the original site of the garden of the abbot of Westminster. The square was laid out in 1632 by Inigo Jones, who designed the portico of St. Paul's, C. G., as the feature on the W. side of the proposed square, regardless of the fact that the altar would have to be at the E. end of the church, with the result that the portico can never be used. C. G. soon became a fashionable quarter. It is the scene of one of Dryden's plays, and is frequently alluded to in other plays of the period. It is now famous for its vegetable, fruit, and flower market, which makes it one of the sights of London. It is seen at its best very early on a summer morning.

Covent Garden Theatre and Royal Opera House. This famous London theatre (almost opposite Old Bow Street police court), now the home of grand opera, was first built in 1732 by the harlequin Rich. At its opening Quin was the leading actor. The present building is practically the fourth on the same site, as the alterations in 1792 amounted to a new theatre. It was burnt down in 1808 and rebuilt by Smirke. The increased prices of admission to cover the costs led to the 'old price riots' of 1809. In 1847 it was called the Royal Italian Opera House. Another fire in 1856 resulted in the present building by Barry, opened in 1858, seating about 2000. The interior is almost semicircular, the stage 90 ft. deep by 50 ft. high. A noticeable feature outside is the Corinthian portico of six columns, with the statues and reliefs by Flaxman and Rossi (saved from the former buildings) ranged on either side. The basement forms a covered carriage entrance to the theatre. Garrick played at C. G. in 1746, joining Rich for the season, 1747. C. G. and Drury Lane (first opened 1663) Theatres

have always been rivals. In 1750-51 *Roméo and Juliet* was produced in rivalry at both houses alike. Peg Woffington performed at C. G. from 1740 to 1757. By 1803 John Kemble was part-proprietor and stage-manager. At this time Mrs. Siddons was the leading actress. She retired in 1812, after playing *Lady Macbeth*. In 1817 John Kemble retired in favour of his brother Charles. The theatre then drifted for a time into great difficulties, and in 1829 was in possession of the bailiffs. Laporte of Her Majesty's and Bunn of Drury Lane were managers, 1832-35. Osbaldestone followed, presenting the tragic actress, Miss H. Fancit, in 1836. Macready, Mathews, and Mme Vestris leased the theatre later. From 1842 to 1859 Jullien's promenade concerts were often held here. The house was opened for opera, 1848, with F. Gye as manager. This venture proved successful, and Gye introduced Gounod and Wagner to London, amongst other composers. Grisi, Mario, and Viardot were all noted singers of this period. From 1888 to 1896 A. Harris took over the management. He devoted his efforts to raising the standard of the whole cast, and not relying solely on the prima donna. After his death a company took over the management. C. G. was leased to the Anti-Corn Law League for its meetings and bazaar, 1843-45.

In 1896 Mr. Neil Forsyth became secretary of the Royal Opera Syndicate, and for many years acted as general manager and held auditions. The secretaryship of the C. G. Syndicate Ltd., in 1930, was vested in S. C. Edgar. Some of the famous singers heard in C. G. were Patti, Alboni, Albani, Tetrazzini, and Summarco. In more recent times the Russian singer Chaliapin charmed opera-lovers, and a few of the newer stars of the musical world to appear at C. G. were Florence Austral, Lotte Lehmann, Rosa Ponselle, a *coloratura* singer of Amer.-It. origin; Rudolf Bockelmann, a Ger. bass-baritone; and Eva Turner and Walter Widdop, two gifted Eng. operatic singers. Bruno Walter was the conductor of the Strauss and Wagner operas at C. G. in more recent years. Sir Thomas Beecham mooted a scheme for an Imperial League of Opera, but the inadequate public response, and the absence of guaranteed support over any considerable period, proved so serious a handicap to the development of grand opera in Great Britain, that until an arrangement was made at the end of 1930 between the C. G. Opera Syndicate and the B.B.C., it seemed improbable that the C. G. seasons would have continued, otherwise than in a limited sense, beyond 1932. The arrangement with the B.B.C., however, provided for production over a number of years, the undertaking being administered by a new company known as the C. G. Opera Syndicate (1930) Ltd.

The grand opera season is from about April to July each year. See D. Shave-Taylor, *Covent Garden*, 1948.

Coventry, Countess of, see GUNNING, MARIA.

Coventry, Sir John (d. 1682), grandson of Lord-Keeper Thomas C. He was M.P. for Evesham in the Long Parliament (1640), and was made a Knight of the Bath at the coronation of Charles II. In 1667 he was elected M.P. for Weymouth, and during a debate on playhouses in 1670 asked whether the king's pleasure lay among the men or the women who acted, popularly supposed to be an allusion to Nell Gwynne. His mutilation by Sir T. Sandys and a band of ruffians in consequence of this remark led to the passing of the Coventry Act which made such mutilation a capital offence. See Pepys's *Diary*.

Coventry, parli. and co. bor. in Warwickshire, England, on the R. Sherbourne, 9½ m. from Warwick, 18 m. S.E. from Birmingham, 10 m. N. from Leamington, and 26 m. N.E. from Stratford-on-Avon. It possesses a station on the main line from Birmingham to London (94 m.), with a branch to Nuneaton and another to Leamington. It has also the advantage of a canal, and thus waterway has connection with the Oxford and Trent and Mersey canals. In 1936 an airport was estab. by the city council. The city returns two members to Parliament.

C., anciently Coventre, and in Domesday Coventrey, is conjectured by Dugdale from the termination 'tre,' a place or dwelling, to have been a Brit. settlement. In 1451 it was constituted by Henry VI. a co. of itself, and this privilege continued until 1843, when it was abolished by an Order in Council, but under the provisions of the Local Government Act, 1888, the distinction was revived, and the place declared a co. bor. A convent appears to have been founded here at an early period of which, in 1016, St. Osburg was abbess, when Edric, invading Mercia, destroyed it. At a later period, in the time of the Confessor, Leofric, earl of Mercia and his countess, Godiva, erected and munificently endowed a monastery on the same site for an abbot and twenty-four monks of the Benedictine order. The famous legend of Godiva and her ride through the city appears to have been first recorded 250 years after the death of Leofric, which occurred in 1057. The city has long maintained a reputation as a manufacturing centre. In 1463 the making of caps and bonnets was extensively carried on, and the place was then famous for a particular kind of blue dye, whence came the saying, 'true as Coventry blue.' The manu. of ribbons was introduced about the beginning of the sixteenth century, and in 1770 that of watches, the first of which is still actively prosecuted. The staple trades now are the bicycle, motor cycle, rayon, motor car, aero engines, machine tools, aircraft, gauges and instruments, tractors, and general allied engineering.

The cathedral church of St. Michael, which possessed perhaps the deepest place in the affections of the people, was entirely destroyed, with the exception of the beautiful spire, by the enemy raid of Nov. 16, 1940. It was an edifice of surpassing beauty and dignity. The spire,

a magnificent specimen of perpendicular architecture, resting on an octagonal tower, rises to a height of 300 ft., and forms a conspicuous feature of the city. St. Mary's Hall was erected early in the fifteenth century. Within this noble apartment, in olden times, assembled many kings and queens and nobles to acquire honorary membership of the prin. guilds, and to enjoy the lavish hospitality of the wealthy merchant princes. The glass in the N. window was for the most part executed by John Thornton, a native of C., to whom is also attributed the famous E. window of York

Fox Photos

COVENTRY CATHEDRAL

The morning of its destruction, 1940

Minster. The glass was removed from the window at the outbreak of the Second World War, and is safe, but the roof was damaged, but now repaired. Ford's Hospital, a charming Tudor almshouse founded in 1509, was one of the many pathetic victims of Ger. bombing outrages. Fires caused by incendiary bombs completely destroyed this lovely old building, rightly considered one of England's finest specimens of Elizabethan architecture. Bond's Hospital provides further testimony to the generosity of C.'s wealthy merchant citizens of a bygone age. This almshouse was founded in 1506, and while the place was damaged in the raids it is hoped to restore it practically as it was in pre-war days. The origin of Holy Trinity Church is lost in obscurity, but sufficient records exist to show its great antiquity and the interesting fact that it was attached to the great, monastic estab., Dugdale mentioning its appropriation to the priory in 1269. The sacred and

historic building of Christ Church was included in the widespread wanton destruction of the raid of April 10, 1941, and was completely burnt out, only the walls and spire remaining standing. This church was notable as being one of the striking architectural group forming the celebrated Three Spires, and has a hist. dating back to Edward III. In the very heart of medieval C., breathing the spirit of the past, was the anct. Palace Yard, a quaint quadrangle of half-timbered buildings of the Elizabethan age, once the home of the Hopkins family, to whose memory a marble monument appeared in the cathedral. Originally there were twelve city gateways, but the only two remaining relics of the medieval city defences now to be seen are the Swanswell or Priory Gate in Hales Street, and Cook Street Gate in Cook Street. Both these have been restored, and are now in an excellent state of preservation. Fragments of the old city walls still remain near Cook Street Gate, and here a beautiful little garden, known as Lady Herbert's Garden, has been laid out by Sir Alfred Herbert, K.B.E. Almshouses are also on the site, the gift of the same donor, but unfortunately half of them were destroyed in the blitz. The C. and Warwickshire Hospital, founded in 1838, was first estab. in a small house in Little Park Street. In 1867 a new hospital was erected in Stonev Stanton Road, and enlarged from time to time over a period of years. In the course of concentrated attacks on the city the hospital was almost totally destroyed, the only part remaining being the out-patients' dept. and the nurses' home.

Most of the damage to C. was done in the city centre, and a plan for the new city centre has been prepared. The layout has been designed to produce wide thoroughfares and good vistas. The various units which contribute to the life of C. have been grouped together, and the new plan shows a shopping centre in which is envisaged two main blocks flanking a shopping avenue from which only pedestrians would have access to the recessed arcades. Service roads, approach roads, and parking areas are planned at the backs of the shopping blocks and off the main thoroughfares. Cinemas and theatres are co-ordinated to take their place in the design, and the cultural side of the city's life is not neglected. Sir Gilbert Scott, the well-known architect, has been engaged to plan the rebuilding of the cathedral. Plans have been worked out, but it will naturally be some time yet before a commencement can be made. Most of the munition factories of the city escaped during the bombing, as they were built on the periphery of the city. The only big factory destroyed in the city centre, engaged on munitions, was the Triumph Engineering Company, in Cope Street and Priory Street. Pop. 167,000.

Coventry, tn. in Kent on Rhode Is., U.S.A., 12 m. S.W. of Providence, has cotton and woollen manufs. Pop. 6500.

Cover: 1. In finance a term used in common with a method of speculating in shares by which it is possible to limit one's

loss to a specified amount, viz. the amount deposited to cover the sum the speculator is willing to risk in the deal. The amount deposited is called the C. If by settling day the difference in the price of the shares is such that the C. is exhausted, or has, as it is termed, run off, a further sum must be deposited with the broker, if the speculator desires to carry over. If not the account is closed. Where a transaction of this nature is entered into with a broker it is no doubt allowable by the rules of the Stock Exchange, and would not, without other evidence, be regarded in a court of law as a mere speculation in differences (*q.v.*). If the contract were made directly with a jobber it would be contrary to the Gaming Acts. Such transactions are common with outside brokers, who are really jobbers, and whose businesses go by the colloquial name of bucket shops. 2. Term used as a synonym for the security given for a loan, *e.g.* debentures, stock bonds, or title deeds, deposited with a banker as security for an overdraft.

Coverdale, Miles (1488-1568), bishop of Exeter, translator of the Bible. He was a native of Yorkshire and was educated in the house of the Augustine friars in Cambridge. He was ordained at Norwich in 1514, and the same year became an Augustine monk. But by 1526 he had entirely changed his religious opinions; he left his convent and preached against confession, and likened the worship of images in churches to idolatry. In 1532 he travelled on the Continent, and possibly assisted Tyndale in his trans. of the Bible. In 1535 his own trans. 'out of Douche and Latyn' appeared, with a dedication to Henry VIII.—the first complete Bible printed in Eng. The Psalms of C.'s Bible are those used in the Book of Common Prayer. In 1538 C. superintended the printing of a trans. in Paris. Many of the copies were seized by the Inquisition, but a few reached England, which enabled the noted printers, Grafton and Whitchurch, to bring out the Great Bible in 1539. C. became bishop of Exeter in 1551. During Mary's reign he sought refuge on the Continent, where he took part in the production of the Geneva trans. (1557 and 1560). C. returned from exile in 1559, but, owing to the principles he had imbibed from continental reformers, he was not restored to the see of Exeter. In 1561 he accepted the rectory of St. Magnus, London, but resigned two years later. C. wrote many tracts in order to promote the doctrines of the Reformation, and trans. works of his friends on the Continent. A complete ed. of his works and letters was issued by the Parker Society in 1841-46. See *The Memorials of Miles Coverdale*, 1838; and F. Fry, *The Bible by Coverdale*, 1867.

Covered Way, term used to describe a passage constructed in fortification outside the ditch of a fortress. It is usually about 11 yds. wide, and being between the counterscarp and the glacis, and protected by the latter as well as by traverses, is used as a safe position for sentries and for the movements of

small bodies of men towards assembling places.

Coverley, Sir Roger de, see ROGER.

Coverture, in law, is a term used to indicate the state of a married woman, who is considered as under cover or the power of her husband, and therefore called a *feme covert*. The condition of C. followed from the legal maxim that by marriage husband and wife became one person, and that the legal existence of the woman was incorporated into that of her husband. Since the passing of the Married Women's Property Act in 1882 the maxim above alluded to was bereft of practically all its force, and a married woman can now make contracts and deal with her property as she chooses, subject, in the case of settled property, to a restraint on anticipation clause. For recent legislation see HUSBAND AND WIFE.

Covilhão, tn. of Beira, Portugal, on slopes of Serra da Estrela, 47 m. N.E. of Coimbra. It has manufs. of woollen goods, and near it are valuable hot springs. Pop. 14,000.

Covington: 1. City of Kentucky, U.S.A., on the Ohio R., opposite Cincinnati, with a suspension bridge 2252 ft. long, a municipal airport, manufs. of X-ray apparatus, tobacco, textiles, etc. Pop. 62,000. 2. Co. seat of Allegheny co., Virginia, with a pulp and paper mill, etc., and sulphur springs. Pop. 6300.

Cow, see under CATTLE; DAIRY-FARMING.

Cowall, or **Cowal**, mountainous peninsular dist. of Argyllshire, Scotland, between Loch Long and the firth of Clyde on the E. and Loch Fyne on the W. It is about 40 m. long by 15 m. broad, and contains Lochs Goll and Eek, and the tn. of Dumoon.

Coward, Noel Pierce (b. 1899), Eng. playwright and actor, b. at Teddington. Began stage career at the age of eleven in *The Goldfish*. Has been styled the *enfant gâté* of the Eng. drama, from the audacity of his plays and their acceptance by the critic and the playgoer alike. Was successful in his own social skit, *The Porter* (1921), and in the production of *Fallen Angels*, a satire on 'modern' wives. Other plays include *Hay Fever* (1925); *Easy Virtue* (1926); and *Private Lives* (1930). Launched out as a composer of light opera, notably in the operetta *Billie Sweet* (1929). His patriotic milestone drama, *Caroline* (1931), was very popular. Other pieces: *Words and Music* (1932); *Conversation Piece* (1934); *To-night at Eight-thirty* (1936); *Billie Spirit* (1941); *Pacific*, 1960 (1947); and film: *In Which We Serve* (1943). Pub.: *Collected Sketches and Lyrics* (1931); *Present Indicative* (autobiography) (1937); and *To Step Aside* (1939). His plays have been widely played in the U.S.A. See P. Braybrooke, *The Amazing Mr. Noel Coward*, 1933.

Cowsajee, Sir Jeshangir Ready-money (1812-78), called the Peubody of Bombay, a Parsee merchant and philanthropist. At the age of fifteen he became warehouse clerk to the firm of Duncan, Gibb & Co., of Bombay. In 1816 he began trading on his own account, and soon amassed a large fortune, of which he gave away huge

sums to philanthropic institutions in Bombay. He was made C.S.I. in 1871, and created a Knight Bachelor of the United Kingdom in 1872.

Cowbane, see WATER HEMLOCK.

Cowbridge, bor. of Glamorganshire, Wales, 12 m. W. of Cardiff. Portions of the old Norman fortifications and wall still remain. The industry is entirely agric., and the tn. has good markets and cattle fairs. Pop. 1100.

Cowdenbeath, tn., Fifeshire, Scotland, 5 m. N.E. of Dunfermline; has coal-mines and blast furnaces. Pop. 11,900.

Cowdray, **Weetman Dickinson Pearson**, first Viscount (1856-1927), Eng. engineer and air minister. Head of a firm of engineers and contractors. Constructed the Dover harbour works, the Blackwall Tunnel, and the tunnel under the East R., New York. Was also engaged on the Tehuantepec Railway, Mexico. Appointed chairman of the Air Board in Jan. 1917. His great experience was invaluable in the board's work of constructing and delivering aeroplanes. Lord rector of Aberdeen Univ., 1918-21. See J. A. Spender, *Weetman Pearson, First Viscount Cowdray, 1856-1927*, 1930.

Cowell, **Edward Byles** (1826-1903), Eng. Sanskrit scholar, who, in 1856, was appointed prof. of hist. at Calcutta, and in 1858 principal of the Gov. Sanskrit College. In 1867 was prof. of Sanskrit at Cambridge. Among his pub. are *Pikramavāsi: an Indian Drama* (1851); *The Kusumāñjali* (1861); *The Aphorisms of Sāṅkhya* (1878); *The Sarra-Darsana-Samgraha* (1878); *Buddha-Karila* (1893); *The Jataka* (1895); *The Harsa-Carita of Bhaṭṭa* (1897); besides the completion, in collaboration with W. F. Webster, of sev. other works, e.g. H. H. Wilson's ed. of the *Rig-Veda-Saṁhitā*, and sev. in collaboration with others. See G. Cowell, *Life and Letters of Edward Byles Cowell*, 1904.

Cowen, **Sir Frederick Hymen** (1832-1935), Eng. musical conductor and composer. *b.* at Kingston, Jamaica. He studied under Benedict and Goss, and at Leipzig and Berlin, and his works include oratorios, operas, symphonies, cantatas, overtures, and the settings of over two hundred songs. He was appointed conductor to the Philharmonic Society in 1888, and held many important appointments as conductor. Among his chief works are *Rose Maiden*, cantata (1870); *Ruth*, oratorio (1887); *Thorggrim*, opera (1890); *Harold*, opera (1895); *Ode to the Passions* (1898); *Coronation Ode* (1902); *John Gilpin*, cantata (1904); *Suite of English Dances* (1905); *The Veil* (the last of his large-scale compositions) (1910); *My Art and My Friends* (1913); *Language of Flowers*, 2nd suite (1914); *Cupid's Conspiracy*, ballet (1916); *Monica's Blue Boy* (1917); and *Twelve Songs of my Little Ones*, from 'Punch' (1927). His ballads *The Better Land* and *The Children's Home* won great popularity.

Cowes, seaport and watering-place in Isle of Wight, England, on the N. coast at the estuary of the R. Medina, 104 m. S.E. of Southampton and 8½ m. S.W. of Portsmouth. It stands in a picturesque

situation on a hillside. At Egypt Point, the angle formed by the riv. and the sea, is a battery. C. is the headquarters of the Royal Yacht Club and the seat of its ann. regatta. There are engineering, ropery, and sail-making works. Dr. Arnold, the headmaster of Rugby, was *b.* here in 1795. Pop. 10,000. E. C., a distinct municipality, is on the opposite side of the Medina; it also has boat-building yards. Osborne House was built in 1845 by Queen Victoria. E. C. Castle and Norris Castle are also noteworthy. Pop. 4700.

Cowie, vil., Kincardineshire, Scotland; has coal-mines and a large fishing industry. Pop. 2500.

Cowlairs, N. suburb of Glasgow, with large railway works.

Cowles, **Henry Chandler** (1869-1937), Amer. botanist; *b.* at Kensington, Connecticut; son of Henry Martyn C. Educated at Oberlin College (A.B., 1893) and Chicago Univ. Prof. of natural sciences at Gates College, Nebraska, 1894-95, and later, of botany at Chicago Univ. Works: *Vegetation of Sand Dunes of Lake Michigan* (1899); *Plant Societies of Chicago* (1901); *Text-book of Plant Ecology* (1911), and, *Plant Societies of Chicago and Vicinity* (1913).

Cowley, **Abraham** (1618-67), Eng. poet and essayist. *b.* in London; educated at Westminster and Trinity College, Cambridge. While still at school he pub. a vol. of poems, *Poetical Blossoms* (1633), and wrote *Lee's Riddle* (1638), a pastoral comedy, and in the same year issued *Naufraquum Joviale*. He was elected from the univ. as a royalist by the parliamentarians in 1643, and removed to St. John's College, Oxford, where he pub. a satire, *The Puritan and the Papist* (1643). In 1646, at the surrender of Oxford, he obtained a confidential appointment in the royal household, going to Paris with the queen and dealing with the cipher correspondence between her and the king. He remained abroad for about ten years, being secretary to Lord Jermyn (the earl of St. Albans), and travelling to Jersey, Scotland, Flanders, Holland, etc., on royalist missions. In 1647 he pub. *The Mistress*, a series of poems in the most exaggerated style of the metaphysical school, and on returning to England in 1656 issued a book of poems containing *Miscellanies*, *The Mistress*, *Pindarique Odes*, and *Daridicis*, the last an epic which had been largely composed at Cambridge. In 1657 he took the degree of doctor of physics at Oxford. After the death of Cromwell he returned to France as secretary to the royal family, and at the Restoration, being apparently disappointed at not receiving a greater reward for his loyalty than a lease of some of the queen's lands, retired to the country, living first at Barn Elms and then at Chertsey. He is buried in Westminster Abbey. His other works include five books on plants in Lat. (1662, 1668, 1678); a comedy, *Cutler of Coleman Street* (1641); in prose, *A Proposition for the Advancement of Experimental Philosophy* (1661); a discourse on the gov. of Cromwell; and some delightfully clear

and pleasant essays. The beauties of his poems are spoilt by false taste and affected wit. See Sir E. Gosse, *Seventeenth-century Studies*, 1883; R. Schafer, *The English Ode*, 1913; and A. H. Nethercot, *Abraham Cowley: the Muse's Hannibal*, 1931.

Cowley, Mrs. Hannah (1743-1809), Eng. dramatic writer, b. at Tiverton, her maiden name being Parkhouse. In 1768 she married Capt. C. of the E. India Company, who d. in 1797. Her two most successful comedies were *The Runaway* (1776) and *The Belle's Stratagem* (1780), and she also produced sev. other popular plays and some poems, including *The Maid of Arragon* (1780); *The Scottish Village or Picaresque Green* (1786), and *The Siege of Acre* (1799, 1801). Her collected works, in 3 vols., 8vo, with memoir, appeared in 1813.

Cowley, Henry Richard Charles Wellesley, first Earl (1808-84), Eng. diplomatist. From 1852 to 1867 he was ambas. at Paris, and exercised great influence in the relations between France and England, helping Clarendon to promote the Declaration of Paris, 1856, and Cobden to carry through his commercial treaty between France and England.

Cow Parsley, or *Charophyllum sylvestre*, umbelliferous plant, often called wild chervil.

Cowpen, part of Blyth urb. dist., Northumberland, with coal-mines.

Cowpens, tn., Spartanburg co., S. Carolina, U.S.A., 2 m. S. of the N. Carolina boundary. It is famous for the battle, during the War of Independence, in which the Amer. general Morgan defeated the Brit. under Tarleton (1781). Pop. 1100.

Cowper, Edward (1790-1852), Eng. engineer and inventor who in 1827, with his brother-in-law, Applegarth, invented the four-cylinder machine, which was in general use for the printing of newspapers for many years.

Cowper, William, first Earl (c. 1665-1723), Eng. statesman, son of Sir Wm. C., M.P. In 1707 he became the first lord chancellor of Great Britain. He presided at the trial of Sacheverell in 1710, but resigned his office on the fall of the Whig ministry in the same year. George I. reappointed him lord chancellor, and as such he presided at the trial of the rebels of 1715. See Lord J. C. Campbell, *Lives of the Lord Chancellors*, 1815-69.

Cowper, William (1666-1709), Eng. surgeon and anatomist, b. at Petersfield, in Hampshire. He was admitted a barber-surgeon in 1682, and pub. *Myolomia Reformata* (1694), a treatise on the muscles, and *The Anatomy of the Human Body* (1698). His most valuable discovery in anatomy was C.'s glands (g.r.).

Cowper, William (1731-1800), Eng. poet, b. at the rectory of Great Berkhampstead, Hertfordshire, of which vil. his father, John C., was the rector. His mother d. when he was very young, and he was sent at the age of ten to Westminster School, having been removed from his previous school on account of the cruel treatment he had sustained from another boy. At Westminster his impressions were also somewhat painful, and from his

youthful experiences he developed a hatred of public schools which he retained all his life. He had here Warren Hastings and the satirist Churchill as fellow pupils. Shortly after leaving school C. was articled to an attorney named Chapman, but he never showed any intention of practising, though he was called to the Bar in 1754. Though he almost entirely neglected his professional work, his time was not being wasted. He was reading and writing, and, with his brother, trans. part of Voltaire's *Henriade*. He also belonged to the Non-sense Club, and fell in love with his cousin Theodora, daughter of Ashley C. The feeling was reciprocated, but the poet never had the energy

WILLIAM COWPER

to overcome his uncle's objections to the match. Meanwhile he was expecting the influence of his family to secure him some useful gov. post where the position was a sinecure, and this occurred in 1763. His cousin, Maj. C., offered him the post of clerk to the journals of the House of Lords, and he accepted it in preference to a more important post which was also vacant. Before he could take up his position, however, he had to undergo a so-called examination as to his fitness, which really amounted to no more than an appearance before the Bar of the House. C., however, who had already been somewhat given to fits of depression, grew so nervous at the prospect of this appearance that he finally attempted to commit suicide. Fortunately his courage failed him. His mind now gave way, and he was visited with terrible religious despair, describing himself as 'damned below Judas.' In this condition he was removed (Dec. 1763) to a private asylum at St. Albans, where he gradually recovered his equilibrium. In 1765 he wandered to Huntingdon, where he became acquainted with the Unwins, at whose house he soon came to reside. They were an amiable

and religious family, and after the death of Mr. Unwin, C. continued to reside with his widow. In 1767 he removed with her to Olney, where he came under the influence of John Newton, curate of the vil. Under this stimulus the poet gave himself up entirely to piety and good works, though too energetically for his health. It is from this period, at the suggestion of Mrs. Unwin, that the real commencement of C.'s poetic life must be dated. In 1773 his failing health again gave way, and a burst of madness ensued, which clouded his brain for three years. In 1779, three years after his recovery, appeared the *Olney Hymns*, written by him in conjunction with Newton. His next vol., consisting of secular verse, appeared in 1782, and contained *Table Talk*, *The Progress of Error*, *Truth*, *Expostulation*, etc. Much of this was the outcome of a new friendship which he had just formed. In 1781 he had begun an acquaintance with Lady Austen, a widow who had lately fixed her residence at Olney. She it was who told C. the tale of John Gilpin, upon which his popular fame so largely rests. Lady Austen then suggested that he should write blank verse, and carelessly pointed to a sofa as a theme. This suggestion was the inspiration of *The Task*, which appeared in six books in 1785. But the year before had seen the end of this fertile friendship, perhaps because of Mrs. Unwin's jealousy of Lady Austen's influence. In 1786 Lady Hesketh, sister of Theodora C., came to visit them at Olney, and persuaded them to move to Weston Underwood in 1787. In 1787 came another six months' insanity, during which the poet again attempted suicide. In 1791 appeared a trans. of Homer into blank verse which he had started in 1784, and a projected ed. of Milton brought him into touch with the famous Hayley. In 1794 came a final attack of insanity, from which he never entirely recovered. His cousin, John Johnson, took him to Norfolk with Mrs. Unwin, who d. at E. Dereham. The poet lingered on for four more years, dying on April 25, 1800. He is buried near Mrs. Unwin in E. Dereham church. C. may justly be described as the herald of the Romantic movement. In him were gathered up and concentrated all the gleams which had shone disconnectedly in Thomson, Gray, Lady Winchelsea, and the novelists. Though not one of the greatest poets of the country, his work is important both intrinsically and historically. He possessed equal merit as a letter-writer. See W. Hayley, *Life and Posthumous Writings*, 1803-4, and *Life and Letters*, 1809; G. Smith, *Cowper*, 1880; T. Wright, *The Life of William Cowper*, 1892; *Correspondence*, 1904, and *Unpublished and Uncollected Letters*, 1925; H. I. A. Fausset, *William Cowper*, 1928; Lord D. Cecil, *The Stricken Deer*, 1929; and T. Gilbert, *William Cowper and the Eighteenth Century*, 1935.

Cowper (afterwards **Cowper-Temple**), **William Francis** (1811-88), second son of the fifth Earl C. and Emily Mary, sister of Viscount Melbourne. Took a prominent part in the movement to prevent the

enclosure of common lands, and in 1867 was elected first president of the Commons Preservation Society. Became chairman of the Select Committee on the Enclosure Acts in 1869, when his activities were successful in stopping the enclosure of Epping Forest. His name is chiefly associated with the Cowper-Temple clause (q.v.) of the Education Bill, 1870.

Cowper's Glands, pair of small bodies, about the size of a pea, situated in the male just below the apex of the prostate and between the two layers of the triangular ligament. They correspond to Bartholin's glands in the female.

Cowper-Temple Clause. The principle underlying this clause of the Education Act, 1870, which was incorporated on the amendment of Sir (then Mr.) Wm. Cowper-Temple (q.v.), on the second reading of the Bill, introduced by Mr. Arnold-Forster, lies at the root of the whole of the bitter controversies that have raged round the education question during the last half-century or more. From the moment public elementary schools were estab. it became clear that rate-payers generally had a right to demand the exclusion from such schools of the teaching of any catechism or formula distinctive of any individual denominational creed. The C. C. was designed to effect that exclusion, but applied only to a public elementary school. On the advice of the law officers of the Crown, the Board of Education decided that the teaching of the Apostles' Creed, the Lord's Prayer, and the Ten Commandments is not a contravention of the clause, but that the teaching of that part of the catechism known as the Duties is a contravention. The whole question of religious instruction in schools was revived in 1897 when voluntary schools received a grant in aid, and, still more acutely in 1902, when the Education Act of that year made such schools rate-aided. See **EDUCATION**.

Cowra, tn. in Australia, Forbes co., in New S. Wales, on the r. b. of the Lachlan R., and 220 m. W. of Sydney. It is 60 m.

S.W. of Bathurst; has gold, silver, copper, and marble in the neighbourhood. Pop. 4000.

Cowrie Pine, see KAURI.

Cowry, name applied to the shell of any of the gastropod molluscs in the family Cypræidae. The shells of *Cypræa moneta* are gathered in India, and used whole in Africa in place of money; are very common in England as counters.

Cowslip, or *Primula veris*, a species of Primulaceæ. The common Eng. variety is a bright yellow herbaceous perennial. The flowers are terminal, rising on scapes, stalking in closely umbellate form. The corolla is gamopetalous and tubular below; the stamens are adnate to the corolla.

Cow-wheat, or *Melampyrum*, genus of the natural order Scrophulariaceæ, consists of plants which are parasitic on roots. It is said to be good for cattle, and especially fattening for cows. There are sev. varieties, among which are the *M. arvense*, growing in the cornfields of the S. of England, sometimes called purple C.

Cox, David (1793-1859), Eng. landscape painter, who in 1813 joined the Society of Painters in Water Colours, and in 1814 pub. *A Treatise on Landscape Painting*. In 1839 he turned his attention to oils, but his oil-paintings, although masterly, are not so well known as his water-colours. It is impossible to rank C. among the greatest artists, even in water-colours, but at his best he was nevertheless a very good one. He made a highly individual contribution to the development of Eng. landscape painting and, in particular, was unequalled as an interpreter of windy, cloudy skies and of rainstorms beating down on open commons. His drawings are still procurable at modest prices, though rapidly rising in the esteem of collectors, and at his best he was second only to Constable and de Wint. Among his most famous pictures are 'Peace and War' (1816), sold for £20 by C., and for £3601 in 1872; 'The Hayfield' in 1875 was sold for £2950, the largest sum paid for a water-colour up to that date; 'The Vale of Clwyd' (1846); 'Bolton Abbey' (1847). C.'s favourite scenery was in N. Wales, especially around Bettws-y-Coed. See W. Hall, *Biography*, 1881; R. and S. Redgrave, *Century of Painting*, 1893; and T. Cox, *David Cox*, 1918.

Cox, Sir George William (1823-1902), Eng. divine and mythologist. b. at Benares, India, and educated at Rugby and Trinity College, Oxford. He pub. *The Mythology of the Aryan Nations* (1870); *Popular Romances of the Middle Ages* (1871); *A General History of Greece to the Death of Alexander the Great* (1876); *History of the Establishment of British Rule in India*, and *An Introduction to the Science of Comparative Mythology and Folklore* (1881); and *A Concise History of England and the English People* (1887).

Cox, Gonzales, see COATES.

Cox, Jacob Dolson (1828-1900). Amer. general, b. in Montreal, Canada; graduated at Oberlin, 1851; admitted to the Ohio Bar in 1853, and was elected to the state Senate, 1859. He took part as a brigadier-general, U.S.A., in the W. Virginia cam-

paign of 1861, and in many campaigns during the war. He was governor of Ohio, 1866-67, was a representative to Congress 1877-99, and president of the univ. of Cincinnati, 1885-89. A great authority on military hist. His *Military Reminiscences of the Civil War* was pub. posthumously (1900).

Cox, Sir Percy Zachariah (1864-1937), Brit. administrator. Educated at Harrow and Sandhurst and began his career in the army, serving in the Cameronians till 1889, when he joined the Indian staff corps. Later he became vice-consul at Zeila, Somali coast, and filled other consular posts at Berbera, 1894-95, at Muscat, 1899-1901, and at Bushire, 1904. He then became political resident for the Persian Gulf, and in 1914 secretary for the dept. of India there, and when the First World War began, chief political officer for the Indian expeditionary force. He was acting minister to Persia in 1919-1920, and closed his career by becoming Iraq's first high commissioner, which post he held for five years. President of the Royal Geographical Society, 1933. See also IRAQ.

Cox, Samuel (1826-93), Eng. non-conformist divine and writer. b. in London. He was appointed president of the Baptist Association in 1873. C. was the founder and editor (1875-84) of the *Expositor*, and the first twenty vols. are nearly all his work. He pub. numerous theological works, the best known of which are *Salvator Mundi* (1877); *A Commentary on the Book of Job* (1880); and *The Larger Hope* (1883).

Coxie, Michael, see COXIE.

Coxe, Henry Octavius (1811-81), Eng. librarian and scholar. b. at Bucklebury, Berkshire. In 1860 he became head librarian of the Bodleian, Oxford. His reputation as a paleographer induced the gov. to send him to the Levant in search of anc. MSS. in 1857, but his quest was unsuccessful, though he detected the forgery attempted by Constantine Simonides. He pub. *Rogeri de Wendover Chronica* (1841-44, 5 vols.) for the Eng. Historical Society; *The Black Prince* (1842); an historical poem written in Fr. by Chandos Herald; Gower's *Vox Clamantis* (1850); and a *Report on the Greek Manuscripts yet remaining in the Libraries of the Levant* (1858). Under his direction the catalogue of the Bodleian in over 720 vols. was completed, and he was the compiler of *Catalogue of Greek MSS. at the Bodleian* (1852-54). See J. W. Burgon, *Twelve Good Men*, 1888.

Coxe, William (1747-1828), Eng. writer of hist. and travels, educated at Eton and Cambridge. He travelled largely on the Continent, once as tutor to the marquis of Blandford and another time as companion to Lord Herbert. D., a prebendary of Salisbury and archdeacon of Wiltshire, at Bemerton rectory. His works include *Travels into Poland, Russia, Sweden, and Denmark* (1784-1790); *Travels in Switzerland* (1789); *Memoirs of the Life and Administration of Sir Robert Walpole* (1798); *History of the House of Austria, 1218 to 1793* (1807);

Memoirs of the Kings of Spain of the House of Bourbon, 1700 to 1788 (1813); and *Memoirs of John, Duke of Marlborough* (1818-19).

Coxie, or Coxle, Michael (1494-1592), Flemish painter, *b.* at Mechlin; studied under van Orley and later at Rome, where he was a great admirer of Raphael, on whose works he based the style of his own. His chief works include 'St. Sebastian' and 'The Triumph of Christ,' both in the Antwerp Gallery; another 'St. Sebastian' in Mechlin Cathedral; and a copy of van Eyck's 'Adoration of the Lamb,' which he executed for Philip II. of Spain, and which is considered his best work. He *d.* at Antwerp.

Coxwell, Henry Tracy (1819-1900), Eng. aeronaut, *b.* at Woudham, near Rochester. He was destined for the army, but became a dentist. In 1844 he made his first balloon ascent and became a professional aeronaut in 1848, giving numerous exhibitions in England and on the Continent. In 1862 with James Glaisher he attained the greatest height on record, 7 m., and added some valuable observations to the science of meteorology. He managed the war balloons for the Gers. during the Franco-Prussian war of 1870. He founded and ed. the *Balloon* in 1845. C. made his last ascent in 1885. He wrote *My Life and Balloon Experiences* (1887).

Coyote, Prairie Wolf, or *Canis latrans*, wolf-like member of the dog family Canidae which inhabits N. America. The fur is long and thick, and the animal has a dirty yellow colour. Its mournful howling in the night is an unwelcome sound to lonely travellers.

Coyote State, see SOUTH DAKOTA.

Coytel, name of four Fr. painters:

Noël Coypel (1628-1707), *b.* at Paris; employed on the decoration of the Louvre in 1655; became an academicien in 1659; became director of the Fr. Academy at Rome in 1672. Returning to Paris later, he executed paintings at the Tuileries and the vault of the Church des Invalides.

Antoine Coypel (1661-1722), son of Noël, *b.* at Paris; studied under his father at Rome, and returning to Paris was very popular, decorating sev. royal palaces, and becoming prin. painter to the king in 1715.

Noël Nicholas Coypel (1688-1734), son of Noël, *b.* at Paris; became an academicien at twenty-eight. He had a considerable contemporary reputation as a historical painter, which has now diminished.

Charles Antoine Coypel (1694-1752), son of Antoine, succeeded his father in the king's household. Noted for his pastel work and twenty-five scenes from the life of Don Quixote.

Coyu, popular name of a species and genus of rodent in the family Actodontidae. The technical name of this S. Amer. creature is *Myocastor* (or *Myopotamus*) C., and in habit and appearance it resembles a large water rat. Its maximum length is about 2 ft., its general colour a brownish-red, and the edges of the lips and muzzle are whitish. It has short limbs, small ears, a long naked tail,

and the hind feet are webbed. The fur (nutria) is used for coats, and the flesh is sometimes eaten. The diet of the C. is principally vegetarian.

Coysevox, Antoine (1640-1720), Fr. sculptor, *b.* at Lyons, of a Sp. family; studied in Paris under Loranbert, and produced a statue of the Virgin before he was seventeen. In 1667 he went to Alsace to decorate the palace of Cardinal Fürstenberg, which occupied him for four years. On returning to Paris he executed two statues of Louis XIV., one being an equestrian figure commissioned by the prov. of Bretagne. He became very famous, and was admitted into the Academy in 1676, later becoming chancellor of that body. Among his chief works are the tombs of Cardinal Mazarin and of Colbert, in St. Eustache; the monument of Charles le Brun in St. Nicholas; the statue of Conde and that of Louis XIV. in Notre Dame; the two-winged horses in marble surmounted by Fame and Mercury placed one on each side of the entrance to the garden of the Tuileries from the Place de la Concorde; and sev. statues in the gardens of Marly and Versailles. His bust by Lemoine is in the Musée des Monuments Français. *See* life by G. Keller-Dorian, 1920.

Cozens, Alexander (d. 1786), landscape painter, *b.* in Russia, a natural son of Peter the Great and a woman from Deptford. He was sent to Italy to study painting, and from there went to England and settled there in 1746. From 1760 to 1781 he exhibited many pictures and some of them at the Royal Academy. During this period, however, he spent much time in teaching, and was from 1763 to 1768 drawing master at Eton. Many of his earlier works in colour, pen and ink, and pencil are in the Brit. Museum. He was the author of sev. works and articles on art.

Cozens, John Robert (1752-99), landscape painter in water-colours, was the son of Alexander C., and was *b.* in England. It has been said that he was 'the greatest genius who ever painted a landscape,' but he is undoubtedly the greatest landscape painter before Turner. He was first instructed in painting by his father. In 1776 he went to Switzerland with R. Payne Knight, and returned to England in 1782; in 1783 he went to Italy with Wm. Beckford. He first exhibited at the Incorporated Society of Brit. Artists in 1767, and he made some beautiful sketches of the trees in Windsor Forest. In 1794 he became insane. Many of his works are to be found in the print room at the Brit. Museum; they are noted for their delicacy and their beautiful colouring, and they certainly influenced Turner and Girtin. Constable said that 'the works of Cozens were all poetry.'

Crab, Roger (c. 1621-80), Eng. hermit, *b.* in Buckinghamshire. From 1642 to 1649 he served in the parli. army and was wounded in the head. In 1651 he sold off his business in Chesham as a 'haberdasher of hate,' and built himself a hut where he retired and practised great aus-

terities. He gained a reputation as a 'witch,' and suffered great persecutions, being imprisoned, cudgelled, and put in the stocks. He pub. *The English Hermit* (1655); *Dagon's Downfall* (1682); and tracts against the Quakers. See R. Chambers, *The Book of Days*, 1862-64.

Crab, name applied to various mechanical weight-lifting contrivances, including an engine with three claws used in the launching and docking of ships, a portable windlass used in building and in loading and unloading operations, and a kind of pillar used as a capstan.

Crab, popular term applied to numerous species of decapod crustaceans, properly only to those in the div. Brachyura, but also commonly to others included in the Anomura. The true Cs. have short antennae, eyes which can be retracted into sockets, a short tail which is tucked up under the cephalothorax, a compressed body covered by a hard carapace, two large anterior claws curved closely round the carapace, and these are usually larger in the male than in the female. In diet they are carnivorous, and will feed on carrion or on living matter; a few species sometimes vary their food with vegetables. Nearly all of the Cs. are marine, but there exist also land Cs., which would drown if kept in water; some are so tiny that they will hide in disused shells, and others have a fondness for burrowing in sand and mud. Many of the males are pugnacious, and will fight bitterly with an opponent; some are capable of casting a claw in self-preservation, and all are able to regenerate a missing limb. In intelligence they rank probably highest of the crustaceans. The hermit or soldier Cs. are anomurous, and are characterised by having a fleshy, spirally twisted abdomen, usually covered over by an empty gastropod shell; they are united in the tribe Paguridea, of which the genus *Pagurus* is typical. The species in the tribe Galatheidæ are symmetrical in shape, and the young are noted for the length of the spines on the carapace; the species and genus, *Egla laris*, is found in fresh-water streams of S. America. The tribe Hippidea comprises the sand or mole Cs., and *Hippa crenata* burrows in the sand. The brachyurous species are divided into five tribes: (1) Brachyura Anomala, Notopoda or Dromæa, of which *Dromia vulgaris* is a common Brit. representative; (2) Oxystomata, in which are found the genera *Dorippe* and *Cymonimus*; (3) Oxyrhyncha, which contains spider Cs. and others, e.g. *Maja*; (4) Catometopa, in which occurs *Sesarma pisoni*, a climbing and air-breathing species, and also the calling-C. genus *Gelasimus*, whose members have one claw larger than the others, and this is borne in a hooking manner; (5) Cyclometopa, to which belongs *Cancer pagurus*, the large edible C. seen in markets, *Carcinus maenas*, the common shore-C. of Britain, *Portunus puber*, the velvet or devil C., and *Corystes cassideatus*, the masked C., a curious species bearing on its carapace marking as of a human face. See also KING-CRAB.

Crab-apple, or *Pyrus malus*, member of

the family Rosaceæ, is a wild apple of which there are many varieties. The fruit of the wild varieties found in Britain in hedges is not sweet nor pleasant to the taste, and is chiefly used in jellies and preserves. It is the origin of the garden apple, but entirely lacks the flavour that cultivation has produced. The Amer. C., *Malus coronaria*, is sweet, and grows on a small tree in Columbia. The flowers are very beautiful, and the fruit, which hangs on long stems, is used for making sauces. The smallest variety is the Oregon C. found in California, not much larger than a hawthorn berry.

Crabbe, George (1751-1832), poet, the son of a schoolmaster and par. clerk, who settled at Aldeborough, had but a very rudimentary education, but by his devotion to his books soon conquered this defect. Destined for the medical profession, he served as apprentice, first to a doctor at Wickham Brook, and presently to another at Woodbridge, in which latter place he first met his future wife, Sarah Elmy, the Mira of his poems. He now began to write verse, and, in 1780, with a borrowed five-pound note and some MSS., went to London to seek fame and fortune. He found the metropolis a cold-hearted stepmother, and he was at the end of his tether, when, having failed to secure a hearing elsewhere, he sent *The Candidate* to Burke. Burke read it, saw its merits, and induced Dodsley to publish it in 1780. At Burke's suggestion he took orders, and, after a term as a curate, was in 1782 appointed chaplain to the duke of Rutland. In the following year *The Village* appeared, and three years later C. pub. *The Newspaper*, after which, though he wrote—and destroyed—diligently, he remained silent for more than a score of years. In 1807 he broke his long silence by the pub. of *The Parish Register*, and this work he followed three years later with *The Borough*. He paid a visit to London in 1817, and was everywhere received as the distinguished man of letters he was. Two years later he pub. his last great work, *Tales of the Hall*, for which John Murray gave him £3000. He d. in 1832 at Trowbridge, where the living had in 1813 been given to him by the duke of Rutland. A monument to his memory has been erected in Trowbridge church. Much of his work was in a way a protest against the pastoral poetry in the style of *Sweet Auburn*. It was his endeavour to paint nature as it was, and in this he succeeded greatly. His complete works were ed., with a life, in 8 vols. by his son George (1834), and his poetical works by A. J. and H. M. Carlyle (1908, 1914). See T. E. Kobbel, *The Life of George Crabbe*, 1888; A. C. Ainger, *Crabbe*, 1903; R. Huchon, *Un Poète réaliste anglais, George Crabbe, 1754-1832* (with bibliography), 1906 (Eng. trans. by F. Clarke, 1907); J. W. Holme, *The Treatment of Nature in Crabbe*, 1912; J. H. Evans, *The Poems of George Crabbe: a Literary and Historical Study*, 1933; and *The Life of George Crabbe*, by his son (with introduction by Edmund Blunden), republished 1947.

Crab, The, *see* **CANCER, OR THE CRAB**.
Cracidae, or **Cracinae**, family of birds belonging to the order Galliformes, sub-order Gall. They are found through Central and S. America, where they inhabit forests within reach of the coast or wooded hills near rivers. They live on leaves and fruit. The nests are carelessly constructed on the level branch of a tree or bush. The *C. vary* in colour from black to blackish-green. The *Penelopinae* are brown or olive-green in colour and number fifteen species. The *Oreophasinae* contains only the Guatemala pheasant, a splendid bird with soft greenish-black plumage, brown at the side and below. The feet are vermilion.

are buried, and which contains Thorwaldsen's statue of Christ; the univ., next to Prague the oldest in central Europe, having been founded in 1364 by Casimir the Great, and reorganised in 1817, and which has fine new buildings in the W. part of the city, including a library of 350,000 vols., a botanic garden, and an observatory; the recently restored Cloth Hall, in Ring Square, which contains the Polish National Museum; the Episcopal Palace; the Royal Academy of Sciences; and the Czartoryski Museum. About 3 m. to the W. of the city is a grassy tumulus over 100 ft. high, which was raised in 1820-23 in commemoration of the patriot Kosciuszko. Another mound has been

CRACOW

The Vistula, with the cathedral of St. Stanislaus and the old royal castle in background

Cracinae, *see* **CURASSON**.
Cracovienne (**Krakowiaki**), national dance of the Polish peasantry in the dist. round Cracow. It has a strongly marked rhythm in 3 time, and is frequently accompanied by singing.

Cracow, or **Krakow** (Polish **Kraków**, Lat. **Cracovia**), tn. and prov. of Poland, on l. b. of R. Vistula, 158 m. S.W. of Warsaw. It occupies an important strategical position, 672 ft. above sea level, in a wide plain commanding the river approach to Silesia and to the Danube valley via the Moravian Gate. The city may be divided into the old tn., with promenades formed on the old walls; the castle quarter, lying to the S.; and the suburbs, including the former Jewish Kasimierz quarter and Podgorz, on the other side of the river, with which it is connected by a bridge built in 1850. *C.* is a very picturesque tn. and contains many interesting buildings. Among them are the castle, on the Wawel Rock, long the residence of the kings of Poland; the Gothic cathedral (1320-59), adjoining the castle, where many of the kings and famous men of Poland, including John Sobieski, Poniatowski, and Kosciuszko,

piled up in memory of the legendary Krak, or Krakus, a Slavonic prince, who is said to have founded the city about 700, and to have given it its name. It is more probable, however, that the name is derived from the Slavonic *krak*, a raven. There are manufs. of cloth, leather, machinery, agric. implements, chemicals, beer, tobacco, etc. *C.* was the cap. of the kingdom of Poland from 1320 to 1609, when Warsaw became the seat of government. *C.* remaining the coronation city for a century and a half longer. The third partition of Poland in 1795 assigned *C.* to Austria. From 1809 to 1815 it was part of the duchy of Warsaw, and during 1815-46 was the cap. of the republic of *C.* This, forming the last stronghold of Polish independence, comprised a ter. of 445 sq. m. After a rebellion it was re-annexed to Austria in Dec. 1846. During the First World War much fighting took place round *C.* in the latter months of 1914. In Sept. of that year there were indications that the Russians under the Grand Duke Nicholas would endeavour to enter Germany via Moravia, and the Central Powers made plans to counter this move. In their retreat before the Russian 'steam-

roller' both Ger. and Austro-Hungarian troops in this region concentrated upon C., the capture of which was essential to the Russian plan of invading Germany. During the last weeks of Nov. the Russians made persistent efforts to break the line between Lodz and C., but failed, and at the latter place the Austrian forces gallantly held their own and foiled all Russian onslaughts. In 1917 there were riots in C., as in other important tns. of the constituent countries of the dual monarchy, organised by agitators against the oppression of subject nationalities. On Sept. 1, 1939, C., together with many other Polish cities, was bombed by the Gers, simultaneously with their general attack on Poland. C. fell to the Gers, on Sept. 6, 1939. It was the cap. of the so-called general gov., and Frank (*q.v.*), the governor, later tried at Nuremberg, had his headquarters in Wawel Castle. It was recaptured by Russian troops on Jan. 14-16, 1945 (see EASTERN FRONT; RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR). Up till the Ger invasion C. remained the great centre of Polish national life. Mean temp. of the year 45.7 F.; winter, 26° F.; summer, 65.5 F.; Mean ann. rainfall, 24.8 in. Pop. 299,300.

Craddock, Charles Egbert, see MURREE, MARY NOBLE.

Cradley, par. and tn. Worcestershire, England, 3½ m. S. of Dudley, with coal- and iron-mines and manufs. of iron and steel goods. Pop. 7600.

Cradling, term used in architecture to designate a slight framework of timber built under floors to form curved ceilings.

Craddock, Rear-Admiral Sir Christopher (1862-1912), Brit. sailor. He commanded the cruiser squadron at the battle of Coronel (*q.v.*), Nov. 1, 1914, which was sunk by the Ger. squadron under Adm. von Spee, C. going down in his flagship the *Monmouth*. C. was b. at Hartforth in Yorkshire and entered the navy in 1875. His first active service was in the 1884 Egyptian campaign, and he was also in the 1891 campaign in the Sudan. In the 1900 China campaign he commanded the Naval Brigade. His gallantry and fearlessness were proverbial in the navy. Promoted captain in 1900 and rear-admiral in 1910. There is a memorial to him in York Minster. He was a writer on naval subjects.

Craddock, tn. and dist. in Cape Prov., S. Africa, 56 m. S.S.E. of Middelburg. Altitude 2850 ft. The pop. of the dist. is 18,380, of whom 5960 are white and occupied in cattle raising. Pop. of tn. 9550, of whom 3980 are white.

Crafers, tn., S. Australia, 21 m. S.E. of Adelaide; nearest station Mount Lofly. The dist. is famous for fruit growing. Pop. 2000.

Crafton, bor. in Allegheny co., Pennsylvania, U.S.A. Pop. 7500.

Crag, term applied in geology to the uppermost of the Tertiary strata in England. It is a shelly sand occurring in E. Anglia, being the only example of a Pliocene stratum. The C. strata consist of the following members, beginning with the uppermost: (1) The Forest Bed series,

containing many animal and plant remains; (2) the Chillesford beds, containing a molluscan fauna; (3) the Norwich C., containing both marine and freshwater shells; (4) the Red C., being a subcalcareous sand rich in shells; (5) the White or Coralline C., being a calcareous mass with argillaceous bands containing Mollusca and Bryozoa. The term C. is taken from the local name for shelly sand.

Crag and Tail, term applied to a peculiar formation of hills in which one side forms a steep and precipitous cliff, while the other 'tails' away in a gentle slope. This is due to glacial action on rocks of varying hardness, the harder rocks (generally igneous, such as dolerite or basalt) having resisted denudation and so protecting the softer rocks on the lee side. The 'crag' thus generally faces the direction from which the ice came, while the 'tail' faces the direction in which it was advancing. The phenomenon is very prevalent in the lowlands of Scotland and especially round Edinburgh; the Castle Rock of Edinburgh and the Abbey Craig of Stirling are two of the most famous examples of this formation.

Craig, Edward Gordon (b. 1872), theatrical designer and actor, b. near London, son of Ellen Terry (*q.v.*) and Edward Wm. Godwin, architect and archaeologist (1833-86). Educated at Bradford College and Heidelberg Univ., on leaving which in 1889 he adopted the name of Edward Gordon C., legalised by deed-poll Jan. 24, 1893. He made his debut under Sir Henry Irving at the Lyceum as Arthur St. Valery in the *Dead Heart*, and in the ensuing ten years took part in various plays of Shakespeare and in *Ravenswood*, *The Lyons Mail*, *School for Scandal*, etc., his best roles being Biondello, Cassio, Petruchio, and Charles Surface. His powers as a designer and producer were first shown in the production of Purcell's *Dido and Eneas* in 1900, and soon after this in *Isithlehem*, *Sword and Song*, *The Tinklers*—in which he made artistic innovations in scenery and costume, lighting and stage management—and in 1905 he prepared designs for Eleonora Duse for the production of *Elektra*. Memorable productions by him include those of *Hamlet*, at the Moscow Art Theatre in 1912, and of Ibsen's *The Pretenders*, at the State Theatre, Copenhagen, in 1920. The designs used in the latter were pub. in 1930, entitled *A Production*. C. also illustrated an ed. of *Hamlet*, pub. by the Cramach Press, Weimar, in 1930. In 1913 he founded a school for the art of the theatre at Florence. His ideas as a theatrical artist, as described in a series of pamphlets and papers collected and pub. under the title *On the Art of the Theatre*, have germinated, and, through E. Inghardt, Jessner, Stanislavsky, and the Russian ballet, have spread throughout the world. The essence of his theories as a practical producer is that the 'art of the theatre is neither acting nor the play, it is not the scene nor dance, but it consists of all the elements of which these things are composed,' and, as a philosopher, he wished the theatre to be

'a place in which the entire beauty of life can be unfolded, and not only the external beauty of the world, but the inner beauty and meaning of life.' The theatrical producers found it impossible to believe that he was anything more than a vague philosopher of an impossible theatre, but through his mother he had his chance in 1903 to reveal his genius; and the beauty of his production of *The Vikings and Murh-Ido*. About Nothing won the admiration of Wm. Rothenstein and Count Kessler even though, commercially, both were failures. Kessler wanted him to produce a play at Weimar for the grand duke, but his revolutionary theories were, in his own view, not likely to appeal to the actors there, and, instead, he went to the Lessing Theatre at Berlin and there produced Hoffmannstahl's version of *Venice Preserved*. Berlin recognised his genius: his shadowy settings with their soaring arches, their deceptive simplicity, and their perfect proportion filled Reinhardt and Jessner with ideas for their work and made possible the expressionism (*q.v.*) of the Ger. theatre of the twenties and such films as *The Cabinet of Dr. Caligari*. Exhibitions of C.'s designs toured Germany and Austria, and from that time his influence spread through central Europe.

C. is also celebrated as a wood-engraver, an art which he began to practise in 1893 at the instance of Wm. Nicholson, the artist. Some of his woodcuts are reproduced in *Woodcuts and some Words* (1924), and many originals are in the Victoria and Albert Museum. Books by C. include *The Art of the Theatre* (1905); *On the Art of the Theatre* (1911); *Towards a New Theatre* (1913) (contains plates of designs for Shakespeare, Ibsen, and other dramatists); *The Theatre Advancing* (1921); *Scene* (1923); *Books and Theatres* (1925); *Henry Irving* (1930); and *Ellen Terry and Her Secret Self* (1931). See E. Rose, *Gordon Craig and the Theatre*, 1931.

Craig, John (c. 1512-1600), Scottish reformer, educated at St. Andrews and became a monk. He was patronised by Cardinal Pole, and on his advice joined the Dominicans, becoming rector of their school at Bologna. He was converted to Protestantism by reading Calvin's *Institutes*, and having made open confession was tried by the Inquisition at Rome and condemned to be burnt to death. The day before his execution, however, Pope Paul IV. d., and the prison being broken open by a mob, he escaped and returned to Scotland about 1560, where he became one of the most popular preachers of the recently estab. Reformation. In 1574 he became minister of Aberdeen, in 1577 the colleague of John Knox at the par. church of Edinburgh, and in 1579 one of the chaplains of the household of James VI. In 1580 he drew up the *National Covenant*, and later compiled part of the *Second Book of Discipline*, and sev. treatises.

Craig, Sir Thomas (1538-1608), Scottish jurist, b. in Edinburgh; studied at St. Andrews Univ. and in Paris. His great work, *Jus Feudale*, completed in 1603, but only pub. in 1655, is still consulted, and he also wrote a treatise proving the

legality of James's right to the Eng. throne. See his life by P. F. Tytler, 1823.

Craigavon of Stormont, Sir James Craig, first Viscount (1871-1940), Irish soldier and statesman, son of James Craig of Craigavon, Down, N. Ireland; educated at Merchiston School, Edinburgh. Captain in old Royal Irish Rifles; served with Imperial Yeomanry and Irish Horse in S. African war (1899-1902). His election for Down (1906) to House of Commons at once placed him in the front rank of Ulster Unionists. When Sir Edward Carson assumed the leadership in Ulster, C. was his right-hand man in the fight for Ulster's integrity against Asquith's Home Rule Bill, and when Carson went to the House of Lords, C. took up the vacant leadership. He joined Mr. Lloyd George's Gov. in 1916 as treasurer of the household, but resigned in 1918 when Carson resigned from the War Cabinet. He was par. secretary to the minister of pensions, 1919-20, and then par. and financial secretary to the admiralty, 1920-21. In June 1921 he resigned his Eng. office on becoming first Prime Minister of N. Ireland—still retaining, though never availing himself of, his seat in the Brit. House of Commons, notwithstanding his peerage, Baronet, 1918. Viscount, 1927. The uncompromising champion of Ulster's membership of the Brit. Commonwealth, he presented an adamant front to all the efforts of Mr. de Valera to induce him to sacrifice the border. His speeches had none of the flamboyant oratory once associated with Irish politics, but were plain, unequivocal statements of policy. Frequently criticised by left-wing publicists and others in the United Kingdom, he held on his course utterly unmoved, cherishing no illusions on the score of Irish unity.

Craigie, Pearl Mary Teresa, see HOMES, JOHN OLIVER.

Craik, Mrs. (Dinah Maria Mulock) (1826-1887), best known as the author of *John Halifax, Gentleman*, was b. at Stoke-upon-Trent. She settled in London at twenty to write for the support of an invalid mother and two young brothers. Her first novel, *The Opilries* (1849), was followed by *Olire* (1850); *The Head of the Family* (1851); and *Agatha's Husband* (1853). *John Halifax, Gentleman* (1856) met with an immense success not only in England, but, through trans., in France, Germany, Italy, Greece, and Russia. A pension of £60 a year awarded to her she placed at the service of poor authors. Among her other works are *A Woman's Thoughts about Women* (1858); *Thirty Years, Poems, New and Old* (1881); *Concerning Men and Other Papers* (1888). See Louisa Parr, *The Author of 'John Halifax, Gentleman': a Memoir*, 1898; and A. J. Roade, *The Mellards and their Descendants*, 1915.

Crail, the Caryl of the ninth century, anct. seaport tn. of Scotland, in Fifeshire, 9 m. S.E. of St. Andrews. Its fishing industry has greatly declined, but it is now an attractive little summer resort with some interesting historical associations. Here John Knox preached his 'Idolatrous sermon', June 9, 1559.

Crailsheim (Krailsheim), tn. of Württemberg, Germany, on the Jagst, 13 m. N. of Ellwangen. Interesting architecture; tanning and weaving industries. Pop. 6400.

Craiova (Kraiova), chief tn. of Județ Dolj, Rumania, 120 m. W. of Bucharest, with many manufs., including (in 1910) belting, candles, soap, preserves, terra cotta. There are also flour mills. There are many churches and synagogues. It is the centre of the very fertile Oltenia dist. Pop. 65,000.

Crake, member of the family of the *Itallidae* (Rails), order of the *Gruiformes*. The best known Brit. C. is the corn-C., whose cry may be heard all over the country in the early summer. They are short-billed, thick-bodied birds. The colour is reddish-brown, lighter below, with dark brown streaks on the feathers above. The corn-C. is becoming rarer in England every year.

Cram, Ralph Adams (b. 1863), Amer. architect and author, b. at Hampton Falls, New Hampshire. Educated at Augusta (Maine) and Westford (Massachusetts) Academies, and Exeter (New Hampshire) High School. Practising architect since 1889, when he opened an office in Boston. As senior partner of C., Goodhue & Ferguson, he helped to design many notable buildings, e.g. Graduate College and Cleveland Tower, Princeton Univ.; the cathedrals of St. Alban, Toronto, and St. Paul, Detroit. He was made consulting architect for the great New York Cathedral of St. John the Divine—being an enthusiast for and an authority on Gothic. Among his books are *The Ruined Abbey of Great Britain* (1906); *The Gothic Quest* (1907); *The Substance of Gothic* (1916, Lowell lectures); *Walled Towns* (1919); and *Towards the Great Place* (1922).

Crambe Maritima, or *Sea-kail*, species of *Crucifera* found on Brit. coasts and cultivated in gardens for its delicate, tender shoots. The plant is glaucous and spreading, with broad, toothed, sinuated, fleshy leaves coated with wax, and dense corymbs of large white flowers.

Crambus (Gk. *κράμβος*, parched), genus of insects in the pyralid family Crambidae, the vaneers, or grass-moths, is well represented in Britain. The species are small and inconspicuous, and are to be found in grassy places.

Cramer, Gabriel (1701–52), Swiss mathematician, b. at Geneva. Until 1724 he held the chair of mathematics in the univ. of Geneva jointly with Calandrin. He wrote *Introduction à l'analyse des lignes courbes algébriques*, and ed. the works of Johann Bernoulli and the *Commercium epistolicum* of Leibnitz and Bernoulli.

Cramer, Johann Baptist (1771–1858), Ger. pianist, one of a family of musicians, the most famous of the three sons of Wilhelm C. (1745–99), himself a musician settled in London. His compositions are no longer valued, but his *Hundred Daily Exercises* has become classic and is still reprinted. He founded the music publishing firm which bears his name.

Cramlington, tn. of Northumberland, England, 8 m. N.N.E. of Newcastle; coal-mining industry. Pop. 8500.

Cramp, spasmodic, painful, and sustained contraction of a muscle or group of muscles. It may affect a limb, or internal muscles, when the sensation is particularly discomforting. There is often no observable cause, though cold, fatigue, or a constrained position may bring on painful cramping. The muscles most often affected are those of the calf and the back of the thigh, and persons of gouty tendencies are specially liable. The muscles suddenly bunch themselves into a hard knot, and are best made to relax by rubbing or stretching; when the calf is cramped, for instance, the foot should be bent upwards with the hand as far as possible.

Bathers' cramp is obscure in its nature. Many bathers know the sudden cramping of the limbs due to fatigue or too long immersion in cold water, but the affection which suddenly renders helpless the most capable swimmer has more severe than that. In all probability the respiratory centres are affected, causing a painful and spasmodic contraction of the muscles actuating the walls of the lungs. In most instances the lungs appear to be immediately flooded with water, and the swimmer sinks 'like a stone.'

Writers' cramp, *telegraphists' cramp*, etc., are conditions following on the continual use of a set of muscles in a particular way. The diseases are gradual in their onset, beginning with a slight disturbance in the usual movements and proceeding to total helplessness in those movements, although the same muscles may be used quite comfortably in another way. Massage is said to have beneficial effects in some instances, but the cause probably lies in the nervous centres, and prolonged rest is usually necessary to effect a cure.

C. is symptomatic of many diseases. Cholera produces C. of the lower extremities, arsenical poisoning is accompanied by painful contractions, colic brings on internal C., and the disturbance of the relative positions of organs in pregnancy produces characteristic C's.

Cramp, **Crampern**, term applied to a metal bar used in masonry. Usually composed of iron, the bar is bent at both ends and let into the upper surface of two pieces of stone which have been joined together by their perpendicular faces. Copper is the most durable material for the purpose.

Cramp Rings, rings worn to ward off attacks of cramp. From the eleventh century to the time of Queen Mary rings blessed by the sovereign on Good Friday, and made of the gold and silver coins offered by him on that festival, were supposed to possess the power of curing cramp, scrofula or 'the king's evil,' and epilepsy.

Crampton, Thomas Russell (1816–88), railway engineer, b. at Broadstairs. He invented the locomotive which bears his name and which for forty years was used by the N. of France railway for its express trains. He invented also a rotary dust-fuel furnace, brick-making machinery, etc., and an automatic hydraulic tunnel-boring machine which aroused great

interest in connection with the Channel tunnel project. C. laid the first successful submarine cable between Dover and Calais in 1851.

Cran, in Scotland, a measure of herring, just taken from the net, that will fill a barrel; equal to $37\frac{1}{2}$ imperial gallons or about 750 herrings.

Cranach, or **Kranach**, **Lucas** (1472-1553), called the Elder, Ger. painter and engraver, b. at Cronach, near Bamberg, Bavaria, his family name being Sunder. For nearly fifty years after this he worked at the electoral palace at Wittenberg. In 1508 Frederick the Wise granted him the crest of a winged serpent, with which all his prin. pictures are marked. He was an intimate friend of Melancthon and Luther, painting portraits of both, and being a witness to, and one of the convivers at, the latter's marriage to Catherine Bora. He was twice burgomaster of Wittenberg, and d. at Weimar. His style seems to have been formed by Matthew Grünewald, and his work is more admirable for invention than execution. Among his best works are 'Christ on the Cross,' being the altar-piece at Weimar, and 'The Preaching of John the Baptist.' His engravings, both on wood and copper, are excellent but very rare. His works are numerous, and may be seen at Weimar, Prague, Leipzig, Schneeberg, Gotha, Munich, and Berlin. See his *Life and Works* by Heller (Nuremberg), 1851.

Cranach, or **Kranach**, **Lucas** (1515-86), called the Younger, Ger. painter, son of Lucas C. the Elder. The son was his father's devoted helper and collaborator, and it is often difficult to decide whether a picture is the work of the elder or of the younger C., so much do their separate paintings resemble each other in style, etc. Some of his pictures are in Wittenberg and others in Dresden, Munich, and Berlin.

CRANBERRY

Cranberry, species of *Vaccinium*, belongs to the Ericaceae and is a member of the same genus as the blackberry (q.v.) and puckleberry. The Brit. C. is found wild abundantly in the fens of Norfolk, Lincolnshire, and many other parts of England, and it occurs frequently in the highlands of Scotland. The fruit is a round, sharp, red berry which makes excellent tarts and preserves, and it is

often stewed with apples to give them a pleasant colour.

Cranborne, par. of Dorsetshire, England, 26 m. N.E. of Dorchester and 10 m. N. of Wimborne in the woodland tract known as C. Chase. Boudicca is believed to have fought the Romans here. Its many antiquities include a hunting residence of King John. Pop. 800.

Cranbrook, little mkt. tn. and par. pleasantly situated in the world of Kent, England. It has a large trade in hops and malt. From the fourteenth century to the seventeenth it was a busy seat of the broadcloth manuf., introduced there by the Flemings. St. Dunstan's Church contains a celebrated baptistery. C. School was founded about 1520 by John Blubery, and received a royal charter in 1574. Pop. 4000.

Crandall, **Prudence** (1803-90), Amer. school teacher, b. at Hopkinton, Rhode Is.; her parents were Quakers; she estab. at Canterbury, Connecticut, a private academy for girls, where she lost her white patrons by admitting a coloured child. She then opened, on advice of W. L. Garrison, a school for 'young ladies and little misses of colour,' in connection with which she was subjected not only to social persecution, but also to prosecution under special enactment of the state legislature—i.e. the Black Law of May 24, 1833. She refused to obey this law, and was imprisoned sev. months. In 1831 her house was attacked and partially destroyed. She gave up her project and married the Rev. Calvin Philleo, after which she lived in New York, Illinois, and Kansas.

Crane, **Stephen** (1871-1900), Amer. writer, b. at Newark, New Jersey, U.S.A. Fourteenth child of a Methodist preacher, he studied for some time at Syracuse Univ. and then entered newspaper work. His first book, a harshly realistic novel, *Maggie: a Girl of the Streets* (1893), did not attract much attention, but in 1895 appeared his masterpiece *The Red Badge of Courage*, a graphic picture of war, the scenes taking place during the Amer. Civil war. Later he was a war correspondent in the Greco-Turkish war and in America's war with Spain. Previously he had been on a filibustering expedition to Cuba. The ship on which he was a passenger was wrecked. The exposure permanently affected his health and eventually brought about his early death, but it also gave him the inspiration for one of the finest short pieces in Amer. literature—*The Open Boat* (1897). C. was also the precursor of the free-verse school, which in after years was to be made celebrated by the Imagists. He pointed the way in his two vols. of verse *The Black Riders* (1895) and *Ifar is Kind* (1899). Came to England in failing health and became a close friend of Joseph Conrad. He d. of consumption at Badenweiler in the Black Forest. See life by T. Hoer, 1923, 1936.

Crane, **Walter** (1846-1915), Eng. artist well known as a painter, designer, book illustrator, writer, and lecturer. He was b. in Liverpool, son of Thomas C., an

artist from whom he received his first lessons in painting. His illustrated children's books are masterpieces and include *Baby's Bouquet*, *Pan-pipes*, Grimm's *Household Stories*, Spenser's *Faerie Queene*, *Illustrations to Shakespeare's Tempest*, etc. He owed his reputation as a painter chiefly to his water-colour paintings, though he worked in oils too. Among his easel pictures are 'The Bridge of Life,' 'The Chariot of the Hours,' 'La Belle Dame Sans Merci,' 'A Masque of the Four Seasons,' 'Prometheus Unbound,' etc. His pictures are generally allegorical in subject and are characterised by minuteness of decoration; the pre-Raphaelite influence predominates. A number of private homes and public buildings contain decorative work—modelling, trezies, panels, and mosaics—by him, and some of his designs for tapestries are in the S. Kensington Museum. He, jointly with Wm. Morris, brought about the revival of the decorative arts and crafts in England; he was the first president of the Arts and Crafts Society, which he helped to found in 1888. He wrote, among other works, *The Bases of Design* (1898); *Line and Form* (1900); *Ideals in Art* (1905); and an autobiography, *An Artist's Reminiscences* (1907). See P. G. Konody, *The Art of Walter Crane*, 1902.

Crane, machine for raising, lowering, or placing in position heavy bodies. From early times such appliances have been in use, but of simple construction actuated by manual or animal power. With public works of magnitude better machines came into being, first actuated by hand power only, later by steam, hydraulic power, or electricity.

Derrick cranes have an upright member pivoted at the ends, the top being maintained in position by two raking members anchored at their lower ends. From the foot of the derrick slopes a raking jib, pivoted at its upper end to the derrick top, suitable crab and lifting tackle being provided.

Portable cranes are jib Cs. mounted upon a carriage, running upon rails. The jib is tied back to the upper part of a frame turning horizontally upon a pivot. The rear end of the frame is carried back to support the crab gear, which, with supplementary weights, balances, in whole or in part, the load to be lifted. Steam power is also used to operate such Cs., a vertical boiler and engine, with the necessary gear and winding drum, being substituted for the crab. Jib Cs. are also mounted on specially constructed motor vehicles.

Gantry cranes consist of girders mounted on end wheels, carrying a crab, and are able to lift and transfer loads to the limit of the gantry run. The crab is made also to travel along its girders, giving a double motion.

Goliath cranes have power appliances for lifting, mounted and running upon girders with rigidly framed legs at either end supported by wheels resting upon rails, along which the whole machine may move. They are used in the shifting and

setting of heavy blocks in harbour work, or other heavy operations.

Titan cranes used for similar purposes have horizontal girders, capable of swivelling upon a turntable which is mounted at the top of a travelling substructure. At one end of the double girder is the power plant. By an ingenious arrangement, the load can be moved along while hanging from the arm of the Titan, remaining at the same level, rising, or falling as desired.

Hammer-headed cranes are similar to Titans, but work on a fixed tower.

Hydraulic cranes, largely used about docks, are simple machines operated by water pressure through the medium of a ram having pulleys, served with a chain or rope passing over the head of a projecting jib, which may be swan-necked in form. See W. H. Atherton, *Hoisting Machinery*, 1940.

Crane, member of the family of the Gruidæ, order Gruiformes, superficially resembling the heron, with which it is commonly confused, and which in Scotland is usually called the C. The Cs. are tall birds with long legs and necks, the head being either naked or tufted. Their wings are short and powerful, the feet unwobbed. They are the largest of the wading birds, and are found in most parts of the world except Malaysia. The hind toe is greatly elevated, and has a sharp claw. Noteworthy among this species is the N. Amer. whooping C. whose breeding places have for long been a mystery. Recent discoveries of the birds in Saskatchewan may enable steps to be taken for their protection, and to save them from rapid extinction. The European C. is now only known in England as a migrant, passing to the N. to breed.

Crane-fly, or **Daddy-long-legs**, popular names given to members of the Tipulidæ, a family of dipterous insects containing over 1000 species world-wide in distribution. The significance of the long and fragile legs is unknown, but their presence has given the owners their nicknames. The larvæ are aquatic and terrestrial; the latter grubs are often called leather-jackets, and are destructive to the roots of crops. The abdomen of the female insect terminates in a long ovipositor.

Crangonore, see **KODUNGALUR**.

Crangon, genus of decapod crustaceans, belongs to the family Crangonidæ. *C. vulgaris* is a very well-known species, as it is the common shrimp found on our shores.

Craniata, term applied in various ways to members of the animal kingdom, but in its widest and most usual sense it is synonymous with the Vertebrata (q.v.).

Craniometry, rules for measuring the cranium in order to fix the facial angle and to provide a basis for the comparison and classification of the skulls of different individuals and of different races. The various linear measurements used are made between localised points on the surface.

Craniotabes, atrophy of the skull occurring in infancy, resulting from syphilis, rickets, or marasmus.

Cranium, see SKULL.

Crank, in mechanics a device consisting of C. arm and C. pin by means of which rectilinear reciprocating motion is changed into rotary motion. The handle of a grindstone is an example of a single C., while the C. of a wheel changes the rectilinear motion of a piston-rod. The bell C. merely changes the direction of rectilinear motion.

Cranleigh, vil. of Surrey, England, 8 m. S.E. of Guildford. Here is a public school. Pop. 4000.

Cranmer, Thomas (1489-1556), archbishop of Canterbury, b. of a good family

THOMAS CRANMER

An engraving after a picture at Lambeth Palace

at Aslaeton in Nottinghamshire. After being educated under a tutor remarkable, even in those days, for sternness, he was sent in 1503 to Jesus College, Cambridge, where he became a fellow. He remained as divinity prof. at this college until 1528. The 'sweating sickness' was then raging throughout the co., to avoid which C. removed to Waltham with two of his pupils. Here he met Fox and Gardiner, to whom, in conversation on the question of Henry VIII.'s divorce from Catherine, he made the remark which was the cause of all his after promotion. His suggestion was that Henry should have recourse to the canonists and univs. rather than to the pope. Henry immediately commanded him to write a treatise on the subject, and to be prepared to support his position. In 1530 C. was sent on an embassy to Rome, and two years later to Germany. The pope made him grand penitentiary of England, and on his Ger. embassy he married the niece of the reformer Oslander, an uncanonical but not illegal proceeding, though he was already high in

the Church. He was summoned back to England on the death of Warham to fill the vacant archiepiscopal throne, and, preceded by his wife, he came reluctantly to be consecrated on March 30, 1533. Henry had succeeded in his choice of a pliable minister. In May C. pronounced the king's marriage with Catherine to be void *ab initio*, and that with Anne Boleyn, secretly celebrated the Jan. before, to be valid. Three years later he annulled the marriage with Anne in the same fashion. In 1540 he divorced him from Anne of Cleves, and next year he was instrumental in securing Catherine Howard's condemnation. Yet, although C.'s frailty led him into culpable compliance with the king's wishes, he was naturally kind-hearted. He opposed the Six Articles (1539), and did his best to save the lives of Fisher, More, and Anne. He had little to do with the dissolution of the monasteries, though he was connected with the deaths of Frith, Lambert, and other heretics. C.'s chief work was in the direction of the Eng. Reformation. From the beginning he had been zealous for the Bible, and in 1538 it was ordered that a copy should be placed in every church. In 1545 he pub. his *Litany*, almost identical with the one at present in use, which shows his great merit as a master of prose. In 1548 came his *Catechismus*, and in 1550 his *Defence of the True and Catholicke Doctrine of the Sacrament*, a powerful attack on transubstantiation. His influence in the compilation of the Prayer Book itself can hardly be overestimated. On the accession of Mary, C. was brought to trial and deposed from his office of archbishop. Finally he was persuaded to recant. Then at the end courage came to him, and at the moment when he should publicly have proclaimed his recantation, he rested his old position, and deplored his past cowardice. Courageously then on March 21, 1556, he met his death at the stake, first burning the hand which had signed his recantation. See J. Strype, *Memorials of Thomas Cranmer*, 1694; W. F. Hook, *Lives of the Archbishops of Canterbury*, 1860-76; A. J. Mason, *Thomas Cranmer*, 1898; C. H. Smyth, *Cranmer and the Reformation under Edward VI.*, 1926; and A. C. Deane, *Life of Thomas Cranmer*, 1927.

Cranmere Pool, boggy pool on Dartmoor, Devonshire, England, about 7 m. from Chagford. It is known as the loneliest place in England.

Crannog (Celtic *crann*, a tree), modern name for the lake-dwellings or stockade is. formerly common in Scotland and Ireland. They consist of stockaded wooden huts built upon a floor of earth and flagstones, having for foundation a shallow or islet raised and strengthened by brushwood, piles, and gravel. This mode of defence seems to have been peculiar to the Celtic races, but they bear no resemblance to the lake-dwellings of Switzerland. No Cs. have been found in England.

Cransac, large com. of France in Aveyron, in the arron. of Villefranche,

20 m. distant. There are mineral springs and coal-mines. Pop. 6300.

Cranston, city of Providence co., Rhode Is., U.S.A., with an area of 29 sq. m. It includes the cotton manufacturing vis. of C. Pontiac, and Natick. There is a state farm. Pop. 47,000.

Cranwell, Lincolnshire, England, situated 6 m. from Sleaford, became noted after the First World War as the headquarters of the R.A.F. command and the cadet college. It has also an electrical and wireless school and an R.A.F. hospital. The college is run on parallel lines to Sandhurst, and all candidates for entry must sit for the navy, army, and air force entrance examination held in June and Nov. of each year. Candidates must be between the ages of 17½ and 19½, and in physically fit condition. In addition to aviation they are taught engineering. The course extends over a period of two years, and the cost is approximately £250; scholarships are awarded, and the sons of service men are sometimes admitted for reduced fees. The college of aeronautics at C. is now kept for post-graduate instruction in aeronautical science and engineering.

Craonne, small Fr. tn., in the dept. of Aisne, 75 m. N.E. of Paris, and 10 m. S.W. of Laon. During the First World War it was the scene of much fighting during the Fr. offensive in April 1917, it being a key position to the famous road, the Chemin des Dames. Here the Gers. were strongly posted with numerous machine guns, which beat off every Fr. advance. Early in May, however, with strong reinforcements the Fr. captured the position.

Crape, thin transparent silk material, with an unglossed, rough, and wavy surface. It is manufactured by twisting the threads before weaving, without removing the natural gum of the silk, and then either boiling or dressing with a viscous gummy solution, by which the threads are partially untwisted and the characteristic appearance obtained. It is usually dyed black and used for mourning dresses. The Fr. word for C. *crêpe*, is usually used to denote C.-type fabrics other than black mourning silk. *Crêpe de Chine* is a coloured or white fabric made from raw silk; other fabrics used as dress materials are *crêpe georgette* and *crêpe marocain*.

Craponne-sur-Arzon, tn. in the dept. of Haute-Loire, France, 19 m. N. of Le Puy, and 27 m. from St. Etienne. Pop. 3000.

Crashaw, Richard (1612-49), Eng. poet and priest, b. in London, the son of Wm. C., a learned divine and a strong upholder of Puritanism. He was educated at the Charterhouse and Pembroke Hall, Cambridge, and became a fellow of Peterhouse in 1633. In 1643 he left Cambridge, shortly after the beginning of the struggle between king and Parliament, and went to the Netherlands. It is possible, although not certain, that he returned to England and became a member of Oxford Univ. In 1644 he was, in his absence, ejected from Cambridge Univ. by the Parliamentarians for

refusing to accept the covenant, and deprived of his fellowship. At this time, or soon after, he was in France under the patronage of the exiled Queen Henrietta Maria, and was converted to Rom. Catholicism. In 1646 he gained, through the friendship of the poet Cowley, the patronage of Cardinal Palotto, who found him a post at Rome. He was later, in 1649, appointed as canon to the church of Our Lady of Loretto, and d. there on Aug. 21 of the same year. His prin. sacred poems were pub. in *Steps to the Temple* (1646), to which were added some secular poems under the title 'Delights of the Muses.' Later eds. (1648 and 1652) contained additional poems, and others have since been added from MS., while his earlier poems in Lat. and Gk. were pub. in 1634 under the title *Epigrammatum Sacrorum Liber*. C.'s poems are of the metaphysical school, and his best work places him in the front rank of Eng. religious poets. A complete ed. of his poems, collated with all existing texts, was pub. in 1927, ed. by L. C. Martin. See Sir E. Gosse, *Seventeenth Century Studies*, 1883; F. Thompson, *Collected Works* (vol. iii.), 1913; R. C. Wallerstein, *Richard Crashaw: a Study in Style and Poetical Development*, 1935; and A. Warren, *Richard Crashaw, a Study in Baroque Sensibility*, 1939.

Crassulaceae, natural order of dicotyledons, consist of succulent plants, herbaceous or shrubby, ann. or perennial, which grow in hot, dry, exposed places in the more temperate parts of the Old World. *Sempervivum* contains the species *S. tectorum*, the house-leek.

Crassus, Lucius Licinius (140-91 B.C.). Rom. orator. He served as proconsul of Gaul, becoming famous both for wit and uprightness. In 95 B.C. he was elected consul together with Quintus Scævola, and the rigorous law they enacted, banishing all who had not the full rights of citizenship from Rome, was one of the causes of the Social war. In 92, as censor, he closed all the schools of the rhetoricians. Cicero, in *De Oratore*, makes him his own mouthpiece.

Crassus, Marcus Licinius (c. 108-53 B.C.). Rom. triumvir, general, and statesman, b. in Rome of a distinguished family, and early known for his great wealth, being surnamed 'The Rich.' He was forced to go into exile in Spain during the dictatorship of Marius and Cinna, but returned to join Sulla, who gave him a command in his army. In 71 B.C. he was chosen prætor, and while in this position took the command against Spartacus, the leader of the revolt of the gladiators of Capua. In a battle near Rhegium he completely defeated the rebels, Spartacus and a very large number of his men being killed. On his return he was rewarded with an ovation, and had a laurel crown instead of the usual myrtle wreath. In 70 he was elected consul together with Pompey, and used every means to gain popular favour, entertaining the whole populace at a great feast and distributing free corn. He narrowly escaped conviction at this time of complicity in the

Catiline conspiracy. A few years later he joined with Pompey and Cæsar to form the first triumvirate, which ruined the power of the senate, and of which he proved himself an important member. In 55 he and Pompey were again elected as consuls, and obtained command of the army in Syria for five years, where he hoped to amass a large fortune. He determined to invade Parthia, and in 54 crossed the Euphrates, but, after taking one tn., returned to winter in Syria. The next year he invaded Mesopotamia, and was defeated with great loss by the Parthian general Surenas at Carrhræ. His troops melted and compelled him to meet Surenas in a conference, at which he was treacherously killed. He was famous for his avarice, industry, and love of speculation, and was a large slave-dealer.

Cratægus, genus of Rosaceæ, consisting of about 100 hardy trees and bushes, the different species of which are cultivated for the sake of their ornamental appearance. *C. oxyacantha* is the hawthorn or may, of which *C. monosperma*, the white thorn, is a variety; both are common to Britain.

Cratæva, genus of tropical plants. *C. gymnandra*, the garlic pear, is an evil-smelling native of bushy places and thickets near the seaside in Jamaica; *C. lapia*, the tapia or common garlic pear, is a tree about 20 ft. high, and the fruit conveys the odour of garlic to animals feeding on it; *C. mannifera*, the bilva or mûhura, is a small tree with a nutritious and aperient fruit of delicious taste.

Crater, see under VOLCANOES.

Crater, constellation of the S. hemisphere below Hydra and just above Leo. None of its three chief stars is of great magnitude.

Craterus (d. 321 B.C.), trusted general, friend, and the mentor of Alexander the Great. C. did not fear to rebuke Alexander for his faults nor to lay before him the complaints of his soldiers. He commanded the cavalry during the expedition to India and led the veteran army back to Macedonia. Alexander appointed him to succeed Antipater, whose daughter he married, as regent of Macedonia, but on Alexander's death in 323 C. and Antipater together governed Macedonia, Greece, and Illyria. He helped to defeat the Gks. in the Samian war, and was killed in combat with Eumenes, his old companion in arms in Antipater's war with Pericles in Cappadocia.

Crates (d. 424 B.C.), Gk. comedian of Athens. His work marks an epoch in the development of the Attic comedy; he abandoned political allusion and the lampooning of individuals and wrote comedies of a more general character.

Crathie, par. in Aberdeenshire, Scotland, among the Grampian Mts. In it is Balmoral Castle, the highland royal residence.

Cratinus (c. 519-422 B.C.), Gk. comic poet, probably b. at Athens, the son of Callimedæ. He was a writer of the old comedy and the rival of Aristophanes, over whom he gained sev. victories, and through whom our knowledge of C. is

mostly gained. He seems not to have begun writing till late in life, and to have lived to a very advanced age. He is credited with various improvements in the arrangement of the chorus and of Gk. comedy generally, and is said to have been the first to make comedy an instrument of personal satire. He himself used it as a vehicle for audacious sarcasm, frequently directed against Pericles. The names of forty comedies by him have come down to us, of which nine appear to have gained prizes. Among these the chief is *The Wine Flask*, which in 423 gained the first prize, the *Comus* of Ameipsias coming second, and the *Clouds* of Aristophanes third.

CRAWFISH

Cratippus, Peripatetic philosopher of Mitylene in the first century B.C., chiefly known through allusions in the works of Cleero, his pupil and friend. Plutarch says that he conversed with Pompey on his retreat from Pharsalia. About 48 B.C. he opened a school of philosophy at Athens, which was attended by Marcus, the son of Cleero, and by M. Brutus.

Crau, La, originally a stony and partially sterile desert in the dept. of Bouches-du-Rhône, France, but developed in recent years into a prospering agric. dist., specialising in early vegetables. It forms part of the alluvial and malarial delta of the R. Rhône, and is traversed by the Crauonne Canal.

Craven, Pauline (1820-91), daughter of Comte Auguste Marie de Ferronnays and wife of Augustus C., diplomatist. Her *Récit d'une sœur* (trans. as *A Sister's Story*, 1868) is the story, told with great charm, of the sorrows of her family while in Rome and Naples. The book, which was crowned by the Académie Française, made so great an impression in France and in England that nine eds. were pub. in a few months. Her other works include *Le Travail d'une Âme* (1877); *La Jeunesse de Fanny Kemble* (1880); and *Kilian* (1882); and *Lucia* (1886).

Crawfish, or **Crayfish**, name given to sev. species of decapod crustaceans which

are very closely allied to the lobsters. All are fresh-water animals, and the only marine crustacean to which the term is ever applied is *Achephrops Norvegicus*, the Norwegian lobster, which is not a true C., but a lobster. C's. are nocturnal in habit, omnivorous in diet, and they undergo a series of moults before the perfect creature is formed. C. may be found in the rivers and streams of England, especially in limestone dists. They make small burrows in the banks where they remain during the daytime, away from the light.

Crawford and Balcarres, Earls of, title of the Scottish family of Lindsay. The first of this name to settle in Scotland seems to have been *Walter de Lindsay*, an Anglo-Norman baron of the reign of David I. Becoming rapidly influential, and spreading from their original homes at Erildoun, Roxburghshire, and Crawford in Clydesdale, to Haddington, Forfar, Elie, etc., the Lindsays figured conspicuously in the hist. of Scotland. Their name occurs frequently in the accounts of the feuds between the Scottish nobles; the doings of 'the Lindsays light and gay' are commemorated in the ballad of the battle of Otterbourn, and *Piersart* refers to the adventures of *Sir John Lindsay* in the same battle. Another renowned member of the family was *Sir David Lindsay* of Glenesk, who was created earl of Crawford in 1397. He married Princess Elizabeth, daughter of Robert II., and is the hero of the celebrated tournament against Lord Welles described in Wymton's *Cromykill*. This redoubtable and gallant warrior helped to his feet his vanquished opponent, whom he was at liberty to slay, and presented him to the queen. *David*, the third earl, was killed fighting on the side of the Douglasses against the king in 1444. *Alexander* (d. 1454), the fourth earl, was famed for his violent and ferocious character, in consequence of which he was surnamed the Tiger Earl; he was also known as Earl Beattie. He became hereditary sheriff of Aberdeen, a dignity of which he was afterwards deprived by James II.; and his estates were forfeited for an attempt, in concert with other Scottish nobles, to dethrone the king. After a long defiance he at last made submission to James who, to satisfy his oath to 'make the highest stone of his (Lindsay's) castle at Finhaven the lowest,' threw a loose stone from one of the battlements. *David*, the fifth earl, became very powerful and was created duke of Montrose in 1488 for his support of James III. against the rebellious barons. The title of duke had never before been conferred upon a Scot not of royal birth. He was besides hereditary sheriff of Angus, keeper of Berwick, high admiral, master of the household, lord chamberlain, joint high justiciary, and was employed on important embassies to England. Wounded and taken prisoner at the battle of Sauchieburn, he was in the next reign deprived of all his offices for his loyalty to James III., but ultimately pardoned. *Alexander*, the ninth earl, won by his crimes and misdeeds the title of the

Wicked Master of Crawford, and forfeited his title which passed to David Lindsay of Edzell, but David dying without issue, the son of the wicked earl succeeded to the title in 1558. In the Reformation struggles the elder branch of the Lindsays took the Catholic side, and their implication in these contests and as royalists in the great civil wars of Mary and James VI. brought about their ruin and the succession to the earldom of the Byres branch of the family. *John*, sixth Lord Lindsay of the Byres, was a Protestant and a name of iron character, who helped to compel Mary to resign her crown. His grandson *John* was high treasurer of Scotland, and his great-grandson *William* was president of the Parliament after the revolution of 1688, and leader of the party who overthrew the episcopacy. The fourteenth, fifteenth, and sixteenth earls were brothers; *George* was assassinated as colonel in a Dutch regiment, *Alexander* d. insane, and the royalist soldier, *Ludovic*, d. in exile. *John*, the twentieth earl, was educated at a military academy near Paris and served with the Imperial army under Prince Eugene, then in Russia and Turkey. In 1717 he was appointed to the command of the Scots Greys, became lieutenant-general, and fought with distinction at Dettingen and Fontenoy. He was much beloved for his bravery, generosity, and amiability. On his death his cousin *George* became earl.

The earldom reverted to the earls of Balcarres on the death (1808) of the twenty-second earl. The title was not assumed by them, however, until 1848, when James, the seventh earl of Balcarres, estab. his claim to it before the House of Lords. The earls of Balcarres descended from the ninth earl of Crawford, *Sir David Lindsay*. Lady Anne Lindsay, author of *Auld Robin Gray*, was a member of this house. *Alexander William Crawford Lindsay*, twenty-fifth earl of Crawford and eighth earl of Balcarres (1812-80), was well known as a writer on religious art and on philosophy, etc. His pub. works include *Lives of the Lindsays* (1840, 1858); *Progression and Antagonism* (1846); *Sketches of the History of Christian Art* (1847); *On the English Hexameter* (1862); and *Etruscan Inscriptions Analysed* (1872). He was also the founder of a magnificent private library at Haigh Hall, Lanarkshire, in which the literatures of all nations were represented. He d. in Florence, and was buried in the family vault at Dun Echt, from which his body was mysteriously removed, to be found again in 1882 in a wood not far away from the mausoleum. He was succeeded by *James Ludovic*, his son, who became twenty-sixth earl. His son, *David Alexander Edward Lindsay* (1871-1940), succeeded to the title in 1913. He was a trustee of the National Gallery, the National Portrait Gallery, and the Brit. Museum, and was for many years Unionist Whip in the House of Commons, where he sat for Chorley div., 1895-1913; was president of the board of agriculture and fisheries, 1916; lord privy seal, 1916-19; chancellor of the duchy of Lancaster, 1919-21; first

commissioner of works, 1921; minister of transport (in Cabinet), 1922. His son, *Robert Alexander Lindsay* (b. 1900) is also a trustee of the Brit. Museum and National Gallery, and is, besides, chairman of the Royal Fine Art Commission (since 1943).

Crawford, Francis Marion (1851-1909). Amer. novelist, son of Thomas C., the sculptor, and nephew of the Gen. Marion who took part in the Amer. War of Independence. He was b. at Bagin-di-Lucca in Tuscany, and spent the first eleven years of his life in Rome. He was educated at Concord, New Hampshire, at Trinity College, Cambridge, at Karlsruhe, and Heidelberg. Returning to Rome at the age of twenty-two he studied the Oriental languages, and in 1873 undertook press work at Allahabad in connection with the *Indian Herald*. Falling ill, he went to live in New York with his uncle, Samuel Ward, who was to become the hero of the novel, *Dr. Claudius*. Later he travelled in America and Turkey. His first novel, *Mr. Isaacs*, appeared in 1882, and following it (among others) came *Dr. Claudius* (1883); *A Roman Singer* and *An American Politician* (1884); *Zoroaster* (1885); *Sarcinacea* and *Mario's Crucifix* (1887); *With the Immortals* (1888); *San' Ilario* (1889); *The Robstons* (1894); *Casa Braccio* (1895); *A Rose of Yesterday* (1897), etc. He wrote also a play, *Francesca da Rimini*, produced in Paris in 1902, and a historical work, *Arc Roma Immortalis* (1898). Marion C. joined the Rom. Catholic Church. He d. at Sorrento.

Crawford, Robert (1700-33), Scottish poet, celebrated as the author of *The Bush about Traquair*, *Tweedside*, and other songs. He contributed lyrics to Allan Ramsay's *Tea-Table Miscellany*. Burns speaks admiringly of some of his work. He was the son of Patrick C., an Edinburgh merchant, and was drowned returning from France. Many of his songs are pub. in the *Orpheus Caledonicus*.

Crawford, Thomas (1813-57), Amer. sculptor, b. in New York city. In 1834 he settled in Rome and studied under Thorwaldsen. He estab. his reputation by a statue of Orpheus for Boston in 1839. He executed also statues of Washington and Beethoven; a figure of Liberty; a bas-relief, 'The Progress of American Civilisation,' etc. He became blind in 1864, and d. in London. See L. Taft, *The History of American Sculpture*, 1924.

Crawfordsville, co. seat of Montgomery co., Indiana, U.S.A., situated on Sugar Creek and on the Chicago, Indianapolis, and Louisville railway. It exports 100,000 pigs annually and has important manufs. Washash College for men is here. Pop. 12,000.

Crawford, Thomas (c. 1530-1603), Scottish soldier, who was taken prisoner at the battle of Pinkie, 1547, and afterwards helped in bringing the murderers of Darnley to trial. He took Dumbarton Castle in 1571, and forced Edinburgh Castle into surrender, 1573.

Crawl, fast racing stroke in swimming (q.v.).

Crayer, or **Crayer**, **Caspar de** (1584-1669), Flemish painter, b. at Antwerp. His chief works were altar-pieces for various tns. In the Netherlands, and include 'Christ appearing to Magdalen,' in the church of Notre Dame at Brussels, and 'The Assumption,' in Ghent Cathedral.

Crayfish, see **CRAWFISH**.

Crayford, nrh. dist. in Kent, on the R. Cray, was the scene of the victory of Hengist over the Britons. It manufs. carpets, and is also noted for calico printing. Pop. 12,000.

Crayon Drawing, see **PASTEL**.

Crazy-bone, see **FUNNY-BONE**.

Crazy Widow, see **COURLAN**.

Cream, see **BUTTER**.

Creameries. Until the middle of the nineteenth century, butter-making was carried out entirely by the farm on which the milk was produced. In Ireland, which has always been primarily an agric. country, Sir Horace Plunkett inaugurated a co-operative movement among farmers which would enable them to market their produce on a more business-like and profitable basis. Plunkett had gained first-hand knowledge of farming while running as a young man in the U. States, and the Irish Agric. Organisation Society, which he founded in 1891, became a great success; he was later, 1900, made vice-president of the Dept. of Agric. and Technical Instruction in Ireland. Although he experienced the utmost difficulty in establishing the first creamery in the country, to-day there are well over a thousand throughout Ireland. The Eng. Agric. Organisation Society was based on the I.A.O.S. To-day comparatively little butter is made on Brit. farms, and its price is always in advance of that of creamery butter. C. also act as collecting and distributing centres for milk, and have pasteurising and bottling plants. 'Clotted cream' (clotted, or scalded) is made chiefly in Devonshire, Somerset, and Cornwall. There are numerous C. in New Zealand and Canada. The average ann. value of Canadian creamery butter is about \$63,000,000, and the output (1941) about 300,000,000 lb. from 1256 C. New Zealand C. have, however, the larger export trade. The total butter-fat production in 1940-41 was 411,000,000 lb. and the amount exported was 2,142,000 cwt.

In the U.S.A. C. are most numerous in the corn belts, and respond to winter as well as summer dairying, whereas the cheese factories are estab. chiefly in the cooler parts of the dairying region of Wisconsin, and are useful mainly in absorbing the extra supply of summer milk. A cheese and butter factory combined was estab. in Orange Co., New York, in 1851, but the first actual creamery dates from 1872 in Manchester, Iowa. In some of the great Amer. C. machinery is estab. which can manuf. millions of pounds of butter every year. An average of over 2,000,000,000 lb. of farm and factory butter is produced yearly. The *Dairy and Creamery Journal* was estab. in London in 1889. See also **DAIRY**; **DAIRY FACTORIES**.

Cream of Tartar, or **Potassium Hydrogen Tartrate** ($C_4H_5O_6K$), substance occurring in a crude form in the later stages of the fermentation of grape-juice. This product is known as 'argol,' and is found deposited on the sides of the cask in which the fermentation has taken place. It is dissolved in hot water, the solution is filtered and the pure C. of T. crystallised out. C. of T. is used in medicine as a purgative, and is often used as the acid element in baking powder.

works are *The Rise and Progress of the British Constitution* (1834); *Some Account of the Foundation of Eton College* (1848); *The Fifteen Decisive Battles of the World* (1851); *Invasions and Projected Invasions of England* (1852); *A History of the Ottoman Turks* (1854-56); and *The Imperial and Colonial Constitutions of the Britannic Empire* (1872).

Creation. For a very long while a deep controversy raged between theologians and scientists as to the origin of the world

MICHELANGELO'S 'THE CREATION OF MAN'

Anderson

A detail from the Sistine chapel of the Vatican, Rome

Creanga, Ion (? 1837-89), Rumanian prose writer of great renown, b. at Hunulesti. His works are considered to be among the glories of the literature of that nation. His stories are written in popular language and are based on the old folk-tales. His writings appeared in 1890 under the name of *Porești* (Tales), and in 1892 appeared his *Amintiri din Copilarie si Anecdote*. His collected works came out in 1896 in six vols.

Creasol, see CREOSOTE.

Creasote, see CREOSOTE.

Creasy, Sir Edward Shepherd (1812-78), historian, b. at Bexley in Kent, and educated at Eton and King's College, Cambridge. He was called to the Bar in 1837, and served as assistant-judge at the Westminster Sessions Court. In 1840 he was appointed prof. of hist. at London Univ., and in 1860 chief justice of Ceylon. Knighted in the same year. His chief

and of mankind. Genesis, it was held, pointed to a creation of the world in six days by the divine command; science, on the other hand, pointed out that the world and life gradually evolved under natural laws. But when the great evidences of geology and biology were recognised, it was seen that the view taken by scientists did not deny the special origin of life or matter, and it was seen that the laws of nature could easily be the laws of God. A further development towards healing the breach between the two views was taken when 'day' was understood as meaning a period. This substitution, biblical scholars affirmed, was easily allowable when the original Heb. was studied. Then for a while theologians who were also scientists endeavoured to harmonise the views expressed in Genesis and by scientists, and many attempts were made to fit in these periods with the order

of formation shown in geology and the succession of life as shown in palaeontology. Prominent among these attempts were the theories laid down by Chalmers, Smith, Miller, and Kuntz. A well-known attempt at thus harmonising the two divergent views was that made by Gladstone, to which Huxley replied.

So the struggle might have gone on indefinitely, as indeed it still does in certain quarters, for all evidence certainly points to a gradual development of matter and life, while Genesis certainly points to a specific C. The comparatively young science of biblical criticism, however, shows that there is no need to attempt this harmonising. It is interesting here to observe that most of the substance of the view of C. as given in Genesis is to be found in other and older cosmogonies. That of the Etruscans is very similar to the Bible story, while the Persian points to six creative periods of a thousand years each. So it is pointed out that the material in Genesis is incorporated from the others, and inspired and made the vehicle of revelation. And it is on this word revelation that the present view of the relation between science and Genesis hangs. It is a fundamental fact of literary criticism that any interpretation of a work must be governed by the *motif* of the whole. Since the Bible is to some extent a work of revelation it includes no matter which men can find for themselves by the exercise of the power of reasoning, otherwise it would not be a revelation. In fact it can be further stated that the Bible, being written in the infancy of the world, had to address itself to the child mind of the world, and its literary form and colour therefore suggest this. And since the child spirit is universal still, when the idea of God is the subject of reason, its purpose still remains the same, to reveal God as the creator of the universe, and therefore it is seen that the view in Genesis does not contradict nor affirm the scientific view of C. They are separate views, and the apparent contradictions between them are of no importance. See ADAM; COSMOGONY; DARWINIAN THEORY; EVOLUTION; GEOLOGY; MAN; and the articles on various religions. See C. M. Walsh, *The Doctrine of Creation*, 1910.

Crébillon, Claude Prosper Jolyot de (1707-77), Fr. novelist and dramatist, *b.* at Paris, the son of Prosper Jolyot de C.; educated at the Jesuit College of Louis le Grand. He began by writing for the stage, but later took up fiction. In 1748 he married Lady Stafford, an Englishwoman. In 1755 he became censor. He seems to have disappeared some time before his death. His novels—which include *Le Sopha* (1745, Eng. trans., 1781), for the indecency of which he was banished from Paris; *The Wanderings of the Heart and Mind* (1736); and *Letters from the Marchioness de M*—(1732, Eng. trans., 1737)—are clever but licentious. They were collected in 1779.

Crébillon, Prosper Jolyot de (1674-1762), Fr. dramatist, *b.* at Dijon; intended for the law, but persisted in writing, and

at an early age produced the tragedy of *Idomeneus*, which was very successful. He continued to issue tragedies on classical subjects in rapid succession. *Atréus*, *Rhadamistus*, popularly supposed to be his masterpiece, and *Electra* being very well received, while *Xerxes*, *Semiramide*, and *Pyrhus* met with but little success. In 1711 he lost his wife, and after her death lived in retirement for some years, much of the time in considerable distress from poverty. Later, however, his previous work was recognised by a place in the Fr. Academy and the position of police censor, and his new comfortable circumstances allowed him to recommence writing. In 1749 *Catiline* appeared, and was produced under court patronage in the presence of the king. At first it was received exceedingly well, but evidently failed on closer study to come up to the public expectation. *Le Triumvirat* (1755) was also only moderately successful. His last play, on Cromwell, was never completed.

Crécy (**Crécy-en-Ponthieu**), or **Cressy**, vil. of France, in the dept. of Somme, 12 m. N.E. of Abbeville, noted for the battle of 1346, in which Edward III. defeated Philip VI. of France. Pop. 1300.

Credence, name given to the small table used in a church, which stands within the chancel rails, beside the altar. It is used to stand the elements for communion on and also all the vessels appertaining to the administration of the sacrament. In the Book of Common Prayer the rubric instructs the priest to 'place upon the table so much Bread and Wine as he shall think sufficient.' Up to this moment the elements have rested on the C. table. The C. table was given final sanction as a 'legal ornament' by the queen in council in the year 1857. The term was also formerly used in social life to designate a side table on which were placed the dishes before being served at the general table. At this side table the different foods were tasted as a precaution against poison. It was employed in Italy, France, and Germany about the fifteenth century.

Credentials, instruments which an ambassador, envoy, or other diplomatic agent receives from his own gov. authorising him to appear in his diplomatic character and denoting his powers. The C. are usually in the form of a closed letter addressed to the sovereign or head of the gov. of the state to which the officer is accredited. A diplomatic officer will not be received in any other character than that which is given him by his C. For this reason he generally imparts their contents before being received by the sovereign or head of the gov. to which he is accredited.

Credi, Lorenzo di (c. 1459-1537), It. painter of the Tuscan school, *b.* at Florence, and a fellow pupil with Leonardo da Vinci under Andrea Verocchio. His style and choice of subject remained uninfluenced by the Renaissance through which he lived, and he actually burnt some of his pictures in the famous bonfire under the influence of Savonarola. He

was not exceptionally gifted, but was extremely persevering, and showed considerable feeling for beauty and elaborate finish. He excelled in madonnas and holy families, and was particularly fond of painting children. His best works include 'The Nativity' in the academy at Florence; 'The Madonna and Child' in the Louvre, Paris, which Vasari considered his masterpiece; 'The Madonna with Saints' in Pistoja Cathedral; 'The Baptism of Christ' in the Church of San Domenico at Fiesole; 'The Virgin' in the National Gallery, London; and 'The Holy Family' at Edinburgh. Others are in the Berlin Museum and the Uffizi at Florence. All show the influence of da Vinci very strongly. See Sir E. J. Poynter, *Classic and Italian Painting*, 1882, and G. Vasari, *Lives of the Painters*, 1885-88.

Credit, in a commercial sense, connotes the undertaking on the part of one party to a contract to pay money at a future time to the other party to the contract who gives valuable consideration for that undertaking. Both modes are used in conjunction with each other in commercial circles by means of the custom of giving bills of exchange drawn on third parties in payment of goods sold, *e.g.* by one merchant to another for exportation. The merchant taking the bill of exchange does not wait for payment to fall due on it, but gets it discounted at a bank. Thus, having given C. to one person in goods, he obtains C. from another in money. Commerce could not be carried on without such a system of C., and the extensive part which C. plays in the circulation of capital or the production and exchange of wealth is one which will be found discussed in all the text-books on political economy. The precise use of C. as an agent in the production of wealth is that it gives circulation to capital (*q.v.*) and renders it available wherever it can be most profitably employed. See further under BILL OF EXCHANGE; CAPITAL.

Crédit Foncier, institution founded in France by the economist Wolowski, and created under gov. patronage by a decree issued in 1852, to enable landowners and owners of house property to obtain money on mortgage of real securities at a low rate of interest, the loans to be repayable by annuities, including redemption of capital. The C. F. is really the name adopted subsequently on the amalgamation of the three original mortgage banks of Paris, Nevers, and Marseilles. Its operations and area of activity have been frequently extended since its formation, and in 1860 it was empowered to make advances to municipalities and depts. for public works and improvements. The control of the gov. over the C. F. is exercised by the appointment of the governor and two deputy governors, and by the rule that the approval of the governor is required to validate the decisions of the directors. The C. F. possesses under its charter, which has been extended for a period of ninety-nine years from 1881, the right to issue bonds at a fixed rate of interest repayable in fifty or sixty years, and,

where specially authorised, carrying a right to draw for prizes.

Credit, Letter of, order, open or sealed, given by bankers or others at one place, to enable a person to receive money from their agents at another place. The person who obtains a L. of C. may go to a particular place and need only carry with him a sum sufficient to defray his expenses. The L. of C. gives him some of the advantages of a banking account when he reaches his destination, as he may avail himself of it for part only of the sum named in it. A L. of C. is not transferable, and is said to be 'special' when addressed to a particular individual by name, requesting him to advance money to the bearer of the L. of C. One of a number of notes of L. of C. each for the same sum given by bankers to their foreign correspondents to pay money to persons about to travel abroad is called a Circular Note.

Crédit Mobilier: 1. Institution formed simultaneously with the *Crédit Foncier* in 1852 in France for making advances on the security of personal or movable (*mobilier*) estate. It was taken over in 1932 by the Banque de l'Union Parisienne. The C. M. of London, which was formed in 1861, was ultimately absorbed in the *Crédit Foncier* of London.

2. The C. M. of America was a construction company which, having obtained the contract to construct the Union Pacific Railroad, caused one of the gravest scandals in the hist. of Amer. politics, by the nature of its financial operations after the railroad company's stock-holders had acquired the controlling interest in its bonds.

Crediton, or Kirkton, bor. and mkt. tn. of England, in the co. of Devonshire. It is situated on the R. Creedy, 8 m. N.W. of Exeter, lying in a narrow valley between two steep hills, and is divided into an old and new tn. It was the bp. of Winfrid, or St. Boniface, in 680, and from 910 to 1049 was the seat of a bishopric, afterwards transferred to Exeter. Cromwell captured it in 1645; in 1743, and again in 1769, much of the tn. was destroyed by fire, consequently it is fairly modern in appearance. Agriculture is the prin. industry, but there are also tanneries. Shoes and under are also manufactured in C. Pop. 3500.

Credit, Social, see SOCIAL CREDIT; and also ABERRIART, WILLIAM.

Creech, Thomas (1659-1701), Eng. poet and translator, b. at Blandford, Dorset. He trans. into Eng. verse Lucretius's *De Rerum Natura* (1682), *The Odes, Satyrs, and Epistles of Horace*, and *The Idylls of Theocritus* (1684). He is best known for his trans. of Horace.

Creech, William (1745-1815), publisher and lord provost of Edinburgh. He is best remembered as being the publisher of the works of Gullen, Gregory, Henry Mackenzie, and also for publishing the second ed. of Robert Burns's poems. Burns thought highly of C. as a social companion, as expressed in his poem *Willie's Awa*, but latterly C. forfeited Burns's esteem through his avarice and

slackness in paying debts. C.'s shop and breakfast-room were the meeting place of many celebrities of that day. See J. C. Carrick, *William Creech, Robert Burns's Best Friend*, 1903.

Creed (A.-S. *creda*, from Lat. *credo*, I believe, the first word of the Apostles' and Nicene Cs.), the authorised expressions of the faith of a church, generally used liturgically. The three great Cs. of the church are very early in date, and of only one of them is the origin at all clearly known. The *Apostles' C.*, being the simplest and earliest, has the most complicated hist. In the fourth century, Rufinus dates its origin from the apostles themselves, each of whom he declares to have had a share in the composition of it. This tradition, however, resting on so doubtful an authority, is generally disregarded. It is certain that some form of baptismal confession was required at a very early date, and the nucleus of this is found in Christ's command to baptise 'in the name of the Father, and of the Son, and of the Holy Ghost.' This formula was expanded into a short form, common to E. and W., divided into the same three members as the present C., but lacking many details, such as the 'He descended into hell' and 'The Communion of Saints,' which two clauses are first found in the Gallican formulae of the fifth century. In the E. this common C. was much modified and expanded in various ways according to the heresy it was required to combat at the moment. In the W. the most important step in the development is the Rom. symbol, which has been variously reconstructed with substantial agreement by various authorities. Before this reference may be made to Irenaeus, Tertullian, and Hippolytus for earlier forms of baptismal confession, all of which show the same type of construction. The present *Apostles' C.* is a compound of Rom. and Gallican forms deriving its authority from Catholic consent. The *Nicene C.* is more definite in its hist. Throughout the second and third centuries there had been keen controversies as to the nature of Christ, and in the fourth century Arius, the great heresiarch, denied that Christ was consubstantial and co-eternal with the Father. The controversy raged throughout the Church, and for long the adversaries of the faith had the upper hand (see *ARIUS*). Athanasius came forward as the defender of the faith, and when, in 325, an oecumenical council was called by Constantine to settle the question, he was the prin. speaker. This council was convoked at Nicea, and the discussion was almost entirely on the person of Christ. The Arians were quite in the minority, but there was a large moderate party, led by Eusebius of Caesarea, who wished to describe Christ not as of the *same substance as the Father* (*ὁμοούσιος*), but as of *like substance* (*ὁμοιούσιος*). Supported by Constantine, the orthodox prevailed, and the first form of the *Nicene C.* was promulgated. At the Council of Constantinople (381) some additions were made, the divinity of the Holy Ghost being stated.

Except for one clause, the *filioque*, declaring the procession of the Holy Ghost to be 'from the Father and the Son,' the C. was now in the form in which we know it in the W. This clause was added in the fifth or sixth century, and was one of the main causes of the controversy between E. and W. which led to the Great Schism. The *Athanasian C.* was formerly believed to date from the fifth century, for its connection with St. Athanasius was never authenticated, and though a determined effort was made in the middle of last century to attribute it to the eighth or ninth century, the earlier position is more probably correct. The C. is an elaborate statement of the doctrine of the Trinity. Since the Council of Trent, the *Professio Fidei Tridentina* issued in 1564 (amended 1870) commonly known as the *C. of Pope Pius*, has practically assumed the rank of a C. in the Rom. Church. See C. A. Swinson, *The Athanasian Creed*, 1870, and *Nicene and Apostles' Creeds*, 1875; C. G. A. Harnack, *The Apostles' Creed* (trans.), 1901; and C. Barth, *Credo* (trans.), 1936.

Creedmoor, dist. of New York city, U.S.A. It stands on Long Is., and is situated in the bor. of Queen's in the co. of the same name.

Creeks, see MISKOGEOANS.

Creek Town, tn. in the Brit. colony of Nigeria, on the Old Calabar R., in W. Africa. Pop. 5000.

Creeper, name often applied to any small bird which seeks its food by running on the ground, but more properly applied only to the family *Certhiidae*, order *Passeriformes*. They have long, slender bills and dull plumage. The tail is somewhat long and square, and the feet slender.

Creeper, see CLIMBING PLANTS. *

Crees (*Cristineaux* or *Knistineaux*), important tribe of N. Amer. Indians of Algonquian stock. They number about 8000, living chiefly in Manitoba and Saskatchewan, between the Red R. and Lake Winnipeg on the E., and Saskatchewan R. on the W. Their first home was near Rainy Lake and Lake Winnipeg, but they spread further, this being largely due to the incursions of the Iroquois (seventeenth century). They are divided into Plain C. (of the Saskatchewan prairies), and Wood C. (of the forests of the Athabaskan region). The name meant 'killers,' but they are now quite peaceable and barter furs with the Hudson's Bay Company.

Creetown, seaport in Kilkendbrightshire, Scotland, at the head of Wigtown Bay, at the mouth of the R. Cree. It is noted for its granite quarries, and the people are mostly engaged in fishing. Pop. 800.

Creevey, Thomas (1768-1838), b. at Liverpool of Irish descent, was M.P. for Thetford and later for Appleby. In old age he enjoyed the offices of treasurer of the ordnance and treasurer of Greenwich Hospital, when he was described by Charles Greville as 'perfectly happy and exceedingly poor.' C. bequeathed to his stepdaughter all his papers—letters, diaries, etc.—and selections from these

were first pub. in 1903. Whilst they are of no great literary worth, they are of considerable interest to the student of the Georgian era. C. was acquainted with almost all the prominent personalities of his day, and their characters as well as the social life of the period are vividly reflected in these papers. What he thought was momentous, politically, may no longer seem so; but personalities hold their attraction undimmed and it is as a gossip, like Pepys, that he retains our affection and, like Pepys, too, C. was 'rediscovered' long after his death. See H. Maxwell (ed.), *The Crewey Papers*, 1903; J. Gore, *Crewey's Life and Times*, 1934; (ed.) *Crewey*, 1949.

Crefeld, see KREFELD.

Creighton, Mandell (1843-1901), Eng. historian, bishop of Peterborough 1891, and of London 1897, b. at Carlisle. In 1882 he pub. the first two vols. of his *History of the Papacy*, and in consequence was appointed Dixie prof. of eccles. hist. at Cambridge in 1881. Three more vols. of this work appeared before 1894. Its historical judgment and widely accurate scholarship are universally acknowledged, yet it is so impartial that Rom. Catholics and Protestants can both appreciate it. He founded the *English Historical Review* in 1886, and ed. it for five years. The following are among his works: *Life of Simon de Montfort* (1876); *The Tudors and the Reformation* (1876); *Cardinal Wolsey* (1888); *Queen Elizabeth* (1896); *Historical Essays and Reviews* (1902); and *Thoughts on Education* (1902). See L. Creighton, *Life and Letters of Mandell Creighton*, 1904.

Creil, tn. of France, in the dept. of Oise and arron. of Senlis, situated on the R. Oise, 22 m. S.E. of Beauvais. Heavy iron goods and machinery are manufactured, also earthenware, porcelain, and glass. There are large copper foundries. C. is an important railway junction. Pop. 10,700.

Crema, tn. of Lombardy, Italy, situated in the prov. of Cremona, on the R. Serio, 27 m. N.W. of Cremona. There are manufs. of lace, silk goods, hats, and linen, and a trade in bell-casting, wax, honey, etc. Flax is largely grown. C. was founded by the Lombards, and possesses an old cathedral and a castle. Pop. 12,000.

Cremation, reduction to ashes of human corpses. At the present day, when there are over forty crematoria in the United Kingdom and as many more under construction or under contemplation, it is difficult to realise that towards the end of the nineteenth century popular sentiment was either so hostile or so apathetic to this mode of burial that not one crematorium existed in England, and very few abroad. On its religious side that sentiment is not passed, and the Cremation Act, 1902, expressly exempts any minister from the obligation to perform a burial service at or after the C. of remains. On the Continent C. is by no means estab.; e.g. it was not until 1931 that it was legalised in Belgium. It prevails mainly in Japan where there are over half a million Cs. annually. In 1946 the number of Cs. in Great Britain

exceeded 50,000. There were 120 crematoria in N. America, the Cs. exceeding 136,000 (U.S.A. and Canada). In Europe there were over 250 crematoria in operation, including 125 in Germany (1939), 40 in Italy, 25 in Switzerland, 20 in Sweden, 16 in Denmark, 12 in Czechoslovakia (1939), 6 in France and only 1 in Russia. There are 10 crematoria in Australia and 4 in New Zealand. C. is by no means a modern practice, except in regard to the scientific process employed; it was the common custom among most of the natives of the ant. world, except Egypt, where embalming was in vogue, and China, where interment in the soil of that country was so involved with religious notions that it was and remains essential to send corpses to China wherever the death may have occurred. It is chiefly due to such lt. chemists and physicians as Polli and Brunetti that the whole question of C. began to be discussed in Europe in the middle of the nineteenth century. In England the matter was never really before the public until Sir Henry Thompson (author of *Modern Cremation: its History and Practice to the Present Date*, 1901), in 1873, having conducted experiments with both regenerative and reverberating furnaces according to the lt. processes, demonstrated the possibility of resolving a corpse into gases with rapidity and efficacy. The result was the formation in 1874 of a society for the promotion of C., with Sir H. Thompson as its president. In 1878 the society bought a site at Woking, but, owing to the opposition of the Home Office, the society was obliged to abstain from any attempt at practising C. In 1881, however, the legality of C. was estab. in a rather curious manner. At the Cardiff assizes in Feb., of that year a man was indicted for attempting to burn the body of his child instead of burying it. Mr. Justice Stephens directed the jury that to burn a dead body instead of burying it was not an offence unless it was done so as to amount to a public nuisance. After this the society, having acquired further funds, announced its intention to perform C., and other crematoria were soon estab. It was not until 1902 that the Act of 2 Ed. VII. c. 8 was passed to legalise and regulate Cs. By this Act burial authorities, including local authorities, maintaining a cemetery under the Public Health (Interments) Act, 1879, may provide and maintain crematoria. No crematorium may be constructed nearer to any dwelling-house than 200 yds. without the consent of the owner or occupier, nor within 50 yds. of the highway, nor in the consecrated part of the burial ground of any burial authority. Regulations were laid down by the home secretary in 1903, providing that no C. may take place until the death of the deceased has been duly registered and the written authority of the medical referee appointed for the crematorium has been obtained. The two ordinary processes of C. are carbonisation in a reverberating furnace, the body being resolved into lime dust by the direct

contact of the fire, and the noxious effluvia consumed in a second or outer chamber, and that of the Siemens regenerative or hot-blast furnace, in which the combustible gases from the body itself meet the hot air sent into the chamber containing the body, this hot air or gas being generated by burning coke in another furnace. See F. C. Fidler, *Cremation* (with bibliography), 1930; P. H. Jones and G. H. Noble, *Cremation in Great Britain*, 1931.

Cremer, Sir William Randall (1838-1908), b. at Fareham, Hampshire, was first apprenticed in the shipbuilding trade, but afterwards became a carpenter, and founded the Amalgamated Society of Joiners. The Inter-Parliamentary Conferences on Peace and on Arbitration were founded by him, and he acted as secretary to the International Arbitration League for thirty-five years. In 1903 he was awarded the Nobel gold medal and prize (amounting to about £8000), but he gave it to the League to promote its cause.

Cremerieux, Isaac Moise, called **Adolphe** (1796-1880), Fr. lawyer and statesman, b. at Nîmes. At the *coup d'état* of 1851, he was arrested and imprisoned, but became minister of justice in the Gov. of National Defence, 1870. He was afterwards one of the ministers of the delegations of Tours and Bordeaux. He resigned in 1871, and was afterwards made senator for life of the national assembly. A selection of his speeches was pub. in 1869, and he helped to compile the *Code des Codes*, 1835.

Cremonitz, see KREMNITZ.

Cremona: 1. Prov. of Italy, in Lombardy, stretching between Rts. Adda and Oglio. Mostly a fertile, cultivated region, W. of the R. Po. Area about 690 sq. m. Produces silk and other fabrics, wheat, flax, maize, rice, and wine. Pop. 370,000. 2. Cap. of above, on l. b. of R. Po. about 60 m. from Milan. Still surrounded by its old walls, it contains many interesting ant. buildings. The twelfth-century Romanesque Lombard cathedral has frescoes by Pordenone and other masters. The main façade is of red and white marble. The Torrazzo near by is the highest clock-tower in Italy, and commands a grand view of the Po valley (396 ft. high). Among the many churches are Sant' Agostino e Giacomo in Brada (1309, with paintings by Perugino), San Sigismondo (1463), San Pietro al Po (1549), Santa Margherita by Giulio Campi (sixteenth century), Sant' Agata. Other interesting buildings are the thirteenth-century tn. hall, Palazzo de' Gonfalonieri, and Palazzo Reale. C. is noted for silk, sweets, preserves (*torrone*), and stringed instruments. Its violins had an immense reputation, the Amatis, the Guarneris, and Stradivari (d. 1746), all being violin-makers. A memorial tablet still marks the house of Stradivari. The anatomist Malpighi was also b. at C. The C. school of painting flourished in the sixteenth and seventeenth centuries. Some of the chief Cremonese painters were Boccaccio, Boccacino, Bembo, the three Camis, Melone, Sofonisba l'Angu-

siola and her sisters. C. was colonised by the Romans, about 218 B.C., to command Cisalpine Gaul; in A.D. 70 it was destroyed by Vespasian, by the Goths in 540, by the Lombards in 605. It became important again in the tenth century, passing into Milan's possession in the fourteenth century. In 1535 under Sp. control; in 1814 it became Austrian, and in 1859 lt. Pop. 64,000.

Cremona, Luigi (1830-1903), It. mathematician, b. at Pavia. In 1860 he was appointed prof. of higher mathematics in Bologna Univ., and was called to the chair of higher mathematics in the univ. of Rome in the year 1873. He was vice-president of the Senate in 1897, and minister of education in 1898. He wrote sev. works, the most noteworthy being *Le Figure reciproche nella Statica grafica* (1879) and *Elementi di Geometria proiettiva* (1873).

Cremona Gardens, situated on the l. b. of the Thames, near Battersea Bridge, served as a popular place of amusement during the middle of the nineteenth century. During the summer evenings entertainments were given, and fêtes were held to provide funds for charitable purposes. They were closed in 1877.

Creoles (derived from Sp. *criar*, to create), strictly the natives of the W. Indies, S. America, and S. U.S.A., descended from the original Fr., Sp., or Portuguese, as distinguished from offspring of mixed races (mulattoes, quadroons, mestizoes), or non-lat. stock, and from negroes and aborigines. The name does not necessarily imply a coloured race, but the term is often wrongly used for negroes and others.

Creon: 1. King of Corinth who was burned to death in the fire which occurred when his daughter, Glauce, put on the garment sent to her by Medea because she had married Jason. 2. Son of Menaceus and brother of Jocaste, the wife of Laius. He governed Thebes for a short time after the death of Laius, but surrendered the kingdom to Oedipus, who delivered the country from the Sphinx. After the death of Eteocles and Polyneices, the sons of Oedipus, he once more took the reins of government. His cruelty in forbidding burial to the corpse of Polyneices, and his sentencing Antigone (q.v.) to death for disobeying his commands, occasioned the death of his own son Haemon, who was in love with Antigone. See the Sophoclean trilogy, *Oedipus Tyrannus*, *Oedipus Coloneus*, and *Antigone*. He sentenced Antigone to death because she, against his wishes, buried the body of Polyneices.

Creosote, **Creasote** (Gk. *κρῆς*, flesh, and *σωτήρ*, to preserve, so named from its ability to preserve animal substances from decay), heavy oil produced in the fractional distillation of coal tar, wood, blast-furnace, and other tars, and used extensively as a preservative for timber. It is a colourless or slightly yellow liquid, with phenolic and empyreumatic smell, sparingly soluble in water, easily in alcohol, ether, and oils. It is a mixture of phenols and phenol ethers, the chief

being guaiacol and creosols. It is a very strong antiseptic and produces local anaesthesia. It is used externally in certain skin diseases, and also internally. C. oil is that fraction of coal tar which distils between 240° and 270°. The solid naphthalene, on cooling, is removed by centrifuging, and the remanent oil is a mixture of phenols and pyridine. It is a valuable preservative for railway sleepers and telegraph poles, and it is also used as liquid fuel for boilers.

Crepis, see BARCKHAUSIA.

Crepuscularia (Lat. *crepusculum*, twilight), tribe of lepidopterous insects, including those called sphinxes or hawk-moths. They are twilight fliers, as distinguished from *Diurna* which, as the name implies, fly in the day, and *Nocturna* which fly by night. The antennae of the C. taper to the end, where they have a club which is pointed at the apex in place of the oval club of the *Diurna* (butterflies) or the filiform antennae of the *Nocturna* (moths). Stantton calls the C. of Latreille *Sphingina*.

Crepuscular Rays (Lat. *crepusculum*, twilight), appearance of rays which frequently appear when the sun is setting with clouds in the vicinity. The reflection of the light from the clouds and floating dust gives the appearance of beams of light all diverging from the sun.

Crépy, or **Crépy-en-Valois**, tn. of France, in the dept. of Oise, and the arron. of Senlis, 12 m. S.E. of Compiègne. The remains of an old castle are here. There are manufs. of fine cotton materials and coarse linen. Pop. 5500.

Créqui, anet. Fr. family of Artois, taking name from a vil. near Calais, and including (1) *Charles* (14th), *Marquis de C. de Blanchefort de Canaples* (c. 1567-1638), soldier and diplomat. Lieutenant-general of Dauphiny. In 1622 made marshal of France. Fought in It. campaigns, and was ambus. —Rome, 1633; Venice, 1634. Killed before Crema, March 17, 1638. (2) *François C. de Blanchefort, Marquis de Marines* (c. 1624-87), soldier, grandson of (1). Marshal of France, 1668. Seized ters. of duke of Lorraine, 1670. Refused service under Turenne, and was exiled. Surprised and beaten at Conzarbruck (1675), lost Trèves, taken prisoner. Returned to France, commanded army of Meuse and Moselle. In 1681 he took Luxembourg. (3) *Renée Caroline de Froulay, Marquise de* (1714-1803), b. at château of Montfleur, married in 1737, *Marquis Louis Marie de C.*, who d. in 1741. Little and plain, but learned, he attracted a literary circle, and influenced J. J. Rousseau. Formed friendship with Sénae de Meilhan. Her letters are extant, but the memoirs are a forgery.

Crescendo (Lat. *crescere*, to grow, increase). The term is used in music to denote a gradual and steady increase in volume of sound, not an increase in pace, though a C. effect is often obtained on a stringed instrument by increasing the pace of the bow.

Crescent, new moon which shows a curving rim of light, ending in points or horns which point to the left of the ob-

server. The term C. is also used when speaking of the Turkish flag, as a C. is seen displayed on that country's ensign. It is also used figuratively when referring to Turkish power, or to the Turkish empire. The Turks adopted the C. as their emblem in 1153 at the taking of Constantinople. A C. in heraldry is an honourable ordinary, being a mark of distinction for the second sons of families and their descendants. The name was also adopted for three orders of knighthood, viz.: (1) That founded by Charles I. of Naples in 1268; (2) that founded by René of Anjou in 1448; and (3) that founded by Sultan Selim III. in 1799, the first recipient of which was Lord Nelson in 1801. All three of these orders are now extinct.

Crescentia, genus of plants in the order Bignoniaceae, named after Pietro Crescenti of Bologna, who lived in the thirteenth century and wrote treatises on agric. subjects dedicated to Charles II. of Sicily. The genus consists of large trees with solitary flowers rising from the trunk or branches. *C. acule* is the culete, or common calabash-tree. It is indigenous to central America and the W. Indies. The subacid pulp is eaten by the natives and is made into poultices. The hard shell is used for a bottle, and is also made into spoons, ladles, cups, basins, and bowls.

Crescentino, com. in Italy in prov. of Novara, Piedmont, 13 m. from Turin. Pop. 5760.

Crescimbeni, Giovanni Mario (1663-1728), an It. poet and critic, joined the Jesuits' college in his native city of Macerata, and there composed his tragedy on the life of Darius and his metrical version of Lucan's *Pharsalia*. In 1679 he became doctor of laws, and in the following year returned to Rome, where he had previously studied under a Fr. priest. His *magnum opus*, *Istoria della volgar Poesia* (1698), revised in 1711, is still a standard work on the hist. of It. poetry, the *Commentaries* (1702-11) being the most valuable of his other works. Yet his country remembers him chiefly for his opposition to the artificial criteria of what was good in literature, which Marini and his admirers had estab. See G. Natali, *Atti dell' Accademia*, 1928.

Crespi, Daniele (1590-1630), It. painter, worked in the studios of Giovanni Battista Crespi and Giulio Procaccini. Pavia and Milan, his bp., contain many of his paintings, and his finest work, a series of pictures illustrative of the life of St. Bruno, hangs in the Carthusian monastery of Milan. His celebrated 'Stoning of St. Stephen' may be seen in Brera. Harmonious colouring and grouping, careful drawing, and a vigour of conception have earned for him a high niche among historical painters.

Crespi, Giovanni Battista (1557-1633), It. artist, known also as Il Cerano after his bp., was president of the Milanese Academy, instituted by Cardinal Borromeo, and attained to high distinction in his native city. A man of versatile gifts, C. was at once sculptor, painter,

and architect. His pictures are remarkable for their pleasing colour blends and their evidence of a lofty imagination, though his figures are often graceless and grotesque.

Crespi, Giuseppe Maria (1665-1747). It. painter, surnamed 'Lo Spagnuolo,' from his love of finery. He was employed by the Grand Duke Ferdinand in the Pitti Palace. His method of colouring, consisting mainly of glazing, has caused the obliteration of many of his works. Besides being a hist. and portrait painter, he was a brilliant caricaturist and did a number of etchings (after Rembrandt and Salvator). His 'Massacre of the Innocents' is at Bologna. Other works are in the Dresden Gallery (series of 'The Seven Sacraments'), Vienna Gallery ('Canaan Sings'), Florence, Leningrad, Munich, and elsewhere. His three sons were also painters. See life by H. Voss (Rome).

HAIRY BITTERCRESS

Cress, name given to various plants with acid or pungent leaves. Nearly all of these belong to the order Cruciferae, but the Indian C., *Tropaeolum majus*, is a species of Tropaeolaceae, and is known as the common nasturtium. The true genus *Nasturtium*, however, contains cruciferous plants, and *N. officinale* is the watercress of salads. Other Brit. species are *Lepidium sativa*, the common or garden C.; *Barbarea praecox* (or *vulgaris*), the winter C. or yellow rocket; *Cardamine hirsuta*, hairy bittercress; *Coronopus Ruelli*, wart or swine's C. (Swine's C. is also classified as *Senecio* *Coronopus*, and wart-C. as *S. dymalis*); Belleisle or Normandy C. (winter C., *Barbarea verna*); while the genus *Arabis* yields sev. rock-C. and *Thlaspi* three species known as penny-C.

Cressy, see CNECY.

'**Cressy**,' armoured cruiser in the Br. Navy, which gave its name to a class of six vessels, laid down in 1898. They were steel built, with a h.p. of 21,000, a displacement of 12,000 tons, and

a length of 410 ft. In the First World War the C. was a unit of the ill-fated force C. Whilst on patrol duty between England and Holland she was torpedoed and sunk together with the *Hogue* and *Aboukir* on Sept. 22, 1914, just off the Dutch coast. This event estab. beyond doubt the power of the submarine, which had previously been underestimated.

Crest, tn. in S.E. France, dept. Drôme, and arron. of Dec. 20 m. S.S.E. of Valence by rail. A centre of silk-worm breeding and silk-spinning, with manufs. of paper, woollens, cotton goods, leather, cement, and beetroot sugar. Pop. 5300.

Crest (Lat. *crista*, a plume or tuft), comb on the head of an animal, whence any tuft or the top of anything, e.g. of a helmet or a hill. (1) In heraldry, the figure or ornament which originally surmounted the helmet of a knight. The practice spread until the C. became an almost indispensable part of a coat of arms, was used in armorial bearings, and as a seal. In spite of the popular misconception the C. is in no way necessary to a coat of arms, which is complete without it. Cs. in helmets were secured in place by rivets, or by lacing with wire or thong. A C. was never actually placed on top of a coronet, as shown in some erroneous modern drawings. The wreath or torse of a helmet was not a lacing, but an ornamental device to conceal the line of junction between C. and helmet. (2) C., or creste, in architecture, an ornamental finish to the ridge of a wall or building, usually conventional foliage, originally in stone, although later it was frequently in metal work. To-day crestings often consist of plain or gilded cast-iron railings. Such forms of decoration were early borrowed from the E. by Romanesque architects. It was common in Gothic, and is still general on the Continent. Exeter Cathedral has a leaden C. of fleurs-de-lis.

Creston, co. seat of Union co., Iowa, U.S.A. It lies 1312 ft. above the sea, and is the junction for two branches of Chicago, Burlington, and Quincy railways. Pop. 3000.

Creswell, Sir William (1850-1933). Australian admiral and organiser of the modern Royal Australian Navy, b. in Gibraltar. In 1891 he was appointed commandant of the Australian Naval Defence Force. When the Australian Commonwealth was estab. he was the first director of its naval forces.

Creswick, small tn. in the co. of Talbot, in Victoria, Australia. It lies on the Tullaroop Creek, 11 m. N. of Ballarat in the centre of a fruitful well-forested country. The neighbouring alluvial gold and quartz mines are the chief source of its prosperity. Pop. 3700.

Creswick, Thomas (1811-69), Eng. landscape painter, began to draw and sketch as a schoolboy at Hazelwood, near Birmingham, and in 1828 went to London to study art. Though C. preferred to give his canvases such fanciful names as 'The Shade of the Beech Trees,' 'A Greenwood Stream,' and 'A Shady Glen,' etc., he usually painted faithful repre-

sentations of the rural scenery he had enjoyed in his native Yorkshire, in N. Wales, and Cornwall. From 1848 onward C. tried his hand at seascapes, the best of which are 'A Squally Day,' and 'Wind on Shore,' but he produced his most attractive pictures when he painted those calm and cheerful country scenes, which bring to the spectator a sense of peace and rest, an effect aided by the smooth placidity of the painting and the grey tones of the greens and blues.

Cretaceous System, so called because its best-known and most characteristic rock consists of white chalk. The C. rocks in England lie to the E. and S.E. of the Jurassic rocks. They extend from the Yorkshire coast through E. Yorkshire, Lancashire, the E. Anglian cos., and so in a S.W. direction to Hampshire and the Isle of Wight, and also eastwards through Surrey, Sussex, and Kent to the coast between the mouth of the Thames and Brighton. They are only found in patches in Scotland and Ireland, but are considerably developed on the Continent, being found spread over large areas in France, Belgium, Holland, Denmark, Sweden, Germany, Poland, and Russia, while also largely developed in S. Europe. They lie under younger formations, being more or less concealed, over a large part of this area, however. In England and France the main cretaceous development is white chalk, in Germany this is replaced by limestones, shales, sandstones, etc., while in S. Europe there is a great development of massive marine limestone (hippurite). The system extends over America, Canada (where there are the chief oil-producing centres), and Greenland, Australia, and New Zealand, while a large development occurs in the Deccan in India.

layers of flint running parallel to the bedding planes in the upper portions. Under the microscope it is found to consist of perfect or broken fossils. Fragments of shells occur plentifully, but it is mainly composed of the remains of foraminifera (*q.v.*).

Fossils of the Cretaceous System are similar to those of Jurassic times. Since the cretaceous strata of Britain are almost all of marine origin, the remains of plant life are chiefly found in the S., where the beds are of fresh-water origin, and consist chiefly of ferns and conifers. The upper C. rocks of Germany, however, furnish plant remains of extinct species of maple, oak, walnut, beech, laurel, etc. Amongst animals the protozoa are abundant. As has been mentioned, the chalk is composed largely of the remains of foraminifera, while sponges, sea-urchins, star-fishes, and brachiopods were common. Bivalves, such as *Hippurites*, etc., were very numerous, while ammonites are the most characteristic fossils and were the most abundant. Among the fishes were various kinds of shark, while the majority of the genera of fishes existing to-day (Teleostei) were existing then. Further, huge land reptiles (dinosaurs), winged reptiles (*Pterodactylus*), and serpent-like reptiles (*Mesosaurus*) were common then, and toothed birds, such as *Ichthyornis* and *Hesperornis*, were also existent in the W. hemisphere in this epoch.

Conditions under which Cretaceous rocks deposited.—The Lower C. rocks were formed under similar conditions to the Upper Jurassic. At this time most of Britain and Ireland existed as dry land, while a large riv. from the N. had its estuary lying over the S.E. of England. The delta deposits of that riv. formed the Wealden beds. Then the land sunk and

CONTINENTAL CRETACEOUS.	EQUIVALENT ENGLISH STRATA.

	Lower Chalk	
Cenomanian	Chloritic Marl	} Upper Greensand
	Upper Greensand	
Albian	Gault	
Neocomian	Lower Greensand	} Lower Cretaceous
	Wealden	

The lower strata of the C. consist of sand and clay. In the S. of England, where the Weald clay is followed by the Lower Greensand, the beds are of fresh-water origin, whereas in Yorkshire they are of marine origin. Above these is a mass of clay known as Gault in the S.E., while in Norfolk, Lincolnshire, and Yorkshire, this is replaced by a thin deposit of lime known as the Red Chalk. These are marine deposits, as also are the Upper Greensand and the Chloritic Marl (*q.v.*). Then lying over these are the most extensive of the C. rocks—the Chalk, which retains the same general characters wherever it exists in England. It is usually a white earthy limestone with

marine conditions prevailed, while the Gault was laid down, although the area was not too remote for mud to be deposited from the rivers. Then as the depression continued, the coast receded until a little earthy deposit was added, and then the Chalk was deposited. Similar conditions at present prevail in the Caribbean Sea, where sediment is being piled up which may form a rock similar to chalk.

Crete (Gk. Κρήνη, Lat. Creta, Turkish Kirit, It. Candia, New Gk. Κάρι), or Candia, large is. in the Mediterranean Sea, considered as the most southerly part of Europe. Its N.W. extremity, Cape Grabusa, is 60 m. S. of Cape Malea in Greece, and its N.E. extremity, Cape

Sidero, is 110 m. from Cape Krio in Asia Minor. C. is situated between $34^{\circ} 50'$ and $35^{\circ} 43'$ N. lat., and between $23^{\circ} 30'$ and $26^{\circ} 20'$ E. long. Its length from E. to W. is about 155 m., its width varies from 7 to 35 m. Its area is a little under 3330 sq. m. (Some estimates give only 2950 sq. m.) The coasts are generally steep and unfavourable for harbourage, though the N. coast is greatly indented. Some of the prin. bays, from W. to E., are those of Kisanos, Canea, Suda, Retimo, Candia, Malea, Mirabello, and Sitia. On the N. are likewise the capes of Spada, Drepano, Stauros, Panagia, and Sidero (N.E.). The chief capes on the S. side, which is less indented, are Krio (S.W.) and Lithinos. The only large bay is that of Messara. The largest is, in the neighbourhood is Gaydo (anct. Claudia), about 40 m. S.W. of Cape Lithinos. The surface is extremely mountainous, especially in the W., where the massive range of the White (or Madaras) Mts. culminates in Mt. Theodoros, at a height of close on 8000 ft. In the centre of the is. is a lower group, but it attains to a greater height in the almost isolated Mt. Psiloti (anct. Ida), over 8000 ft. in height, the highest peak in the is. Further E. are the Lassithi Mts. (chief peak Mt. Christos), and the Sitia Mts. with Mt. Kavousi. There are a few plains of which the largest is that of Messara, extending from the coast to the Lassithi range over an expanse of nearly 400 sq. m. Next to this comes the plain of Canea in the N., through which flows the R. Platanos (anct. Iardanos). From the nature of the country it is evident that the streams are mere mt. torrents. The mountainous country is cut up by deep and precipitous ravines in which snow remains throughout the year. Among the mts. are fertile plateaux, which furnish excellent pasturage during the warm season of the year. The climate is mild and salubrious, and is one of the best in Europe. The air is pure and fresh as a general rule, but the fierce southerly wind, known as the *sirocco*, sometimes raises the temp. to 100° F. Earthquakes are experienced at times, and on Feb. 14, 1930, serious damage was caused by a severe shock, which was felt in Athens, Cairo, and over the Aegean Sea. Many buildings in Candia were shaken to their foundations, a number of people were injured, and ten vill. were destroyed.

Flora and Fauna.—The forests with which C. was once covered have now disappeared almost entirely, but the cypress is still found extensively among the hills, while the lower slopes of the mts. and many of the valleys are covered with olive woods. Though in many parts the soil prevents the growth of vegetation, in others it is very luxuriant. Oranges and lemons are extensively cultivated and exported, while the carob-tree yields the carob beans. Sheep are bred in many parts of the is., and the native breed of mules is very famous. The most important wild animal to mention is the Cretan ibex or goat. Large numbers of these animals are still found in the higher regions.

Minerals.—The volcanic origin of the is. would lead one to the opinion that it is rich in minerals, but nothing much has yet been done to verify this supposition. Gypsum, slate, and iron have been found, and it is probable that considerable quantities of lead, manganese, sulphur, and other minerals also exist.

Population, Religion, and Chief Cities.—The pop. is approximately 336,000. The vast majority of the inhab. of C. are Christians, and there is a steadily declining number of Muslims, to whom the Gks. are hostile. The Jewish pop. is numbered only in hundreds. Under the Venetians, the pop. had been estimated at 250,000, but this number diminished after the conquest of the is. by Turkey. The pop. then rose until the Gk. revolution of 1821, after which came a great fall. Since that time it has again increased to the present number. All the inhab., whether Christian or non-Christian, speak Gk. and the great bulk of the inhab. belong to the Gk. Orthodox Church; the is. being governed by a synod of seven bishops, with their president, the metropolitan of Candia, dependent on the patriarch of Constantinople. There are about 3500 Gk. churches on the is., and four Rom. Catholic churches. Education is nominally compulsory. The chief cities are Canea, the cap. (26,600), Candia or Heraklion, the former cap. and see of the archbishop of C. (39,000), and Retimo (Rethymno) (10,000), all on the N. side of the is.

Archaeology.—In the Homeric age there were over a hundred flourishing cities throughout C. The remains of many of these are of great interest archæologically. Extensive excavations have been carried out during the nineteenth century, and through the discoveries made by Schliemann at His-sarlik (Troy) and at Mycenæ, interest in the origin of prehistoric Gk. civilisation was revived. The art and culture thus brought to light were termed Mycenaean, covering the later Bronze Age. This civilisation was but a late and decadent stage of a highly advanced and wide civilisation centred in C., of which the great period may be dated from the end of the third millennium B.C. to the first half of the second millennium B.C. This civilisation, now generally known as Aegean, covers all that period of E. Mediterranean culture before the beginning of the historic period of Gk. hist., usually dated 800 B.C. Perhaps the most striking feature is that writing, hieroglyphic and linear, was in use, a confirmation of the old legend that the Phœnicians did not invent but only changed the alphabet. Evidence of this civilisation has been found as far W. as Spain, Sardinia, and Marseilles, near Venice in the Adriatic, largely in Sicily, throughout the Aegean, in Cyprus, and in Palestine. Trade with Egypt was frequent from the earliest time. Before the discoveries, mainly due to Sir Arthur Evans, Gk. hist. before the Dorian invasion was a waste of legends and myths. The tale of Minos, the law-giver, the tribute of boys and maidens from Athens to the minotaur, of Theseus, Ariadne, and the labyrinth built by

Dædalus, all have now a foundation of fact. In 1834 was found, 4 m. from Candia, the site of Cnossus, the anct. metropolis; in 1851 Spratt discovered many ruins, and in 1878 Minos Kalokairinos came on large jars and remains of pottery identical with 'Mycenean' art. In 1894 Evans explored part of E. and Central C. Evidence was forthcoming of a script entirely unknown and undecipherable. In 1905 Evans began the excavation work at Cnossus, and unearthed a vast palace, forming a large

handsome youthful cup-bearer with tightly fitting belted drawers has a profile almost Gk. in outline, with no Semitic or E. traces. Immense stone and earthenware jars, beautifully decorated, were found in large quantities, probably used for storing oil and corn. Clay documents, inscribed in the unknown writing, abound, as also do lead and clay seals, probably used for documents of more perishable nature. From the shrines it is seen that the worship was mainly that of a great mother goddess, with fetish images of

L.N.A.

THE HALL OF THE DOUBLE AXES IN THE PALACE OF MINOS, CNOSSUS

square, occupying nearly six acres, with a paved central court, halls, and ante-chambers, connected by passages well built and arranged. A small council chamber, in which is a gypsum throne, has a bath chamber attached; there were upper stories and wide stone stairs; the palace revealed a most modern system of drainage, with water-closets, a stone shaft carrying the water from the roofs to flush the drains, latrines, and other sanitary conveniences. Terra-cotta pipes of modern pattern connect with the main drains. Fresco-painting of an advanced and realistic style decorated the walls, many representing bulls and bull-fights, one of a procession in life-size of women with tight-belted waists and flounced skirts, curiously modern in appearance. The costume is distinctly marked from that of historic Greece. A fresco of a

pillar and dove, of double-headed axes and of serpents. Enamel work and inlay are of high artistic excellence; a gaming-table of gold-plated ivory with crystal plaques set in silver and blue enamel is a beautiful example. Ivory figures of exquisite workmanship show the plastic skill. The highest perfection is found in the pottery: the polychrome on white or dark ground, 'Kamarea' ware, preceding that of dark painting on a lighter ground. The decoration, markedly distinguished from the early Gk. geometric patterns, is designed in fine representations of flowers, aquatic plants, and animals. A small columnar sanctuary used in the worship of the Minoan goddess as Lady of the Nether World was found in 1929, and the W. portico and E. portico were explored. A winding staircase from the sanctuary led to a lustral basin in the depths of the

earth; while a runnel in the E. bastion was found to lead in a series of parabolic curves, broken up at intervals by small settling tanks, to a large tank for purposes of washing. Sherds were also found, which dated from about 1900 B.C., and wall-paintings formed by the impressions caused by a small sponge dipped into yellow paint and then applied to the wall. The restoration of a fresco of Minoan octagonal shields and spiral bands was accomplished.

In June 1930 an outer entrance system was seen and explored. A wall dating from about 2100 B.C., composed of massive blocks, enclosed an acropolis, houses, and part of the palace court. Two round walled pits disclosed sherds dating from the Middle Minoan period. A movable stone altar, with a relief of the sacred horns and double axes, was a notable discovery. These anct. remains were found to have been built over houses of a still more distant period, with stucco pavements, stairways, and household relics in wonderful preservation. Many vessels decorated with snake designs were revealed. Remains of other palaces and shrines have been discovered throughout the is., at Gortyna, Hagia Triada, Zakro, Phastos, Palaikastro, and elsewhere. The central date of this great and historic civilisation may be put at about 3000 to 2000 B.C. The periods are divided into Early Minoan, Middle Minoan, Late Minoan, each being divided into three. Some terrible catastrophe, probably from the sea, overwhelmed this great civilisation; a revival took place, only to be followed by another wave, probably connected with the Dorian migrations in Greece; from this blow the great civilisation never recovered.

History.—Recent archaeological investigations prove that C. was the home of an advanced civilisation even before the Bronze Age, and that the Iron Age saw the end of this civilisation. The earliest written histories of C. are much intermixed with myth, and in the old Gk. traditions the is. bulks largely. The Homeric poems speak of 'hundred-citied Creta' as peopled by people of mixed Cretan, Achaean, and Doric descent. The early legends centre mainly on the name of Minos, who reigned as king of C. at the city of Cnossus. He is spoken of as the founder of Cretan sea power. From his name is derived the term 'Minoan,' applied to the early period of C.'s greatness. The Cretans had, however, no kind of unity among themselves, and hence the islanders never figure largely in Gk. hist. They took no part in either the Persian or the Peloponnesian wars, being continuously engaged in internal struggles, which Polybius tells us were carried on with unprecedented animosity. The three leading cities at this time were Cnossus, Gortyna, and Cydonia. In the first century B.C. the Cretans incurred the enmity of Rome, by an alliance with Mithridates, and this was increased when the islanders joined arms with their neighbours of Cilicia in piratical expeditions. An attack was made on C., and the is. was subdued in 66 B.C. by

Q. Metellus, then surnamed Creticus. It then continued as a Rom. prov. till the year 823, belonging after the div. of the empire to the Byzantine emperors. During this latter period it formed part of the prefecture of Illyria. In 823 it was taken by the Saracens, under whose rule it became a slave market and a centre of piracy. In 960 it was recaptured by Nicephorus Phocas and remained under the Byzantine sovereigns until 1204. Then, on the capture of Constantinople by the Lat., and the estab. of the Lat. empire, C. was allotted to Boniface, marquis of Montserrat, who sold it to the Venetians. The Venetian rule in C. was most oppressive, and many revolts took place but none were attended with success. During this period Candia was made the cap. of the is., to which it gave the official title in Venetian language of 'Candia,' a name which the is. still retains among the Its. In 1645, the Turks made an attack on the is., and the discontent of the Cretans made their conquest an easy one. Only the cap. held out for long, but the siege of this city, though intermittent, is said to be the longest on record. It lasted for twenty-four years. From this time until the Gk. revolution, C. remained subject to the Porte, but its lot was indeed unfortunate. The first of a regular series of revolts broke out in 1770, but this was ruthlessly put down before it could spread far. The gov. grew worse rather than better, and fresh rebellions occurred in 1813 and 1821. In this last the Christian pop. succeeded in possessing themselves of the whole country, when 7000 Albanians were imported from Egypt. Even with this aid, however, the Turks were not able to reduce the is. to submission till 1824. The great powers (France, England, and Russia) refused to allow the cession of C. to Greece, and for ten years the is. was under the rule of the Egyptian governor. This was the best period in Cretan hist., but it soon came to an end. Further revolts occurred, but in 1878, after the treaty of Berlin, when fresh insurrections stirred up by Greece were in progress, the pact of Halepa was drawn up, largely by the efforts of the Brit. consul in the is. This pact gave the is. almost entire autonomy, but party struggles were so fierce and the intrigues so persistent that the condition of the country grew gradually worse. In 1889 the Porte sent a military governor to the is., whose rule practically abrogated the former treaties. The powers, however, refused to intervene. No improvement yet showed itself, as the Christians resolutely refused to submit to Muslim misrule, and in 1894, the powers persuaded Turkey to appoint a Christian governor. But in the years since 1889, large sums of money had been drawn from C. to Turkey, and financial troubles ensued. This, and the recall of the Christian governor, led to the outbreak of 1896. The powers becoming more favourable to C., the sultan assumed a conciliatory attitude and assented to a scheme of reform presented by the insurrectionists, which practically put the gov. into the same condition as the Halepa

pact had done. Things now seemed to be settled, but the Porte did all in its power to prevent the reforms promised. In 1897 a Gk. force landed in C. and attacked the Turks. The is. was again aflame, but Greece and C. were alone, for the powers sided with Turkey. Complete autonomy was granted, but annexation by Greece was declared impossible. The powers compelled assent to this decision by force of arms, and the failure of the Gk. attack on Turkey ratified it. In 1898, the Turkish forces were withdrawn from the is., and Prince George of Greece was nominated as high commissioner of the is. A small section of the people disliked his arbitrary policy and raised a revolt in 1905, proclaiming the annexation of the is. to Greece. This insurrection was put down by the powers. In 1906 the powers gave to King George of Greece the right to propose the high commissioner, and he appointed Alexander Zaimis. His administration was most successful, and the powers were soon able to remove their troops. In 1911 it was announced that no more high commissioners would be appointed to office. On Oct. 11, 1912, Cretan deputies were admitted to the Gk. Chamber, and the is. was annexed by Greece. The treaty of London, signed in Dec. 1913, confirmed this act and C. has ever since been under Gk. rule. In the Second World War C. was captured by the Gers. between May 21 and June 2, 1941 and held the is. until late 1944. See also succeeding article. See R. Pashley, *Travels in Crete*, 1837; T. A. B. Evans, *The Palace of Minos at Knossos*, 1921-36; G. Glasgow, *The Minoans*, 1923; J. Charbonneau, *L'Art égéen*, 1929; and H. T. Bossert, *The Art of Ancient Crete*, 1937.

Crete, the Battle of (May-June 1941). With characteristic speed the Gers. attacked C. only three weeks after the Brit. evacuation of Greece in the Second World War (see GREECE, SECOND WORLD WAR, CAMPAIGNS IN (1941)). They captured the is. within the space of twelve days (May 21 to June 2) and by June 3 the Brit. and Anzac garrison had evacuated the is., leaving some 6000 men unaccounted for. The brief campaign was a triumph of Ger. thoroughness in organisation and ingenuity. It afforded the first instance in modern warfare of the capture of a country exclusively by airborne troops, dropped by parachute, and opposed by a strong garrison and a navy in full control of the sea. The Mediterranean Brit. fleet played its part successfully in so far as it was able to disperse Ger. convoys, sink many boatloads of Ger. invading troops, and prevent any landing from the sea in force on Cretan soil. But their losses were grave, comprising two cruisers (*Gloicester*, *Fiji*) and four destroyers (*Juno*, *Greyhound*, *Kelly*, and *Kashmir*); and later, the cruiser *York*, which was being repaired in Cretan waters, was also sunk. The lack of fighter-plane support and the narrow

waters in which the ships were engaged made them an all too open target for the attacks of Ger. bombers. By the aid of hundreds of dive-bombers, operating from the captured and newly organised airfields in Greece, only 80-100 m. from Crete, the Gers. were not only able to give adequate protection to their airborne troops, which were 'ferried' over in a ceaseless stream of transport planes and gliders, but to crush the spirit of the people and deliver annihilating attacks on the Brit. and Anzac garrison. It was found impossible to give the garrison any adequate protection from the air, and such fighter planes as had been operating from Maleme aerodrome in C. were withdrawn owing to the weight of the attacks on the aerodrome. It was out of the question to send fighters from Egypt, the distance being 400 m. from C.

The Gers. landed their airborne troops regardless of losses. Large numbers of their parachutists were wooden dummies sent to divert the Brit. fire. Most of a force of 3000 men who dropped in the all-important Suda Bay region and in the Candia area were killed, as well as a detachment which reached the outskirts of Canea (May 21). The next day came more swarms of Ger. parachutists. Ger. bombers sprayed the is.'s airfields with explosives for hours at a stretch. Troop-carriers landed on the beaches. Yet for some time the Brit. and Anzac troops, under Gen. Freyberg, V.C., and aided by Gk. and Cretan hillsmen, held the airfields with the courage born of despair. Great numbers of parachutists were killed and many troop-carriers and gliders were destroyed by gunfire in the air. After another day's intense fighting, the Gers. gained a foothold at the one important aerodrome, at Maleme, 10 m. S.W. of Canea, and also in the tn. of Iraklion (Candia) 70 m. E. of Canea. There were further landings of airborne Ger. troops in the succeeding days, but on a much smaller scale. The R.A.F. delivered heavy attacks on enemy positions and aircraft in C. and Brit. heavy bombers attacked the aerodrome at Maleme as soon as it had fallen into Ger. hands.

It is probable that the Brit. resistance was unexpectedly prolonged in the eyes of the Gers., for, having failed to capture the three chief ports, Canea, Retimo (Rethymno), and Iraklion, at the start of the invasion, they bombed those tns. for sev. hrs. (May 24). King George of the Hellenes and the Gk. Gov., who had arrived in C. on April 23, when the Gers. were overrunning Greece, had, in the meantime, left the is. and reached Egypt. In their flight from the is. the king and his party had to take cover every few yds. from Ger. planes which roared so low overhead that the airmen's faces could be seen. They therefore made for the mts. and sheltered for three days in a shepherd's cave, after which they succeeded in embarking. On May 26, the Gers., flinging in fresh troops and always regardless of heavy losses in men and aircraft, renewed their offensive, concentrating their attack on the Maleme

area in a drive towards Canea. On that day at least twenty-four Ger. aircraft of all types were destroyed and numerous others were hit by Brit. fighters. But, despite the severe losses inflicted by the R.A.F., airborne reinforcements continued to reach the Gers. Often the parachutists landed on hills in almost perfect circular formation, reaching the ground safely after only a very short drop from mass-produced plywood gliders. Many had their faces painted green in the hope of camouflaging themselves against the verdure of the hills. All were supported

But the end was now in sight; for the Gers. had captured the port and aerodrome at Heraklion and were threatening the vital position of Suda Bay. Already the Brit. command was learning a lesson in modern warfare demonstrated in practice. The Ger. parachutist was a man superior in small arms. He usually had a tommy-gun. This he could use solely for defence if necessary, but primarily for offence. He was continuously protected, supported, and directed by Ger. aeroplanes. As in Norway, Finland, France, and Greece, experience was proving the

THE TOWN OF HAGIA DEMEA, CRETE

E.N.A.

by the most sustained and intense bombing by dive-bombers, and this co-ordination was impressively assisted by a revolutionary use of wireless. The Ger. forces in the is. were now enlarging their penetration into the Brit. defences, so that, in the area W. of Canea, the defending forces were compelled to withdraw to new positions. Laden enemy transports were sunk by the R.N. as well as two enemy E-boats; but it was on this day (May 27) that the Admiralty announced the loss of two cruisers and four destroyers though many survivors had been landed. Two days later the Brit. forces had withdrawn to the E. of Suda Bay in the face of new attacks by a still more heavily reinforced enemy. More than a hundred Ger. aircraft were successfully attacked by the R.A.F. on the beaches and this no doubt saved the fleet from further losses.

superiority of the bomber used as frontal artillery. It could ferret out anything in the way of defence, though its destructive was less than its paralyzing power, which, however, was great. It had become obvious that the Gers. contemplated the task of taking C. as principally a matter for aeroplanes and tommy-guns. Apart from landing heavy mortars and light field-pieces, the Gers. broke the ground with tommy-guns and planes.

After twelve days of what till that date had been the fiercest fighting in the war, the Brit. High Command decided to withdraw from C. It had become evident that the Brit. naval and military forces could not operate indefinitely in and near the is. without more air support than could be provided from the bases in Africa. Apart from Gk. and It. soldiers and some civilians who were taken with the Brit. imperial forces, some 17,000

Brit. troops were evacuated by the beginning of June, and nearly half the garrison had become casualties. Continuous patrols of R.A.F. and S. African fighters protected the warships and merchantmen in the task of evacuating the troops. Other aircraft dropped food and medical supplies to units isolated in the is., while heavy bombers continued to destroy Ger. planes on the ground in Maleme and elsewhere. Great hardship was endured by the Maoris and other troops in their nightmare journey of 60 m. through the hills. Many reached the shores with boots torn to shreds, only half-clad, starving, and often with grave untended wounds. No quarter had been given in the fighting and none was asked. So confused was the situation that fantastic things kept happening. The Gers., for instance, continued to drop all manner of supplies on top of the fleeing Brit. troops under the impression that they were their own men—condensed food, four-inch mortars in long cylindrical cases, two-pounder field-guns, unpacked and attached to triple parachutes, and tins of petrol.

Thus ended in a phantasma of incredible scenes, the epic battle for C. The chances of the defence succeeding against a ruthless airborne invasion covered by dive-bombers inevitably turned upon a copious supply of heavy equipment, and this it was apparently impossible to grant. The dive-bomber, in fact, smothered the small artillery and anti-aircraft equipment. It was objected by contemporary critics that, inasmuch as the Brit. authorities had been in occupation of the is. for seven months before the invasion, they ought to have had a longer-sighted appreciation of the kind of attack that they would have to meet, and that they too lightly assumed that the Gers. could not succeed without the heavier material that could come only by sea, while they did not foresee that airborne troops, aided by dive-bombers, could not be overcome without adequate supplies of tanks and heavy guns. The greater anxiety was felt in the outcome of this historic battle not only from its obvious effect on the defence of Egypt, but from the consideration that the invasion of C. was, in some sort, an illustration of, perhaps even a try-out or prelude to, an invasion of Britain. But there were other and competing claims for anti-aircraft guns, especially for ships in the battle of the Atlantic, and for the ports, cities, and factories of Britain. When the Brit. entered C. they took steps to defend the anchorage of Suda Bay as an important naval base, and to develop the aerodrome near the bay, and to provide both base and aerodrome with the largest quantity of anti-aircraft guns which it was possible to divert from the other strategic points in the Mediterranean. The B. of C. was, in fact, 'only one part of the very important and complicated campaign which was being fought in the Middle E., and to select one particular sector of our widely extended front,' for criticism and debate was a 'misleading

method of examining the conduct of war' (Mr. Churchill in the Commons, June 10, 1941). Moreover, Germany had a great advantage in the matter of moving her air force from one side of Europe to another. Brit. aircraft had to be packed in crates and transported by sea round the Cape of Good Hope. Yet, despite all these drawbacks, the Brit. Gov. and chief of staff (Gen. Wavell), and other general officers of the staff, decided to defend C., hoping that some 50,000 good troops (actually there were 27,000 Brit. and 26,000 Australian and New Zealand troops) would be able to destroy the parachutists and glider landings, while the navy destroyed the seaborne attacks. But there was a time limit: the action of the navy in maintaining the N. seaguard without adequate air defence was bound to be very costly, and, when a certain proportion of naval losses had been incurred, the safeguard had to be withdrawn. Similarly, when it was clear that the fighter-planes had no reasonably safe landing ground they, too, had to be withdrawn. More air-fields were not prepared because there were insufficient guns to defend them. Had the Brit. long-range bomber-fighters been able to take part in the battle from the start the result might have been different; the margin of defeat was in fact a narrow one. But even at this time the Ger. air force greatly outnumbered the Brit. and allied air forces, and, striking from the centre, was able to concentrate overwhelming strength at any point on the periphery of the Reich's defences.

Yet it was not all gain on the one side and all loss on the other. The twelve-day interval helped the Brit. to regain control in Iraq (*q.v.* and see *infra*), and it gave time for the arrival of further reinforcements in the Near E. A pusillanimous refusal to defend C. would have had, too, as lamentable an effect on Amer. public opinion and on that of other neutrals, as a refusal to defend Greece. It was the soundest strategy to compel Germany to fight for every inch of the soil she coveted and to make her victories as costly as possible. Some 3,000 Gers. were drowned in trying to cross the sea, and at least 12,000 were killed or wounded on the is. The Ger. Luftwaffe suffered extraordinary losses. Above 180 fighter and bomber aircraft were destroyed, and at least 250 troop-carrying aeroplanes, and that at a time when Brit. air strength was overtaking the Ger. Immediately, however, the situation in the E. Mediterranean was changed, to the disadvantage of the Allies. The navy now had to operate in narrower waters, and between recaptured Cyrenaica and captured C. a new Seylla and Charybdis had come into being—one reason more for holding grimly on to Tobruk. Serious, too, was likely to be the effect upon Germany's use of the Dardanelles. With O. athwart the Aegean entrance, it would be easier for the Gers. to develop coastal traffic through the Dardanelles and Gk. territorial waters up to Trieste. But, in the sequel, it became evident that Germany's main

preoccupation was the protection of the right flank of their armies, which were now being disposed for attack along the whole Russian frontier from Finland to Rumania. See Dilys Powell, *Remember Greece*, 1941, and A. Moorhead, *Mediterranean Front*, 1942.

Crétineau-Joly, Jacques (1803-75), Fr. historian whose *Histoire de la Vendée* (1840-42) is a standard work, whilst he was an authority on the relations between the Rom. Catholic Church and the State. For his *Histoire religieuse, politique et*

trading tongues. They have receding foreheads, large hands and feet, and rickety limbs, while they usually have a dwarfish body, with thick, dry, loose skin, and a protuberant abdomen. The treatment consists in the careful administration of some part or all of the thyroid gland of the sheep. See GOITRE and MYXŒDEMA.

Cretonne (perhaps from Creton, a vil. in Normandy, where linen goods were manufactured), was originally a Fr. fabric, strong and white, with linen weft and

littéraire de la compagnie de Jésus (1844-1846), he was able to avail himself of reliable and hitherto unpublished records, yet critics deprecate the work on the ground of its personal bias.

Cretenism, congenital disease, causing idiocy or arrested mental development, together with bodily deformity, always associated with absence or atrophy of the thyroid gland. The connection between goitre, myxœdema, and C. is close. Myxœdema, however, comes on in adult life, and is associated with a destructive change in the thyroid gland, although the removal of the gland will bring on a similar condition. An enlargement of the gland causes goitre, while a loss of the functioning of it seems to be the cause of C. It is found all over the world, and in all classes of society, it is most common in the deep-lying valleys, where light and free circulation of the air are impeded. Thus of Crete and largely in the lower valleys of reinforced Pyrenees, and other mountain ranges of Europe. It is rarely met by the R.A.F. above 3000 ft. Cretenism no doubt saves, obscene, and shameless, loose.

open mouths with pro-

hempen wool. The material known as C. to-day is a stout cotton cloth, with a crape, basket, or wave figure produced on the loom, and a pattern printed sometimes on both sides, when the two designs usually differ. It is unglazed, and was introduced about 1860 as a substitute for the thinner chintz, which was largely used for curtains and for covering chairs, etc. Inferior qualities have a weft of cotton waste and patterns printed in bright, fugitive colours.

Creusa: 1. A daughter of Heecuba and Priam, king of Troy. The wife of Æneas, and mother of Ascanius, she was parted from her husband during the tumult following on the fall of Troy, and finally saved by the goddess Cybele, who made her a priestess. In the Virgilian story she appears as a phantom before Æneas, uttering dramatic prophecies of the disasters and eventual glory that awaited him in Italy. 2. Called also Glauce, a daughter of Creon, king of Corinth. Jason conceived a passion for her, and Medea, his wife, jealous of her supplanter in Jason's affections, sent her as a wedding gift a poisoned garment which brought

about an agonising death. 3. A daughter of Erechtheus, king of Athens, and the mother of Janus and Ion by Apollo. She exposed Ion at his birth and married Nuthus, to whom she bore no children. The Delphic oracle told them to take Ion for their son, who had meanwhile been brought up by the Pythian goddess at Delphi. Suspecting his true identity C. determined to poison Ion, but the latter discovered her plot, and she herself was only saved from death by fleeing at once to Apollo's altar.

Creuse, riv. and dept. in the centre of France. The riv. rises near Fémiers and flows about 150 m. through the depts. of Creuse-et-Indre, Vienne, and Indre-et-Loire, joining the Vienne, a trib. of the Loire, about 12 m. N. of Châtelleraulx. The dept. is formed of the old Haute Marche, and parts of Berry and Limousin. It is drained by the R. C., and its surface is mountainous, and its soil thin and unproductive. In the S. hilly dist. there are wide stretches of pasture land. The climate is moist and the cold very severe in winter. Chestnuts form a large proportion of the food of the pop.; hemp, potatoes, and fruit are also grown, while cattle, sheep, pigs, and goats are reared on the pasture lands. Coal is mined at Ahun. There are some manufs. of carpets and hangings, and there are dye-works at Aubusson and Felletin. Wooden shoes and hats are made in large numbers. C. is divided into the arrons. of Aubusson and Guéret. Cap. Guéret. Area 2163 sq. m. Pop. 188,600.

Creusot, Le, tn., 34 m. N.W. of Mâcon, in the arron. of Autun and the dept. of Saône-et-Loire, central France. The neighbouring coalfield and iron ores have caused a number of metallurgical and engineering works to spring up (including the celebrated Schneider-Creusot cannon works), which are connected together by over 30 m. of railroad. It was on Oct. 17, 1942, that ninety-four unescorted Lancaster bombers of the R.A.F. heavily hit the Schneider arms works at Le C.—then in Ger. occupation. The attacking force lost only one machine. The armament works were hit again on June 19, 1943. The tn. fell to the Allies soon after the landings in S. France in the autumn of 1944. Pop. 24,100.

Creutz, Gustav Filip, Count (1731–85). Swedish poet and diplomat, b. at Angårds in Finland. In 1762 his *Allis och Camilla* was pub. in a collection of poems. This pastoral idyll, for many years regarded as the crowning ornament of Swedish poetry, possesses, like C.'s other inimitable pastoral, *Daphne*, a grace of style and melody which led admiring critics to call the author 'the last artificer of the language.'

Creuzer, Georg Friedrich (1771–1858). Ger. philologist, whose earliest and best-known work, *Symbolik und Mythologie der alten Völker, besonders der Griechen* (1810–1812) was an ingenious attempt to carry back the mythology of Homer and Hesiod through the Pelasgians to an E. source. His hypotheses, however, were pulled to pieces by Hermann, Voss, and others.

Among other learned works are his complete ed. of Plotinus and treatises on classical philology in 1854.

Creuznach, see KREUZNACH, BAD.

Crevalcore, com. 12 m. N.E. by E. of Modena, in the prov. of Bologna, in Emilia, Italy. Pop. 12,800.

Crèvecoeur (Fr. for heart-breaker), Dutch stronghold, which was important in hist. from 1587 to 1794, commanding a central strategic position at the confluence of the Dieze and Maas. 4 m. N.N.W. of Bois-le-Duc ('S Hertogenbosch'), in N. Brabant, Holland.

Crèvecoeur, vil. of France in the dept. of Nord, situated on the R. Escaut or Scheldt, 5 m. S. of Cambrai. Pop. 2100. It was entirely destroyed during the First World War.

Crèvecoeur-le-Grand, vil. of France in the dept. of Oise, 12 m. N. of Beauvais. It possesses an old castle with picturesque gardens. There are manufs. of woollen goods and pottery. Pop. 2100.

Crèvecoeur, Michel Guillaume Jean de (pseudonym, J. Hector St. John) (1735–1813), Fr. writer, b. near Caen, France, and educated at a Jesuit school, also spending some time in England. He went to New York in 1759 and became naturalised as an Amer. citizen in 1765, having acquired a farm near Chester, New York. Returned to France 1780–83, 1790–1813. His fame rests on his *Letters from an American Farmer* (first pub. in England 1782)—a series of charming essays giving a farmer's reactions to the life and issues of the times. These *Letters*, with their glowing descriptions of the Amer. frontier, are said to have had an appreciable influence on emigration to America which sometimes led to disillusionment. Other works were *Loupe dans la haute Pensylvanie et dans l'état de New York* (3 vols., Paris, 1801); and *Sketches of Eighteenth Century America*, ed. by H. L. Bourdin, R. G. Gabriel, and S. T. Williams, pub. 1925. An ed. of the *Letters*, with an introduction by Ludwig Lewisohn, appeared in 1904. The township of St. Johnsbury, Vermont, founded 1785, was named in honour of C., who was Fr. consul at New York and a benefactor of Vermont. Lives by Robert de Crèvecoeur (Paris) 1889, and J. P. Mitchell (New York), 1916.

Crevillente, tn. in the prov. of Alicante, Spain. The surrounding country produces fine melons, wine, wheat, olives, and esparto grass, and oils, carpets, and flour are manufactured in the tn., which, with its orange-groves and dwarf palms, its cañi and its rocks, presents a very keen and attractive appearance. Pop. 10,000.

Crew (probably from *accree*, reinforcement, from O.F. *accree* and *accroître*, to increase) is used of a body of men who associate together to carry out some special work, and especially of men employed on a ship, that is, of the petty officers and seamen, exclusive of the captain and commissioned officers. In the royal navy the C. is divided into over 175 grades, the chief being that of the able-bodied seaman. On merchant ships,

both sailing vessels and steamers, Cs. are now smaller than they were in consequence of rapid improvements in masting, rigging, etc., in mechanical appliances and generally in the economy of work and power. The Merchant Shipping Acts, especially the elaborate statute of 1894, protect the rights of seamen. Brit. consuls in seaports abroad have numerous duties with regard to Brit. merchant shipping. Thus a consul may make inquiry into all agreements and accounts of the Cs. and into all offences and misdemeanours. Further, he must provide subsistence for shipwrecked, discharged, or abandoned sailors, and listen to any complaints with regard to food, etc. Since the repeal of the Navigation Acts a master has been able to man his ships with sailors irrespective of qualification, nationality, age, or strength. Frequently in these times half the Cs. on Brit. ships are foreigners and Lascars, almost equally divided. By the Act of 1907, however, it is stipulated that no seaman may be shipped without some acquaintance with the Eng. language. The term *aircrew* is applied to the complement of a military aircraft.

Crewe, municipal bor. (incorporated in 1877), with an acreage of 2193, in the C. parlt. div. of Cheshire, England. Lying 158 m. N.N.W. of London, it owes its commercial importance to the fact that it is a locomotive building centre of Brit. Railways (formerly of the London Midland and Scottish Railway Co.), that it connects with the S. the main lines feeding the N. of England and Scotland, and that it is a junction for the lines passing through the mining dists. of Wales and the Black Country of Staffordshire. From C. it is possible to go direct to Liverpool and Manchester, Holyhead, and N. Wales. N. Stafford, and Hereford, besides London. It is mainly inhabited by workers in the service of the railway, which gave the tn. its schools, its mechanics' institute, including science and art classes, and a library, and also Victoria Park. The company further provided an electric power station, a number of subterranean roads to facilitate goods traffic, and a series of postal offices in which the mails for Scotland and Ireland are sorted. Before railways existed C. consisted of three or four farm houses, one of which with the date 1639 still remains. The railway works are the largest in the world. Pop. 46,500.

Crewe, Robert Offley Ashburton Crewe-Milnes, first Earl of (1858-1915), Brit. statesman, the son of Baron Houghton. In 1899 he married Lady Margaret Primrose, daughter of the earl of Rosebery. In politics he always followed the Liberal cause. In 1908, he was appointed secretary of state for the colonies. In 1910 he was secretary of state for India and was ambas. to France 1922-28. Secretary of state for war, 1931. Leader of the Liberal party in the House of Lords 1936-44. During his tenure of office as secretary of state for India he was responsible for the important changes announced at the Delhi Durbar, including

the removal of the cap., and the abandonment of the partition of Bengal. Publications: *Stray Verses* (1889-90), and *Lord Rosebery* (1931).

Crewel Work, embroidery worked in coloured worsted yarns called crewels. This kind of wool is especially suitable for larger pieces of needlework, such as tablecloths, tapestries, and various furniture covers. Finer silks have tended to supplant crewels in the field of artistic needlecraft.

Crewkerne, tn. of England, in Somersetshire, in a fertile valley, 16 m. S.E. of Taunton. Manufact. of horsehair cloth, sail cloth, and dowlas are carried on. The grammar school was founded in 1499. Pop. 3500.

Cribb, Tom (1781-1848), champion pugilist, started life as a bell-hanger, and became in turn dock labourer, sailor, and coal porter. The important years of his life were given up to fighting, and throughout his many contests he sustained only one defeat, that being at his second fight in 1805. Among his more famous adversaries were Jean Belcher, whom he defeated twice (in 1807 and 1809), the second time at Epsom, when the stakes were 200 guineas; Bob Gregson and Molmeux, the Amer. coloured champion, whom also he worsted on two occasions (in 1810 and 1811). His great fighting days over, C. sank to the position of publican in the Haymarket, whence he twice emerged into public notice, once when he sparred in Pall Mall before the emperor of Russia (1814), and again when in the dress of a page he guarded Westminster Hall at the coronation of George IV.

Cribbage. This game is usually played by two persons with a pack of fifty-two cards. Sixty-one points constitute a game, and these are scored by means of two pegs on a board containing sixty-one holes. The value of the cards is as follows: the kings, queens, knaves, and tens all count as ten, the rest of the cards having their face value, the aces counting as one only. The points of the game are scored by means of fifteens, sequences, pairs, by the knave being turned up (usually this point is termed 'one for his nob'), and by making thirty-one, or getting nearest to that number ('one for go'). The cards are shuffled and cut in the usual way; the player cutting the lowest card wins the cut and proceeds to deal. This he does by dealing out five alternate cards face downwards; the non-dealer has the right to score three points at any period of the game to make up for the advantage of the deal. The players having reviewed their cards now proceed to place two from their hand on the table; this is called making the 'crib.' The remainder of the pack is then cut by the non-dealer, and the top card turned up. The cards are then played alternately, starting with the non-dealer, and each card is 'called' as it is played, e.g. A, the non-dealer, plays a five, and calls five, the dealer B plays a six and calls eleven. A then plays a four and calls fifteen (for this he scores two points).

B then plays a ten and calls twenty-five. A, finding that he cannot play without exceeding thirty-one, calls 'go' and B scores 'one for the go,' since he also cannot play without exceeding thirty-one, or, on the other hand, plays a four (or a card of a value which will not make the total score thirty-one), and scores 'one for the go' just the same. Should the scores reached be exactly thirty-one, the player first reaching that score marks two points for game. The non-dealer then counts up his score (if any) from his hand, and then the dealer counts first his hand and then, turning up the crib, the crib. The card which has been turned up earlier in the game is a neutral card and counts to the non-dealer, or dealer, if it is any good. Pairs are reckoned up in the hands, or at the end. Sequences: any three cards or more forming a sequence count one point for each card. Also if by replacing one card already counted by another in the same hand of similar value but different denomination, another sequence can be reckoned, this is done, e.g. three (hearts), four, and five count as a sequence, whilst if the player holds also a three (clubs), this forms another sequence and is counted. Fifteen a.c. counted during the play, whenever the value of all the cards played comes to fifteen, and is also counted in the hands or the crib afterwards; in the hands or the crib any combination of cards which amounts to fifteen may be scored, two being counted for each combination. A flush is counted only in the hands or in the crib. In the hands if all the cards are of the same suit this counts a flush, and one is counted for each card, whilst if the card turned up is of the same suit also, one more is counted. In the crib, however, the flush does not count unless the cards in the crib are of the same suit as the card turned up.

Crib biting, see under HOUSE (DISEASES).

Cricieth, picturesque vil. with ruined castle and fortress, situated on Cardigan Bay in Carnarvonshire, Wales. It is a favourite seaside resort. Pop. 1400.

Crichton, James (1560-85), commonly called The Admirable. Romance and tradition have been so busy with his name that it is difficult to form any just estimate of either his life or his character. He was b. at Elioek, Dumfriesshire, Scotland, and educated at the college of St. Salvator, St. Andrews, under Buchanan, where he had the young king for a fellow pupil. In 1575 he took his degree of A.M. with great honour and proceeded to Paris. There he served in the army for a short time, and in the univ. of Paris issued a universal challenge to all men upon all things, to be held in twelve different languages. In spite of spending the interval in music and dancing, on the appointed day he vanquished all his opponents. From Paris he went to Genoa, and repeated the feat, and thence to Venice in 1580. In Venice he won the friendship of the grandson of the famous printer, Aldus Manutius, and challenged all the scholars to feats not only of learning, poetry, and linguistic fluency, but of swordsmanship as well. Tradition says

that he later proved his exceptional ability as a swordsman by slaying in combat a renowned gladiator at Mantua. In 1584 he pub. an elegy on the death of the archbishop of Milan, Cardinal Borromeo, and odes in honour of his successor and of the duke of Savoy, and in 1585 he pub. a vol. of Lat. poems. In the same year he was appointed as the tutor to the duke of Mantua's son, but was stabbed by his pupil, whether through jealousy or in a drunken brawl is unknown. That he was a prodigy was acknowledged by men of some weight, although, owing to his youth, it was improbable that his learning was of any depth, or his accomplishments of more than surface excellence. See Sir T. Urquhart, *Discovery of a most Esquisite Jewel*, 1562; T. H. Ainsworth, *Crichton*, 1837; and life by D. Irving.

Crichton-Browne, Sir James (1840-1938), commissioner in lunacy, attended Glenalmond, and later Edinburgh Univ., where he obtained in 1862 his M.D. degree. From 1875 he was the lord chancellor's visitor in lunacy, and acted as vice-president and treasurer of the Royal Institution from 1889. Besides being the recipient of many honorary degrees, he pub. a number of treatises on nervous and mental diseases, and, in 1932, *The Doctor's Afterthoughts*.

Cricket. Although the present game is of comparatively recent date, the origin of the pastime goes back to the dim mists of the past. The Saxons had a game called *creag*, which they played with a bent, wooden bat, and in the reign of Edward I., mention was made of the game in the wardrobe account of the king for the year 1300. It was said to have been played in Surrey in the middle of the sixteenth century, and is alluded to in Phillips's *Mysteries of Love and Eloquence*, which was pub. in 1658; and in an old book pub. in 1672 it was stated: 'Maldstone was formerly a very prophane town, inasmuch that before 1640 I have seen morrice dance, cudgel playing, stoolball, cicketts, and many other sports openly and publickly on the Lord's Day.' In the *Postman* for July 24, 1705, there is a notice to the effect that a C. match 'will be plaid between eleven gentlemen of the west part of Kent and those of Chatham for eleven guineas a man.' In 1711 Kent played all England, and in a copy of the *Evening Post* for Aug. 7, 1729, is the following quaint entry: 'On Tuesday was played a cricket match on Kennington Common between the Londoners and the Dartford men for a considerable sum of money, Wager and Betts, and the latter beat the former very much.' The nobility and even royalty were enthusiastic patrons of the game, and large sums of money were wagered, and in 1735 the Prince of Wales and the earl of Middlesex brought two teams together for a bet of £1000. In 1746 Kent again played all England, and this is the first match of which the full score has been preserved, the co. winning by one wicket. In 1747 Surrey played all England; in 1754 the first co. match was played between Sussex and

Kent. The Hambledon was the first club to be formed, and flourished about this time. It was started in 1750 in Hampshire, and had its ground on Broad Halfpenny and Windmill Downs. It was the cradle of modern C., and took the lead in all matters pertaining to the game. David Harris and Wm. Beldham were the most famous players of that old-time club, as batsman and bowler respectively. In 1774 the first written rules were drawn up. In the early days wickets consisting of only two stumps were used, and it was not until the close of the eighteenth century that the third was instituted. At first there was no limit to the size of the bat, which was shaped rather like a club. Single-wicket matches were at one time very popular and often played for high stakes, but now they are practically never seen. In the early days the score was kept by cutting notches on a stick, one for each run. The Hambledon Club continued till 1791, when it was disbanded, but the newly formed Marylebone Club (started in 1787) took its place as leader of the C. world, a position which it fills to this day. The first ground of the M.C.C. (as the club is popularly known) was in Dorset Square, Marylebone, and then Regent's Park, but in 1814 it moved to St. John's Wood, the ground of Thomas Lord, which has ever since been known as Lord's. The M.C.C. is regarded as the governing body of the game. Its committee is responsible for the laws of the game, which must be approved by a two-thirds majority of the members. It was the M.C.C. which first sponsored touring sides from this country and guaranteed any losses, and it still does so. Full ordinary membership is normally acquired by nomination at fourteen and election fifteen to twenty years later. No professional could become a member of the M.C.C. until in recent years a number of retired professionals, who had rendered notable service to the game, were elected to honorary membership. The total membership of the M.C.C. is about 7000.

The earliest writers on the game were Nyren, Lambert, and Pycroft, and their books are very curious and interesting, and show how different the game was in their day. All bowling was at one time underhand, and the introduction of the round-arm deliveries was at first viewed with great disfavour by the Marylebone Club. It was not until about 1825 that this method of bowling became at all general. It was considered dangerous and led to the introduction of leg-pads and batting gloves, things quite unknown in the old days. The game continued to progress in popular favour, and in 1845 the I Zingari Club was formed. From that date the game has advanced by leaps and bounds, till nowadays it has become so scientific that were the ghosts of the early players to return they would hardly know it, much less be able to play it. In 1865 overhand bowling was sanctioned, and this made a great difference in the game.

The modern game is played with eleven

men on each side. There are three stumps, 28 in. high (out of the ground), and the wicket 9 in. wide. The wickets are pitched 22 yds. apart, and surmounted with two balls each, 4½ in. in length. The ball weighs 5½–5¾ oz., and a full-size bat is 38 in. by 4½ in. at the widest part. Two batsmen are at the wickets at once, the object being to score as many runs as possible, one run being scored every time the batsmen exchange ends. The batsmen can be out in nine different ways: (1) being bowled; (2) being caught; (3) being stumped; (4) leg-before-wicket (in 1937 it was ruled that a player could be adjudged out if he intercepted an off-side pitched ball, which would have hit the wicket); (5) hit wicket; (6) obstructing the field; (7) wilfully hitting the ball twice except in defence of the wicket; (8) being run out; (9) handling the ball.

Many variations occur in the placing of the field, according to different bowlers. It is the wicket-keeper's duty to prevent an unfit ball from passing him; if he fails to do so it is a *bye* and on it the batsman may score a run. Sometimes the wicket-keeper is aided by another man straight behind him called *long stop*, but in good-class C. this practice has died out. Should the ball pass the wicket-keeper it can be fielded by *first slip* or *fine leg* who stand behind the wicket-keeper to right and left respectively, assuming that the batsman is playing right-handed. To the right of first slip stands *second slip*; on the batsman's right stands *gully* (a forward slip), *point*, or *backward point*, on the off side; *cover point* is further to the right and front. *Mid-on* and *mid-off* are near the bowler, on the on and off sides; while behind the bowler and often the furthest fielders from the batsman are *long-on* and *long-off*. Other placings are shown in the diagram opposite. These are the usual positions, but a captain may place his men where he will. Bowling takes place alternately from each wicket in series of six deliveries (in Australia the over consists of eight deliveries). This series is called an *over*, and a *maiden over* is one in which no runs have been scored. At the end of each over the fielding team takes up the corresponding places in regard to the new bowling point. The umpires are the sole judges of every point that may arise, and their decision is final; no umpire is allowed to bet on the game.

Various changes were made in the laws of C. as from 1943; the latest state of the laws will always be found in the *Wisden Cricketer's Almanack*. In allowing a fielding substitute a captain may specify where he may not field, instead of where he may field. It is a fallacy to suppose that a substitute may not keep wicket. This has often been allowed and, subject to consent, it may still be allowed. The captain may now agree to dispense with the new ball (under the new ball rule, the new ball can be taken after sixty-five overs) at the start of an innings. The term the pitch has been defined as the ground between the wickets, but the term wickets

is now restricted to the stumps and bails. Previously to the changes, if a wicket fell within two minutes of time, the batting side had the unilateral option of continuing the game or not; but either captain may now demand that the last over of a match be finished—a change that may help to reduce the number of drawn matches. Regarding the 'no-ball' law as far as the position of the bowler's back foot is concerned: for years umpires had disregarded the rule that the foot should be 'grounded,' because most medium to fast bowlers lift their back foot before delivery.

expanded to cover two points which were not explicit in the old interpretation: the striker can be out if the ball strikes him above the top of the stumps, provided it would have hit the wicket. The law also provides, for the l.b.w. decision in the case of a full pitch (i.e. a ball which does not strike the ground before reaching the batsman). There are also new points in the laws dealing with run out and stumping by the wicket-keeper: he can take a ball in front of the wicket for the purpose of stumping or catching provided it has previously touched the striker's bat or

FIELDING POSITIONS

The diagram is not a field setting, but shows the positions in which the nine fieldsmen, apart from bowler and wicket-keeper, can be disposed.

W.k., wicket-keeper; F.S.L., forward short leg or silly mid-on; S.M.O., silly mid-off.

The licence had become a traditional custom and the new law recognises it, so that the umpire is only required to 'no-ball' a bowler if his back foot touches or crosses the bowling crease either on the ground or in the air before the ball leaves his hand. The old interpretation of the laws directed an umpire to regard the wicket as down if the ball was just disturbed without falling; but now the ball must fall from its position on the top of the stumps for a wicket to be down. As regards the practice of batsmen returning the ball to the fielding side before it becomes 'dead' and without being asked to do so the umpire, if there is an appeal for handling the ball, has only one possible verdict to give under relevant laws, that is 'out.' For this reason, all players should avoid the practice. The leg-before-wicket law has been

person and provided he does not interfere with the striker's right to guard his wicket. Stumped is now confined to cases in which the striker is definitely not attempting a run. In no case can he be stumped off a no-ball. But if he attempts to run he can be run out as before the changes. Finally, a remedy is provided for an attempt by the batsmen to change ends by stealing a run during the bowler's run up and delivery: now, as soon as the batsmen have crossed in any such ill-oft attempt the umpire will call 'dead ball' and send the batsmen back to their starting points.

Organisation of First-class Cricket.—First-class matches take three days to play, but the great majority of club matches are one day or half a day only. Test matches (i.e. inter-imperial) are allotted 3-6 days,

but the final match, if it is the deciding game, may be played to a finish. The M.C.C. has power to say which Eng. co. teams are termed 'first class,' but the number of seventeen has remained unaltered for many years. They are Derbyshire, Essex, Glamorgan, Gloucestershire, Hampshire, Kent, Lancashire, Leicestershire, Middlesex, Northamptonshire, Nottinghamshire, Somerset, Surrey, Sussex, Warwickshire, Worcestershire, and Yorkshire. These compete for the co. championship, each co. having to play twenty-eight matches. In the championship twelve points are given for a win, these being divided in the event of a tie, while in an unfinished match four points go to the side leading on the first innings. The M.C.C., Australians, S. Africans, W. Indians, Indians, and in England both Oxford and Cambridge Univs., are counted as 'first-class' C. teams. A man can be eligible to play for his co. in two ways, either by birth or residence, the latter having to be two consecutive years before the season. This rule applies to amateurs and professionals alike. A cricketer may qualify for one co. by residence, and at the same time play for another co. Apart from the test and co. matches the chief events of the C. season in England are the matches between Gentlemen and Players, Oxford and Cambridge, and Eton and Harrow.

Great Cricketers and Records. As regards the more personal side of the game, one of the most famous players the world has produced was Dr. W. G. Grace, who for nearly forty years took an active part in first-class C., and was top of the batting averages twelve times. Altogether he scored 217 centuries, 126 of these being in first-class C., and his total number of runs was 54,896. He is, however, rivalled by the Surrey professional, Jack Hobbs, who had scored 197 centuries in first-class C., when he retired in 1931. He surpassed Grace's record in 1925 with a seasonal aggregate of 3024, including sixteen three-figure innings, then a record number. He played a great part in bringing the Ashes back to England in the year 1911. Prince Hanjirahji was another notable cricketer, and during the years 1890-1900 was the finest batsman in the world. A. C. MacLaren held the record of the highest individual score, which is still the highest in Eng. C.; he made 424 for Lancashire against Somerset at Taunton in 1895. At present the record is 452 runs, scored by D. G. Bradman (knighted in 1949) for New S. Wales against Queensland at Sydney, in 1929-30. But MacLaren's 424 is still the highest score in the world under the conditions—which were a five-ball over and a three-day match. Ponsford's 429 in 1922-23 was made for Victoria against the weak Tasmanian eleven in time-unlimited C., with the eight-ball over; his 437 in 1927-28 and Bradman's 452 (not out) in 1929-30 were both made off a weak bowling side of Queensland, both under the eight-ball over and sev. days' play conditions. C. B. Fry, once captain of England, was a great batsman,

as well as a grand all-round athlete, and in his career he scored over 30,000 runs. P. F. Warner was another Eng. captain, and a fine batsman. His *Book of Cricket* is an interesting personal record of the game, besides being a fundamental exposition of the art of bowling, fielding, and captaincy. Among the professionals must be mentioned the Surrey pair, Abel and Hayward. The latter's record for the highest number of runs scored in a season (3518) stood unbeaten until 1917, when it was surpassed by Denis Compton's 3816 and W. J. Edrich's 3539. Among other cricketers may be mentioned: G. Gunn and A. Shrewsbury of Nottinghamshire; A. P. Freeman of Kent, who

Fox Photos

DENIS COMPTON

in 1928 took 301 wickets—a world record; G. Hirst and W. Rhodes of Yorkshire—the veteran Rhodes returned in 1926 and did much to win the Tests for England; the Foster brothers of Worcester (H. K. and R. E.); B. J. T. Bosanquet of Middlesex, inventor of the googly; R. H. Spooner and R. Tyldesley of Lancashire; L. C. H. Paludet of Somerset, K. L. Hutchings of Kent, the Hon. F. S. Jackson of Yorkshire, and J. T. Hearne of Middlesex. M. W. Tate, the bowler, H. Sutcliffe, and W. R. Hammond, D. Compton, and W. J. Edrich (three 'all-rounders'), are among great players of more recent years. T. Hayward, E. Hendren, C. P. Mead, P. E. Woolley, E. Tyldesley, W. R. Hammond, D. G. Bradman, L. E. G. Ames, and A. Sandham have all obtained over a hundred centuries. To mention a few other C. records, it may be interesting to note that the highest partnership in co. C. for first wicket is 555, made by P. Holmes and H. Sutcliffe, for Yorkshire against Essex, in 1932. The highest recorded partnership for second wicket is that of B. B. Nimbalkar and K. V. Bhandarkar (455) playing for Maharashtra against W. India States, 1948-49; for third wicket,

D. Compton and R. T. Simpson (399) playing for M.C.C. against N.E. Transvaal, 1948-49. W. G. Grace took 2876 wickets during his long career, and the highest number has been W. Rhodes with 4188. But F. R. Foster and S. F. Barnes will probably be remembered as the greatest bowlers England has ever produced. Among the wicket-keepers, E. Pooley's record of eight catches and four stumpings in one match for Surrey in 1868 has only been equalled by D. Tallon (Queensland), who dismissed twelve batsmen in one match in 1938. At the top of the seasonal aggregates is A. P. Freeman with 304 wickets in 1928; while

W. J. EDRICH

Fox Photos

one of the most remarkable bowling analyses has been that of H. Verity, who at Leeds in 1932 took ten wickets for ten runs. The highest total in first-class C., 1107, was made by Victoria against New S. Wales at Melbourne, in 1926. In England the highest is 903 for seven wickets, made by England in 1938. The lowest score is twelve by Oxford, when playing the M.C.C. in 1877, and by Northamptonshire, against Gloucestershire, in 1907. Victoria were once dismissed for fifteen when playing against England in 1903. Test match records: *Australia*: 729 (6 wickets declared), at Lords, 1930; 701 at the Oval, 1931; 674 against India at Adelaide, 1948; 649 at Sydney, 1947; 600 at Melbourne, 1924-25. *England*: 903 (7 wickets declared) at the Oval, 1938; 658 (8 wickets declared) at Nottingham, 1938; 636 at Sydney, 1928-1929; 627 (9 wickets declared) at Manchester, 1934. Highest individual scores above 350: Sir D. G. Bradman, 452 (not out) at Sydney, 1929-30, and 369 at Adelaide, 1935-36; W. H. Ponsford, 437 at Melbourne, 1926, and 429 at Melbourne, 1927-28; A. C. MacLaren, 424 at Taunton, 1895; C. W. Gregory, 383 at Brisbane,

1906-7; C. Hill, 365 (not out) at Adelaide, 1900-1; L. Hutton, 364 at the Oval, 1938; V. M. Merchant, 359 (not out) at Bombay, 1943-44; R. Abel, 357 (not out) at the Oval, 1899. Examples of rapid scoring are the feats of G. L. Jessop, who in 1907 made 191 out of 234 in 14 hours, being surpassed only by Alletson of Nottinghamshire, who played against Sussex at Hove in 1911. In 90 min. he hit 159 out of 227, but his first 142 runs out of 152 were hit in 35 min.

Cricket in the Dominions.—An Eng. touring team visited Canada in 1859, but C. has never flourished in the Amer. continent except in a few communities which have their devotees. The first visit to Australia was in 1861; and in 1880 the first Australian team came over here, and was beaten in the only Test match played. But in 1882 at the Oval Australia triumphed, and it was from this match that the expression 'the Ashes' arose, the *Sporting Times* publishing a satirical obituary lamenting the death of Eng. cricket. Since then visits of both teams to each country have been made. In all, 153 (1948) Test matches have been played between England and Australia, of which Australia have won 65, England 56, and 32 have been drawn. Among the best known of the Australian cricketers may be mentioned two of the finest batsmen that country has produced: Victor Trumper, who once hit up 50 in 5 min., and Don Bradman, who, although equalled in skill, has not been surpassed in the will to score runs; M. A. Noble, a splendid all-round cricketer; George Giffen, the Grace of Australia; Clem Hill, perhaps the finest left-handed batsman of any period; J. J. Darling, another left-hander; F. R. Spofforth and H. Trumble, Australia's greatest bowlers; W. Armstrong, V. Ransford, W. Bardsley, G. C. Macartney, S. E. Gregory, C. V. Grimmett, W. H. Ponsford, A. Jackson, S. F. Barnes, and A. Morris. C. in Australia has a universal popularity comparable only to that enjoyed by soccer in England. It is organised on an inter-state basis, and the sides compete for the Sheffield Shield. The S. Africans are comparatively new as a cricketing power, for the first Eng. team as such to visit that country was that of 1907. Altogether sixty-nine Test matches have been played, of which England have won thirty-one, S. Africa twelve, and twenty-six have been drawn. The Test match which lasted ten days at Durban, 1939, was the longest in C. hist. (scores: S. Africa, 530, 181; England 316, 654 (5 wickets)). The season 1912 was unique in the hist. of the game, for the Triangular Tournament between England, Australia, and S. Africa took place then. Nine matches in all were played, three between England and Australia, three between England and S. Africa, and three between Australia and S. Africa. England won the tournament and the actual results were as follows: England v. Australia: England, 1; Australia, 0; drawn 2. England v. S. Africa: England, 3; S. Africa, 0; drawn 0. Australia v. S. Africa: Australia, 2; S. Africa, 0; drawn 1.

Three Test matches were played against India in 1934, two of which were won by England and one by India. In 1937-38 five matches were played by Lord Tennyson's team in India, of which three were won by his team and two by India. An Indian team visited England in 1946—four matches were played, one being won by England, while the remainder were drawn. Test matches have been played by the W. Indies against England, Australia, and India, the first series being against England in 1928. New Zealand also sends representative teams to England, Australia, and S. Africa. The Test matches between England and Australia in Australia, in 1932-33, were remarkable for the unfortunate 'body-line' bowling controversy caused by the Eng. fast bowler Larwood, developing the 'leg theory' manner of bowling. The outcome of his success in forcing the batsmen to

English Game (anthology), 1948; and *Wisden Cricketer's Almanack* (ann.).

Cricket, name applied to members of the family of orthopterous insects known as Gryllidae, which is very closely allied to locust family. The species are noted for their long and slender antennae, hind legs formed for jumping, wings folded closely lengthwise, tarsi usually three-jointed, and a long ovipositor in all the females but those of the sub-family Gryllotalpinae. Many of the species are wingless, and it is the males only which make a chirping sound by rubbing the wing-covers on one another. They are widely distributed, and all are herbivorous but the carnivorous Gryllotalpidae. *Gryllus campestris*, the field C.; *G. domesticus* or *Achely domestica*, the house C. (Milton's 'cricket on the hearth'), and *Gryllotalpa vulgaris*, the common mole-cricket, are well-known representatives of the family.

be caught out by a field well packed on the leg side led to the Victorian Cricket Association in 1933 passing a rule empowering the umpire to ban any bowler whom he considers to be bowling with a view to intimidating the batsman. In the same year the M.C.C., in order to check fast short bowling on the leg side, resolved that any form of bowling which was obviously a direct attack on the batsman would be an offence against the spirit of the game and, in the following year, ruled that the type of bowling regarded as a direct attack on the batsman consisted in 'persistent and systematic bowling of fast, short-pitched balls at the batsman standing clear of his wicket.' Crickhowel, tn. of Wales in Brecknockshire, situated in the Usk valley. It possesses a Norman castle, belonging to the duke of Beaufort. About 2 m. N.E. of the tn. is a hill named Crug-llwyel, from which the name C. is derived. Pop. 6700.

Cricklade, mrkt. tn. of England in the co. of Wiltshire, situated on the Thames, 7 m. N.W. of Swindon, and 42 m. N. of Salisbury. It was formerly an important tn., having Anglo-Saxon associations. The industries are purely agric. It is endowed richly with charities, and possesses sev. educational establs. Pop. (with Wootton Bassett) 1300.

Crief, police bor. of Porthshire, Scotland, lying 18 m. to the W. of Perth. Here there are manufactories of woollen and worsted, cotton and linen goods, but the tn. is known chiefly as a health and pleasure resort because of the purity of its air. Many tourists visit the terraced ft. and Dutch gardens of Drummond Castle, the keep of which was built in 1490. Up to 1770 a great cattle fair was held at C., when its 'kind gallows' punished the highland cattle lifters. Pop. 6300.

Crikvenica, tn. of Croatia, Yugoslavia. A tourist centre of the Croatian littoral, 22 m. S. of Trieste.

Crillon, Louis des Balbes de Berton de (c. 1541-1615), Fr. soldier, surnamed le Brave, served his apprenticeship for

war under the famous Francis, duke of Guise, then the mirror of all military virtues. The valour displayed by C. at the siege of Calais and the taking of Guines won for him many fat livings, which he gave to the keeping of learned priests. At Dreux and Moncontour he was again to the fore, and at the battle of Lepanto, in spite of wounds, he was chosen to hear the tidings of victory to the king. Shocked at the Bartholomew massacres, as a staunch Catholic he nevertheless fought at the siege of La Rochelle (1573), but when Henry of Navarre came to the throne he gladly fought his battles. His last days were passed in pious exercises at Avignon.

Crime. In Great Britain the ann. averages of all Cs. known to the police (excluding traffic offences) in the forty years preceding the Second World War increased from about 81,000 to 150,000—an increase which partly corresponds to the increase of pop. over that period, but Cs. of violence steadily diminished; 140 murders, of which 41 were of infants, were committed in 1927, whereas the ann. average for 1929-30 was 152. Cs. against property tend to occur in autumn and winter, Cs. against the person in spring and summer. There is no conclusive evidence of a so-called 'crime-wave' in Great Britain. Housebreaking, burglary, and larceny have, however, increased during the past four decades. In 1939-40, during the 'black-out' necessitated by air-raid precautions, burglaries were of very frequent occurrence. The number of persons found guilty of offences of all kinds in 1935 was 759,423, an increase of 101,660 compared with 1931. But of these, 132,816 were traffic offences while a great proportion of the residue were merely offences punishable under summary jurisdiction of police courts or at petty sessions. Serious Cs. of violence against the person accounted for only 1397 or 0.2 per cent of the offenders. Of the 51,477 persons guilty of larceny, more than half were under twenty-one, and 37 per cent under the age of seventeen. The increase in juvenile C. is a noticeable feature of C. statistics. Birthings, however, have ranged from 2000 cases in 1912, to 5000 in 1917 and only 200 in recent years. The daily average prison pop. in 1936 was 10,600 against 11,300 in 1935.

C. statistics for 1946 showed no decrease in serious C. nor in offences by juveniles. The disturbing influence of war is, in part, the explanation of this increase, but economic stress or other environmental conditions may also be contributory factors. The more modern methods of treatment by way of re-adjusting the criminal to society have not yet demonstrated their superiority over the earlier methods of penal reform. Just as the old argument, that the general law-abidingness of the community proved the virtue of the deterrent methods, has long been seen to be fallacious, so neither a diminution in the ranks of a recognizable criminal class nor any statistics yet produced through 'follow-up' studies of individual offenders justify any con-

clusion on the efficacy of the latest methods in eradicating C.; for there are far too many complicating factors in both the new and the old methods to allow of a convincing comparison of the deterrent and reformatory systems on the basis of results. The latter system, however, plays a large part in the provisions of the new Criminal Justice Act, 1948 (see below). C. statistics for 1946 (pub. July 8, 1948) recorded that convictions, excluding persons charged under Defence Regulations, totalled 522,011, viz. 107,809 (37 per cent more than in 1938) for indictable offences and 424,202 (42 per cent less than in 1938) for non-indictable offences; the drop in the latter category was mainly due to big decreases in the number found guilty of traffic offences (260,000 compared with 475,124 in 1938) and drunkenness (19,377, compared with 52,661 in 1938). Of the convictions for indictable offences, 83 per cent were for larceny and breaking and entering, the number of the latter cases being 93 per cent above 1938 (in the seventeen to twenty-one age group 140 per cent higher), and the number of receiving cases 132 per cent higher; 59 per cent of the 20,874 breaking and entering cases, and 32 per cent of the 69,127 larceny cases, were committed by boys and girls under seventeen. Convictions against girls and women for indictable offences rose from 9,781 in 1938 to 14,884, there being, however, six times as many males convicted of such offences as females. Sexual offences rose from 2321 in 1938 to 3331, convictions for cruelty to children and neglect from 632 to 1058 (being, however, 576 fewer than in 1945), and violence cases from 1538 to 2172. On the other hand, convictions for fraud and false pretences fell from 2749 to 2303. During the year 127 persons over one year old were murdered, compared with an ann. average of 102 between 1932 and 1935, 194 from 1936 to 1939, 159 in 1942, 95 in 1944, and 141 in 1945; 77 arrests were made for murder and sentences of death were passed in 25 cases. Of the 732 juveniles dealt with at assizes, quarter sessions, and the central criminal court (compared with 241 in 1938), 276 were placed under the supervision of a probation officer, 89 bound over without supervision, and 212 sent to Borstal, whilst 20,079 males and 4117 females were placed under supervision in the lower courts. Magistrates' courts sentenced a smaller proportion of adults to imprisonment than in 1938, but there was a big increase in the number of adolescents of seventeen to twenty-one sent to prison by those courts and the higher courts. Corporal punishment ordered by higher courts rose from 17 cases in 1938 and 14 in 1945 to 35 in 1946 (including 8 cases of the 'cut' and 27 of the birch), whilst magistrates' courts ordered 13 boys to be whipped in 1946, compared with 25 in 1945 and 48 in 1938. Finally, the official report stated that 20,389 persons had been found guilty of offences against Defence Regulations, almost all being concerned with black market operations and building licence offences.

Crime and the Second World War.—The war and its aftermath gave an undoubted impetus to C. throughout the country. This was partly due to a general lowering of standards through the brutalising effects of war. Murder and other major Cs. of violence are more frequent to-day than in the pre-war years, but the prin. increase in C. falls within the general category of theft. In 1946 the number of indictable Cs. in London was 128,000, i.e. 32,500 or 34.1 per cent higher than that of 1938. The theft of money, clothing, suitcases, jewellery, and food formed a high percentage of this total; the theft of vehicle accessories, tools, furniture, electrical goods, cigarettes, and furs also formed a substantial percentage. One of the causes of this increase is the shortage of goods and the readiness with which, when stolen, they can be disposed of at high prices; and a second is the slow pace at which the police forces of the country are being restored to full strength after wartime depletion. So long as the shortage of goods continues there is little hope of a diminution of Cs. of theft with or without violence. Moreover, owing to the continued rationing of goods and various regulations affecting the sale and use of many commodities there are innumerable new law-breakers ranging from the person who lightheartedly takes advantage of an easily evaded regulation to the determined 'black market' operator—many of whom do not consider themselves to have any 'criminal intent' despite the calculated fraud involved in a large number of these new statutory offences. There have also been great increases in cases of attempted evasion of customs duties or smuggling and in offences against currency regulations. A disturbing element in the prevalence of Cs. that can be broadly referred to the category of theft is a continued increase in the number of juvenile offenders—an element which might seem to refute any assumption that the present level of C. is a transient phase. Of some 3800 persons charged in 1946 with shopbreaking in the London Metropolitan dist., 2550 or two-thirds were under twenty-one and nearly one-third were schoolchildren. Nearly half of the 960 persons arrested for burglary were under twenty-one and one-quarter were not more than sixteen. Youths between seventeen and twenty formed more than one-third of the total of 1200 persons charged with stealing motor cars. Over 3400 children between eight and thirteen were arrested, mainly for shopbreaking or simple theft. Public tolerance of the criminal is one reason for the increase of C. The modern criminal is becoming a highly trained specialist, and there is no branch of C. so efficiently specialised as that of safe-breaking. The 'yegg' or safe-breaker is a competent mechanic, often able to open the most intricate combination locks; but even when this is done, he will blast off the lock with an oxy-acetylene lamp to avoid suspicion that that particular lock is no longer efficacious. Nitroglycerine is also used

for blowing open a safe, the explosive being inserted in a hole made with an electric drill. Another method of safe-breaking is to sprinkle on the top of the safe a mixture of iron oxide, powdered aluminium, and powdered magnesium, which, when lighted, melts the flat steel surface. To prevent this, safe manufacturers have evolved an elliptical safe. The modern cracksmen is well equipped with scientific methods of house-breaking, etc.; burglar-bells, for instance, can be put out of action by corrosive acid carried in a syringe. Behind the professional burglar there is often a large and efficient organisation. Working in 'gangs' is a feature especially of Amer. C. The casual type of burglar with mask and jemmy is a thing of the past. The modern crook has become a psychologist, and turns confidence trickster or organises what in America is known as a racket. Organised racketeers force owners of, for example, laundry businesses and garages to pay a monthly subscription for immunity, otherwise their business is ruined in ways which do not admit of police prosecution. Besides the racketeer who trades on his personality to acquire people's confidence, there are those who organise real estate swindles, stock market and insurance frauds, gambling rings, smuggling schemes, etc. Each new law, such as prohibition, brings its own sort of C. (see BOOT-LEGGING). One distinguishing feature of Amer. C. is the accompanying violence, often resulting in the death of police officers. In the U.S.A. in many states there are no restrictions on the sale of arms nor on their possession provided that they are not concealed. Bandits are therefore armed, and 'hold-ups' are considered more profitable than house-breaking. The days of the highwayman have returned, but the modern bandit escapes in the high-speed car, which has become an indispensable asset to all criminals. On the other hand the resources of science are also enlisted in the detection of C. This is exemplified by recent successes of the forensic science laboratories. Thus microphotography made it possible to identify the fire-arm from which a bullet had been fired, or to connect the striations on a knife with those on a broken piece of blade. Microscopic and chemical analysis of traces of paint from road vehicles found on the clothing of a victim of a road accident, and from doors and windows of houses on a house-breaker's tools, provided corroborative evidence. 'Fluorescent analysis' and photography of documents by ultra-violet light afforded positive proof of forgery, where chemical means had been used to eradicate the original marks. Documents, including licences, petrol coupons, ration books, and log books, are photographed every week by the police, and numerous convictions obtained on this evidence alone. For the classification of Cs., see CRIMINAL LAW.

Crimea (Tatar *Krym*, a fortress, auct. *Taurica Chersonesus*), region of the R.S.F.S.R., with its cap. at Simferopol. It forms a peninsula between the Black Sea and the sea of Azov, and connected

with the mainland of S. Russia by the isthmus of Perekop, 18½ m. long by 3 to 4 m. in breadth at its narrowest part. The peninsula, an irregular quadrilateral in shape, is 200 m. from E. to W. by 125 m. from N. to S., with an area of 9700 sq. m. Its coast-line is about 625 m. in extent. The Crimean peninsula is cut off from the mainland on the E. by the strait of Yonikale or Kerch. On the N.E. is the shallow inlet of the sea of Azov known as the Sivash, or Putrid Sea. On the S. the coast is broken by the bay of Kaffa, or Feodosia, W. of which it becomes rocky and broken into many capes and small bays. Balaklava and more especially Sebastopol have very fine harbours. The C. is watered by many small rivs., the chief of which, the Salghir, divides the peninsula into two distinct regions. The N.W., and much the larger, div. is a continuation of the Russian steppes, an extensive plain with a salty soil only fit for pasturage. The S.E. div. is for the most part mountainous, broken by fertile valleys and beautiful meadowlands. The Yailah-dagh (Taurus) range of mts. skirts the S.E. coast, attaining to a height of 5060 ft. in Roman-kosh, and 5000 ft. in Chutyr-dagh, or Tent Mt. (anc. Trapezus). Thermal and naphtha springs and mud volcanoes are found in the hilly dist. round Kerch. The climate of the two divs. is as different as their surface. The N.W. is healthy and mild in the spring, summer, and autumn, but in the winter is exposed to cold winds from the steppes and very severe frost and snow-storms. The S. coast enjoys the same sub-tropical climate as the Riviera with accompanying vegetation: vineyards, olive gardens, laurels, cyresses, and fig-trees, and with the brilliant flowers of the Mediterranean coast. The chief products of the C. are grain, tobacco, wines, and fruits. Its honey is famous, and there is a large cattle-raising industry. The small salt lakes yield large quantities of salt; porphyry, lime-stone, and sandstone are also found. Fish of many kinds, including salmon and sturgeon, abound round the coasts, and the C. provides a noted oyster. The chief tns. are Simferopol, Sevastopol, Yalta, and Feodosia, chief of the summer bathing resorts. The bulk of the pop. is of Tatar extraction, with the chief Tatar characteristics often practically obliterated by constant inter-marriage with Gks. and others, so that the unmistakable Tatars are outnumbered by Russians. The remainder of the pop. is composed of Gks., Karaites, Jews, Bulgarians, and Armenians. Pop. 750,000.

History.—The earliest inhab. who left any traces were the Celtic Cimmerians expelled by the Scythians in the seventh century B.C. They took refuge in the mts., and were known later as the Tauri. In the sixth century B.C. Ionian and Dorian Gks. began to settle in the peninsula, the former at Theodosia and Bosphorus or Panticapaeum, which they turned into a granary to supply Athens with wheat. In the fourth century B.C.

the ruler of the latter kingdom assumed the title of king of Bosphorus. In the first century B.C. the then king of Bosphorus, to obtain help against the Scythians, put himself under the protection of Mithridates, king of Pontus, and in 63 B.C. Mithridates' son was given the kingdom of Bosphorus by the Romans as a reward for helping them against his father. In 15 B.C. the king of Pontus regained it, but only as a trib. state of Rome. In the third and fourth centuries the C. was successively overrun by the Goths and Huns, by the Khazars (eighth century), the Byzantine Gks. (eleventh century), Komans or Kipchaks (1050), and the Mongols (thirteenth century). In the thirteenth century first the Venetians and then the Genoese formed trading settlements on the coast which flourished until the conquest of the peninsula by the Ottoman Turks in 1475. In 1783 the C. was annexed to the Russian empire, and since then until the Second World War, the only important event in its hist. was the war of 1854-56. In Sept. 1941 mechanised Ger. troops crossed the Dnieper above Kherson, turned towards the coast to reach the sea of Azov and cut off the Crimean Peninsula at the Perekop Isthmus; but they had no immediate success in penetrating the peninsula. In Oct. a Ger. attack penetrated the first line of defences but thereafter met with the most spirited resistance. Towards the end of that month the Ger. investment of the fortress of Sevastopol began. It was very long drawn out. On June 5, 1942, a Ger. bombardment opened the attack on Sevastopol and breached the N. defences by June 19. A few days later the Gers. gained control N. of Sevastopol. The tn. and harbour were then subjected to attack by incessant waves of 300 planes and the air blockade of the city was virtually complete. By the end of June the fortress was in process of collapse, for on July 1 the Gers. captured Balaklava and overcame the last defensive position outside Sevastopol with the taking of Malakov. At noon on that day their forces stormed into the city itself. The Russians made a last stand on the Chersonese Peninsula but the heroic defence of the great Russian fortress was now finally at an end. With the defeat of von Paulus at Stalingrad, however, came the turn of the tide in Russia. Part of the Ger. armies retreating from the Caucasus passed through the Taman Peninsula into the C. By the autumn of 1943 the Russians, having smashed the Ger. line based on Melitopol, had cut off the landward approaches to the C. After the recapture of Odessa by the Russians on April 10, 1944, their armies broke into the Crimean Peninsula across the Perekop Isthmus on April 11 and Sevastopol fell to them on May 9. In 1946 the C. lost its status as a Soviet republic on account of collaboration with the Gers., and large numbers of the inhab. were deported. The C. Conference was held at Yalta (4-11 Feb. 1945), at which Mr. Churchill, President Roosevelt, and Marshal Stalin completed plans for the defeat of Germany,

and the occupation and control of the country after its defeat; the conference also made preparations for the Polish settlement, and for the San Francisco Conference (q.v.). See also under YALTA. See further EASTERN FRONT OF RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR. See C. Bossall, *The Beautiful Scenery of the Crimea*, 1855-56; J. B. Telfer, *The Crimea and Transcaucasia*, 1876; Sir E. Wood, *The Crimea in 1854 and 1894*, 1895; and A. A. Vasiliev, *Goths in the Crimea*, 1936. See also BOSPHORUS and CRIMEAN WAR.

Crimean War was brought about largely through the aggressive policy of Tsar Nicholas I. of Russia, who had visions of a Russian empire embracing the whole of S.E. Europe, and determined to win Constantinople. Using as his pretext an obscure quarrel in Jerusalem between Gk. and Lat. Christians, Nicholas boldly claimed from the sultan a protectorate over all the Gk. Christians in the Ottoman dominions, thereby hoping to make the impending war a struggle between Cross and Crescent. But the sultan issued a solemn edict to the Christians, promising them full religious liberty, and appealing to France and England for help. Both powers responded to his request, the former because it was anxious to avenge Moscow, the latter because it feared its E. possessions would be menaced were Russia allowed to reach the Mediterranean. Yet at the time the Manchester leaders, Cobden and Bright, courageously denounced the war in the face of a bellicose people. The actual war extended from 1853 to 1856, being terminated by the unsatisfactory Peace of Paris. There were some naval engagements in the Baltic, but the true interest of the war is concentrated round Sebastopol, the Russian stronghold in the Crimea. The allied forces were at first mustered in Varna, but in 1854 were transported to Eupatoria, after having suffered terribly through cholera. By the victory of the Alma in Sept. 1854, when the brunt of the fighting fell on the Eng., a way for the Allies was cleared to Sebastopol. It was during an Oct. attack by the Russian general Bismarck upon Balaklava, the Eng. headquarters, that the Light Brigade won an undying fame by its fatal but valiant charge through N. Valley. In Nov. the Eng. Guards and troops on the hill of Inkermann beat back the assaulting Russians, but in spite of their victory dared not attempt to capture Sebastopol by storm. Accordingly the Allies settled down to a winter siege. Tempests wrecked the transports bearing clothing, ammunition, etc., so that the soldiers were totally unprepared to endure the snows and bitter cold, and Miss Florence Nightingale, who did noble work as nurse, bore vivid testimony to the acute sufferings and deprivations and also to the patience and courage of the soldiers. Early in 1855 the Eng. commander-in-chief, Raglan, and Nicholas d. In Aug. the Fr. and Sardinians, who had joined in the war, defeated the Russians at the battle of the Chernaya, and the former

captured the Malakov redoubt, though the Eng. were driven back from the Tchernaya. In Sept. the Russians surrendered Sebastopol. By the provisions of the treaty the Russians abandoned their claim to a protectorate over the Christians, and agreed not to build any more forts on the Kuxine, but recovered Sebastopol. The great powers assumed responsibility for seeing that the Sublime Porte fulfilled its guarantees to the Christians. Navigation on the Danube was thrown open. This war demonstrated to England the folly of attempting to rehabilitate Turkey, the crying need for reform in military organisation, and the stubborn valour of the troops. See L. Tolstoy, *Sevastopol*, 1863-87; A. W. Kinglake, *The Invasion of the Crimea*, 1899; C. F. MacMunn, *The Crimea in Perspective*, 1935; and H. W. V. Temperley, *England and the Near East*, vol. 1, *The Crimea*, 1936.

Crimes, War. The whole complex of legal rules which order the life of a community in time of peace are equally valid in time of war. The laws of peace remain in force despite the state of war, though they are subject to exceptions which operate in certain circumstances and under certain conditions, and so give what validity there may be in the dogma *inter arma leges silent*. War sanctions by its very existence the use of force, the use of lethal weapons, the destruction of life and property. Hence civilised states have long reached an agreement by which they decided to introduce order into the chaos of war, or, in other words, to make 'laws of warfare' by way of providing a solution of the age-old conflict between brute force which knows no limits and force controlled by rules. These laws of warfare are a great compromise resulting from the conflict between the command of law and the necessities of war. Long before the world wars there were numerous written laws of warfare—conventions, regulations, protocols, etc.—and these together form the body of the international (written) laws of warfare. Among them are the declaration of Paris, 1856 (q.v.); the Geneva Convention, 1864, for the amelioration of wounded soldiers; and some thirteen Hague conventions, signed between 1899 and 1907, and various Hague declarations, e.g. that of 1899 concerning projectiles diffusing asphyxiating gases (which is confirmed and extended by the protocol of 1925), the Geneva Convention of 1929 on the treatment of sick and wounded and of prisoners of war, and the London Protocol of 1936 relating to the use of submarines against merchant vessels. But the mere fact that this body of laws does not expressly cover all crimes does not mean that the rules of warfare approve of such omitted crimes. The Fourth Hague Convention (1907) covers omissions by saying that the powers 'were inspired by the desire to diminish the evils of war' and that 'the right of belligerents to adopt means of injuring the enemy is not unlimited' (Article 22). But at the time when the Hague rules were drafted, it was not

anticipated that all the new inventions and developments would be used one day as mortal weapons of destruction, that the greater the achievements of science the deeper would be the abyss of brutality, cruelty, and vandalism. That is probably why the written laws of warfare, though prohibiting some minor offences and crimes, did not deal with the very great crimes. But this lack of rules does not mean that these crimes can escape prosecution, for all of them are prohibited by the unwritten, if not written, rules of war. On this point the preamble to the Fourth Hague Convention says: 'Until a more complete code of laws of war can be issued the high contracting parties think it expedient to declare that in cases not included in the regulations adopted by them, populations and belligerents remain under the protection and the rule of the law of nations (see *JUS GENTIUM*), as they result from the usages established between civilised nations, from the laws of humanity, and the requirements of the public conscience.'
